 24806 implementation-defined way to initialize the file's group ID to the effective group ID of the  
 24807 calling process. The owner, group, and other permission bits of `mode` shall be modified by the file  
 24808 mode creation mask of the process. The `mknod()` function shall clear each bit whose  
 24809 corresponding bit in the file mode creation mask of the process is set.

- 24810 If *path* names a symbolic link, *mknod()* shall fail and set *errno* to [EEXIST].
- 24811 Upon successful completion, *mknod()* shall mark for update the *st\_atime*, *st\_ctime*, and *st\_mtime*  
24812 fields of the file. Also, the *st\_ctime* and *st\_mtime* fields of the directory that contains the new  
24813 entry shall be marked for update.
- 24814 Only a process with appropriate privileges may invoke *mknod()* for file types other than FIFO-  
24815 special.
- 24816 **RETURN VALUE**
- 24817 Upon successful completion, *mknod()* shall return 0. Otherwise, it shall return -1, the new file  
24818 shall not be created, and *errno* shall be set to indicate the error.
- 24819 **ERRORS**
- 24820 The *mknod()* function shall fail if:
- 24821 [EACCES] A component of the path prefix denies search permission, or write permission  
24822 is denied on the parent directory.
- 24823 [EEXIST] The named file exists.
- 24824 [EINVAL] An invalid argument exists.
- 24825 [EIO] An I/O error occurred while accessing the file system.
- 24826 [ELOOP] A loop exists in symbolic links encountered during resolution of the *path*  
24827 argument.
- 24828 [ENAMETOOLONG]
- 24829 The length of a pathname exceeds {PATH\_MAX} or a pathname component is  
24830 longer than {NAME\_MAX}.
- 24831 [ENOENT] A component of the path prefix specified by *path* does not name an existing  
24832 directory or *path* is an empty string.
- 24833 [ENOSPC] The directory that would contain the new file cannot be extended or the file  
24834 system is out of file allocation resources.
- 24835 [ENOTDIR] A component of the path prefix is not a directory.
- 24836 [EPERM] The invoking process does not have appropriate privileges and the file type is  
24837 not FIFO-special.
- 24838 [EROFS] The directory in which the file is to be created is located on a read-only file  
24839 system.
- 24840 The *mknod()* function may fail if:
- 24841 [ELOOP] More than {SYMLOOP\_MAX} symbolic links were encountered during  
24842 resolution of the *path* argument.
- 24843 [ENAMETOOLONG]
- 24844 Pathname resolution of a symbolic link produced an intermediate result  
24845 whose length exceeds {PATH\_MAX}.

24846 **EXAMPLES**24847 **Creating a FIFO Special File**

24848 The following example shows how to create a FIFO special file named `/home/cnd/mod_done`,  
24849 with read/write permissions for owner, and with read permissions for group and others.

```
24850 #include <sys/types.h>
24851 #include <sys/stat.h>
24852 dev_t dev;
24853 int status;
24854 ...
24855 status = mknod("/home/cnd/mod_done", S_IFIFO | S_IWUSR |
24856 S_IRUSR | S_IRGRP | S_IROTH, dev);
```

24857 **APPLICATION USAGE**

24858 The `mkfifo()` function is preferred over this function for making FIFO special files.

24859 **RATIONALE**

24860 The POSIX.1-1990 standard required that the group ID of a newly created file be set to the group  
24861 ID of its parent directory or to the effective group ID of the creating process. FIPS 151-2 required  
24862 that implementations provide a way to have the group ID be set to the group ID of the  
24863 containing directory, but did not prohibit implementations also supporting a way to set the  
24864 group ID to the effective group ID of the creating process. Conforming applications should not  
24865 assume which group ID will be used. If it matters, an application can use `chown()` to set the  
24866 group ID after the file is created, or determine under what conditions the implementation will  
24867 set the desired group ID.

24868 **FUTURE DIRECTIONS**

24869 None.

24870 **SEE ALSO**

24871 `chmod()`, `creat()`, `exec`, `mkdir()`, `mkfifo()`, `open()`, `stat()`, `umask()`, the Base Definitions volume of  
24872 IEEE Std 1003.1-2001, `<sys/stat.h>`

24873 **CHANGE HISTORY**

24874 First released in Issue 4, Version 2.

24875 **Issue 5**

24876 Moved from X/OPEN UNIX extension to BASE.

24877 **Issue 6**

24878 The DESCRIPTION is updated to avoid use of the term “must” for application requirements.

24879 The wording of the mandatory [ELOOP] error condition is updated, and a second optional  
24880 [ELOOP] error condition is added.

24881 **NAME**

24882 mkstemp — make a unique filename

24883 **SYNOPSIS**24884 XSI 

```
#include <stdlib.h>
```

24885 

```
int mkstemp(char *template);
```

24886

24887 **DESCRIPTION**

24888 The *mkstemp()* function shall replace the contents of the string pointed to by *template* by a unique  
24889 filename, and return a file descriptor for the file open for reading and writing. The function thus  
24890 prevents any possible race condition between testing whether the file exists and opening it for  
24891 use. The string in *template* should look like a filename with six trailing 'X's; *mkstemp()* replaces  
24892 each 'X' with a character from the portable filename character set. The characters are chosen  
24893 such that the resulting name does not duplicate the name of an existing file at the time of a call  
24894 to *mkstemp()*.

24895 **RETURN VALUE**

24896 Upon successful completion, *mkstemp()* shall return an open file descriptor. Otherwise, -1 shall  
24897 be returned if no suitable file could be created.

24898 **ERRORS**

24899 No errors are defined.

24900 **EXAMPLES**24901 **Generating a Filename**

24902 The following example creates a file with a 10-character name beginning with the characters  
24903 "file" and opens the file for reading and writing. The value returned as the value of *fd* is a file  
24904 descriptor that identifies the file.

```
24905 #include <stdlib.h>  
24906 ...  
24907 char template[] = "/tmp/fileXXXXXX";  
24908 int fd;  
  
24909 fd = mkstemp(template);
```

24910 **APPLICATION USAGE**

24911 It is possible to run out of letters.

24912 The *mkstemp()* function need not check to determine whether the filename part of *template*  
24913 exceeds the maximum allowable filename length.

24914 **RATIONALE**

24915 None.

24916 **FUTURE DIRECTIONS**

24917 None.

24918 **SEE ALSO**

24919 *getpid()*, *open()*, *tmpfile()*, *tmpnam()*, the Base Definitions volume of IEEE Std 1003.1-2001,  
24920 <stdlib.h>

24921 **CHANGE HISTORY**

24922           First released in Issue 4, Version 2.

24923 **Issue 5**

24924           Moved from X/OPEN UNIX extension to BASE.

24925 **NAME**24926 mktemp — make a unique filename (**LEGACY**)24927 **SYNOPSIS**24928 XSI `#include <stdlib.h>`24929 `char *mktemp(char *template);`

24930

24931 **DESCRIPTION**

24932 The *mktemp()* function shall replace the contents of the string pointed to by *template* by a unique  
24933 filename and return *template*. The application shall initialize *template* to be a filename with six  
24934 trailing 'X's; *mktemp()* shall replace each 'X' with a single byte character from the portable  
24935 filename character set.

24936 **RETURN VALUE**

24937 The *mktemp()* function shall return the pointer *template*. If a unique name cannot be created,  
24938 *template* shall point to a null string.

24939 **ERRORS**

24940 No errors are defined.

24941 **EXAMPLES**24942 **Generating a Filename**

24943 The following example replaces the contents of the "template" string with a 10-character  
24944 filename beginning with the characters "file" and returns a pointer to the "template" string  
24945 that contains the new filename.

```
24946 #include <stdlib.h>
24947 ...
24948 char *template = "/tmp/fileXXXXXX";
24949 char *ptr;
24950 ptr = mktemp(template);
```

24951 **APPLICATION USAGE**

24952 Between the time a pathname is created and the file opened, it is possible for some other process  
24953 to create a file with the same name. The *mkstemp()* function avoids this problem and is preferred  
24954 over this function.

24955 **RATIONALE**

24956 None.

24957 **FUTURE DIRECTIONS**

24958 This function may be withdrawn in a future version.

24959 **SEE ALSO**24960 *mkstemp()*, *tmpfile()*, *tmpnam()*, the Base Definitions volume of IEEE Std 1003.1-2001, `<stdlib.h>`24961 **CHANGE HISTORY**

24962 First released in Issue 4, Version 2.

24963 **Issue 5**

24964 Moved from X/OPEN UNIX extension to BASE.

24965 **Issue 6**

24966 This function is marked LEGACY.

24967 The DESCRIPTION is updated to avoid use of the term “must” for application requirements.

24968 **NAME**

24969 mktime — convert broken-down time into time since the Epoch

24970 **SYNOPSIS**

24971 #include &lt;time.h&gt;

24972 time\_t mktime(struct tm \*timeptr);

24973 **DESCRIPTION**

24974 **CX** The functionality described on this reference page is aligned with the ISO C standard. Any  
 24975 conflict between the requirements described here and the ISO C standard is unintentional. This  
 24976 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

24977 The *mktime()* function shall convert the broken-down time, expressed as local time, in the  
 24978 structure pointed to by *timeptr*, into a time since the Epoch value with the same encoding as that  
 24979 of the values returned by *time()*. The original values of the *tm\_wday* and *tm\_yday* components of  
 24980 the structure are ignored, and the original values of the other components are not restricted to  
 24981 the ranges described in <time.h>.

24982 **CX** A positive or 0 value for *tm\_isdst* shall cause *mktime()* to presume initially that Daylight Savings  
 24983 Time, respectively, is or is not in effect for the specified time. A negative value for *tm\_isdst* shall  
 24984 cause *mktime()* to attempt to determine whether Daylight Savings Time is in effect for the  
 24985 specified time.

24986 Local timezone information shall be set as though *mktime()* called *tzset()*.

24987 The relationship between the **tm** structure (defined in the <time.h> header) and the time in  
 24988 seconds since the Epoch is that the result shall be as specified in the expression given in the  
 24989 definition of seconds since the Epoch (see the Base Definitions volume of IEEE Std 1003.1-2001,  
 24990 Section 4.14, Seconds Since the Epoch) corrected for timezone and any seasonal time  
 24991 adjustments, where the names in the structure and in the expression correspond.

24992 Upon successful completion, the values of the *tm\_wday* and *tm\_yday* components of the structure  
 24993 shall be set appropriately, and the other components are set to represent the specified time since  
 24994 the Epoch, but with their values forced to the ranges indicated in the <time.h> entry; the final  
 24995 value of *tm\_mday* shall not be set until *tm\_mon* and *tm\_year* are determined.

24996 **RETURN VALUE**

24997 The *mktime()* function shall return the specified time since the Epoch encoded as a value of type  
 24998 **time\_t**. If the time since the Epoch cannot be represented, the function shall return the value  
 24999 (**time\_t**)-1.

25000 **ERRORS**

25001 No errors are defined.

25002 **EXAMPLES**

25003 What day of the week is July 4, 2001?

25004 #include &lt;stdio.h&gt;

25005 #include &lt;time.h&gt;

25006 struct tm time\_str;

25007 char daybuf[20];

25008 int main(void)

25009 {

25010 time\_str.tm\_year = 2001 - 1900;

25011 time\_str.tm\_mon = 7 - 1;

25012 time\_str.tm\_mday = 4;

```
25013     time_str.tm_hour = 0;
25014     time_str.tm_min = 0;
25015     time_str.tm_sec = 1;
25016     time_str.tm_isdst = -1;
25017     if (mktime(&time_str) == -1)
25018         (void)puts("-unknown-");
25019     else {
25020         (void)strftime(daybuf, sizeof(daybuf), "%A", &time_str);
25021         (void)puts(daybuf);
25022     }
25023     return 0;
25024 }
```

**25025 APPLICATION USAGE**

25026 None.

**25027 RATIONALE**

25028 None.

**25029 FUTURE DIRECTIONS**

**25034 CHANGE HISTORY**

25035 First released in Issue 3. Included for alignment with the POSIX.1-1988 standard and the ANSI C  
25036 standard.

**25037 Issue 6**

25038 Extensions beyond the ISO C standard are marked.

25039 **NAME**25040 mlock, munlock — lock or unlock a range of process address space (**REALTIME**)25041 **SYNOPSIS**25042 MLR `#include <sys/mman.h>`25043 `int mlock(const void *addr, size_t len);`25044 `int munlock(const void *addr, size_t len);`

25045

25046 **DESCRIPTION**

25047 The *mlock()* function shall cause those whole pages containing any part of the address space of  
 25048 the process starting at address *addr* and continuing for *len* bytes to be memory-resident until  
 25049 unlocked or until the process exits or *execs* another process image. The implementation may  
 25050 require that *addr* be a multiple of {PAGESIZE}.

25051 The *munlock()* function shall unlock those whole pages containing any part of the address space  
 25052 of the process starting at address *addr* and continuing for *len* bytes, regardless of how many  
 25053 times *mlock()* has been called by the process for any of the pages in the specified range. The  
 25054 implementation may require that *addr* be a multiple of {PAGESIZE}.

25055 If any of the pages in the range specified to a call to *munlock()* are also mapped into the address  
 25056 spaces of other processes, any locks established on those pages by another process are  
 25057 unaffected by the call of this process to *munlock()*. If any of the pages in the range specified by a  
 25058 call to *munlock()* are also mapped into other portions of the address space of the calling process  
 25059 outside the range specified, any locks established on those pages via the other mappings are also  
 25060 unaffected by this call.

25061 Upon successful return from *mlock()*, pages in the specified range shall be locked and memory-  
 25062 resident. Upon successful return from *munlock()*, pages in the specified range shall be unlocked  
 25063 with respect to the address space of the process. Memory residency of unlocked pages is  
 25064 unspecified.

25065 The appropriate privilege is required to lock process memory with *mlock()*.

25066 **RETURN VALUE**

25067 Upon successful completion, the *mlock()* and *munlock()* functions shall return a value of zero.  
 25068 Otherwise, no change is made to any locks in the address space of the process, and the function  
 25069 shall return a value of  $-1$  and set *errno* to indicate the error.

25070 **ERRORS**

25071 The *mlock()* and *munlock()* functions shall fail if:

25072 [ENOMEM] Some or all of the address range specified by the *addr* and *len* arguments does  
 25073 not correspond to valid mapped pages in the address space of the process.

25074 The *mlock()* function shall fail if:

25075 [EAGAIN] Some or all of the memory identified by the operation could not be locked  
 25076 when the call was made.

25077 The *mlock()* and *munlock()* functions may fail if:

25078 [EINVAL] The *addr* argument is not a multiple of {PAGESIZE}.

25079 The *mlock()* function may fail if:

25080 [ENOMEM] Locking the pages mapped by the specified range would exceed an  
 25081 implementation-defined limit on the amount of memory that the process may  
 25082 lock.

25083 [EPERM] The calling process does not have the appropriate privilege to perform the  
25084 requested operation.

25085 **EXAMPLES**

25086 None.

25087 **APPLICATION USAGE**

25088 None.

25089 **RATIONALE**

25090 None.

25091 **FUTURE DIRECTIONS**

25092 None.

25093 **SEE ALSO**

25094 *exec*, *exit()*, *fork()*, *mlockall()*, *munmap()*, the Base Definitions volume of IEEE Std 1003.1-2001,  
25095 <sys/mman.h>

25096 **CHANGE HISTORY**

25097 First released in Issue 5. Included for alignment with the POSIX Realtime Extension.

25098 **Issue 6**

25099 The *mlock()* and *munlock()* functions are marked as part of the Range Memory Locking option.

25100 The [ENOSYS] error condition has been removed as stubs need not be provided if an  
25101 implementation does not support the Range Memory Locking option.

25102 **NAME**25103 mlockall, munlockall — lock/unlock the address space of a process (**REALTIME**)25104 **SYNOPSIS**

25105 ML #include &lt;sys/mman.h&gt;

25106 int mlockall(int flags);

25107 int munlockall(void);

25108

25109 **DESCRIPTION**

25110 The *mlockall()* function shall cause all of the pages mapped by the address space of a process to  
 25111 be memory-resident until unlocked or until the process exits or *execs* another process image. The  
 25112 *flags* argument determines whether the pages to be locked are those currently mapped by the  
 25113 address space of the process, those that are mapped in the future, or both. The *flags* argument is  
 25114 constructed from the bitwise-inclusive OR of one or more of the following symbolic constants,  
 25115 defined in <sys/mman.h>:

25116 MCL\_CURRENT Lock all of the pages currently mapped into the address space of the process.

25117 MCL\_FUTURE Lock all of the pages that become mapped into the address space of the  
25118 process in the future, when those mappings are established.

25119 If MCL\_FUTURE is specified, and the automatic locking of future mappings eventually causes  
 25120 the amount of locked memory to exceed the amount of available physical memory or any other  
 25121 implementation-defined limit, the behavior is implementation-defined. The manner in which the  
 25122 implementation informs the application of these situations is also implementation-defined.

25123 The *munlockall()* function shall unlock all currently mapped pages of the address space of the  
 25124 process. Any pages that become mapped into the address space of the process after a call to  
 25125 *munlockall()* shall not be locked, unless there is an intervening call to *mlockall()* specifying  
 25126 MCL\_FUTURE or a subsequent call to *mlockall()* specifying MCL\_CURRENT. If pages mapped  
 25127 into the address space of the process are also mapped into the address spaces of other processes  
 25128 and are locked by those processes, the locks established by the other processes shall be  
 25129 unaffected by a call by this process to *munlockall()*.

25130 Upon successful return from the *mlockall()* function that specifies MCL\_CURRENT, all currently  
 25131 mapped pages of the process' address space shall be memory-resident and locked. Upon return  
 25132 from the *munlockall()* function, all currently mapped pages of the process' address space shall be  
 25133 unlocked with respect to the process' address space. The memory residency of unlocked pages is  
 25134 unspecified.

25135 The appropriate privilege is required to lock process memory with *mlockall()*.25136 **RETURN VALUE**

25137 Upon successful completion, the *mlockall()* function shall return a value of zero. Otherwise, no  
 25138 additional memory shall be locked, and the function shall return a value of -1 and set *errno* to  
 25139 indicate the error. The effect of failure of *mlockall()* on previously existing locks in the address  
 25140 space is unspecified.

25141 If it is supported by the implementation, the *munlockall()* function shall always return a value of  
 25142 zero. Otherwise, the function shall return a value of -1 and set *errno* to indicate the error.

25143 **ERRORS**25144 The *mlockall()* function shall fail if:

25145 [EAGAIN] Some or all of the memory identified by the operation could not be locked  
 25146 when the call was made.

- 25147 [EINVAL] The *flags* argument is zero, or includes unimplemented flags.
- 25148 The *mlockall()* function may fail if:
- 25149 [ENOMEM] Locking all of the pages currently mapped into the address space of the  
25150 process would exceed an implementation-defined limit on the amount of  
25151 memory that the process may lock.
- 25152 [EPERM] The calling process does not have the appropriate privilege to perform the  
25153 requested operation.
- 25154 **EXAMPLES**
- 25155 None.
- 25156 **APPLICATION USAGE**
- 25157 None.
- 25158 **RATIONALE**
- 25159 None.
- 25160 **FUTURE DIRECTIONS**
- 25161 None.
- 25162 **SEE ALSO**
- 25163 *exec*, *exit()*, *fork()*, *mlock()*, *munmap()*, the Base Definitions volume of IEEE Std 1003.1-2001,  
25164 <*sys/mman.h*>
- 25165 **CHANGE HISTORY**
- 25166 First released in Issue 5. Included for alignment with the POSIX Realtime Extension.
- 25167 **Issue 6**
- 25168 The *mlockall()* and *munlockall()* functions are marked as part of the Process Memory Locking  
25169 option.
- 25170 The [ENOSYS] error condition has been removed as stubs need not be provided if an  
25171 implementation does not support the Process Memory Locking option.

25172 **NAME**25173 `mmap` — map pages of memory25174 **SYNOPSIS**25175 MF|SHM `#include <sys/mman.h>`

```
25176 void *mmap(void *addr, size_t len, int prot, int flags,
25177            int fildes, off_t off);
25178
```

25179 **DESCRIPTION**

25180 The `mmap()` function shall establish a mapping between a process' address space and a file,  
 25181 TYM shared memory object, or typed memory object. The format of the call is as follows:

```
25182 pa=mmap(addr, len, prot, flags, fildes, off);
```

25183 The `mmap()` function shall establish a mapping between the address space of the process at an  
 25184 address `pa` for `len` bytes to the memory object represented by the file descriptor `fildes` at offset `off`  
 25185 for `len` bytes. The value of `pa` is an implementation-defined function of the parameter `addr` and  
 25186 the values of `flags`, further described below. A successful `mmap()` call shall return `pa` as its result.  
 25187 The address range starting at `pa` and continuing for `len` bytes shall be legitimate for the possible  
 25188 (not necessarily current) address space of the process. The range of bytes starting at `off` and  
 25189 continuing for `len` bytes shall be legitimate for the possible (not necessarily current) offsets in the  
 25190 TYM file, shared memory object, or typed memory object represented by `fildes`.

25191 TYM If `fildes` represents a typed memory object opened with either the  
 25192 `POSIX_TYPED_MEM_ALLOCATE` flag or the `POSIX_TYPED_MEM_ALLOCATE_CONTIG`  
 25193 flag, the memory object to be mapped shall be that portion of the typed memory object allocated  
 25194 by the implementation as specified below. In this case, if `off` is non-zero, the behavior of `mmap()`  
 25195 is undefined. If `fildes` refers to a valid typed memory object that is not accessible from the calling  
 25196 process, `mmap()` shall fail.

25197 The mapping established by `mmap()` shall replace any previous mappings for those whole pages  
 25198 containing any part of the address space of the process starting at `pa` and continuing for `len`  
 25199 bytes.

25200 If the size of the mapped file changes after the call to `mmap()` as a result of some other operation  
 25201 on the mapped file, the effect of references to portions of the mapped region that correspond to  
 25202 added or removed portions of the file is unspecified.

25203 TYM The `mmap()` function shall be supported for regular files, shared memory objects, and typed  
 25204 memory objects. Support for any other type of file is unspecified.

25205 The parameter `prot` determines whether read, write, execute, or some combination of accesses  
 25206 are permitted to the data being mapped. The `prot` shall be either `PROT_NONE` or the bitwise-  
 25207 inclusive OR of one or more of the other flags in the following table, defined in the  
 25208 `<sys/mman.h>` header.

25209

25210

25211

25212

25213

25214

| Symbolic Constant       | Description              |
|-------------------------|--------------------------|
| <code>PROT_READ</code>  | Data can be read.        |
| <code>PROT_WRITE</code> | Data can be written.     |
| <code>PROT_EXEC</code>  | Data can be executed.    |
| <code>PROT_NONE</code>  | Data cannot be accessed. |

25215 If an implementation cannot support the combination of access types specified by `prot`, the call  
 25216 to `mmap()` shall fail.

25217 MPR An implementation may permit accesses other than those specified by *prot*; however, if the  
 25218 Memory Protection option is supported, the implementation shall not permit a write to succeed  
 25219 where PROT\_WRITE has not been set or shall not permit any access where PROT\_NONE alone  
 25220 has been set. The implementation shall support at least the following values of *prot*:  
 25221 PROT\_NONE, PROT\_READ, PROT\_WRITE, and the bitwise-inclusive OR of PROT\_READ and  
 25222 PROT\_WRITE. If the Memory Protection option is not supported, the result of any access that  
 25223 conflicts with the specified protection is undefined. The file descriptor *fildev* shall have been  
 25224 opened with read permission, regardless of the protection options specified. If PROT\_WRITE is  
 25225 specified, the application shall ensure that it has opened the file descriptor *fildev* with write  
 25226 permission unless MAP\_PRIVATE is specified in the *flags* parameter as described below.

25227 The parameter *flags* provides other information about the handling of the mapped data. The  
 25228 value of *flags* is the bitwise-inclusive OR of these options, defined in `<sys/mman.h>`:

25229

25230

25231

25232

25233

| Symbolic Constant | Description                    |
|-------------------|--------------------------------|
| MAP_SHARED        | Changes are shared.            |
| MAP_PRIVATE       | Changes are private.           |
| MAP_FIXED         | Interpret <i>addr</i> exactly. |

25234 Implementations that do not support the Memory Mapped Files option are not required to  
 25235 support MAP\_PRIVATE.

25236 XSI It is implementation-defined whether MAP\_FIXED shall be supported. MAP\_FIXED shall be  
 25237 supported on XSI-conformant systems.

25238 MAP\_SHARED and MAP\_PRIVATE describe the disposition of write references to the memory  
 25239 object. If MAP\_SHARED is specified, write references shall change the underlying object. If  
 25240 MAP\_PRIVATE is specified, modifications to the mapped data by the calling process shall be  
 25241 visible only to the calling process and shall not change the underlying object. It is unspecified  
 25242 whether modifications to the underlying object done after the MAP\_PRIVATE mapping is  
 25243 established are visible through the MAP\_PRIVATE mapping. Either MAP\_SHARED or  
 25244 MAP\_PRIVATE can be specified, but not both. The mapping type is retained across *fork()*.

25245 TYM When *fildev* represents a typed memory object opened with either the  
 25246 POSIX\_TYPED\_MEM\_ALLOCATE flag or the POSIX\_TYPED\_MEM\_ALLOCATE\_CONTIG  
 25247 flag, *mmap()* shall, if there are enough resources available, map *len* bytes allocated from the  
 25248 corresponding typed memory object which were not previously allocated to any process in any  
 25249 processor that may access that typed memory object. If there are not enough resources available,  
 25250 the function shall fail. If *fildev* represents a typed memory object opened with the  
 25251 POSIX\_TYPED\_MEM\_ALLOCATE\_CONTIG flag, these allocated bytes shall be contiguous  
 25252 within the typed memory object. If *fildev* represents a typed memory object opened with the  
 25253 POSIX\_TYPED\_MEM\_ALLOCATE flag, these allocated bytes may be composed of non-  
 25254 contiguous fragments within the typed memory object. If *fildev* represents a typed memory  
 25255 object opened with neither the POSIX\_TYPED\_MEM\_ALLOCATE\_CONTIG flag nor the  
 25256 POSIX\_TYPED\_MEM\_ALLOCATE flag, *len* bytes starting at offset *off* within the typed memory  
 25257 object are mapped, exactly as when mapping a file or shared memory object. In this case, if two  
 25258 processes map an area of typed memory using the same *off* and *len* values and using file  
 25259 descriptors that refer to the same memory pool (either from the same port or from a different  
 25260 port), both processes shall map the same region of storage.

25261 When MAP\_FIXED is set in the *flags* argument, the implementation is informed that the value of  
 25262 *pa* shall be *addr*, exactly. If MAP\_FIXED is set, *mmap()* may return MAP\_FAILED and set *errno* to  
 25263 [EINVAL]. If a MAP\_FIXED request is successful, the mapping established by *mmap()* replaces  
 25264 any previous mappings for the process' pages in the range [*pa*,*pa+len*).

25265 When `MAP_FIXED` is not set, the implementation uses *addr* in an implementation-defined  
 25266 manner to arrive at *pa*. The *pa* so chosen shall be an area of the address space that the  
 25267 implementation deems suitable for a mapping of *len* bytes to the file. All implementations  
 25268 interpret an *addr* value of 0 as granting the implementation complete freedom in selecting *pa*,  
 25269 subject to constraints described below. A non-zero value of *addr* is taken to be a suggestion of a  
 25270 process address near which the mapping should be placed. When the implementation selects a  
 25271 value for *pa*, it never places a mapping at address 0, nor does it replace any extant mapping.

25272 The *off* argument is constrained to be aligned and sized according to the value returned by  
 25273 `sysconf()` when passed `_SC_PAGESIZE` or `_SC_PAGE_SIZE`. When `MAP_FIXED` is specified, the  
 25274 application shall ensure that the argument *addr* also meets these constraints. The  
 25275 implementation performs mapping operations over whole pages. Thus, while the argument *len*  
 25276 need not meet a size or alignment constraint, the implementation shall include, in any mapping  
 25277 operation, any partial page specified by the range [*pa*,*pa+len*).

25278 The system shall always zero-fill any partial page at the end of an object. Further, the system  
 25279 shall never write out any modified portions of the last page of an object which are beyond its  
 25280 MPR end. References within the address range starting at *pa* and continuing for *len* bytes to whole  
 25281 pages following the end of an object shall result in delivery of a SIGBUS signal.

25282 An implementation may generate SIGBUS signals when a reference would cause an error in the  
 25283 mapped object, such as out-of-space condition.

25284 The `mmap()` function shall add an extra reference to the file associated with the file descriptor  
 25285 *fdes* which is not removed by a subsequent `close()` on that file descriptor. This reference shall be  
 25286 removed when there are no more mappings to the file.

25287 The *st\_atime* field of the mapped file may be marked for update at any time between the `mmap()`  
 25288 call and the corresponding `munmap()` call. The initial read or write reference to a mapped region  
 25289 shall cause the file's *st\_atime* field to be marked for update if it has not already been marked for  
 25290 update.

25291 The *st\_ctime* and *st\_mtime* fields of a file that is mapped with `MAP_SHARED` and `PROT_WRITE`  
 25292 shall be marked for update at some point in the interval between a write reference to the  
 25293 mapped region and the next call to `msync()` with `MS_ASYNC` or `MS_SYNC` for that portion of  
 25294 the file by any process. If there is no such call and if the underlying file is modified as a result of  
 25295 a write reference, then these fields shall be marked for update at some time after the write  
 25296 reference.

25297 There may be implementation-defined limits on the number of memory regions that can be  
 25298 mapped (per process or per system).

25299 XSI If such a limit is imposed, whether the number of memory regions that can be mapped by a  
 25300 process is decreased by the use of `shmat()` is implementation-defined.

25301 If `mmap()` fails for reasons other than `[EBADF]`, `[EINVAL]`, or `[ENOTSUP]`, some of the  
 25302 mappings in the address range starting at *addr* and continuing for *len* bytes may have been  
 25303 unmapped.

25304 **RETURN VALUE**

25305 Upon successful completion, the `mmap()` function shall return the address at which the mapping  
 25306 was placed (*pa*); otherwise, it shall return a value of `MAP_FAILED` and set *errno* to indicate the  
 25307 error. The symbol `MAP_FAILED` is defined in the `<sys/mman.h>` header. No successful return  
 25308 from `mmap()` shall return the value `MAP_FAILED`.

25309 **ERRORS**

- 25310 The *mmap()* function shall fail if:
- 25311 [EACCES] The *fildev* argument is not open for read, regardless of the protection specified, or *fildev* is not open for write and PROT\_WRITE was specified for a MAP\_SHARED type mapping.
- 25312
- 25313
- 25314 ML [EAGAIN] The mapping could not be locked in memory, if required by *mlockall()*, due to a lack of resources.
- 25315
- 25316 [EBADF] The *fildev* argument is not a valid open file descriptor.
- 25317 [EINVAL] The *addr* argument (if MAP\_FIXED was specified) or *off* is not a multiple of the page size as returned by *sysconf()*, or is considered invalid by the implementation.
- 25318
- 25319
- 25320 [EINVAL] The value of *flags* is invalid (neither MAP\_PRIVATE nor MAP\_SHARED is set).
- 25321
- 25322 [EMFILE] The number of mapped regions would exceed an implementation-defined limit (per process or per system).
- 25323
- 25324 [ENODEV] The *fildev* argument refers to a file whose type is not supported by *mmap()*.
- 25325 [ENOMEM] MAP\_FIXED was specified, and the range [*addr*,*addr+len*) exceeds that allowed for the address space of a process; or, if MAP\_FIXED was not specified and there is insufficient room in the address space to effect the mapping.
- 25326
- 25327
- 25328 ML [ENOMEM] The mapping could not be locked in memory, if required by *mlockall()*, because it would require more space than the system is able to supply.
- 25329
- 25330 TYM [ENOMEM] Not enough unallocated memory resources remain in the typed memory object designated by *fildev* to allocate *len* bytes.
- 25331
- 25332 [ENOTSUP] MAP\_FIXED or MAP\_PRIVATE was specified in the *flags* argument and the implementation does not support this functionality.
- 25333
- 25334 The implementation does not support the combination of accesses requested in the *prot* argument.
- 25335
- 25336 [ENXIO] Addresses in the range [*off*,*off+len*) are invalid for the object specified by *fildev*.
- 25337 [ENXIO] MAP\_FIXED was specified in *flags* and the combination of *addr*, *len*, and *off* is invalid for the object specified by *fildev*.
- 25338
- 25339 TYM [ENXIO] The *fildev* argument refers to a typed memory object that is not accessible from the calling process.
- 25340
- 25341 [EOVERFLOW] The file is a regular file and the value of *off* plus *len* exceeds the offset maximum established in the open file description associated with *fildev*.
- 25342

25343 **EXAMPLES**

25344 None.

25345 **APPLICATION USAGE**

25346 Use of *mmap()* may reduce the amount of memory available to other memory allocation functions.

25347

25348 Use of MAP\_FIXED may result in unspecified behavior in further use of *malloc()* and *shmat()*. The use of MAP\_FIXED is discouraged, as it may prevent an implementation from making the most effective use of resources.

25349

25350

25351 The application must ensure correct synchronization when using *mmap()* in conjunction with  
 25352 any other file access method, such as *read()* and *write()*, standard input/output, and *shmat()*.

25353 The *mmap()* function allows access to resources via address space manipulations, instead of  
 25354 *read()/write()*. Once a file is mapped, all a process has to do to access it is use the data at the  
 25355 address to which the file was mapped. So, using pseudo-code to illustrate the way in which an  
 25356 existing program might be changed to use *mmap()*, the following:

```
25357 fildes = open(...)
25358 lseek(fildes, some_offset)
25359 read(fildes, buf, len)
25360 /* Use data in buf. */
```

25361 becomes:

```
25362 fildes = open(...)
25363 address = mmap(0, len, PROT_READ, MAP_PRIVATE, fildes, some_offset)
25364 /* Use data at address. */
```

### 25365 RATIONALE

25366 After considering several other alternatives, it was decided to adopt the *mmap()* definition found  
 25367 in SVR4 for mapping memory objects into process address spaces. The SVR4 definition is  
 25368 minimal, in that it describes only what has been built, and what appears to be necessary for a  
 25369 general and portable mapping facility.

25370 Note that while *mmap()* was first designed for mapping files, it is actually a general-purpose  
 25371 mapping facility. It can be used to map any appropriate object, such as memory, files, devices,  
 25372 and so on, into the address space of a process.

25373 When a mapping is established, it is possible that the implementation may need to map more  
 25374 than is requested into the address space of the process because of hardware requirements. An  
 25375 application, however, cannot count on this behavior. Implementations that do not use a paged  
 25376 architecture may simply allocate a common memory region and return the address of it; such  
 25377 implementations probably do not allocate any more than is necessary. References past the end of  
 25378 the requested area are unspecified.

25379 If an application requests a mapping that would overlay existing mappings in the process, it  
 25380 might be desirable that an implementation detect this and inform the application. However, the  
 25381 default, portable (not *MAP\_FIXED*) operation does not overlay existing mappings. On the other  
 25382 hand, if the program specifies a fixed address mapping (which requires some implementation  
 25383 knowledge to determine a suitable address, if the function is supported at all), then the program  
 25384 is presumed to be successfully managing its own address space and should be trusted when it  
 25385 asks to map over existing data structures. Furthermore, it is also desirable to make as few system  
 25386 calls as possible, and it might be considered onerous to require an *munmap()* before an *mmap()*  
 25387 to the same address range. This volume of IEEE Std 1003.1-2001 specifies that the new mappings  
 25388 replace any existing mappings, following existing practice in this regard.

25389 It is not expected, when the Memory Protection option is supported, that all hardware  
 25390 implementations are able to support all combinations of permissions at all addresses. When this  
 25391 option is supported, implementations are required to disallow write access to mappings without  
 25392 write permission and to disallow access to mappings without any access permission. Other than  
 25393 these restrictions, implementations may allow access types other than those requested by the  
 25394 application. For example, if the application requests only *PROT\_WRITE*, the implementation  
 25395 may also allow read access. A call to *mmap()* fails if the implementation cannot support allowing  
 25396 all the access requested by the application. For example, some implementations cannot support  
 25397 a request for both write access and execute access simultaneously. All implementations  
 25398 supporting the Memory Protection option must support requests for no access, read access,

25399 write access, and both read and write access. Strictly conforming code must only rely on the  
25400 required checks. These restrictions allow for portability across a wide range of hardware.

25401 The MAP\_FIXED address treatment is likely to fail for non-page-aligned values and for certain  
25402 architecture-dependent address ranges. Conforming implementations cannot count on being  
25403 able to choose address values for MAP\_FIXED without utilizing non-portable, implementation-  
25404 defined knowledge. Nonetheless, MAP\_FIXED is provided as a standard interface conforming to  
25405 existing practice for utilizing such knowledge when it is available.

25406 Similarly, in order to allow implementations that do not support virtual addresses, support for  
25407 directly specifying any mapping addresses via MAP\_FIXED is not required and thus a  
25408 conforming application may not count on it.

25409 The MAP\_PRIVATE function can be implemented efficiently when memory protection hardware  
25410 is available. When such hardware is not available, implementations can implement such  
25411 “mappings” by simply making a real copy of the relevant data into process private memory,  
25412 though this tends to behave similarly to *read()*.

25413 The function has been defined to allow for many different models of using shared memory.  
25414 However, all uses are not equally portable across all machine architectures. In particular, the  
25415 *mmap()* function allows the system as well as the application to specify the address at which to  
25416 map a specific region of a memory object. The most portable way to use the function is always to  
25417 let the system choose the address, specifying NULL as the value for the argument *addr* and not  
25418 to specify MAP\_FIXED.

25419 If it is intended that a particular region of a memory object be mapped at the same address in a  
25420 group of processes (on machines where this is even possible), then MAP\_FIXED can be used to  
25421 pass in the desired mapping address. The system can still be used to choose the desired address  
25422 if the first such mapping is made without specifying MAP\_FIXED, and then the resulting  
25423 mapping address can be passed to subsequent processes for them to pass in via MAP\_FIXED.  
25424 The availability of a specific address range cannot be guaranteed, in general.

25425 The *mmap()* function can be used to map a region of memory that is larger than the current size  
25426 of the object. Memory access within the mapping but beyond the current end of the underlying  
25427 objects may result in SIGBUS signals being sent to the process. The reason for this is that the size  
25428 of the object can be manipulated by other processes and can change at any moment. The  
25429 implementation should tell the application that a memory reference is outside the object where  
25430 this can be detected; otherwise, written data may be lost and read data may not reflect actual  
25431 data in the object.

25432 Note that references beyond the end of the object do not extend the object as the new end cannot  
25433 be determined precisely by most virtual memory hardware. Instead, the size can be directly  
25434 manipulated by *ftruncate()*.

25435 Process memory locking does apply to shared memory regions, and the MEMLOCK\_FUTURE  
25436 argument to *mlockall()* can be relied upon to cause new shared memory regions to be  
25437 automatically locked.

25438 Existing implementations of *mmap()* return the value `-1` when unsuccessful. Since the casting of  
25439 this value to type `void *` cannot be guaranteed by the ISO C standard to be distinct from a  
25440 successful value, this volume of IEEE Std 1003.1-2001 defines the symbol MAP\_FAILED, which a  
25441 conforming implementation does not return as the result of a successful call.

#### 25442 **FUTURE DIRECTIONS**

25443 None.

25444 **SEE ALSO**

25445 *exec*, *fcntl()*, *fork()*, *lockf()*, *msync()*, *munmap()*, *mprotect()*, *posix\_typed\_mem\_open()*, *shmat()*,

25447 **CHANGE HISTORY**

25448 First released in Issue 4, Version 2.

25449 **Issue 5**

25450 Moved from X/OPEN UNIX extension to BASE.

25451 Aligned with *mmap()* in the POSIX Realtime Extension as follows:

- 25452 • The DESCRIPTION is extensively reworded.
- 25453 • The [EAGAIN] and [ENOTSUP] mandatory error conditions are added.
- 25454 • New cases of [ENOMEM] and [ENXIO] are added as mandatory error conditions.
- 25455 • The value returned on failure is the value of the constant MAP\_FAILED; this was previously  
 25456 defined as -1.

25457 Large File Summit extensions are added.

25458 **Issue 6**

25459 The *mmap()* function is marked as part of the Memory Mapped Files option.

25460 The Open Group Corrigendum U028/6 is applied, changing (void \*)-1 to MAP\_FAILED.

25461 The following new requirements on POSIX implementations derive from alignment with the  
 25462 Single UNIX Specification:

- 25463 • The DESCRIPTION is updated to described the use of MAP\_FIXED.
- 25464 • The DESCRIPTION is updated to describe the addition of an extra reference to the file  
 25465 associated with the file descriptor passed to *mmap()*.
- 25466 • The DESCRIPTION is updated to state that there may be implementation-defined limits on  
 25467 the number of memory regions that can be mapped.
- 25468 • The DESCRIPTION is updated to describe constraints on the alignment and size of the *off*  
 25469 argument.
- 25470 • The [EINVAL] and [EMFILE] error conditions are added.
- 25471 • The [EOVERFLOW] error condition is added. This change is to support large files.

25472 The following changes are made for alignment with the ISO POSIX-1: 1996 standard:

- 25473 • The DESCRIPTION is updated to describe the cases when MAP\_PRIVATE and MAP\_FIXED  
 25474 need not be supported.

25475 The following changes are made for alignment with IEEE Std 1003.1j-2000:

- 25476 • Semantics for typed memory objects are added to the DESCRIPTION.
- 25477 • New [ENOMEM] and [ENXIO] errors are added to the ERRORS section.
- 25478 • The *posix\_typed\_mem\_open()* function is added to the SEE ALSO section.

25479 The DESCRIPTION is updated to avoid use of the term “must” for application requirements.

25480 **NAME**

25481 modf, modff, modfl — decompose a floating-point number

25482 **SYNOPSIS**

25483 #include <math.h>

25484 double modf(double *x*, double \**iptr*);

25485 float modff(float *value*, float \**iptr*);

25486 long double modfl(long double *value*, long double \**iptr*);

25487 **DESCRIPTION**

25488 **CX** The functionality described on this reference page is aligned with the ISO C standard. Any  
 25489 conflict between the requirements described here and the ISO C standard is unintentional. This  
 25490 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

25491 These functions shall break the argument *x* into integral and fractional parts, each of which has  
 25492 the same sign as the argument. It stores the integral part as a **double** (for the *modf()* function), a  
 25493 **float** (for the *modff()* function), or a **long double** (for the *modfl()* function), in the object pointed  
 25494 to by *iptr*.

25495 **RETURN VALUE**

25496 Upon successful completion, these functions shall return the signed fractional part of *x*.

25497 **MX** If *x* is NaN, a NaN shall be returned, and \**iptr* shall be set to a NaN.

25498 If *x* is ±Inf, ±0 shall be returned, and \**iptr* shall be set to ±Inf.

25499 **ERRORS**

25500 No errors are defined.

25501 **EXAMPLES**

25502 None.

25503 **APPLICATION USAGE**

25504 The *modf()* function computes the function result and \**iptr* such that:

25505 a = modf(x, &iptr) ;

25506 x == a+\*iptr ;

25507 allowing for the usual floating-point inaccuracies.

25508 **RATIONALE**

25509 None.

25510 **FUTURE DIRECTIONS**

25511 None.

25512 **SEE ALSO**

25513 *frexp()*, *isnan()*, *ldexp()*, the Base Definitions volume of IEEE Std 1003.1-2001, <math.h>

25514 **CHANGE HISTORY**

25515 First released in Issue 1. Derived from Issue 1 of the SVID.

25516 **Issue 5**

25517 The DESCRIPTION is updated to indicate how an application should check for an error. This  
 25518 text was previously published in the APPLICATION USAGE section.

25519 **Issue 6**

25520 The *modff()* and *modfl()* functions are added for alignment with the ISO/IEC 9899:1999  
 25521 standard.

25522           The DESCRIPTION, RETURN VALUE, ERRORS, and APPLICATION USAGE sections are  
25523           revised to align with the ISO/IEC 9899:1999 standard.

25524           IEC 60559:1989 standard floating-point extensions over the ISO/IEC 9899:1999 standard are  
25525           marked.

25526 **NAME**

25527 mprotect — set protection of memory mapping

25528 **SYNOPSIS**

25529 MPR #include &lt;sys/mman.h&gt;

25530 int mprotect(void \*addr, size\_t len, int prot);

25531

25532 **DESCRIPTION**

25533 The *mprotect()* function shall change the access protections to be that specified by *prot* for those  
 25534 whole pages containing any part of the address space of the process starting at address *addr* and  
 25535 continuing for *len* bytes. The parameter *prot* determines whether read, write, execute, or some  
 25536 combination of accesses are permitted to the data being mapped. The *prot* argument should be  
 25537 either PROT\_NONE or the bitwise-inclusive OR of one or more of PROT\_READ, PROT\_WRITE,  
 25538 and PROT\_EXEC.

25539 If an implementation cannot support the combination of access types specified by *prot*, the call  
 25540 to *mprotect()* shall fail.

25541 An implementation may permit accesses other than those specified by *prot*; however, no  
 25542 implementation shall permit a write to succeed where PROT\_WRITE has not been set or shall  
 25543 permit any access where PROT\_NONE alone has been set. Implementations shall support at  
 25544 least the following values of *prot*: PROT\_NONE, PROT\_READ, PROT\_WRITE, and the bitwise-  
 25545 inclusive OR of PROT\_READ and PROT\_WRITE. If PROT\_WRITE is specified, the application  
 25546 shall ensure that it has opened the mapped objects in the specified address range with write  
 25547 permission, unless MAP\_PRIVATE was specified in the original mapping, regardless of whether  
 25548 the file descriptors used to map the objects have since been closed.

25549 The implementation shall require that *addr* be a multiple of the page size as returned by  
 25550 *sysconf()*.

25551 The behavior of this function is unspecified if the mapping was not established by a call to  
 25552 *mmap()*.

25553 When *mprotect()* fails for reasons other than [EINVAL], the protections on some of the pages in  
 25554 the range [*addr,addr+len*) may have been changed.

25555 **RETURN VALUE**

25556 Upon successful completion, *mprotect()* shall return 0; otherwise, it shall return -1 and set *errno*  
 25557 to indicate the error.

25558 **ERRORS**25559 The *mprotect()* function shall fail if:

25560 [EACCES] The *prot* argument specifies a protection that violates the access permission  
 25561 the process has to the underlying memory object.

25562 [EAGAIN] The *prot* argument specifies PROT\_WRITE over a MAP\_PRIVATE mapping  
 25563 and there are insufficient memory resources to reserve for locking the private  
 25564 page.

25565 [EINVAL] The *addr* argument is not a multiple of the page size as returned by *sysconf()*.

25566 [ENOMEM] Addresses in the range [*addr,addr+len*) are invalid for the address space of a  
 25567 process, or specify one or more pages which are not mapped.

25568 [ENOMEM] The *prot* argument specifies PROT\_WRITE on a MAP\_PRIVATE mapping, and  
 25569 it would require more space than the system is able to supply for locking the  
 25570 private pages, if required.

25571 [ENOTSUP] The implementation does not support the combination of accesses requested  
 25572 in the *prot* argument.

25573 **EXAMPLES**

25574 None.

25575 **APPLICATION USAGE**

25576 The [EINVAL] error above is marked EX because it is defined as an optional error in the POSIX  
 25577 Realtime Extension.

25578 **RATIONALE**

25579 None.

25580 **FUTURE DIRECTIONS**

25581 None.

25582 **SEE ALSO**

25583 *mmap()*, *sysconf()*, the Base Definitions volume of IEEE Std 1003.1-2001, <sys/mman.h>

25584 **CHANGE HISTORY**

25585 First released in Issue 4, Version 2.

25586 **Issue 5**

25587 Moved from X/OPEN UNIX extension to BASE.

25588 Aligned with *mprotect()* in the POSIX Realtime Extension as follows:

- 25589 • The DESCRIPTION is largely reworded.
- 25590 • [ENOTSUP] and a second form of [ENOMEM] are added as mandatory error conditions.
- 25591 • [EAGAIN] is moved from the optional to the mandatory error conditions.

25592 **Issue 6**

25593 The *mprotect()* function is marked as part of the Memory Protection option.

25594 The following new requirements on POSIX implementations derive from alignment with the  
 25595 Single UNIX Specification:

- 25596 • The DESCRIPTION is updated to state that implementations require *addr* to be a multiple of  
 25597 the page size as returned by *sysconf()*.
- 25598 • The [EINVAL] error condition is added.

25599 The DESCRIPTION is updated to avoid use of the term “must” for application requirements.

25600 **NAME**

25601 mq\_close — close a message queue (**REALTIME**)

25602 **SYNOPSIS**

25603 MSG #include <mqueue.h>

25604 int mq\_close(mqd\_t mqdes);

25605

25606 **DESCRIPTION**

25607 The *mq\_close()* function shall remove the association between the message queue descriptor,  
25608 *mqdes*, and its message queue. The results of using this message queue descriptor after  
25609 successful return from this *mq\_close()*, and until the return of this message queue descriptor  
25610 from a subsequent *mq\_open()*, are undefined.

25611 If the process has successfully attached a notification request to the message queue via this  
25612 *mqdes*, this attachment shall be removed, and the message queue is available for another process  
25613 to attach for notification.

25614 **RETURN VALUE**

25615 Upon successful completion, the *mq\_close()* function shall return a value of zero; otherwise, the  
25616 function shall return a value of -1 and set *errno* to indicate the error.

25617 **ERRORS**

25618 The *mq\_close()* function shall fail if:

25619 [EBADF] The *mqdes* argument is not a valid message queue descriptor.

25620 **EXAMPLES**

25621 None.

25622 **APPLICATION USAGE**

25623 None.

25624 **RATIONALE**

25625 None.

25626 **FUTURE DIRECTIONS**

25627 None.

25628 **SEE ALSO**

25629 *mq\_open()*, *mq\_unlink()*, *msgctl()*, *msgget()*, *msgrcv()*, *msgsnd()*, the Base Definitions volume of  
25630 IEEE Std 1003.1-2001, <mqueue.h>

25631 **CHANGE HISTORY**

25632 First released in Issue 5. Included for alignment with the POSIX Realtime Extension.

25633 **Issue 6**

25634 The *mq\_close()* function is marked as part of the Message Passing option.

25635 The [ENOSYS] error condition has been removed as stubs need not be provided if an  
25636 implementation does not support the Message Passing option.

25637 **NAME**25638 mq\_getattr — get message queue attributes (**REALTIME**)25639 **SYNOPSIS**

25640 MSG #include &lt;mqqueue.h&gt;

25641 int mq\_getattr(mqd\_t mqdes, struct mq\_attr \*mqstat);

25642

25643 **DESCRIPTION**25644 The *mq\_getattr()* function shall obtain status information and attributes of the message queue  
25645 and the open message queue description associated with the message queue descriptor.25646 The *mqdes* argument specifies a message queue descriptor.25647 The results shall be returned in the **mq\_attr** structure referenced by the *mqstat* argument.25648 Upon return, the following members shall have the values associated with the open message  
25649 queue description as set when the message queue was opened and as modified by subsequent  
25650 *mq\_setattr()* calls: *mq\_flags*.25651 The following attributes of the message queue shall be returned as set at message queue  
25652 creation: *mq\_maxmsg*, *mq\_msgsize*.25653 Upon return, the following members within the **mq\_attr** structure referenced by the *mqstat*  
25654 argument shall be set to the current state of the message queue:25655 *mq\_curmsgs* The number of messages currently on the queue.25656 **RETURN VALUE**25657 Upon successful completion, the *mq\_getattr()* function shall return zero. Otherwise, the function  
25658 shall return  $-1$  and set *errno* to indicate the error.25659 **ERRORS**25660 The *mq\_getattr()* function shall fail if:25661 [EBADF] The *mqdes* argument is not a valid message queue descriptor.25662 **EXAMPLES**

25663 None.

25664 **APPLICATION USAGE**

25665 None.

25666 **RATIONALE**

25667 None.

25668 **FUTURE DIRECTIONS**

25669 None.

25670 **SEE ALSO**25671 *mq\_open()*, *mq\_send()*, *mq\_setattr()*, *mq\_timedsend()*, *msgctl()*, *msgget()*, *msgrcv()*, *msgsnd()*, the  
25672 Base Definitions volume of IEEE Std 1003.1-2001, <mqqueue.h>25673 **CHANGE HISTORY**

25674 First released in Issue 5. Included for alignment with the POSIX Realtime Extension.

25675 **Issue 6**25676 The *mq\_getattr()* function is marked as part of the Message Passing option.25677 The [ENOSYS] error condition has been removed as stubs need not be provided if an  
25678 implementation does not support the Message Passing option.

25679  
25680

The *mq\_timedsend()* function is added to the SEE ALSO section for alignment with IEEE Std 1003.1d-1999.

25681 **NAME**25682 mq\_notify — notify process that a message is available (**REALTIME**)25683 **SYNOPSIS**

25684 MSG #include &lt;mqueue.h&gt;

25685 int mq\_notify(mqd\_t mqdes, const struct sigevent \*notification);

25686

25687 **DESCRIPTION**

25688 If the argument *notification* is not NULL, this function shall register the calling process to be  
 25689 notified of message arrival at an empty message queue associated with the specified message  
 25690 queue descriptor, *mqdes*. The notification specified by the *notification* argument shall be sent to  
 25691 the process when the message queue transitions from empty to non-empty. At any time, only  
 25692 one process may be registered for notification by a message queue. If the calling process or any  
 25693 other process has already registered for notification of message arrival at the specified message  
 25694 queue, subsequent attempts to register for that message queue shall fail.

25695 If *notification* is NULL and the process is currently registered for notification by the specified  
 25696 message queue, the existing registration shall be removed.

25697 When the notification is sent to the registered process, its registration shall be removed. The  
 25698 message queue shall then be available for registration.

25699 If a process has registered for notification of message arrival at a message queue and some  
 25700 thread is blocked in *mq\_receive()* waiting to receive a message when a message arrives at the  
 25701 queue, the arriving message shall satisfy the appropriate *mq\_receive()*. The resulting behavior is  
 25702 as if the message queue remains empty, and no notification shall be sent.

25703 **RETURN VALUE**

25704 Upon successful completion, the *mq\_notify()* function shall return a value of zero; otherwise, the  
 25705 function shall return a value of -1 and set *errno* to indicate the error.

25706 **ERRORS**25707 The *mq\_notify()* function shall fail if:25708 [EBADF] The *mqdes* argument is not a valid message queue descriptor.

25709 [EBUSY] A process is already registered for notification by the message queue.

25710 **EXAMPLES**

25711 None.

25712 **APPLICATION USAGE**

25713 None.

25714 **RATIONALE**

25715 None.

25716 **FUTURE DIRECTIONS**

25717 None.

25718 **SEE ALSO**

25719 *mq\_open()*, *mq\_send()*, *mq\_timedsend()*, *msgctl()*, *msgget()*, *msgrcv()*, *msgsnd()*, the Base  
 25720 Definitions volume of IEEE Std 1003.1-2001, <mqueue.h>

25721 **CHANGE HISTORY**

25722 First released in Issue 5. Included for alignment with the POSIX Realtime Extension.

25723 **Issue 6**

25724 The *mq\_notify()* function is marked as part of the Message Passing option.

25725 The [ENOSYS] error condition has been removed as stubs need not be provided if an  
25726 implementation does not support the Message Passing option.

25727 The *mq\_timedsend()* function is added to the SEE ALSO section for alignment with  
25728 IEEE Std 1003.1d-1999.

25729 **NAME**25730 `mq_open` — open a message queue (**REALTIME**)25731 **SYNOPSIS**25732 MSG `#include <mqueue.h>`25733 `mqd_t mq_open(const char *name, int oflag, ...);`

25734

25735 **DESCRIPTION**

25736 The `mq_open()` function shall establish the connection between a process and a message queue  
 25737 with a message queue descriptor. It shall create an open message queue description that refers to  
 25738 the message queue, and a message queue descriptor that refers to that open message queue  
 25739 description. The message queue descriptor is used by other functions to refer to that message  
 25740 queue. The *name* argument points to a string naming a message queue. It is unspecified whether  
 25741 the name appears in the file system and is visible to other functions that take pathnames as  
 25742 arguments. The *name* argument shall conform to the construction rules for a pathname. If *name*  
 25743 begins with the slash character, then processes calling `mq_open()` with the same value of *name*  
 25744 shall refer to the same message queue object, as long as that name has not been removed. If *name*  
 25745 does not begin with the slash character, the effect is implementation-defined. The interpretation  
 25746 of slash characters other than the leading slash character in *name* is implementation-defined. If  
 25747 the *name* argument is not the name of an existing message queue and creation is not requested,  
 25748 `mq_open()` shall fail and return an error.

25749 A message queue descriptor may be implemented using a file descriptor, in which case  
 25750 applications can open up to at least {OPEN\_MAX} file and message queues.

25751 The *oflag* argument requests the desired receive and/or send access to the message queue. The  
 25752 requested access permission to receive messages or send messages shall be granted if the calling  
 25753 process would be granted read or write access, respectively, to an equivalently protected file.

25754 The value of *oflag* is the bitwise-inclusive OR of values from the following list. Applications  
 25755 shall specify exactly one of the first three values (access modes) below in the value of *oflag*:

25756 **O\_RDONLY** Open the message queue for receiving messages. The process can use the  
 25757 returned message queue descriptor with `mq_receive()`, but not `mq_send()`. A  
 25758 message queue may be open multiple times in the same or different processes  
 25759 for receiving messages.

25760 **O\_WRONLY** Open the queue for sending messages. The process can use the returned  
 25761 message queue descriptor with `mq_send()` but not `mq_receive()`. A message  
 25762 queue may be open multiple times in the same or different processes for  
 25763 sending messages.

25764 **O\_RDWR** Open the queue for both receiving and sending messages. The process can use  
 25765 any of the functions allowed for **O\_RDONLY** and **O\_WRONLY**. A message  
 25766 queue may be open multiple times in the same or different processes for  
 25767 sending messages.

25768 Any combination of the remaining flags may be specified in the value of *oflag*:

25769 **O\_CREAT** Create a message queue. It requires two additional arguments: *mode*, which  
 25770 shall be of type **mode\_t**, and *attr*, which shall be a pointer to an **mq\_attr**  
 25771 structure. If the pathname *name* has already been used to create a message  
 25772 queue that still exists, then this flag shall have no effect, except as noted under  
 25773 **O\_EXCL**. Otherwise, a message queue shall be created without any messages  
 25774 in it. The user ID of the message queue shall be set to the effective user ID of  
 25775 the process, and the group ID of the message queue shall be set to the effective

|       |                     |                                                                                               |
|-------|---------------------|-----------------------------------------------------------------------------------------------|
| 25776 |                     | group ID of the process. The file permission bits shall be set to the value of                |
| 25777 |                     | <i>mode</i> . When bits in <i>mode</i> other than file permission bits are set, the effect is |
| 25778 |                     | implementation-defined. If <i>attr</i> is NULL, the message queue shall be created            |
| 25779 |                     | with implementation-defined default message queue attributes. If <i>attr</i> is non-          |
| 25780 |                     | NULL and the calling process has the appropriate privilege on <i>name</i> , the               |
| 25781 |                     | message queue <i>mq_maxmsg</i> and <i>mq_msgsize</i> attributes shall be set to the values    |
| 25782 |                     | of the corresponding members in the <b>mq_attr</b> structure referred to by <i>attr</i> . If  |
| 25783 |                     | <i>attr</i> is non-NULL, but the calling process does not have the appropriate                |
| 25784 |                     | privilege on <i>name</i> , the <i>mq_open()</i> function shall fail and return an error       |
| 25785 |                     | without creating the message queue.                                                           |
| 25786 | O_EXCL              | If O_EXCL and O_CREAT are set, <i>mq_open()</i> shall fail if the message queue               |
| 25787 |                     | <i>name</i> exists. The check for the existence of the message queue and the creation         |
| 25788 |                     | of the message queue if it does not exist shall be atomic with respect to other               |
| 25789 |                     | threads executing <i>mq_open()</i> naming the same <i>name</i> with O_EXCL and                |
| 25790 |                     | O_CREAT set. If O_EXCL is set and O_CREAT is not set, the result is                           |
| 25791 |                     | undefined.                                                                                    |
| 25792 | O_NONBLOCK          | Determines whether an <i>mq_send()</i> or <i>mq_receive()</i> waits for resources or          |
| 25793 |                     | messages that are not currently available, or fails with <i>errno</i> set to [EAGAIN];        |
| 25794 |                     | see <i>mq_send()</i> and <i>mq_receive()</i> for details.                                     |
| 25795 |                     | The <i>mq_open()</i> function does not add or remove messages from the queue.                 |
| 25796 | <b>RETURN VALUE</b> |                                                                                               |
| 25797 |                     | Upon successful completion, the function shall return a message queue descriptor; otherwise,  |
| 25798 |                     | the function shall return ( <b>mqd_t</b> )−1 and set <i>errno</i> to indicate the error.      |
| 25799 | <b>ERRORS</b>       |                                                                                               |
| 25800 |                     | The <i>mq_open()</i> function shall fail if:                                                  |
| 25801 | [EACCES]            | The message queue exists and the permissions specified by <i>oflag</i> are denied, or         |
| 25802 |                     | the message queue does not exist and permission to create the message queue                   |
| 25803 |                     | is denied.                                                                                    |
| 25804 | [EEXIST]            | O_CREAT and O_EXCL are set and the named message queue already exists.                        |
| 25805 | [EINTR]             | The <i>mq_open()</i> function was interrupted by a signal.                                    |
| 25806 | [EINVAL]            | The <i>mq_open()</i> function is not supported for the given name.                            |
| 25807 | [EINVAL]            | O_CREAT was specified in <i>oflag</i> , the value of <i>attr</i> is not NULL, and either      |
| 25808 |                     | <i>mq_maxmsg</i> or <i>mq_msgsize</i> was less than or equal to zero.                         |
| 25809 | [EMFILE]            | Too many message queue descriptors or file descriptors are currently in use by                |
| 25810 |                     | this process.                                                                                 |

25829 **CHANGE HISTORY**

25830 First released in Issue 5. Included for alignment with the POSIX Realtime Extension.

25831 **Issue 6**25832 The *mq\_open()* function is marked as part of the Message Passing option.

25833 The [ENOSYS] error condition has been removed as stubs need not be provided if an  
25834 implementation does not support the Message Passing option.

25835 The *mq\_timedreceive()* and *mq\_timedsend()* functions are added to the SEE ALSO section for  
25836 alignment with IEEE Std 1003.1d-1999.

25837 The DESCRIPTION of O\_EXCL is updated in response to IEEE PASC Interpretation 1003.1c #48.

## 25838 NAME

25839 mq\_receive, mq\_timedreceive — receive a message from a message queue (**REALTIME**)

## 25840 SYNOPSIS

25841 MSG #include <mqueue.h>

```
25842 ssize_t mq_receive(mqd_t mqdes, char *msg_ptr, size_t msg_len,
25843 unsigned *msg_prio);
```

25844

25845 MSG TMO #include <mqueue.h>

25846 #include <time.h>

```
25847 ssize_t mq_timedreceive(mqd_t mqdes, char *restrict msg_ptr,
25848 size_t msg_len, unsigned *restrict msg_prio,
25849 const struct timespec *restrict abs_timeout);
```

25850

## 25851 DESCRIPTION

25852 The *mq\_receive()* function shall receive the oldest of the highest priority message(s) from the  
 25853 message queue specified by *mqdes*. If the size of the buffer in bytes, specified by the *msg\_len*  
 25854 argument, is less than the *mq\_msgsize* attribute of the message queue, the function shall fail and  
 25855 return an error. Otherwise, the selected message shall be removed from the queue and copied to  
 25856 the buffer pointed to by the *msg\_ptr* argument.

25857 If the value of *msg\_len* is greater than {SSIZE\_MAX}, the result is implementation-defined.

25858 If the argument *msg\_prio* is not NULL, the priority of the selected message shall be stored in the  
 25859 location referenced by *msg\_prio*.

25860 If the specified message queue is empty and O\_NONBLOCK is not set in the message queue  
 25861 description associated with *mqdes*, *mq\_receive()* shall block until a message is enqueued on the  
 25862 message queue or until *mq\_receive()* is interrupted by a signal. If more than one thread is waiting  
 25863 to receive a message when a message arrives at an empty queue and the Priority Scheduling  
 25864 option is supported, then the thread of highest priority that has been waiting the longest shall be  
 25865 selected to receive the message. Otherwise, it is unspecified which waiting thread receives the  
 25866 message. If the specified message queue is empty and O\_NONBLOCK is set in the message  
 25867 queue description associated with *mqdes*, no message shall be removed from the queue, and  
 25868 *mq\_receive()* shall return an error.

25869 TMO The *mq\_timedreceive()* function shall receive the oldest of the highest priority messages from the  
 25870 message queue specified by *mqdes* as described for the *mq\_receive()* function. However, if  
 25871 O\_NONBLOCK was not specified when the message queue was opened via the *mq\_open()*  
 25872 function, and no message exists on the queue to satisfy the receive, the wait for such a message  
 25873 shall be terminated when the specified timeout expires. If O\_NONBLOCK is set, this function is  
 25874 equivalent to *mq\_receive()*.

25875 The timeout expires when the absolute time specified by *abs\_timeout* passes, as measured by the  
 25876 clock on which timeouts are based (that is, when the value of that clock equals or exceeds  
 25877 *abs\_timeout*), or if the absolute time specified by *abs\_timeout* has already been passed at the time  
 25878 of the call.

25879 TMO TMR If the Timers option is supported, the timeout shall be based on the CLOCK\_REALTIME clock; if  
 25880 the Timers option is not supported, the timeout shall be based on the system clock as returned  
 25881 by the *time()* function.

25882 TMO The resolution of the timeout shall be the resolution of the clock on which it is based. The  
 25883 *timespec* argument is defined in the <time.h> header.

25884 Under no circumstance shall the operation fail with a timeout if a message can be removed from  
 25885 the message queue immediately. The validity of the *abs\_timeout* parameter need not be checked  
 25886 if a message can be removed from the message queue immediately.

#### 25887 RETURN VALUE

25888 TMO Upon successful completion, the *mq\_receive()* and *mq\_timedreceive()* functions shall return the  
 25889 length of the selected message in bytes and the message shall be removed from the queue.  
 25890 Otherwise, no message shall be removed from the queue, the functions shall return a value of -1,  
 25891 and set *errno* to indicate the error.

#### 25892 ERRORS

25893 TMO The *mq\_receive()* and *mq\_timedreceive()* functions shall fail if:

25894 [EAGAIN] O\_NONBLOCK was set in the message description associated with *mqdes*,  
 25895 and the specified message queue is empty.

25896 [EBADF] The *mqdes* argument is not a valid message queue descriptor open for reading.

25897 [EMSGSIZE] The specified message buffer size, *msg\_len*, is less than the message size  
 25898 attribute of the message queue.

25899 TMO [EINTR] The *mq\_receive()* or *mq\_timedreceive()* operation was interrupted by a signal.

25900 TMO [EINVAL] The process or thread would have blocked, and the *abs\_timeout* parameter  
 25901 specified a nanoseconds field value less than zero or greater than or equal to  
 25902 1 000 million.

25903 TMO [ETIMEDOUT] The O\_NONBLOCK flag was not set when the message queue was opened,  
 25904 but no message arrived on the queue before the specified timeout expired.

25905 TMO The *mq\_receive()* and *mq\_timedreceive()* functions may fail if:

25906 [EBADMSG] The implementation has detected a data corruption problem with the  
 25907 message.

#### 25919 CHANGE HISTORY

25920 First released in Issue 5. Included for alignment with the POSIX Realtime Extension.

#### 25921 Issue 6

25922 The *mq\_receive()* function is marked as part of the Message Passing option.

25923 The Open Group Corrigendum U021/4 is applied. The DESCRIPTION is changed to refer to  
 25924 *msg\_len* rather than *maxsize*.

25925 The [ENOSYS] error condition has been removed as stubs need not be provided if an  
 25926 implementation does not support the Message Passing option.

- 25927 The following new requirements on POSIX implementations derive from alignment with the  
25928 Single UNIX Specification:
- 25929 • In this function it is possible for the return value to exceed the range of the type **ssize\_t** (since  
25930 **size\_t** has a larger range of positive values than **ssize\_t**). A sentence restricting the size of  
25931 the **size\_t** object is added to the description to resolve this conflict.
- 25932 The *mq\_timedreceive()* function is added for alignment with IEEE Std 1003.1d-1999.
- 25933 The **restrict** keyword is added to the *mq\_timedreceive()* prototype for alignment with the  
25934 ISO/IEC 9899:1999 standard.
- 25935 IEEE PASC Interpretation 1003.1 #109 is applied, correcting the return type for *mq\_timedreceive()*  
25936 from **int** to **ssize\_t**.

25937 **NAME**25938 mq\_send, mq\_timedsend — send a message to a message queue (**REALTIME**)25939 **SYNOPSIS**

25940 MSG #include &lt;mqueue.h&gt;

25941 int mq\_send(mqd\_t mqdes, const char \*msg\_ptr, size\_t msg\_len,  
25942 unsigned msg\_prio);

25943

25944 MSG TMO #include &lt;mqueue.h&gt;

25945 #include &lt;time.h&gt;

25946 int mq\_timedsend(mqd\_t mqdes, const char \*msg\_ptr, size\_t msg\_len,  
25947 unsigned msg\_prio, const struct timespec \*abs\_timeout);

25948

25949 **DESCRIPTION**

25950 The *mq\_send()* function shall add the message pointed to by the argument *msg\_ptr* to the  
25951 message queue specified by *mqdes*. The *msg\_len* argument specifies the length of the message, in  
25952 bytes, pointed to by *msg\_ptr*. The value of *msg\_len* shall be less than or equal to the *mq\_msgsize*  
25953 attribute of the message queue, or *mq\_send()* shall fail.

25954 If the specified message queue is not full, *mq\_send()* shall behave as if the message is inserted  
25955 into the message queue at the position indicated by the *msg\_prio* argument. A message with a  
25956 larger numeric value of *msg\_prio* shall be inserted before messages with lower values of  
25957 *msg\_prio*. A message shall be inserted after other messages in the queue, if any, with equal  
25958 *msg\_prio*. The value of *msg\_prio* shall be less than {MQ\_PRIO\_MAX}.

25959 If the specified message queue is full and O\_NONBLOCK is not set in the message queue  
25960 description associated with *mqdes*, *mq\_send()* shall block until space becomes available to  
25961 enqueue the message, or until *mq\_send()* is interrupted by a signal. If more than one thread is  
25962 waiting to send when space becomes available in the message queue and the Priority Scheduling  
25963 option is supported, then the thread of the highest priority that has been waiting the longest  
25964 shall be unblocked to send its message. Otherwise, it is unspecified which waiting thread is  
25965 unblocked. If the specified message queue is full and O\_NONBLOCK is set in the message  
25966 queue description associated with *mqdes*, the message shall not be queued and *mq\_send()* shall  
25967 return an error.

25968 TMO The *mq\_timedsend()* function shall add a message to the message queue specified by *mqdes* in the  
25969 manner defined for the *mq\_send()* function. However, if the specified message queue is full and  
25970 O\_NONBLOCK is not set in the message queue description associated with *mqdes*, the wait for  
25971 sufficient room in the queue shall be terminated when the specified timeout expires. If  
25972 O\_NONBLOCK is set in the message queue description, this function shall be equivalent to  
25973 *mq\_send()*.

25974 The timeout shall expire when the absolute time specified by *abs\_timeout* passes, as measured by  
25975 the clock on which timeouts are based (that is, when the value of that clock equals or exceeds  
25976 *abs\_timeout*), or if the absolute time specified by *abs\_timeout* has already been passed at the time  
25977 of the call.

25978 TMO TMR If the Timers option is supported, the timeout shall be based on the CLOCK\_REALTIME clock; if  
25979 the Timers option is not supported, the timeout shall be based on the system clock as returned  
25980 by the *time()* function.

25981 TMO The resolution of the timeout shall be the resolution of the clock on which it is based. The  
25982 *timespec* argument is defined in the <time.h> header.

25983 Under no circumstance shall the operation fail with a timeout if there is sufficient room in the  
 25984 queue to add the message immediately. The validity of the *abs\_timeout* parameter need not be  
 25985 checked when there is sufficient room in the queue.

#### 25986 RETURN VALUE

25987 TMO Upon successful completion, the *mq\_send()* and *mq\_timedsend()* functions shall return a value of  
 25988 zero. Otherwise, no message shall be enqueued, the functions shall return  $-1$ , and *errno* shall be  
 25989 set to indicate the error.

#### 25990 ERRORS

25991 TMO The *mq\_send()* and *mq\_timedsend()* functions shall fail if:

25992 [EAGAIN] The O\_NONBLOCK flag is set in the message queue description associated  
 25993 with *mqdes*, and the specified message queue is full.

25994 [EBADF] The *mqdes* argument is not a valid message queue descriptor open for writing.

25995 TMO [EINTR] A signal interrupted the call to *mq\_send()* or *mq\_timedsend()*.

25996 [EINVAL] The value of *msg\_prio* was outside the valid range.

25997 TMO [EINVAL] The process or thread would have blocked, and the *abs\_timeout* parameter  
 25998 specified a nanoseconds field value less than zero or greater than or equal to  
 25999 1 000 million.

26000 [EMSGSIZE] The specified message length, *msg\_len*, exceeds the message size attribute of  
 26001 the message queue.

26002 TMO [ETIMEDOUT] The O\_NONBLOCK flag was not set when the message queue was opened,  
 26003 but the timeout expired before the message could be added to the queue.

#### 26004 EXAMPLES

26005 None.

#### 26006 APPLICATION USAGE

26007 The value of the symbol {MQ\_PRIO\_MAX} limits the number of priority levels supported by the  
 26008 application. Message priorities range from 0 to {MQ\_PRIO\_MAX}-1.

#### 26009 RATIONALE

26010 None.

#### 26011 FUTURE DIRECTIONS

26012 None.

#### 26013 SEE ALSO

26014 *mq\_open()*, *mq\_receive()*, *mq\_setattr()*, *mq\_timedreceive()*, *time()*, the Base Definitions volume of  
 26015 IEEE Std 1003.1-2001, <mqqueue.h>, <time.h>

#### 26016 CHANGE HISTORY

26017 First released in Issue 5. Included for alignment with the POSIX Realtime Extension.

#### 26018 Issue 6

26019 The *mq\_send()* function is marked as part of the Message Passing option.

26020 The [ENOSYS] error condition has been removed as stubs need not be provided if an  
 26021 implementation does not support the Message Passing option.

26022 The *mq\_timedsend()* function is added for alignment with IEEE Std 1003.1d-1999.

26023 **NAME**26024 mq\_setattr — set message queue attributes (**REALTIME**)26025 **SYNOPSIS**

26026 MSG #include &lt;mqqueue.h&gt;

```
26027 int mq_setattr(mqd_t mqdes, const struct mq_attr *restrict mqstat,
26028               struct mq_attr *restrict omqstat);
26029
```

26030 **DESCRIPTION**26031 The *mq\_setattr()* function shall set attributes associated with the open message queue description referenced by the message queue descriptor specified by *mqdes*.26033 The message queue attributes corresponding to the following members defined in the **mq\_attr** structure shall be set to the specified values upon successful completion of *mq\_setattr()*:26035 *mq\_flags* The value of this member is the bitwise-logical OR of zero or more of  
26036 O\_NONBLOCK and any implementation-defined flags.26037 The values of the *mq\_maxmsg*, *mq\_msgsize*, and *mq\_curmsgs* members of the **mq\_attr** structure shall be ignored by *mq\_setattr()*.26039 If *omqstat* is non-NULL, the *mq\_setattr()* function shall store, in the location referenced by  
26040 *omqstat*, the previous message queue attributes and the current queue status. These values shall  
26041 be the same as would be returned by a call to *mq\_getattr()* at that point.26042 **RETURN VALUE**26043 Upon successful completion, the function shall return a value of zero and the attributes of the  
26044 message queue shall have been changed as specified.26045 Otherwise, the message queue attributes shall be unchanged, and the function shall return a  
26046 value of -1 and set *errno* to indicate the error.26047 **ERRORS**26048 The *mq\_setattr()* function shall fail if:26049 [EBADF] The *mqdes* argument is not a valid message queue descriptor.26050 **EXAMPLES**

26060 Definitions volume of IEEE Std 1003.1-2001, <**mqqueue.h**>26061 **CHANGE HISTORY**

26062 First released in Issue 5. Included for alignment with the POSIX Realtime Extension.

26063 **Issue 6**

26064 The *mq\_setattr()* function is marked as part of the Message Passing option.

26065 The [ENOSYS] error condition has been removed as stubs need not be provided if an  
26066 implementation does not support the Message Passing option.

26067 The *mq\_timedsend()* function is added to the SEE ALSO section for alignment with  
26068 IEEE Std 1003.1d-1999.

26069 The **restrict** keyword is added to the *mq\_setattr()* prototype for alignment with the  
26070 ISO/IEC 9899:1999 standard.

26071 **NAME**26072 `mq_timedreceive` — receive a message from a message queue (**ADVANCED REALTIME**)26073 **SYNOPSIS**26074 MSG TMO 

```
#include <mqueue.h>
```

26075 

```
#include <time.h>
```

26076 

```
ssize_t mq_timedreceive(mqd_t mqdes, char *restrict msg_ptr,
```

26077 

```
    size_t msg_len, unsigned *restrict msg_prio,
```

26078 

```
    const struct timespec *restrict abs_timeout);
```

26079

26080 **DESCRIPTION**26081 Refer to `mq_receive()`.

26082 **NAME**

26083       mq\_timedsend — send a message to a message queue (**ADVANCED REALTIME**)

26084 **SYNOPSIS**

26085 MSG TMO #include <mqueue.h>

26086       #include <time.h>

26087       int mq\_timedsend(mqd\_t mqdes, const char \*msg\_ptr, size\_t msg\_len,

26088           unsigned msg\_prio, const struct timespec \*abs\_timeout);

26089

26090 **DESCRIPTION**

26091       Refer to *mq\_send()*.

26092 **NAME**26093 mq\_unlink — remove a message queue (**REALTIME**)26094 **SYNOPSIS**

26095 MSG #include &lt;mqueue.h&gt;

26096 int mq\_unlink(const char \*name);

26097

26098 **DESCRIPTION**

26099 The *mq\_unlink()* function shall remove the message queue named by the pathname *name*. After  
 26100 a successful call to *mq\_unlink()* with *name*, a call to *mq\_open()* with *name* shall fail if the flag  
 26101 O\_CREAT is not set in *flags*. If one or more processes have the message queue open when  
 26102 *mq\_unlink()* is called, destruction of the message queue shall be postponed until all references to  
 26103 the message queue have been closed.

26104 Calls to *mq\_open()* to recreate the message queue may fail until the message queue is actually  
 26105 removed. However, the *mq\_unlink()* call need not block until all references have been closed; it  
 26106 may return immediately.

26107 **RETURN VALUE**

26108 Upon successful completion, the function shall return a value of zero. Otherwise, the named  
 26109 message queue shall be unchanged by this function call, and the function shall return a value of  
 26110 -1 and set *errno* to indicate the error.

26111 **ERRORS**26112 The *mq\_unlink()* function shall fail if:

26113 [EACCES] Permission is denied to unlink the named message queue.

26114 [ENAMETOOLONG]

26115 The length of the *name* argument exceeds {PATH\_MAX} or a pathname  
 26116 component is longer than {NAME\_MAX}.

26117 [ENOENT] The named message queue does not exist.

26118 **EXAMPLES**

26119 None.

26120 **APPLICATION USAGE**

26121 None.

26122 **RATIONALE**

26123 None.

26124 **FUTURE DIRECTIONS**

26125 None.

26126 **SEE ALSO**

 26128 IEEE Std 1003.1-2001, <mqueue.h>

26129 **CHANGE HISTORY**

26130 First released in Issue 5. Included for alignment with the POSIX Realtime Extension.

26131 **Issue 6**26132 The *mq\_unlink()* function is marked as part of the Message Passing option.

26133 The Open Group Corrigendum U021/5 is applied, clarifying that upon unsuccessful completion,  
 26134 the named message queue is unchanged by this function.

26135  
26136

The [ENOSYS] error condition has been removed as stubs need not be provided if an implementation does not support the Message Passing option.

26137 **NAME**

26138           mrand48 — generate uniformly distributed pseudo-random signed long integers

26139 **SYNOPSIS**

26140 xSI       #include <stdlib.h>

26141           long mrand48(void);

26142

26143 **DESCRIPTION**

26144           Refer to *drand48()*.

26145 **NAME**

26146 msgctl — XSI message control operations

26147 **SYNOPSIS**

26148 XSI #include &lt;sys/msg.h&gt;

26149 int msgctl(int *msqid*, int *cmd*, struct *msqid\_ds* \**buf*);

26150

26151 **DESCRIPTION**

26152 The *msgctl()* function operates on XSI message queues (see the Base Definitions volume of  
 26153 IEEE Std 1003.1-2001, Section 3.224, Message Queue). It is unspecified whether this function  
 26154 interoperates with the realtime interprocess communication facilities defined in Section 2.8 (on  
 26155 page 41).

26156 The *msgctl()* function shall provide message control operations as specified by *cmd*. The  
 26157 following values for *cmd*, and the message control operations they specify, are:

26158 **IPC\_STAT** Place the current value of each member of the **msqid\_ds** data structure  
 26159 associated with *msqid* into the structure pointed to by *buf*. The contents of this  
 26160 structure are defined in <sys/msg.h>.

26161 **IPC\_SET** Set the value of the following members of the **msqid\_ds** data structure  
 26162 associated with *msqid* to the corresponding value found in the structure  
 26163 pointed to by *buf*:

26164 msg\_perm.uid  
 26165 msg\_perm.gid  
 26166 msg\_perm.mode  
 26167 msg\_qbytes

26168 **IPC\_SET** can only be executed by a process with appropriate privileges or that  
 26169 has an effective user ID equal to the value of **msg\_perm.cuid** or  
 26170 **msg\_perm.uid** in the **msqid\_ds** data structure associated with *msqid*. Only a  
 26171 process with appropriate privileges can raise the value of **msg\_qbytes**.

26172 **IPC\_RMID** Remove the message queue identifier specified by *msqid* from the system and  
 26173 destroy the message queue and **msqid\_ds** data structure associated with it.  
 26174 **IPC\_RMD** can only be executed by a process with appropriate privileges or  
 26175 one that has an effective user ID equal to the value of **msg\_perm.cuid** or  
 26176 **msg\_perm.uid** in the **msqid\_ds** data structure associated with *msqid*.

26177 **RETURN VALUE**

26178 Upon successful completion, *msgctl()* shall return 0; otherwise, it shall return -1 and set *errno* to  
 26179 indicate the error.

26180 **ERRORS**

26181 The *msgctl()* function shall fail if:

26182 **[EACCES]** The argument *cmd* is **IPC\_STAT** and the calling process does not have read  
 26183 permission; see Section 2.7 (on page 39).

26184 **[EINVAL]** The value of *msqid* is not a valid message queue identifier; or the value of *cmd*  
 26185 is not a valid command.

26186 **[EPERM]** The argument *cmd* is **IPC\_RMID** or **IPC\_SET** and the effective user ID of the  
 26187 calling process is not equal to that of a process with appropriate privileges  
 26188 and it is not equal to the value of **msg\_perm.cuid** or **msg\_perm.uid** in the data  
 26189 structure associated with *msqid*.

26190 [EPERM] The argument *cmd* is `IPC_SET`, an attempt is being made to increase to the  
26191 value of `msg_qbytes`, and the effective user ID of the calling process does not  
26192 have appropriate privileges.

26193 **EXAMPLES**

26194 None.

26195 **APPLICATION USAGE**

26196 The POSIX Realtime Extension defines alternative interfaces for interprocess communication  
26197 (IPC). Application developers who need to use IPC should design their applications so that  
26198 modules using the IPC routines described in Section 2.7 (on page 39) can be easily modified to  
26199 use the alternative interfaces.

26200 **RATIONALE**

26201 None.

26202 **FUTURE DIRECTIONS**

26203 None.

26208 **CHANGE HISTORY**

26209 First released in Issue 2. Derived from Issue 2 of the SVID.

26210 **Issue 5**

26211 The note about use of POSIX Realtime Extension IPC routines has been moved from FUTURE  
26212 DIRECTIONS to a new APPLICATION USAGE section.

## 26213 NAME

26214 msgget — get the XSI message queue identifier

## 26215 SYNOPSIS

26216 XSI 

```
#include <sys/msg.h>
```

26217 

```
int msgget(key_t key, int msgflg);
```

26218

## 26219 DESCRIPTION

26220 The *msgget()* function operates on XSI message queues (see the Base Definitions volume of  
 26221 IEEE Std 1003.1-2001, Section 3.224, Message Queue). It is unspecified whether this function  
 26222 interoperates with the realtime interprocess communication facilities defined in Section 2.8 (on  
 26223 page 41).

26224 The *msgget()* function shall return the message queue identifier associated with the argument  
 26225 *key*.

26226 A message queue identifier, associated message queue, and data structure (see `<sys/msg.h>`),  
 26227 shall be created for the argument *key* if one of the following is true:

- 26228 • The argument *key* is equal to `IPC_PRIVATE`.
- 26229 • The argument *key* does not already have a message queue identifier associated with it, and  
 26230 (*msgflg* & `IPC_CREAT`) is non-zero.

26231 Upon creation, the data structure associated with the new message queue identifier shall be  
 26232 initialized as follows:

- 26233 • `msg_perm.cuid`, `msg_perm.uid`, `msg_perm.cgid`, and `msg_perm.gid` shall be set equal to the  
 26234 effective user ID and effective group ID, respectively, of the calling process.
- 26235 • The low-order 9 bits of `msg_perm.mode` shall be set equal to the low-order 9 bits of *msgflg*.
- 26236 • `msg_qnum`, `msg_lspid`, `msg_lrpipid`, `msg_stime`, and `msg_rtime` shall be set equal to 0.
- 26237 • `msg_ctime` shall be set equal to the current time.
- 26238 • `msg_qbytes` shall be set equal to the system limit.

## 26239 RETURN VALUE

26240 Upon successful completion, *msgget()* shall return a non-negative integer, namely a message  
 26241 queue identifier. Otherwise, it shall return `-1` and set *errno* to indicate the error.

## 26242 ERRORS

26243 The *msgget()* function shall fail if:

- |       |          |                                                                                                                                                                                                    |
|-------|----------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 26244 | [EACCES] | A message queue identifier exists for the argument <i>key</i> , but operation permission as specified by the low-order 9 bits of <i>msgflg</i> would not be granted; see Section 2.7 (on page 39). |
| 26245 |          |                                                                                                                                                                                                    |
| 26246 |          |                                                                                                                                                                                                    |
| 26247 | [EEXIST] | A message queue identifier exists for the argument <i>key</i> but $((msgflg \& IPC\_CREAT) \&\& (msgflg \& IPC\_EXCL))$ is non-zero.                                                               |
| 26248 |          |                                                                                                                                                                                                    |
| 26249 | [ENOENT] | A message queue identifier does not exist for the argument <i>key</i> and $(msgflg \& IPC\_CREAT)$ is 0.                                                                                           |
| 26250 |          |                                                                                                                                                                                                    |
| 26251 | [ENOSPC] | A message queue identifier is to be created but the system-imposed limit on the maximum number of allowed message queue identifiers system-wide would be exceeded.                                 |
| 26252 |          |                                                                                                                                                                                                    |
| 26253 |          |                                                                                                                                                                                                    |

26272 The note about use of POSIX Realtime Extension IPC routines has been moved from FUTURE  
26273 DIRECTIONS to a new APPLICATION USAGE section.

## 26274 NAME

26275 msgrcv — XSI message receive operation

## 26276 SYNOPSIS

26277 XSI #include &lt;sys/msg.h&gt;

```
26278 ssize_t msgrcv(int msqid, void *msgp, size_t msgsz, long msgtyp,
26279               int msgflg);
26280
```

## 26281 DESCRIPTION

26282 The *msgrcv()* function operates on XSI message queues (see the Base Definitions volume of  
 26283 IEEE Std 1003.1-2001, Section 3.224, Message Queue). It is unspecified whether this function  
 26284 interoperates with the realtime interprocess communication facilities defined in Section 2.8 (on  
 26285 page 41).

26286 The *msgrcv()* function shall read a message from the queue associated with the message queue  
 26287 identifier specified by *msqid* and place it in the user-defined buffer pointed to by *msgp*.

26288 The application shall ensure that the argument *msgp* points to a user-defined buffer that contains  
 26289 first a field of type **long** specifying the type of the message, and then a data portion that holds  
 26290 the data bytes of the message. The structure below is an example of what this user-defined  
 26291 buffer might look like:

```
26292 struct mymsg {
26293     long   mtype;      /* Message type. */
26294     char   mtext[1];  /* Message text. */
26295 }
```

26296 The structure member *mtype* is the received message's type as specified by the sending process.

26297 The structure member *mtext* is the text of the message.

26298 The argument *msgsz* specifies the size in bytes of *mtext*. The received message shall be truncated  
 26299 to *msgsz* bytes if it is larger than *msgsz* and (*msgflg* & MSG\_NOERROR) is non-zero. The  
 26300 truncated part of the message shall be lost and no indication of the truncation shall be given to  
 26301 the calling process.

26302 If the value of *msgsz* is greater than {SSIZE\_MAX}, the result is implementation-defined.

26303 The argument *msgtyp* specifies the type of message requested as follows:

- 26304 • If *msgtyp* is 0, the first message on the queue shall be received.
- 26305 • If *msgtyp* is greater than 0, the first message of type *msgtyp* shall be received.
- 26306 • If *msgtyp* is less than 0, the first message of the lowest type that is less than or equal to the  
 26307 absolute value of *msgtyp* shall be received.

26308 The argument *msgflg* specifies the action to be taken if a message of the desired type is not on the  
 26309 queue. These are as follows:

- 26310 • If (*msgflg* & IPC\_NOWAIT) is non-zero, the calling thread shall return immediately with a  
 26311 return value of -1 and *errno* set to [ENOMSG].
- 26312 • If (*msgflg* & IPC\_NOWAIT) is 0, the calling thread shall suspend execution until one of the  
 26313 following occurs:
  - 26314 — A message of the desired type is placed on the queue.
  - 26315 — The message queue identifier *msqid* is removed from the system; when this occurs, *errno*  
 26316 shall be set equal to [EIDRM] and -1 shall be returned.

26317 — The calling thread receives a signal that is to be caught; in this case a message is not  
 26318 received and the calling thread resumes execution in the manner prescribed in *sigaction()*.

26319 Upon successful completion, the following actions are taken with respect to the data structure  
 26320 associated with *msqid*:

- 26321 • **msg\_qnum** shall be decremented by 1.
- 26322 • **msg\_lrpid** shall be set equal to the process ID of the calling process.
- 26323 • **msg\_rtime** shall be set equal to the current time.

#### 26324 RETURN VALUE

26325 Upon successful completion, *msgrcv()* shall return a value equal to the number of bytes actually  
 26326 placed into the buffer *mtext*. Otherwise, no message shall be received, *msgrcv()* shall return  
 26327 (**ssize\_t**)−1, and *errno* shall be set to indicate the error.

#### 26328 ERRORS

26329 The *msgrcv()* function shall fail if:

- |                |          |                                                                                                         |
|----------------|----------|---------------------------------------------------------------------------------------------------------|
| 26330          | [E2BIG]  | The value of <i>mtext</i> is greater than <i>msgsz</i> and ( <i>msgflg</i> & MSG_NOERROR) is 0.         |
| 26331<br>26332 | [EACCES] | Operation permission is denied to the calling process; see Section 2.7 (on page 39).                    |
| 26333          | [EIDRM]  | The message queue identifier <i>msqid</i> is removed from the system.                                   |
| 26334          | [EINTR]  | The <i>msgrcv()</i> function was interrupted by a signal.                                               |
| 26335          | [EINVAL] | <i>msqid</i> is not a valid message queue identifier.                                                   |
| 26336<br>26337 | [ENOMSG] | The queue does not contain a message of the desired type and ( <i>msgflg</i> & IPC_NOWAIT) is non-zero. |

#### 26338 EXAMPLES

##### 26339 Receiving a Message

26340 The following example receives the first message on the queue (based on the value of the *msgtyp*  
 26341 argument, 0). The queue is identified by the *msqid* argument (assuming that the value has  
 26342 previously been set). This call specifies that an error should be reported if no message is  
 26343 available, but not if the message is too large. The message size is calculated directly using the  
 26344 *sizeof* operator.

```

26345 #include <sys/msg.h>
26346 ...
26347 int result;
26348 int msqid;
26349 struct message {
26350     long type;
26351     char text[20];
26352 } msg;
26353 long msgtyp = 0;
26354 ...
26355 result = msgrcv(msqid, (void *) &msg, sizeof(msg.text),
26356               msgtyp, MSG_NOERROR | IPC_NOWAIT);
  
```

**26357 APPLICATION USAGE**

26358           The POSIX Realtime Extension defines alternative interfaces for interprocess communication  
26359           (IPC). Application developers who need to use IPC should design their applications so that  
26360           modules using the IPC routines described in Section 2.7 (on page 39) can be easily modified to  
26361           use the alternative interfaces.

**26362 RATIONALE**

26363           None.

**26364 FUTURE DIRECTIONS**

26365           None.

**26366 SEE ALSO**

26367           Section 2.7 (on page 39), Section 2.8 (on page 41), *mq\_close()*, *mq\_getattr()*, *mq\_notify()*,  
26368           *mq\_open()*, *mq\_receive()*, *mq\_send()*, *mq\_setattr()*, *mq\_unlink()*, *msgctl()*, *msgget()*, *msgsnd()*,

**26370 CHANGE HISTORY**

26371           First released in Issue 2. Derived from Issue 2 of the SVID.

**26372 Issue 5**

26373           The type of the return value is changed from **int** to **ssize\_t**, and a warning is added to the  
26374           DESCRIPTION about values of *msgsz* larger than {SSIZE\_MAX}.

26375           The note about use of POSIX Realtime Extension IPC routines has been moved from FUTURE  
26376           DIRECTIONS to the APPLICATION USAGE section.

**26377 Issue 6**

26378           The DESCRIPTION is updated to avoid use of the term “must” for application requirements.

26379 **NAME**

26380 msgsnd — XSI message send operation

26381 **SYNOPSIS**26382 XSI 

```
#include <sys/msg.h>
```

26383 

```
int msgsnd(int msqid, const void *msgp, size_t msgsz, int msgflg);
```

26384

26385 **DESCRIPTION**

26386 The *msgsnd()* function operates on XSI message queues (see the Base Definitions volume of  
 26387 IEEE Std 1003.1-2001, Section 3.224, Message Queue). It is unspecified whether this function  
 26388 interoperates with the realtime interprocess communication facilities defined in Section 2.8 (on  
 26389 page 41).

26390 The *msgsnd()* function shall send a message to the queue associated with the message queue  
 26391 identifier specified by *msqid*.

26392 The application shall ensure that the argument *msgp* points to a user-defined buffer that contains  
 26393 first a field of type **long** specifying the type of the message, and then a data portion that holds  
 26394 the data bytes of the message. The structure below is an example of what this user-defined  
 26395 buffer might look like:

```
26396 struct mymsg {
26397     long    mtype;           /* Message type. */
26398     char    mtext[1];       /* Message text. */
26399 }
```

26400 The structure member *mtype* is a non-zero positive type **long** that can be used by the receiving  
 26401 process for message selection.

26402 The structure member *mtext* is any text of length *msgsz* bytes. The argument *msgsz* can range  
 26403 from 0 to a system-imposed maximum.

26404 The argument *msgflg* specifies the action to be taken if one or more of the following is true:

- 26405 • The number of bytes already on the queue is equal to **msg\_qbytes**; see `<sys/msg.h>`.
- 26406 • The total number of messages on all queues system-wide is equal to the system-imposed  
 26407 limit.

26408 These actions are as follows:

- 26409 • If (*msgflg* & IPC\_NOWAIT) is non-zero, the message shall not be sent and the calling thread  
 26410 shall return immediately.
- 26411 • If (*msgflg* & IPC\_NOWAIT) is 0, the calling thread shall suspend execution until one of the  
 26412 following occurs:
  - 26413 — The condition responsible for the suspension no longer exists, in which case the message  
 26414 is sent.
  - 26415 — The message queue identifier *msqid* is removed from the system; when this occurs, *errno*  
 26416 shall be set equal to [EIDRM] and `-1` shall be returned.
  - 26417 — The calling thread receives a signal that is to be caught; in this case the message is not  
 26418 sent and the calling thread resumes execution in the manner prescribed in *sigaction()*.

26419 Upon successful completion, the following actions are taken with respect to the data structure  
 26420 associated with *msqid*; see `<sys/msg.h>`:

- 26421 • **msg\_qnum** shall be incremented by 1.
- 26422 • **msg\_lspid** shall be set equal to the process ID of the calling process.
- 26423 • **msg\_stime** shall be set equal to the current time.

**26424 RETURN VALUE**

26425 Upon successful completion, *msgsnd()* shall return 0; otherwise, no message shall be sent,  
 26426 *msgsnd()* shall return -1, and *errno* shall be set to indicate the error.

**26427 ERRORS**

26428 The *msgsnd()* function shall fail if:

- 26429 [EACCES] Operation permission is denied to the calling process; see Section 2.7 (on page  
 26430 39).
- 26431 [EAGAIN] The message cannot be sent for one of the reasons cited above and (*msgflg* &  
 26432 IPC\_NOWAIT) is non-zero.
- 26433 [EIDRM] The message queue identifier *msgid* is removed from the system.
- 26434 [EINTR] The *msgsnd()* function was interrupted by a signal.
- 26435 [EINVAL] The value of *msgid* is not a valid message queue identifier, or the value of  
 26436 *mtype* is less than 1; or the value of *msgsz* is less than 0 or greater than the  
 26437 system-imposed limit.

**26438 EXAMPLES****26439 Sending a Message**

26440 The following example sends a message to the queue identified by the *msgid* argument  
 26441 (assuming that value has previously been set). This call specifies that an error should be  
 26442 reported if no message is available. The message size is calculated directly using the *sizeof*  
 26443 operator.

```

26444 #include <sys/msg.h>
26445 ...
26446 int result;
26447 int msgid;
26448 struct message {
26449     long type;
26450     char text[20];
26451 } msg;

26452 msg.type = 1;
26453 strcpy(msg.text, "This is message 1");
26454 ...
26455 result = msgsnd(msgid, (void *) &msg, sizeof(msg.text), IPC_NOWAIT);
  
```

**26456 APPLICATION USAGE**

26457 The POSIX Realtime Extension defines alternative interfaces for interprocess communication  
 26458 (IPC). Application developers who need to use IPC should design their applications so that  
 26459 modules using the IPC routines described in Section 2.7 (on page 39) can be easily modified to  
 26460 use the alternative interfaces.

26461 **RATIONALE**

26462           None.

26463 **FUTURE DIRECTIONS**

26464           None.

26465 **SEE ALSO**

26466           Section 2.7 (on page 39), Section 2.8 (on page 41), *mq\_close()*, *mq\_getattr()*, *mq\_notify()*,  
26467           *mq\_open()*, *mq\_receive()*, *mq\_send()*, *mq\_setattr()*, *mq\_unlink()*, *msgctl()*, *msgget()*, *msgrcv()*,

26469 **CHANGE HISTORY**

26470           First released in Issue 2. Derived from Issue 2 of the SVID.

26471 **Issue 5**

26472           The note about use of POSIX Realtime Extension IPC routines has been moved from FUTURE  
26473           DIRECTIONS to a new APPLICATION USAGE section.

26474 **Issue 6**

26475           The DESCRIPTION is updated to avoid use of the term “must” for application requirements.

26476 **NAME**

26477       msync — synchronize memory with physical storage

26478 **SYNOPSIS**

26479 MF SIO   #include &lt;sys/mman.h&gt;

26480       int msync(void \*addr, size\_t len, int flags);

26481

26482 **DESCRIPTION**

26483       The *msync()* function shall write all modified data to permanent storage locations, if any, in  
 26484 those whole pages containing any part of the address space of the process starting at address  
 26485 *addr* and continuing for *len* bytes. If no such storage exists, *msync()* need not have any effect. If  
 26486 requested, the *msync()* function shall then invalidate cached copies of data.

26487       The implementation shall require that *addr* be a multiple of the page size as returned by  
 26488 *sysconf()*.

26489       For mappings to files, the *msync()* function shall ensure that all write operations are completed  
 26490 as defined for synchronized I/O data integrity completion. It is unspecified whether the  
 26491 implementation also writes out other file attributes. When the *msync()* function is called on  
 26492 MAP\_PRIVATE mappings, any modified data shall not be written to the underlying object and  
 26493 shall not cause such data to be made visible to other processes. It is unspecified whether data in  
 26494 SHM|TYM MAP\_PRIVATE mappings has any permanent storage locations. The effect of *msync()* on a  
 26495 shared memory object or a typed memory object is unspecified. The behavior of this function is  
 26496 unspecified if the mapping was not established by a call to *mmap()*.

26497       The *flags* argument is constructed from the bitwise-inclusive OR of one or more of the following  
 26498 flags defined in the <sys/mman.h> header:

26499

26500

26501

26502

26503

| Symbolic Constant | Description                  |
|-------------------|------------------------------|
| MS_ASYNC          | Perform asynchronous writes. |
| MS_SYNC           | Perform synchronous writes.  |
| MS_INVALIDATE     | Invalidate cached data.      |

26504       When MS\_ASYNC is specified, *msync()* shall return immediately once all the write operations  
 26505 are initiated or queued for servicing; when MS\_SYNC is specified, *msync()* shall not return until  
 26506 all write operations are completed as defined for synchronized I/O data integrity completion.  
 26507 Either MS\_ASYNC or MS\_SYNC is specified, but not both.

26508       When MS\_INVALIDATE is specified, *msync()* shall invalidate all cached copies of mapped data  
 26509 that are inconsistent with the permanent storage locations such that subsequent references shall  
 26510 obtain data that was consistent with the permanent storage locations sometime between the call  
 26511 to *msync()* and the first subsequent memory reference to the data.

26512       If *msync()* causes any write to a file, the file's *st\_ctime* and *st\_mtime* fields shall be marked for  
 26513 update.

26514 **RETURN VALUE**

26515       Upon successful completion, *msync()* shall return 0; otherwise, it shall return -1 and set *errno* to  
 26516 indicate the error.

26517 **ERRORS**26518       The *msync()* function shall fail if:

26519       [EBUSY]       Some or all of the addresses in the range starting at *addr* and continuing for *len*  
 26520 bytes are locked, and MS\_INVALIDATE is specified.

- 26521 [EINVAL] The value of *flags* is invalid.
- 26522 [EINVAL] The value of *addr* is not a multiple of the page size {PAGESIZE}.
- 26523 [ENOMEM] The addresses in the range starting at *addr* and continuing for *len* bytes are  
26524 outside the range allowed for the address space of a process or specify one or  
26525 more pages that are not mapped.

**26526 EXAMPLES**

26527 None.

**26528 APPLICATION USAGE**

26529 The *msync()* function is only supported if the Memory Mapped Files option and the  
26530 Synchronized Input and Output option are supported, and thus need not be available on all  
26531 implementations.

26532 The *msync()* function should be used by programs that require a memory object to be in a  
26533 known state; for example, in building transaction facilities.

26534 Normal system activity can cause pages to be written to disk. Therefore, there are no guarantees  
26535 that *msync()* is the only control over when pages are or are not written to disk.

**26536 RATIONALE**

26537 The *msync()* function writes out data in a mapped region to the permanent storage for the  
26538 underlying object. The call to *msync()* ensures data integrity of the file.

26539 After the data is written out, any cached data may be invalidated if the MS\_INVALIDATE flag  
26540 was specified. This is useful on systems that do not support read/write consistency.

**26541 FUTURE DIRECTIONS**

26542 None.

**26543 SEE ALSO**

26544 *mmap()*, *sysconf()*, the Base Definitions volume of IEEE Std 1003.1-2001, <sys/mman.h>

**26545 CHANGE HISTORY**

26546 First released in Issue 4, Version 2.

**26547 Issue 5**

26548 Moved from X/OPEN UNIX extension to BASE.

26549 Aligned with *msync()* in the POSIX Realtime Extension as follows:

- 26550 • The DESCRIPTION is extensively reworded.
- 26551 • [EBUSY] and a new form of [EINVAL] are added as mandatory error conditions.

**26552 Issue 6**

26553 The *msync()* function is marked as part of the Memory Mapped Files and Synchronized Input  
26554 and Output options.

26555 The following changes are made for alignment with the ISO POSIX-1: 1996 standard:

- 26556 • The [EBUSY] mandatory error condition is added.

26557 The following new requirements on POSIX implementations derive from alignment with the  
26558 Single UNIX Specification:

- 26559 • The DESCRIPTION is updated to state that implementations require *addr* to be a multiple of  
26560 the page size.
- 26561 • The second [EINVAL] error condition is made mandatory.

26562  
26563

The DESCRIPTION is updated for alignment with IEEE Std 1003.1j-2000 by adding reference to typed memory objects.

26564 **NAME**

26565           munlock — unlock a range of process address space

26566 **SYNOPSIS**

26567 MLR       #include &lt;sys/mman.h&gt;

26568           int munlock(const void \*addr, size\_t len);

26569

26570 **DESCRIPTION**26571           Refer to *mlock()*.

26572 **NAME**

26573           munlockall — unlock the address space of a process

26574 **SYNOPSIS**

26575 ML       #include <sys/mman.h>

26576           int munlockall(void);

26577

26578 **DESCRIPTION**

26579           Refer to *mlockall()*.

26580 **NAME**

26581           munmap — unmap pages of memory

26582 **SYNOPSIS**

26583 MF|SHM   #include &lt;sys/mman.h&gt;

26584           int munmap(void \*addr, size\_t len);

26585

26586 **DESCRIPTION**

26587           The *munmap()* function shall remove any mappings for those entire pages containing any part of  
 26588           the address space of the process starting at *addr* and continuing for *len* bytes. Further references  
 26589           to these pages shall result in the generation of a SIGSEGV signal to the process. If there are no  
 26590           mappings in the specified address range, then *munmap()* has no effect.

26591           The implementation shall require that *addr* be a multiple of the page size {PAGESIZE}.

26592           If a mapping to be removed was private, any modifications made in this address range shall be  
 26593           discarded.

26594 ML|MLR   Any memory locks (see *mlock()* and *mlockall()*) associated with this address range shall be  
 26595           removed, as if by an appropriate call to *munlock()*.

26596 TYM     If a mapping removed from a typed memory object causes the corresponding address range of  
 26597           the memory pool to be inaccessible by any process in the system except through allocatable  
 26598           mappings (that is, mappings of typed memory objects opened with the  
 26599           POSIX\_TYPED\_MEM\_MAP\_ALLOCATABLE flag), then that range of the memory pool shall  
 26600           become deallocated and may become available to satisfy future typed memory allocation  
 26601           requests.

26602           A mapping removed from a typed memory object opened with the  
 26603           POSIX\_TYPED\_MEM\_MAP\_ALLOCATABLE flag shall not affect in any way the availability of  
 26604           that typed memory for allocation.

26605           The behavior of this function is unspecified if the mapping was not established by a call to  
 26606           *mmap()*.

26607 **RETURN VALUE**

26608           Upon successful completion, *munmap()* shall return 0; otherwise, it shall return -1 and set *errno*  
 26609           to indicate the error.

26610 **ERRORS**

26611           The *munmap()* function shall fail if:

26612           [EINVAL]       Addresses in the range [*addr*,*addr+len*) are outside the valid range for the  
 26613           address space of a process.

26614           [EINVAL]       The *len* argument is 0.

26615           [EINVAL]       The *addr* argument is not a multiple of the page size as returned by *sysconf()*.

26616 **EXAMPLES**

26617 None.

26618 **APPLICATION USAGE**

26619 The *munmap()* function is only supported if the Memory Mapped Files option or the Shared  
 26620 Memory Objects option is supported.

26621 **RATIONALE**26622 The *munmap()* function corresponds to SVR4, just as the *mmap()* function does.

26623 It is possible that an application has applied process memory locking to a region that contains  
 26624 shared memory. If this has occurred, the *munmap()* call ignores those locks and, if necessary,  
 26625 causes those locks to be removed.

26626 **FUTURE DIRECTIONS**

26627 None.

26628 **SEE ALSO**

26629 *mlock()*, *mlockall()*, *mmap()*, *posix\_typed\_mem\_open()*, *sysconf()*, the Base Definitions volume of  
 26630 IEEE Std 1003.1-2001, <signal.h>, <sys/mman.h>

26631 **CHANGE HISTORY**

26632 First released in Issue 4, Version 2.

26633 **Issue 5**

26634 Moved from X/OPEN UNIX extension to BASE.

26635 Aligned with *munmap()* in the POSIX Realtime Extension as follows:

- 26636 • The DESCRIPTION is extensively reworded.
- 26637 • The SIGBUS error is no longer permitted to be generated.

26638 **Issue 6**

26639 The *munmap()* function is marked as part of the Memory Mapped Files and Shared Memory  
 26640 Objects option.

26641 The following new requirements on POSIX implementations derive from alignment with the  
 26642 Single UNIX Specification:

- 26643 • The DESCRIPTION is updated to state that implementations require *addr* to be a multiple of  
 26644 the page size.
- 26645 • The [EINVAL] error conditions are added.

26646 The following changes are made for alignment with IEEE Std 1003.1j-2000:

- 26647 • Semantics for typed memory objects are added to the DESCRIPTION.
- 26648 • The *posix\_typed\_mem\_open()* function is added to the SEE ALSO section.

26649 **NAME**

26650 nan, nanf, nanl — return quiet NaN

26651 **SYNOPSIS**

26652 #include &lt;math.h&gt;

26653 double nan(const char \*tagp);

26654 float nanf(const char \*tagp);

26655 long double nanl(const char \*tagp);

26656 **DESCRIPTION**

26657 cx The functionality described on this reference page is aligned with the ISO C standard. Any  
 26658 conflict between the requirements described here and the ISO C standard is unintentional. This  
 26659 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

26660 The function call *nan*("n-char-sequence") shall be equivalent to:

26661 strtod("NAN(n-char-sequence)", (char \*\*) NULL);

26662 The function call *nan*("") shall be equivalent to:

26663 strtod("NAN()", (char \*\*) NULL)

26664 If *tagp* does not point to an *n-char* sequence or an empty string, the function call shall be  
 26665 equivalent to:

26666 strtod("NAN", (char \*\*) NULL)

26667 Function calls to *nanf*() and *nanl*() are equivalent to the corresponding function calls to *strtof*()  
 26668 and *strtold*().

26669 **RETURN VALUE**26670 These functions shall return a quiet NaN, if available, with content indicated through *tagp*.

26671 If the implementation does not support quiet NaNs, these functions shall return zero.

26672 **ERRORS**

26673 No errors are defined.

26674 **EXAMPLES**

26675 None.

26676 **APPLICATION USAGE**

26677 None.

26678 **RATIONALE**

26679 None.

26680 **FUTURE DIRECTIONS**

26681 None.

26682 **SEE ALSO**26683 *strtod*(), *strtold*(), the Base Definitions volume of IEEE Std 1003.1-2001, <math.h>26684 **CHANGE HISTORY**

26685 First released in Issue 6. Derived from the ISO/IEC 9899:1999 standard.

## 26686 NAME

26687 nanosleep — high resolution sleep (**REALTIME**)

## 26688 SYNOPSIS

26689 TMR `#include <time.h>`26690 `int nanosleep(const struct timespec *rqtp, struct timespec *rmtp);`

26691

## 26692 DESCRIPTION

26693 The *nanosleep()* function shall cause the current thread to be suspended from execution until  
 26694 either the time interval specified by the *rqtp* argument has elapsed or a signal is delivered to the  
 26695 calling thread, and its action is to invoke a signal-catching function or to terminate the process.  
 26696 The suspension time may be longer than requested because the argument value is rounded up to  
 26697 an integer multiple of the sleep resolution or because of the scheduling of other activity by the  
 26698 system. But, except for the case of being interrupted by a signal, the suspension time shall not be  
 26699 less than the time specified by *rqtp*, as measured by the system clock `CLOCK_REALTIME`.

26700 The use of the *nanosleep()* function has no effect on the action or blockage of any signal.

## 26701 RETURN VALUE

26702 If the *nanosleep()* function returns because the requested time has elapsed, its return value shall  
26703 be zero.

26704 If the *nanosleep()* function returns because it has been interrupted by a signal, it shall return a  
 26705 value of `-1` and set *errno* to indicate the interruption. If the *rmtp* argument is non-NULL, the  
 26706 **timespec** structure referenced by it is updated to contain the amount of time remaining in the  
 26707 interval (the requested time minus the time actually slept). If the *rmtp* argument is NULL, the  
 26708 remaining time is not returned.

26709 If *nanosleep()* fails, it shall return a value of `-1` and set *errno* to indicate the error.

## 26710 ERRORS

26711 The *nanosleep()* function shall fail if:26712 [EINTR] The *nanosleep()* function was interrupted by a signal.26713 [EINVAL] The *rqtp* argument specified a nanosecond value less than zero or greater than  
26714 or equal to 1 000 million.

## 26715 EXAMPLES

26716 None.

## 26717 APPLICATION USAGE

26718 None.

## 26719 RATIONALE

26720 It is common to suspend execution of a process for an interval in order to poll the status of a  
 26721 non-interrupting function. A large number of actual needs can be met with a simple extension to  
 26722 *sleep()* that provides finer resolution.

26723 In the POSIX.1-1990 standard and SVR4, it is possible to implement such a routine, but the  
 26724 frequency of wakeup is limited by the resolution of the *alarm()* and *sleep()* functions. In 4.3 BSD,  
 26725 it is possible to write such a routine using no static storage and reserving no system facilities.  
 26726 Although it is possible to write a function with similar functionality to *sleep()* using the  
 26727 remainder of the *timer\_\**() functions, such a function requires the use of signals and the  
 26728 reservation of some signal number. This volume of IEEE Std 1003.1-2001 requires that  
 26729 *nanosleep()* be non-intrusive of the signals function.

26730 The *nanosleep()* function shall return a value of 0 on success and –1 on failure or if interrupted.  
26731 This latter case is different from *sleep()*. This was done because the remaining time is returned  
26732 via an argument structure pointer, *rmtp*, instead of as the return value.

26733 **FUTURE DIRECTIONS**

26734 None.

26735 **SEE ALSO**

26736 *sleep()*, the Base Definitions volume of IEEE Std 1003.1-2001, <**time.h**>

26737 **CHANGE HISTORY**

26738 First released in Issue 5. Included for alignment with the POSIX Realtime Extension.

26739 **Issue 6**

26740 The *nanosleep()* function is marked as part of the Timers option.

26741 The [ENOSYS] error condition has been removed as stubs need not be provided if an  
26742 implementation does not support the Timers option.

26743 **NAME**

26744 nearbyint, nearbyintf, nearbyintl — floating-point rounding functions

26745 **SYNOPSIS**

26746 #include &lt;math.h&gt;

26747 double nearbyint(double x);

26748 float nearbyintf(float x);

26749 long double nearbyintl(long double x);

26750 **DESCRIPTION**

26751 **CX** The functionality described on this reference page is aligned with the ISO C standard. Any  
 26752 conflict between the requirements described here and the ISO C standard is unintentional. This  
 26753 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

26754 These functions shall round their argument to an integer value in floating-point format, using  
 26755 the current rounding direction and without raising the inexact floating-point exception.

26756 An application wishing to check for error situations should set *errno* to zero and call  
 26757 *feclearexcept*(FE\_ALL\_EXCEPT) before calling these functions. On return, if *errno* is non-zero or  
 26758 *fetestexcept*(FE\_INVALID | FE\_DIVBYZERO | FE\_OVERFLOW | FE\_UNDERFLOW) is non-  
 26759 zero, an error has occurred.

26760 **RETURN VALUE**

26761 Upon successful completion, these functions shall return the rounded integer value.

26762 **MX** If *x* is NaN, a NaN shall be returned.26763 If *x* is  $\pm 0$ ,  $\pm 0$  shall be returned.26764 If *x* is  $\pm\text{Inf}$ , *x* shall be returned.

26765 **XSI** If the correct value would cause overflow, a range error shall occur and *nearbyint*(), *nearbyintf*(),  
 26766 and *nearbyintl*() shall return the value of the macro  $\pm\text{HUGE\_VAL}$ ,  $\pm\text{HUGE\_VALF}$ , and  
 26767  $\pm\text{HUGE\_VALL}$  (with the same sign as *x*), respectively.

26768 **ERRORS**

26769 These functions shall fail if:

26770 **XSI** **Range Error** The result would cause an overflow.

26771 If the integer expression (math\_errhandling & MATH\_ERRNO) is non-zero,  
 26772 then *errno* shall be set to [ERANGE]. If the integer expression  
 26773 (math\_errhandling & MATH\_ERREXCEPT) is non-zero, then the overflow  
 26774 floating-point exception shall be raised.

26775 **EXAMPLES**

26776 None.

26777 **APPLICATION USAGE**

26778 On error, the expressions (math\_errhandling & MATH\_ERRNO) and (math\_errhandling &  
 26779 MATH\_ERREXCEPT) are independent of each other, but at least one of them must be non-zero.

26780 **RATIONALE**

26781 None.

26782 **FUTURE DIRECTIONS**

26783 None.

26784 **SEE ALSO**

26785            *feclearexcept()*, *fetetestexcept()*, the Base Definitions volume of IEEE Std 1003.1-2001, Section 4.18,  
26786            Treatment of Error Conditions for Mathematical Functions, <math.h>

26787 **CHANGE HISTORY**

26788            First released in Issue 6. Derived from the ISO/IEC 9899:1999 standard.

26789 **NAME**

26790 nextafter, nextafterf, nextafterl, nexttoward, nexttowardf, nexttowardl — next representable  
 26791 floating-point number

26792 **SYNOPSIS**

```
26793 #include <math.h>

26794 double nextafter(double x, double y);
26795 float nextafterf(float x, float y);
26796 long double nextafterl(long double x, long double y);
26797 double nexttoward(double x, long double y);
26798 float nexttowardf(float x, long double y);
26799 long double nexttowardl(long double x, long double y);
```

26800 **DESCRIPTION**

26801 **CX** The functionality described on this reference page is aligned with the ISO C standard. Any  
 26802 conflict between the requirements described here and the ISO C standard is unintentional. This  
 26803 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

26804 The *nextafter()*, *nextafterf()*, and *nextafterl()* functions shall compute the next representable  
 26805 floating-point value following *x* in the direction of *y*. Thus, if *y* is less than *x*, *nextafter()* shall  
 26806 return the largest representable floating-point number less than *x*. The *nextafter()*, *nextafterf()*,  
 26807 and *nextafterl()* functions shall return *y* if *x* equals *y*.

26808 The *nexttoward()*, *nexttowardf()*, and *nexttowardl()* functions shall be equivalent to the  
 26809 corresponding *nextafter()* functions, except that the second parameter shall have type **long**  
 26810 **double** and the functions shall return *y* converted to the type of the function if *x* equals *y*.

26811 An application wishing to check for error situations should set *errno* to zero and call  
 26812 *feclearexcept*(FE\_ALL\_EXCEPT) before calling these functions. On return, if *errno* is non-zero or  
 26813 *fetestexcept*(FE\_INVALID | FE\_DIVBYZERO | FE\_OVERFLOW | FE\_UNDERFLOW) is non-  
 26814 zero, an error has occurred.

26815 **RETURN VALUE**

26816 Upon successful completion, these functions shall return the next representable floating-point  
 26817 value following *x* in the direction of *y*.

26818 If *x*==*y*, *y* (of the type *x*) shall be returned.

26819 If *x* is finite and the correct function value would overflow, a range error shall occur and  
 26820 ±HUGE\_VAL, ±HUGE\_VALF, and ±HUGE\_VALL (with the same sign as *x*) shall be returned as  
 26821 appropriate for the return type of the function.

26822 **MX** If *x* or *y* is NaN, a NaN shall be returned.

26823 If *x*!=*y* and the correct function value is subnormal, zero, or underflows, a range error shall  
 26824 occur, and either the correct function value (if representable) or 0.0 shall be returned.

26825 **ERRORS**

26826 These functions shall fail if:

26827 **Range Error** The correct value overflows.

26828 If the integer expression (math\_errhandling & MATH\_ERRNO) is non-zero,  
 26829 then *errno* shall be set to [ERANGE]. If the integer expression  
 26830 (math\_errhandling & MATH\_ERREXCEPT) is non-zero, then the overflow  
 26831 floating-point exception shall be raised.

26832 **MX** **Range Error** The correct value is subnormal or underflows.

26833 If the integer expression (`math_errhandling & MATH_ERRNO`) is non-zero,  
26834 then *errno* shall be set to [ERANGE]. If the integer expression  
26835 (`math_errhandling & MATH_ERREXCEPT`) is non-zero, then the underflow  
26836 floating-point exception shall be raised.

**26837 EXAMPLES**

26838 None.

**26839 APPLICATION USAGE**

26840 On error, the expressions (`math_errhandling & MATH_ERRNO`) and (`math_errhandling &`  
26841 `MATH_ERREXCEPT`) are independent of each other, but at least one of them must be non-zero.

**26842 RATIONALE**

26843 None.

**26844 FUTURE DIRECTIONS**

26845 None.

**26846 SEE ALSO**

26847 *feclearexcept()*, *fetestexcept()*, the Base Definitions volume of IEEE Std 1003.1-2001, Section 4.18,  
26848 Treatment of Error Conditions for Mathematical Functions, <**math.h**>

**26849 CHANGE HISTORY**

26850 First released in Issue 4, Version 2.

**26851 Issue 5**

26852 Moved from X/OPEN UNIX extension to BASE.

**26853 Issue 6**

26854 The *nextafter()* function is no longer marked as an extension.

26855 The *nextafterf()*, *nextafterl()*, *nexttoward()*, *nexttowardf()*, and *nexttowardl()* functions are added  
26856 for alignment with the ISO/IEC 9899:1999 standard.

26857 The DESCRIPTION, RETURN VALUE, ERRORS, and APPLICATION USAGE sections are  
26858 revised to align with the ISO/IEC 9899:1999 standard.

26859 IEC 60559:1989 standard floating-point extensions over the ISO/IEC 9899:1999 standard are  
26860 marked.

## 26861 NAME

26862 nftw — walk a file tree

## 26863 SYNOPSIS

26864 XSI 

```
#include <ftw.h>
```

```
26865 int nftw(const char *path, int (*fn)(const char *,
26866         const struct stat *, int, struct FTW *), int depth, int flags);
26867
```

## 26868 DESCRIPTION

26869 The *nftw()* function shall recursively descend the directory hierarchy rooted in *path*. The *nftw()*  
 26870 function has a similar effect to *ftw()* except that it takes an additional argument *flags*, which is a  
 26871 bitwise-inclusive OR of zero or more of the following flags:

26872 **FTW\_CHDIR** If set, *nftw()* shall change the current working directory to each directory as it  
 26873 reports files in that directory. If clear, *nftw()* shall not change the current  
 26874 working directory.

26875 **FTW\_DEPTH** If set, *nftw()* shall report all files in a directory before reporting the directory  
 26876 itself. If clear, *nftw()* shall report any directory before reporting the files in that  
 26877 directory.

26878 **FTW\_MOUNT** If set, *nftw()* shall only report files in the same file system as *path*. If clear,  
 26879 *nftw()* shall report all files encountered during the walk.

26880 **FTW\_PHYS** If set, *nftw()* shall perform a physical walk and shall not follow symbolic links.

26881 If **FTW\_PHYS** is clear and **FTW\_DEPTH** is set, *nftw()* shall follow links instead of reporting  
 26882 them, but shall not report any directory that would be a descendant of itself. If **FTW\_PHYS** is  
 26883 clear and **FTW\_DEPTH** is clear, *nftw()* shall follow links instead of reporting them, but shall not  
 26884 report the contents of any directory that would be a descendant of itself.

26885 At each file it encounters, *nftw()* shall call the user-supplied function *fn* with four arguments:

- 26886 • The first argument is the pathname of the object.
- 26887 • The second argument is a pointer to the **stat** buffer containing information on the object.
- 26888 • The third argument is an integer giving additional information. Its value is one of the  
 26889 following:

26890 **FTW\_F** The object is a file.

26891 **FTW\_D** The object is a directory.

26892 **FTW\_DP** The object is a directory and subdirectories have been visited. (This condition  
 26893 shall only occur if the **FTW\_DEPTH** flag is included in *flags*.)

26894 **FTW\_SL** The object is a symbolic link. (This condition shall only occur if the **FTW\_PHYS**  
 26895 flag is included in *flags*.)

26896 **FTW\_SLN** The object is a symbolic link that does not name an existing file. (This  
 26897 condition shall only occur if the **FTW\_PHYS** flag is not included in *flags*.)

26898 **FTW\_DNR** The object is a directory that cannot be read. The *fn* function shall not be called  
 26899 for any of its descendants.

26900 **FTW\_NS** The *stat()* function failed on the object because of lack of appropriate  
 26901 permission. The **stat** buffer passed to *fn* is undefined. Failure of *stat()* for any  
 26902 other reason is considered an error and *nftw()* shall return  $-1$ .

26903       • The fourth argument is a pointer to an **FTW** structure. The value of **base** is the offset of the  
 26904       object's filename in the pathname passed as the first argument to *fn*. The value of **level**  
 26905       indicates depth relative to the root of the walk, where the root level is 0.

26906       The results are unspecified if the application-supplied *fn* function does not preserve the current  
 26907       working directory.

26908       The argument *depth* sets the maximum number of file descriptors that shall be used by *nftw()*  
 26909       while traversing the file tree. At most one file descriptor shall be used for each directory level.

26910       The *nftw()* function need not be reentrant. A function that is not required to be reentrant is not  
 26911       required to be thread-safe.

#### 26912 RETURN VALUE

26913       The *nftw()* function shall continue until the first of the following conditions occurs:

- 26914       • An invocation of *fn* shall return a non-zero value, in which case *nftw()* shall return that value.
- 26915       • The *nftw()* function detects an error other than [EACCES] (see FTW\_DNR and FTW\_NS  
 26916       above), in which case *nftw()* shall return  $-1$  and set *errno* to indicate the error.
- 26917       • The tree is exhausted, in which case *nftw()* shall return 0.

#### 26918 ERRORS

26919       The *nftw()* function shall fail if:

26920       [EACCES]       Search permission is denied for any component of *path* or read permission is  
 26921       denied for *path*, or *fn* returns  $-1$  and does not reset *errno*.

26922       [ELOOP]         A loop exists in symbolic links encountered during resolution of the *path*  
 26923       argument.

26924       [ENAMETOOLONG]

26925       The length of the *path* argument exceeds {PATH\_MAX} or a pathname  
 26926       component is longer than {NAME\_MAX}.

26927       [ENOENT]        A component of *path* does not name an existing file or *path* is an empty string.

26928       [ENOTDIR]       A component of *path* is not a directory.

26929       [EOVERFLOW]    A field in the **stat** structure cannot be represented correctly in the current  
 26930       programming environment for one or more files found in the file hierarchy.

26931       The *nftw()* function may fail if:

26932       [ELOOP]         More than {SYMLOOP\_MAX} symbolic links were encountered during  
 26933       resolution of the *path* argument.

26934       [EMFILE]        {OPEN\_MAX} file descriptors are currently open in the calling process.

26935       [ENAMETOOLONG]

26936       Pathname resolution of a symbolic link produced an intermediate result  
 26937       whose length exceeds {PATH\_MAX}.

26938       [ENFILE]        Too many files are currently open in the system.

26939       In addition, *errno* may be set if the function pointed to by *fn* causes *errno* to be set.

**26940 EXAMPLES**

26941 The following example walks the `/tmp` directory and its subdirectories, calling the `nftw()`  
 26942 function for every directory entry, to a maximum of 5 levels deep.

```
26943 #include <ftw.h>
26944 ...
26945 int nftwfunc(const char *, const struct stat *, int, struct FTW *);
26946
26947 int nftwfunc(const char *filename, const struct stat *statptr,
26948             int fileflags, struct FTW *pftw)
26949 {
26950     return 0;
26951 }
26952 ...
26953 char *startpath = "/tmp";
26954 int depth = 5;
26955 int flags = FTW_CHDIR | FTW_DEPTH | FTW_MOUNT;
26956 int ret;
26957
26958 ret = nftw(startpath, nftwfunc, depth, flags);
```

**26957 APPLICATION USAGE**

26958 None.

**26959 RATIONALE**

26960 None.

**26961 FUTURE DIRECTIONS**

26962 None.

**26963 SEE ALSO**

26964 `lstat()`, `opendir()`, `readdir()`, `stat()`, the Base Definitions volume of IEEE Std 1003.1-2001, `<ftw.h>`

**26965 CHANGE HISTORY**

26966 First released in Issue 4, Version 2.

**26967 Issue 5**

26968 Moved from X/OPEN UNIX extension to BASE.

26969 In the DESCRIPTION, the definition of the *depth* argument is clarified.

**26970 Issue 6**

26971 The Open Group Base Resolution bwg97-003 is applied.

26972 The ERRORS section is updated as follows:

- 26973 • The wording of the mandatory [ELOOP] error condition is updated.
- 26974 • A second optional [ELOOP] error condition is added.
- 26975 • The [EOVERFLOW] mandatory error condition is added.

26976 Text is added to the DESCRIPTION to say that the `nftw()` function need not be reentrant and  
 26977 that the results are unspecified if the application-supplied *fn* function does not preserve the  
 26978 current working directory.

26979 **NAME**

26980 nice — change the nice value of a process

26981 **SYNOPSIS**26982 XSI `#include <unistd.h>`26983 `int nice(int incr);`

26984

26985 **DESCRIPTION**

26986 The *nice()* function shall add the value of *incr* to the nice value of the calling process. A process' nice value is a non-negative number for which a more positive value shall result in less favorable scheduling.

26989 A maximum nice value of  $2*\{\text{NZERO}\}-1$  and a minimum nice value of 0 shall be imposed by the system. Requests for values above or below these limits shall result in the nice value being set to the corresponding limit. Only a process with appropriate privileges can lower the nice value.

26992 PS|TPS Calling the *nice()* function has no effect on the priority of processes or threads with policy SCHED\_FIFO or SCHED\_RR. The effect on processes or threads with other scheduling policies is implementation-defined.

26995 The nice value set with *nice()* shall be applied to the process. If the process is multi-threaded, the nice value shall affect all system scope threads in the process.

26997 As  $-1$  is a permissible return value in a successful situation, an application wishing to check for error situations should set *errno* to 0, then call *nice()*, and if it returns  $-1$ , check to see whether *errno* is non-zero.

27000 **RETURN VALUE**

27001 Upon successful completion, *nice()* shall return the new nice value  $-\{\text{NZERO}\}$ . Otherwise,  $-1$  shall be returned, the process' nice value shall not be changed, and *errno* shall be set to indicate the error.

27004 **ERRORS**27005 The *nice()* function shall fail if:

27006 [EPERM] The *incr* argument is negative and the calling process does not have appropriate privileges.

27008 **EXAMPLES**27009 **Changing the Nice Value**

27010 The following example adds the value of the *incr* argument,  $-20$ , to the nice value of the calling process.

27012 `#include <unistd.h>`27013 `...`27014 `int incr = -20;`27015 `int ret;`27016 `ret = nice(incr);`27017 **APPLICATION USAGE**

27018 None.

27019 **RATIONALE**

27020           None.

27021 **FUTURE DIRECTIONS**

27022           None.

27023 **SEE ALSO**27024           *getpriority()*, *setpriority()*, the Base Definitions volume of IEEE Std 1003.1-2001, <**limits.h**>,  
27025           <**unistd.h**>27026 **CHANGE HISTORY**

27027           First released in Issue 1. Derived from Issue 1 of the SVID.

27028 **Issue 5**27029           A statement is added to the description indicating the effects of this function on the different  
27030           scheduling policies and multi-threaded processes.

27031 **NAME**

27032 nl\_langinfo — language information

27033 **SYNOPSIS**

27034 XSI #include &lt;langinfo.h&gt;

27035 char \*nl\_langinfo(nl\_item item);

27036

27037 **DESCRIPTION**

27038 The *nl\_langinfo()* function shall return a pointer to a string containing information relevant to  
 27039 the particular language or cultural area defined in the program's locale (see <langinfo.h>). The  
 27040 manifest constant names and values of *item* are defined in <langinfo.h>. For example:

27041 nl\_langinfo(ABDAY\_1)

27042 would return a pointer to the string "Dom" if the identified language was Portuguese, and  
 27043 "Sun" if the identified language was English.

27044 Calls to *setlocale()* with a category corresponding to the category of *item* (see <langinfo.h>), or to  
 27045 the category *LC\_ALL*, may overwrite the array pointed to by the return value.

27046 The *nl\_langinfo()* function need not be reentrant. A function that is not required to be reentrant is  
 27047 not required to be thread-safe.

27048 **RETURN VALUE**

27049 In a locale where *langinfo* data is not defined, *nl\_langinfo()* shall return a pointer to the  
 27050 corresponding string in the POSIX locale. In all locales, *nl\_langinfo()* shall return a pointer to an  
 27051 empty string if *item* contains an invalid setting.

27052 This pointer may point to static data that may be overwritten on the next call.

27053 **ERRORS**

27054 No errors are defined.

27055 **EXAMPLES**27056 **Getting Date and Time Formatting Information**

27057 The following example returns a pointer to a string containing date and time formatting  
 27058 information, as defined in the *LC\_TIME* category of the current locale.

27059 #include &lt;time.h&gt;

27060 #include &lt;langinfo.h&gt;

27061 ...

27062 strftime(datestring, sizeof(datestring), nl\_langinfo(D\_T\_FMT), tm);

27063 ...

27064 **APPLICATION USAGE**

27065 The array pointed to by the return value should not be modified by the program, but may be  
 27066 modified by further calls to *nl\_langinfo()*.

27067 **RATIONALE**

27068 None.

27069 **FUTURE DIRECTIONS**

27070 None.

27071 **SEE ALSO**

27072        *setlocale()*, the Base Definitions volume of IEEE Std 1003.1-2001, Chapter 7, Locale, <**langinfo.h**>,  
27073        <**nl\_types.h**>

27074 **CHANGE HISTORY**

27075        First released in Issue 2.

27076 **Issue 5**

27077        The last paragraph of the DESCRIPTION is moved from the APPLICATION USAGE section.

27078        A note indicating that this function need not be reentrant is added to the DESCRIPTION.

27079 **NAME**

27080 nrand48 — generate uniformly distributed pseudo-random non-negative long integers

27081 **SYNOPSIS**

```
27082 xSI #include <stdlib.h>
```

```
27083 long nrand48(unsigned short xsubi[3]);
```

27084

27085 **DESCRIPTION**

27086 Refer to *drand48()*.

27087 **NAME**

27088       ntohl, ntohs — convert values between host and network byte order

27089 **SYNOPSIS**

27090       #include <arpa/inet.h>

27091       uint32\_t ntohl(uint32\_t *netlong*);

27092       uint16\_t ntohs(uint16\_t *netshort*);

27093 **DESCRIPTION**

27094       Refer to *htonl()*.

27095 **NAME**

27096           open — open a file

27097 **SYNOPSIS**

27098 OH       #include &lt;sys/stat.h&gt;

27099           #include &lt;fcntl.h&gt;

27100           int open(const char \*path, int oflag, ... );

27101 **DESCRIPTION**

27102       The *open()* function shall establish the connection between a file and a file descriptor. It shall  
 27103       create an open file description that refers to a file and a file descriptor that refers to that open file  
 27104       description. The file descriptor is used by other I/O functions to refer to that file. The *path*  
 27105       argument points to a pathname naming the file.

27106       The *open()* function shall return a file descriptor for the named file that is the lowest file  
 27107       descriptor not currently open for that process. The open file description is new, and therefore the  
 27108       file descriptor shall not share it with any other process in the system. The FD\_CLOEXEC file  
 27109       descriptor flag associated with the new file descriptor shall be cleared.

27110       The file offset used to mark the current position within the file shall be set to the beginning of the  
 27111       file.

27112       The file status flags and file access modes of the open file description shall be set according to  
 27113       the value of *oflag*.

27114       Values for *oflag* are constructed by a bitwise-inclusive OR of flags from the following list,  
 27115       defined in <fcntl.h>. Applications shall specify exactly one of the first three values (file access  
 27116       modes) below in the value of *oflag*:

27117       O\_RDONLY       Open for reading only.

27118       O\_WRONLY       Open for writing only.

27119       O\_RDWR         Open for reading and writing. The result is undefined if this flag is applied to  
27120       a FIFO.

27121       Any combination of the following may be used:

27122       O\_APPEND       If set, the file offset shall be set to the end of the file prior to each write.

27123       O\_CREAT         If the file exists, this flag has no effect except as noted under O\_EXCL below.  
 27124       Otherwise, the file shall be created; the user ID of the file shall be set to the  
 27125       effective user ID of the process; the group ID of the file shall be set to the  
 27126       group ID of the file's parent directory or to the effective group ID of the  
 27127       process; and the access permission bits (see <sys/stat.h>) of the file mode shall  
 27128       be set to the value of the third argument taken as type **mode\_t** modified as  
 27129       follows: a bitwise AND is performed on the file-mode bits and the  
 27130       corresponding bits in the complement of the process' file mode creation mask.  
 27131       Thus, all bits in the file mode whose corresponding bit in the file mode  
 27132       creation mask is set are cleared. When bits other than the file permission bits  
 27133       are set, the effect is unspecified. The third argument does not affect whether  
 27134       the file is open for reading, writing, or for both. Implementations shall provide  
 27135       a way to initialize the file's group ID to the group ID of the parent directory.  
 27136       Implementations may, but need not, provide an implementation-defined way  
 27137       to initialize the file's group ID to the effective group ID of the calling process.

27138 SIO       O\_DSYNC       Write I/O operations on the file descriptor shall complete as defined by  
 27139       synchronized I/O data integrity completion.

|       |             |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|-------|-------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 27140 | O_EXCL      | If O_CREAT and O_EXCL are set, <i>open()</i> shall fail if the file exists. The check for the existence of the file and the creation of the file if it does not exist shall be atomic with respect to other threads executing <i>open()</i> naming the same filename in the same directory with O_EXCL and O_CREAT set. If O_EXCL and O_CREAT are set, and <i>path</i> names a symbolic link, <i>open()</i> shall fail and set <i>errno</i> to [EEXIST], regardless of the contents of the symbolic link. If O_EXCL is set and O_CREAT is not set, the result is undefined. |

| 27248     | [ETXTBSY]      | The file is a pure procedure (shared text) file that is being executed and <i>oflag</i> is O_WRONLY or O_RDWR.                                                       |
| 27249     |                |                                                                                                                                                                      |

## 27250 EXAMPLES

### 27251 Opening a File for Writing by the Owner

27252 The following example opens the file `/tmp/file`, either by creating it (if it does not already exist),  
 27253 or by truncating its length to 0 (if it does exist). In the former case, if the call creates a new file,  
 27254 the access permission bits in the file mode of the file are set to permit reading and writing by the  
 27255 owner, and to permit reading only by group members and others.

27256 If the call to *open()* is successful, the file is opened for writing.

```

27257 #include <fcntl.h>
27258 ...
27259 int fd;
27260 mode_t mode = S_IRUSR | S_IWUSR | S_IRGRP | S_IROTH;
27261 char *filename = "/tmp/file";
27262 ...
27263 fd = open(filename, O_WRONLY | O_CREAT | O_TRUNC, mode);
27264 ...

```

27265 **Opening a File Using an Existence Check**

27266 The following example uses the *open()* function to try to create the **LOCKFILE** file and open it  
 27267 for writing. Since the *open()* function specifies the **O\_EXCL** flag, the call fails if the file already  
 27268 exists. In that case, the program assumes that someone else is updating the password file and  
 27269 exits.

```
27270 #include <fcntl.h>
27271 #include <stdio.h>
27272 #include <stdlib.h>

27273 #define LOCKFILE "/etc/ptmp"
27274 ...
27275 int pfd; /* Integer for file descriptor returned by open() call. */
27276 ...
27277 if ((pfd = open(LOCKFILE, O_WRONLY | O_CREAT | O_EXCL,
27278               S_IRUSR | S_IWUSR | S_IRGRP | S_IROTH)) == -1)
27279 {
27280     fprintf(stderr, "Cannot open /etc/ptmp. Try again later.\n");
27281     exit(1);
27282 }
27283 ...
```

27284 **Opening a File for Writing**

27285 The following example opens a file for writing, creating the file if it does not already exist. If the  
 27286 file does exist, the system truncates the file to zero bytes.

```
27287 #include <fcntl.h>
27288 #include <stdio.h>
27289 #include <stdlib.h>

27290 #define LOCKFILE "/etc/ptmp"
27291 ...
27292 int pfd;
27293 char filename[PATH_MAX+1];
27294 ...
27295 if ((pfd = open(filename, O_WRONLY | O_CREAT | O_TRUNC,
27296               S_IRUSR | S_IWUSR | S_IRGRP | S_IROTH)) == -1)
27297 {
27298     perror("Cannot open output file\n"); exit(1);
27299 }
27300 ...
```

27301 **APPLICATION USAGE**

27302 None.

27303 **RATIONALE**

27304 Except as specified in this volume of IEEE Std 1003.1-2001, the flags allowed in *oflag* are not  
 27305 mutually-exclusive and any number of them may be used simultaneously.

27306 Some implementations permit opening FIFOs with **O\_RDWR**. Since FIFOs could be  
 27307 implemented in other ways, and since two file descriptors can be used to the same effect, this  
 27308 possibility is left as undefined.

27309 See *getgroups()* about the group of a newly created file.

27310 The use of *open()* to create a regular file is preferable to the use of *creat()*, because the latter is  
27311 redundant and included only for historical reasons.

27312 The use of the O\_TRUNC flag on FIFOs and directories (pipes cannot be *open()*-ed) must be  
27313 permissible without unexpected side effects (for example, *creat()* on a FIFO must not remove  
27314 data). Since terminal special files might have type-ahead data stored in the buffer, O\_TRUNC  
27315 should not affect their content, particularly if a program that normally opens a regular file  
27316 should open the current controlling terminal instead. Other file types, particularly  
27317 implementation-defined ones, are left implementation-defined.

27318 IEEE Std 1003.1-2001 permits [EACCES] to be returned for conditions other than those explicitly  
27319 listed.

27320 The O\_NOCTTY flag was added to allow applications to avoid unintentionally acquiring a  
27321 controlling terminal as a side effect of opening a terminal file. This volume of  
27322 IEEE Std 1003.1-2001 does not specify how a controlling terminal is acquired, but it allows an  
27323 implementation to provide this on *open()* if the O\_NOCTTY flag is not set and other conditions  
27324 specified in the Base Definitions volume of IEEE Std 1003.1-2001, Chapter 11, General Terminal  
27325 Interface are met. The O\_NOCTTY flag is an effective no-op if the file being opened is not a  
27326 terminal device.

27327 In historical implementations the value of O\_RDONLY is zero. Because of that, it is not possible  
27328 to detect the presence of O\_RDONLY and another option. Future implementations should  
27329 encode O\_RDONLY and O\_WRONLY as bit flags so that:

```
27330 O_RDONLY | O_WRONLY == O_RDWR
```

27331 In general, the *open()* function follows the symbolic link if *path* names a symbolic link. However,  
27332 the *open()* function, when called with O\_CREAT and O\_EXCL, is required to fail with [EEXIST]  
27333 if *path* names an existing symbolic link, even if the symbolic link refers to a nonexistent file. This  
27334 behavior is required so that privileged applications can create a new file in a known location  
27335 without the possibility that a symbolic link might cause the file to be created in a different  
27336 location.

27337 For example, a privileged application that must create a file with a predictable name in a user-  
27338 writable directory, such as the user's home directory, could be compromised if the user creates a  
27339 symbolic link with that name that refers to a nonexistent file in a system directory. If the user can  
27340 influence the contents of a file, the user could compromise the system by creating a new system  
27341 configuration or spool file that would then be interpreted by the system. The test for a symbolic  
27342 link which refers to a nonexistent file must be atomic with the creation of a new file.

27343 The POSIX.1-1990 standard required that the group ID of a newly created file be set to the group  
27344 ID of its parent directory or to the effective group ID of the creating process. FIPS 151-2 required  
27345 that implementations provide a way to have the group ID be set to the group ID of the  
27346 containing directory, but did not prohibit implementations also supporting a way to set the  
27347 group ID to the effective group ID of the creating process. Conforming applications should not  
27348 assume which group ID will be used. If it matters, an application can use *chown()* to set the  
27349 group ID after the file is created, or determine under what conditions the implementation will  
27350 set the desired group ID.

#### 27351 FUTURE DIRECTIONS

27352 None.

#### 27353 SEE ALSO

27354 *chmod()*, *close()*, *creat()*, *dup()*, *fcntl()*, *lseek()*, *read()*, *umask()*, *unlockpt()*, *write()*, the Base  
27355 Definitions volume of IEEE Std 1003.1-2001, <fcntl.h>, <sys/stat.h>, <sys/types.h>

27356 **CHANGE HISTORY**

27357 First released in Issue 1. Derived from Issue 1 of the SVID.

27358 **Issue 5**

27359 The DESCRIPTION is updated for alignment with the POSIX Realtime Extension and the POSIX  
27360 Threads Extension.

27361 Large File Summit extensions are added.

27362 **Issue 6**

27363 In the SYNOPSIS, the optional include of the `<sys/types.h>` header is removed.

27364 The following new requirements on POSIX implementations derive from alignment with the  
27365 Single UNIX Specification:

27366 • The requirement to include `<sys/types.h>` has been removed. Although `<sys/types.h>` was  
27367 required for conforming implementations of previous POSIX specifications, it was not  
27368 required for UNIX applications.

27369 • In the DESCRIPTION, `O_CREAT` is amended to state that the group ID of the file is set to the  
27370 group ID of the file's parent directory or to the effective group ID of the process. This is a  
27371 FIPS requirement.

27372 • In the DESCRIPTION, text is added to indicate setting of the offset maximum in the open file  
27373 description. This change is to support large files.

27374 • In the ERRORS section, the `[E_OVERFLOW]` condition is added. This change is to support  
27375 large files.

27376 • The `[ENXIO]` mandatory error condition is added.

27377 • The `[EINVAL]`, `[ENAMETOOLONG]`, and `[ETXTBSY]` optional error conditions are added.

27378 The DESCRIPTION and ERRORS sections are updated so that items related to the optional XSI  
27379 STREAMS Option Group are marked.

27380 The following changes were made to align with the IEEE P1003.1a draft standard:

27381 • An explanation is added of the effect of the `O_CREAT` and `O_EXCL` flags when the path  
27382 refers to a symbolic link.

27383 • The `[ELOOP]` optional error condition is added.

27384 The DESCRIPTION is updated to avoid use of the term “must” for application requirements.

27385 The DESCRIPTION of `O_EXCL` is updated in response to IEEE PASC Interpretation 1003.1c #48.

27386 **NAME**

27387            opendir — open a directory

27388 **SYNOPSIS**

27389            #include <dirent.h>

27390            DIR \*opendir(const char \*dirname);

27391 **DESCRIPTION**

27392            The *opendir()* function shall open a directory stream corresponding to the directory named by  
 27393            the *dirname* argument. The directory stream is positioned at the first entry. If the type **DIR** is  
 27394            implemented using a file descriptor, applications shall only be able to open up to a total of  
 27395            {OPEN\_MAX} files and directories.

27396 **RETURN VALUE**

27397            Upon successful completion, *opendir()* shall return a pointer to an object of type **DIR**.  
 27398            Otherwise, a null pointer shall be returned and *errno* set to indicate the error.

27399 **ERRORS**

27400            The *opendir()* function shall fail if:

27401            [EACCES]            Search permission is denied for the component of the path prefix of *dirname* or  
 27402            read permission is denied for *dirname*.

27403            [ELOOP]            A loop exists in symbolic links encountered during resolution of the *dirname*  
 27404            argument.

27405            [ENAMETOOLONG]       The length of the *dirname* argument exceeds {PATH\_MAX} or a pathname  
 27406            component is longer than {NAME\_MAX}.  
 27407

27408            [ENOENT]            A component of *dirname* does not name an existing directory or *dirname* is an  
 27409            empty string.

27410            [ENOTDIR]          A component of *dirname* is not a directory.

27411            The *opendir()* function may fail if:

27412            [ELOOP]            More than {SYMLOOP\_MAX} symbolic links were encountered during  
 27413            resolution of the *dirname* argument.

27414            [EMFILE]            {OPEN\_MAX} file descriptors are currently open in the calling process.

27415            [ENAMETOOLONG]       As a result of encountering a symbolic link in resolution of the *dirname*  
 27416            argument, the length of the substituted pathname string exceeded  
 27417            {PATH\_MAX}.  
 27418

27419            [ENFILE]            Too many files are currently open in the system.

27420 **EXAMPLES**27421 **Open a Directory Stream**

27422 The following program fragment demonstrates how the *opendir()* function is used.

```

27423 #include <sys/types.h>
27424 #include <dirent.h>
27425 #include <libgen.h>
27426 ...
27427     DIR *dir;
27428     struct dirent *dp;
27429 ...
27430     if ((dir = opendir (".")) == NULL) {
27431         perror ("Cannot open .");
27432         exit (1);
27433     }
27434     while ((dp = readdir (dir)) != NULL) {
27435         ...

```

27436 **APPLICATION USAGE**

27437 The *opendir()* function should be used in conjunction with *readdir()*, *closedir()*, and *rewinddir()* to  
 27438 examine the contents of the directory (see the EXAMPLES section in *readdir()*). This method is  
 27439 recommended for portability.

27440 **RATIONALE**

27441 Based on historical implementations, the rules about file descriptors apply to directory streams  
 27442 as well. However, this volume of IEEE Std 1003.1-2001 does not mandate that the directory  
 27443 stream be implemented using file descriptors. The description of *closedir()* clarifies that if a file  
 27444 descriptor is used for the directory stream, it is mandatory that *closedir()* deallocate the file  
 27445 descriptor. When a file descriptor is used to implement the directory stream, it behaves as if the  
 27446 FD\_CLOEXEC had been set for the file descriptor.

27447 The directory entries for dot and dot-dot are optional. This volume of IEEE Std 1003.1-2001 does  
 27448 not provide a way to test *a priori* for their existence because an application that is portable must  
 27449 be written to look for (and usually ignore) those entries. Writing code that presumes that they  
 27450 are the first two entries does not always work, as many implementations permit them to be  
 27451 other than the first two entries, with a “normal” entry preceding them. There is negligible value  
 27452 in providing a way to determine what the implementation does because the code to deal with  
 27453 dot and dot-dot must be written in any case and because such a flag would add to the list of  
 27454 those flags (which has proven in itself to be objectionable) and might be abused.

27455 Since the structure and buffer allocation, if any, for directory operations are defined by the  
 27456 implementation, this volume of IEEE Std 1003.1-2001 imposes no portability requirements for  
 27457 erroneous program constructs, erroneous data, or the use of unspecified values such as the use  
 27458 or referencing of a *dirp* value or a **dirent** structure value after a directory stream has been closed  
 27459 or after a *fork()* or one of the *exec* function calls.

27460 **FUTURE DIRECTIONS**

27461 None.

27462 **SEE ALSO**

27463 *closedir()*, *lstat()*, *readdir()*, *rewinddir()*, *symlink()*, the Base Definitions volume of  
 27464 IEEE Std 1003.1-2001, <dirent.h>, <limits.h>, <sys/types.h>

27465 **CHANGE HISTORY**

27466 First released in Issue 2.

27467 **Issue 6**27468 In the SYNOPSIS, the optional include of the `<sys/types.h>` header is removed.27469 The following new requirements on POSIX implementations derive from alignment with the  
27470 Single UNIX Specification:

- 27471 • The requirement to include `<sys/types.h>` has been removed. Although `<sys/types.h>` was  
27472 required for conforming implementations of previous POSIX specifications, it was not  
27473 required for UNIX applications.
- 27474 • The [ELOOP] mandatory error condition is added.
- 27475 • A second [ENAMETOOLONG] is added as an optional error condition.

27476 The following changes were made to align with the IEEE P1003.1a draft standard:

- 27477 • The [ELOOP] optional error condition is added.

27478 **NAME**

27479           openlog — open a connection to the logging facility

27480 **SYNOPSIS**

27481 xSI       #include &lt;syslog.h&gt;

27482           void openlog(const char \*ident, int logopt, int facility);

27483

27484 **DESCRIPTION**27485           Refer to *closelog()*.

27486 **NAME**

27487           optarg, opterr, optind, optopt — options parsing variables

27488 **SYNOPSIS**

27489           #include &lt;unistd.h&gt;

27490           extern char \*optarg;

27491           extern int opterr, optind, optopt;

27492 **DESCRIPTION**27493           Refer to *getopt()*.

27494 **NAME**

27495 pathconf — get configurable pathname variables

27496 **SYNOPSIS**

27497 #include &lt;unistd.h&gt;

27498 long pathconf(const char \*path, int name);

27499 **DESCRIPTION**27500 Refer to *fpathconf()*.

27501 **NAME**

27502 pause — suspend the thread until a signal is received

27503 **SYNOPSIS**

27504 #include <unistd.h>

27505 int pause(void);

27506 **DESCRIPTION**

27507 The *pause()* function shall suspend the calling thread until delivery of a signal whose action is  
27508 either to execute a signal-catching function or to terminate the process.

27509 If the action is to terminate the process, *pause()* shall not return.

27510 If the action is to execute a signal-catching function, *pause()* shall return after the signal-catching  
27511 function returns.

27512 **RETURN VALUE**

27513 Since *pause()* suspends thread execution indefinitely unless interrupted by a signal, there is no  
27514 successful completion return value. A value of  $-1$  shall be returned and *errno* set to indicate the  
27515 error.

27516 **ERRORS**

27517 The *pause()* function shall fail if:

27518 [EINTR] A signal is caught by the calling process and control is returned from the  
27519 signal-catching function.

27520 **EXAMPLES**

27521 None.

27522 **APPLICATION USAGE**

27523 Many common uses of *pause()* have timing windows. The scenario involves checking a  
27524 condition related to a signal and, if the signal has not occurred, calling *pause()*. When the signal  
27525 occurs between the check and the call to *pause()*, the process often blocks indefinitely. The  
27526 *sigprocmask()* and *sigsuspend()* functions can be used to avoid this type of problem.

27527 **RATIONALE**

27528 None.

27529 **FUTURE DIRECTIONS**

27530 None.

27531 **SEE ALSO**

27532 *sigsuspend()*, the Base Definitions volume of IEEE Std 1003.1-2001, <unistd.h>

27533 **CHANGE HISTORY**

27534 First released in Issue 1. Derived from Issue 1 of the SVID.

27535 **Issue 5**

27536 The DESCRIPTION is updated for alignment with the POSIX Threads Extension.

27537 **Issue 6**

27538 The APPLICATION USAGE section is added.

27539 **NAME**

27540 pclose — close a pipe stream to or from a process

27541 **SYNOPSIS**

27542 cx #include &lt;stdio.h&gt;

27543 int pclose(FILE \*stream);

27544

27545 **DESCRIPTION**

27546 The *pclose()* function shall close a stream that was opened by *popen()*, wait for the command to  
 27547 terminate, and return the termination status of the process that was running the command  
 27548 language interpreter. However, if a call caused the termination status to be unavailable to  
 27549 *pclose()*, then *pclose()* shall return  $-1$  with *errno* set to [ECHILD] to report this situation. This can  
 27550 happen if the application calls one of the following functions:

- 27551 • *wait()*
- 27552 • *waitpid()* with a *pid* argument less than or equal to 0 or equal to the process ID of the  
 27553 command line interpreter
- 27554 • Any other function not defined in this volume of IEEE Std 1003.1-2001 that could do one of  
 27555 the above

27556 In any case, *pclose()* shall not return before the child process created by *popen()* has terminated.

27557 If the command language interpreter cannot be executed, the child termination status returned  
 27558 by *pclose()* shall be as if the command language interpreter terminated using *exit(127)* or  
 27559 *\_exit(127)*.

27560 The *pclose()* function shall not affect the termination status of any child of the calling process  
 27561 other than the one created by *popen()* for the associated stream.

27562 If the argument *stream* to *pclose()* is not a pointer to a stream created by *popen()*, the result of  
 27563 *pclose()* is undefined.

27564 **RETURN VALUE**

27565 Upon successful return, *pclose()* shall return the termination status of the command language  
 27566 interpreter. Otherwise, *pclose()* shall return  $-1$  and set *errno* to indicate the error.

27567 **ERRORS**

27568 The *pclose()* function shall fail if:

27569 [ECHILD] The status of the child process could not be obtained, as described above.

27570 **EXAMPLES**

27571 None.

27572 **APPLICATION USAGE**

27573 None.

27574 **RATIONALE**

27575 There is a requirement that *pclose()* not return before the child process terminates. This is  
 27576 intended to disallow implementations that return [EINTR] if a signal is received while waiting.  
 27577 If *pclose()* returned before the child terminated, there would be no way for the application to  
 27578 discover which child used to be associated with the stream, and it could not do the cleanup  
 27579 itself.

27580 If the stream pointed to by *stream* was not created by *popen()*, historical implementations of  
 27581 *pclose()* return  $-1$  without setting *errno*. To avoid requiring *pclose()* to set *errno* in this case,  
 27582 IEEE Std 1003.1-2001 makes the behavior unspecified. An application should not use *pclose()* to

27583 close any stream that was not created by *popen()*.

27584 Some historical implementations of *pclose()* either block or ignore the signals SIGINT, SIGQUIT,  
27585 and SIGHUP while waiting for the child process to terminate. Since this behavior is not  
27586 described for the *pclose()* function in IEEE Std 1003.1-2001, such implementations are not  
27587 conforming. Also, some historical implementations return [EINTR] if a signal is received, even  
27588 though the child process has not terminated. Such implementations are also considered non-  
27589 conforming.

27590 Consider, for example, an application that uses:

```
27591 popen("command", "r")
```

27592 to start *command*, which is part of the same application. The parent writes a prompt to its  
27593 standard output (presumably the terminal) and then reads from the *popen()*ed stream. The child  
27594 reads the response from the user, does some transformation on the response (pathname  
27595 expansion, perhaps) and writes the result to its standard output. The parent process reads the  
27596 result from the pipe, does something with it, and prints another prompt. The cycle repeats.  
27597 Assuming that both processes do appropriate buffer flushing, this would be expected to work.

27598 To conform to IEEE Std 1003.1-2001, *pclose()* must use *waitpid()*, or some similar function,  
27599 instead of *wait()*.

27600 The code sample below illustrates how the *pclose()* function might be implemented on a system  
27601 conforming to IEEE Std 1003.1-2001.

```
27602 int pclose(FILE *stream)
27603 {
27604     int stat;
27605     pid_t pid;
27606
27607     pid = <pid for process created for stream by popen(>
27608         (void) fclose(stream);
27609     while (waitpid(pid, &stat, 0) == -1) {
27610         if (errno != EINTR){
27611             stat = -1;
27612             break;
27613         }
27614     }
27615     return(stat);
27616 }
```

#### 27616 FUTURE DIRECTIONS

27617 None.

#### 27620 CHANGE HISTORY

27621 First released in Issue 1. Derived from Issue 1 of the SVID.

27622 **NAME**

27623           perror — write error messages to standard error

27624 **SYNOPSIS**

27625           #include &lt;stdio.h&gt;

27626           void perror(const char \*s);

27627 **DESCRIPTION**

27628 **CX**       The functionality described on this reference page is aligned with the ISO C standard. Any  
 27629 conflict between the requirements described here and the ISO C standard is unintentional. This  
 27630 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

27631       The *perror()* function shall map the error number accessed through the symbol *errno* to a  
 27632 language-dependent error message, which shall be written to the standard error stream as  
 27633 follows:

- 27634           • First (if *s* is not a null pointer and the character pointed to by *s* is not the null byte), the string  
 27635           pointed to by *s* followed by a colon and a <space>.
- 27636           • Then an error message string followed by a <newline>.

27637       The contents of the error message strings shall be the same as those returned by *strerror()* with  
 27638 argument *errno*.

27639 **CX**       The *perror()* function shall mark the file associated with the standard error stream as having  
 27640 been written (*st\_ctime*, *st\_mtime* marked for update) at some time between its successful  
 27641 completion and *exit()*, *abort()*, or the completion of *fflush()* or *fclose()* on *stderr*.

27642       The *perror()* function shall not change the orientation of the standard error stream.

27643 **RETURN VALUE**27644           The *perror()* function shall not return a value.27645 **ERRORS**

27646           No errors are defined.

27647 **EXAMPLES**27648           **Printing an Error Message for a Function**

27649       The following example replaces *bufptr* with a buffer that is the necessary size. If an error occurs,  
 27650 the *perror()* function prints a message and the program exits.

```

27651       #include <stdio.h>
27652       #include <stdlib.h>
27653       ...
27654       char *bufptr;
27655       size_t szbuf;
27656       ...
27657       if ((bufptr = malloc(szbuf)) == NULL) {
27658           perror("malloc"); exit(2);
27659       }
27660       ...
```

27661 **APPLICATION USAGE**

27662           None.

27663 **RATIONALE**

27664           None.

27665 **FUTURE DIRECTIONS**

27666           None.

27667 **SEE ALSO**27668           *strerror()*, the Base Definitions volume of IEEE Std 1003.1-2001, <**stdio.h**>27669 **CHANGE HISTORY**

27670           First released in Issue 1. Derived from Issue 1 of the SVID.

27671 **Issue 5**27672           A paragraph is added to the DESCRIPTION indicating that *perror()* does not change the  
27673           orientation of the standard error stream.27674 **Issue 6**

27675           Extensions beyond the ISO C standard are marked.

27676 **NAME**

27677 pipe — create an interprocess channel

27678 **SYNOPSIS**

27679 #include &lt;unistd.h&gt;

27680 int pipe(int *fildes*[2]);27681 **DESCRIPTION**

27682 The *pipe()* function shall create a pipe and place two file descriptors, one each into the  
 27683 arguments *fildes*[0] and *fildes*[1], that refer to the open file descriptions for the read and write  
 27684 ends of the pipe. Their integer values shall be the two lowest available at the time of the *pipe()*  
 27685 call. The O\_NONBLOCK and FD\_CLOEXEC flags shall be clear on both file descriptors. (The  
 27686 *fcntl()* function can be used to set both these flags.)

27687 Data can be written to the file descriptor *fildes*[1] and read from the file descriptor *fildes*[0]. A  
 27688 read on the file descriptor *fildes*[0] shall access data written to the file descriptor *fildes*[1] on a  
 27689 first-in-first-out basis. It is unspecified whether *fildes*[0] is also open for writing and whether  
 27690 *fildes*[1] is also open for reading.

27691 A process has the pipe open for reading (correspondingly writing) if it has a file descriptor open  
 27692 that refers to the read end, *fildes*[0] (write end, *fildes*[1]).

27693 Upon successful completion, *pipe()* shall mark for update the *st\_atime*, *st\_ctime*, and *st\_mtime*  
 27694 fields of the pipe.

27695 **RETURN VALUE**

27696 Upon successful completion, 0 shall be returned; otherwise, -1 shall be returned and *errno* set to  
 27697 indicate the error.

27698 **ERRORS**27699 The *pipe()* function shall fail if:

27700 [EMFILE] More than {OPEN\_MAX} minus two file descriptors are already in use by this  
 27701 process.

27702 [ENFILE] The number of simultaneously open files in the system would exceed a  
 27703 system-imposed limit.

27704 **EXAMPLES**

27705 None.

27706 **APPLICATION USAGE**

27707 None.

27708 **RATIONALE**

27709 The wording carefully avoids using the verb “to open” in order to avoid any implication of use  
 27710 of *open()*; see also *write()*.

27711 **FUTURE DIRECTIONS**

27712 None.

27713 **SEE ALSO**27714 *fcntl()*, *read()*, *write()*, the Base Definitions volume of IEEE Std 1003.1-2001, <*fcntl.h*>,  
 27715 <*unistd.h*>27716 **CHANGE HISTORY**

27717 First released in Issue 1. Derived from Issue 1 of the SVID.

27718 **Issue 6**

27719 The following new requirements on POSIX implementations derive from alignment with the  
27720 Single UNIX Specification:

- 27721 • The DESCRIPTION is updated to indicate that certain dispositions of *fildev[0]* and *fildev[1]*  
27722 are unspecified.

## 27723 NAME

27724 poll — input/output multiplexing

## 27725 SYNOPSIS

27726 XSI #include &lt;poll.h&gt;

27727 int poll(struct pollfd *fds*[], nfd\_t *nfds*, int *timeout*);

27728

## 27729 DESCRIPTION

27730 The *poll()* function provides applications with a mechanism for multiplexing input/output over  
 27731 a set of file descriptors. For each member of the array pointed to by *fds*, *poll()* shall examine the  
 27732 given file descriptor for the event(s) specified in *events*. The number of **pollfd** structures in the  
 27733 *fds* array is specified by *nfds*. The *poll()* function shall identify those file descriptors on which an  
 27734 application can read or write data, or on which certain events have occurred.

27735 The *fds* argument specifies the file descriptors to be examined and the events of interest for each  
 27736 file descriptor. It is a pointer to an array with one member for each open file descriptor of  
 27737 interest. The array's members are **pollfd** structures within which *fd* specifies an open file  
 27738 descriptor and *events* and *revents* are bitmasks constructed by OR'ing a combination of the  
 27739 following event flags:

|           |            |                                                                                        |
|-----------|------------|----------------------------------------------------------------------------------------|
| 27740     | POLLIN     | Data other than high-priority data may be read without blocking.                       |
| 27741 XSR |            | For STREAMS, this flag is set in <i>revents</i> even if the message is of zero length. |
| 27742     |            | This flag shall be equivalent to POLLRDNORM   POLLRDBAND.                              |
| 27743     | POLLRDNORM | Normal data may be read without blocking.                                              |
| 27744 XSR |            | For STREAMS, data on priority band 0 may be read without blocking. This                |
| 27745     |            | flag is set in <i>revents</i> even if the message is of zero length.                   |
| 27746     | POLLRDBAND | Priority data may be read without blocking.                                            |
| 27747 XSR |            | For STREAMS, data on priority bands greater than 0 may be read without                 |
| 27748     |            | blocking. This flag is set in <i>revents</i> even if the message is of zero length.    |
| 27749     | POLLPRI    | High-priority data may be read without blocking.                                       |
| 27750 XSR |            | For STREAMS, this flag is set in <i>revents</i> even if the message is of zero length. |
| 27751     | POLLOUT    | Normal data may be written without blocking.                                           |
| 27752 XSR |            | For STREAMS, data on priority band 0 may be written without blocking.                  |
| 27753     | POLLWRNORM | Equivalent to POLLOUT.                                                                 |
| 27754     | POLLWRBAND | Priority data may be written.                                                          |
| 27755 XSR |            | For STREAMS, data on priority bands greater than 0 may be written without              |
| 27756     |            | blocking. If any priority band has been written to on this STREAM, this event          |
| 27757     |            | only examines bands that have been written to at least once.                           |
| 27758     | POLLERR    | An error has occurred on the device or stream. This flag is only valid in the          |
| 27759     |            | <i>revents</i> bitmask; it shall be ignored in the <i>events</i> member.               |
| 27760     | POLLHUP    | The device has been disconnected. This event and POLLOUT are mutually-                 |
| 27761     |            | exclusive; a stream can never be writable if a hangup has occurred. However,           |
| 27762     |            | this event and POLLIN, POLLRDNORM, POLLRDBAND, or POLLPRI are not                      |
| 27763     |            | mutually-exclusive. This flag is only valid in the <i>revents</i> bitmask; it shall be |
| 27764     |            | ignored in the <i>events</i> member.                                                   |

|           |                     |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|-----------|---------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 27765     | POLLNVAL            | The specified <i>fd</i> value is invalid. This flag is only valid in the <i>revents</i> member; it shall be ignored in the <i>events</i> member.                                                                                                                                                                                                                                                                                                                                                                              |
| 27766     |                     |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| 27767     |                     | The significance and semantics of normal, priority, and high-priority data are file and device-specific.                                                                                                                                                                                                                                                                                                                                                                                                                      |
| 27768     |                     |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| 27769     |                     | If the value of <i>fd</i> is less than 0, <i>events</i> shall be ignored, and <i>revents</i> shall be set to 0 in that entry on return from <i>poll()</i> .                                                                                                                                                                                                                                                                                                                                                                   |
| 27770     |                     |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| 27771     |                     | In each <b>pollfd</b> structure, <i>poll()</i> shall clear the <i>revents</i> member, except that where the application requested a report on a condition by setting one of the bits of <i>events</i> listed above, <i>poll()</i> shall set the corresponding bit in <i>revents</i> if the requested condition is true. In addition, <i>poll()</i> shall set the POLLHUP, POLLERR, and POLLNVAL flag in <i>revents</i> if the condition is true, even if the application did not set the corresponding bit in <i>events</i> . |

| 27791     | <b>RETURN VALUE</b> |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| 27792     |                     | Upon successful completion, <i>poll()</i> shall return a non-negative value. A positive value indicates the total number of file descriptors that have been selected (that is, file descriptors for which the <i>revents</i> member is non-zero). A value of 0 indicates that the call timed out and no file descriptors have been selected. Upon failure, <i>poll()</i> shall return -1 and set <i>errno</i> to indicate the error.                                                                                          |
| 27793     |                     |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

| 27803     |                     |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

## 27804 EXAMPLES

27805 **Checking for Events on a Stream**

27806 The following example opens a pair of STREAMS devices and then waits for either one to  
27807 become writable. This example proceeds as follows:

- 27808 1. Sets the *timeout* parameter to 500 milliseconds.
- 27809 2. Opens the STREAMS devices */dev/dev0* and */dev/dev1*, and then polls them, specifying  
27810 POLLOUT and POLLWRBAND as the events of interest.
- 27811 The STREAMS device names */dev/dev0* and */dev/dev1* are only examples of how  
27812 STREAMS devices can be named; STREAMS naming conventions may vary among  
27813 systems conforming to the IEEE Std 1003.1-2001.
- 27814 3. Uses the *ret* variable to determine whether an event has occurred on either of the two  
27815 STREAMS. The *poll()* function is given 500 milliseconds to wait for an event to occur (if it  
27816 has not occurred prior to the *poll()* call).
- 27817 4. Checks the returned value of *ret*. If a positive value is returned, one of the following can  
27818 be done:
  - 27819 a. Priority data can be written to the open STREAM on priority bands greater than 0,  
27820 because the POLLWRBAND event occurred on the open STREAM (*fds[0]* or *fds[1]*).
  - 27821 b. Data can be written to the open STREAM on priority-band 0, because the POLLOUT  
27822 event occurred on the open STREAM (*fds[0]* or *fds[1]*).
- 27823 5. If the returned value is not a positive value, permission to write data to the open STREAM  
27824 (on any priority band) is denied.
- 27825 6. If the POLLHUP event occurs on the open STREAM (*fds[0]* or *fds[1]*), the device on the  
27826 open STREAM has disconnected.

```

27827 #include <stropts.h>
27828 #include <poll.h>
27829 ...
27830 struct pollfd fds[2];
27831 int timeout_msecs = 500;
27832 int ret;
27833     int i;

27834 /* Open STREAMS device. */
27835 fds[0].fd = open("/dev/dev0", ...);
27836 fds[1].fd = open("/dev/dev1", ...);
27837     fds[0].events = POLLOUT | POLLWRBAND;
27838     fds[1].events = POLLOUT | POLLWRBAND;

27839 ret = poll(fds, 2, timeout_msecs);

27840 if (ret > 0) {
27841     /* An event on one of the fds has occurred. */
27842     for (i=0; i<2; i++) {
27843         if (fds[i].revents & POLLWRBAND) {
27844             /* Priority data may be written on device number i. */
27845             ...
27846         }
27847         if (fds[i].revents & POLLOUT) {

```

```
27848          /* Data may be written on device number i. */
27849      ...
27850          }
27851      if (fds[i].revents & POLLHUP) {
27852          /* A hangup has occurred on device number i. */
27853      ...
27854          }
27855      }
27856  }
```

**27866 CHANGE HISTORY**

27867 First released in Issue 4, Version 2.

**27868 Issue 5**

27869 Moved from X/OPEN UNIX extension to BASE.

27870 The description of POLLWRBAND is updated.

**27871 Issue 6**

27872 Text referring to sockets is added to the DESCRIPTION.

27873 Text relating to the XSI STREAMS Option Group is marked.

27874 The Open Group Corrigendum U055/3 is applied, updating the DESCRIPTION of  
27875 POLLWRBAND.

27876 **NAME**

27877 popen — initiate pipe streams to or from a process

27878 **SYNOPSIS**27879 cx `#include <stdio.h>`27880 `FILE *popen(const char *command, const char *mode);`

27881

27882 **DESCRIPTION**

27883 The *popen()* function shall execute the command specified by the string *command*. It shall create a  
 27884 pipe between the calling program and the executed command, and shall return a pointer to a  
 27885 stream that can be used to either read from or write to the pipe.

27886 The environment of the executed command shall be as if a child process were created within the  
 27887 *popen()* call using the *fork()* function, and the child invoked the *sh* utility using the call:

27888 `execl(shell_path, "sh", "-c", command, (char *)0);`27889 where *shell\_path* is an unspecified pathname for the *sh* utility.

27890 The *popen()* function shall ensure that any streams from previous *popen()* calls that remain open  
 27891 in the parent process are closed in the new child process.

27892 The *mode* argument to *popen()* is a string that specifies I/O mode:

- 27893 1. If *mode* is *r*, when the child process is started, its file descriptor `STDOUT_FILENO` shall be  
 27894 the writable end of the pipe, and the file descriptor *fileno(stream)* in the calling process,  
 27895 where *stream* is the stream pointer returned by *popen()*, shall be the readable end of the  
 27896 pipe.
- 27897 2. If *mode* is *w*, when the child process is started its file descriptor `STDIN_FILENO` shall be  
 27898 the readable end of the pipe, and the file descriptor *fileno(stream)* in the calling process,  
 27899 where *stream* is the stream pointer returned by *popen()*, shall be the writable end of the  
 27900 pipe.
- 27901 3. If *mode* is any other value, the result is undefined.

27902 After *popen()*, both the parent and the child process shall be capable of executing independently  
 27903 before either terminates.

27904 Pipe streams are byte-oriented.

27905 **RETURN VALUE**

27906 Upon successful completion, *popen()* shall return a pointer to an open stream that can be used to  
 27907 read or write to the pipe. Otherwise, it shall return a null pointer and may set *errno* to indicate  
 27908 the error.

27909 **ERRORS**27910 The *popen()* function may fail if:

27911 [EMFILE] {FOPEN\_MAX} or {STREAM\_MAX} streams are currently open in the calling  
 27912 process.

27913 [EINVAL] The *mode* argument is invalid.27914 The *popen()* function may also set *errno* values as described by *fork()* or *pipe()*.

27915 **EXAMPLES**

27916 None.

27917 **APPLICATION USAGE**

27918 Since open files are shared, a mode *r* command can be used as an input filter and a mode *w*  
27919 command as an output filter.

27920 Buffered reading before opening an input filter may leave the standard input of that filter  
27921 mispositioned. Similar problems with an output filter may be prevented by careful buffer  
27922 flushing; for example, with *fflush()*.

27923 A stream opened by *popen()* should be closed by *pclose()*.

27924 The behavior of *popen()* is specified for values of *mode* of *r* and *w*. Other modes such as *rb* and  
27925 *wb* might be supported by specific implementations, but these would not be portable features.  
27926 Note that historical implementations of *popen()* only check to see if the first character of *mode* is  
27927 *r*. Thus, a *mode* of *robert the robot* would be treated as *mode r*, and a *mode* of *anything else* would be  
27928 treated as *mode w*.

27929 If the application calls *waitpid()* or *waitid()* with a *pid* argument greater than 0, and it still has a  
27930 stream that was called with *popen()* open, it must ensure that *pid* does not refer to the process  
27931 started by *popen()*.

27932 To determine whether or not the environment specified in the Shell and Utilities volume of  
27933 IEEE Std 1003.1-2001 is present, use the function call:

27934 `sysconf(_SC_2_VERSION)`

27935 (See *sysconf()*).

27936 **RATIONALE**

27937 The *popen()* function should not be used by programs that have set user (or group) ID privileges.  
27938 The *fork()* and *exec* family of functions (except *execlp()* and *execvp()*), should be used instead.  
27939 This prevents any unforeseen manipulation of the environment of the user that could cause  
27940 execution of commands not anticipated by the calling program.

27941 If the original and *popen()*ed processes both intend to read or write or read and write a common  
27942 file, and either will be using FILE-type C functions (*fread()*, *fwrite()*, and so on), the rules for  
27943 sharing file handles must be observed (see Section 2.5.1 (on page 35)).

27944 **FUTURE DIRECTIONS**

27945 None.

27946 **SEE ALSO**

27947 *pclose()*, *pipe()*, *sysconf()*, *system()*, the Base Definitions volume of IEEE Std 1003.1-2001,  
27948 `<stdio.h>`, the Shell and Utilities volume of IEEE Std 1003.1-2001, *sh*

27949 **CHANGE HISTORY**

27950 First released in Issue 1. Derived from Issue 1 of the SVID.

27951 **Issue 5**

27952 A statement is added to the DESCRIPTION indicating that pipe streams are byte-oriented.

27953 **Issue 6**

27954 The following new requirements on POSIX implementations derive from alignment with the  
27955 Single UNIX Specification:

- 27956 • The optional [EMFILE] error condition is added.

27957 **NAME**27958 posix\_fadvise — file advisory information (**ADVANCED REALTIME**)27959 **SYNOPSIS**

27960 ADV #include &lt;fcntl.h&gt;

27961 int posix\_fadvise(int *fd*, off\_t *offset*, size\_t *len*, int *advice*);

27962

27963 **DESCRIPTION**

27964 The *posix\_fadvise()* function shall advise the implementation on the expected behavior of the  
 27965 application with respect to the data in the file associated with the open file descriptor, *fd*,  
 27966 starting at *offset* and continuing for *len* bytes. The specified range need not currently exist in the  
 27967 file. If *len* is zero, all data following *offset* is specified. The implementation may use this  
 27968 information to optimize handling of the specified data. The *posix\_fadvise()* function shall have no  
 27969 effect on the semantics of other operations on the specified data, although it may affect the  
 27970 performance of other operations.

27971 The advice to be applied to the data is specified by the *advice* parameter and may be one of the  
 27972 following values:

27973 POSIX\_FADV\_NORMAL

27974 Specifies that the application has no advice to give on its behavior with respect to the  
 27975 specified data. It is the default characteristic if no advice is given for an open file.

27976 POSIX\_FADV\_SEQUENTIAL

27977 Specifies that the application expects to access the specified data sequentially from lower  
 27978 offsets to higher offsets.

27979 POSIX\_FADV\_RANDOM

27980 Specifies that the application expects to access the specified data in a random order.

27981 POSIX\_FADV\_WILLNEED

27982 Specifies that the application expects to access the specified data in the near future.

27983 POSIX\_FADV\_DONTNEED

27984 Specifies that the application expects that it will not access the specified data in the near  
 27985 future.

27986 POSIX\_FADV\_NOREUSE

27987 Specifies that the application expects to access the specified data once and then not reuse it  
 27988 thereafter.

27989 These values are defined in &lt;fcntl.h&gt;.

27990 **RETURN VALUE**

27991 Upon successful completion, *posix\_fadvise()* shall return zero; otherwise, an error number shall  
 27992 be returned to indicate the error.

27993 **ERRORS**27994 The *posix\_fadvise()* function shall fail if:27995 [EBADF] The *fd* argument is not a valid file descriptor.27996 [EINVAL] The value of *advice* is invalid.27997 [ESPIPE] The *fd* argument is associated with a pipe or FIFO.

27998 **EXAMPLES**

27999           None.

28000 **APPLICATION USAGE**

28001           The *posix\_fadvise()* function is part of the Advisory Information option and need not be provided  
28002           on all implementations.

28003 **RATIONALE**

28004           None.

28005 **FUTURE DIRECTIONS**

28006           None.

28007 **SEE ALSO**

28008           *posix\_madvise()*, the Base Definitions volume of IEEE Std 1003.1-2001, <fcntl.h>

28009 **CHANGE HISTORY**

28010           First released in Issue 6. Derived from IEEE Std 1003.1d-1999.

28011           In the SYNOPSIS, the inclusion of <sys/types.h> is no longer required.

28012 **NAME**28013 posix\_fallocate — file space control (**ADVANCED REALTIME**)28014 **SYNOPSIS**

28015 ADV #include &lt;fcntl.h&gt;

28016 int posix\_fallocate(int *fd*, off\_t *offset*, size\_t *len*);

28017

28018 **DESCRIPTION**

28019 The *posix\_fallocate()* function shall ensure that any required storage for regular file data starting  
 28020 at *offset* and continuing for *len* bytes is allocated on the file system storage media. If  
 28021 *posix\_fallocate()* returns successfully, subsequent writes to the specified file data shall not fail  
 28022 due to the lack of free space on the file system storage media.

28023 If the *offset+len* is beyond the current file size, then *posix\_fallocate()* shall adjust the file size to  
 28024 *offset+len*. Otherwise, the file size shall not be changed.

28025 It is implementation-defined whether a previous *posix\_fadvise()* call influences allocation  
 28026 strategy.

28027 Space allocated via *posix\_fallocate()* shall be freed by a successful call to *creat()* or *open()* that  
 28028 truncates the size of the file. Space allocated via *posix\_fallocate()* may be freed by a successful call  
 28029 to *ftruncate()* that reduces the file size to a size smaller than *offset+len*.

28030 **RETURN VALUE**

28031 Upon successful completion, *posix\_fallocate()* shall return zero; otherwise, an error number shall  
 28032 be returned to indicate the error.

28033 **ERRORS**28034 The *posix\_fallocate()* function shall fail if:

- |       |          |                                                                                    |
|-------|----------|------------------------------------------------------------------------------------|
| 28035 | [EBADF]  | The <i>fd</i> argument is not a valid file descriptor.                             |
| 28036 | [EBADF]  | The <i>fd</i> argument references a file that was opened without write permission. |
| 28037 | [EFBIG]  | The value of <i>offset+len</i> is greater than the maximum file size.              |
| 28038 | [EINTR]  | A signal was caught during execution.                                              |
| 28039 | [EINVAL] | The <i>len</i> argument was zero or the <i>offset</i> argument was less than zero. |
| 28040 | [EIO]    | An I/O error occurred while reading from or writing to a file system.              |
| 28041 | [ENODEV] | The <i>fd</i> argument does not refer to a regular file.                           |
| 28042 | [ENOSPC] | There is insufficient free space remaining on the file system storage media.       |
| 28043 | [ESPIPE] | The <i>fd</i> argument is associated with a pipe or FIFO.                          |

28044 **EXAMPLES**

28045 None.

28046 **APPLICATION USAGE**

28047 The *posix\_fallocate()* function is part of the Advisory Information option and need not be  
 28048 provided on all implementations.

28049 **RATIONALE**

28050 None.

28051 **FUTURE DIRECTIONS**

28052       None.

28053 **SEE ALSO**28054       *creat()*, *ftruncate()*, *open()*, *unlink()*, the Base Definitions volume of IEEE Std 1003.1-2001,  
28055       <fcntl.h>28056 **CHANGE HISTORY**

28057       First released in Issue 6. Derived from IEEE Std 1003.1d-1999.

28058       In the SYNOPSIS, the inclusion of &lt;sys/types.h&gt; is no longer required.

28059 **NAME**

28060 posix\_madvise — memory advisory information and alignment control (**ADVANCED**  
28061 **REALTIME**)

28062 **SYNOPSIS**

28063 ADV #include <sys/mman.h>

28064 int posix\_madvise(void \*addr, size\_t len, int advice);

28065

28066 **DESCRIPTION**

28067 MF|SHM The *posix\_madvise()* function need only be supported if either the Memory Mapped Files or the  
28068 Shared Memory Objects options are supported.

28069 The *posix\_madvise()* function shall advise the implementation on the expected behavior of the  
28070 application with respect to the data in the memory starting at address *addr*, and continuing for  
28071 *len* bytes. The implementation may use this information to optimize handling of the specified  
28072 data. The *posix\_madvise()* function shall have no effect on the semantics of access to memory in  
28073 the specified range, although it may affect the performance of access.

28074 The implementation may require that *addr* be a multiple of the page size, which is the value  
28075 returned by *sysconf()* when the name value *\_SC\_PAGESIZE* is used.

28076 The advice to be applied to the memory range is specified by the *advice* parameter and may be  
28077 one of the following values:

28078 POSIX\_MADV\_NORMAL

28079 Specifies that the application has no advice to give on its behavior with respect to the  
28080 specified range. It is the default characteristic if no advice is given for a range of memory.

28081 POSIX\_MADV\_SEQUENTIAL

28082 Specifies that the application expects to access the specified range sequentially from lower  
28083 addresses to higher addresses.

28084 POSIX\_MADV\_RANDOM

28085 Specifies that the application expects to access the specified range in a random order.

28086 POSIX\_MADV\_WILLNEED

28087 Specifies that the application expects to access the specified range in the near future.

28088 POSIX\_MADV\_DONTNEED

28089 Specifies that the application expects that it will not access the specified range in the near  
28090 future.

28091 These values are defined in the <sys/mman.h> header.

28092 **RETURN VALUE**

28093 Upon successful completion, *posix\_madvise()* shall return zero; otherwise, an error number shall  
28094 be returned to indicate the error.

28095 **ERRORS**

28096 The *posix\_madvise()* function shall fail if:

28097 [EINVAL] The value of *advice* is invalid.

28098 [ENOMEM] Addresses in the range starting at *addr* and continuing for *len* bytes are partly  
28099 or completely outside the range allowed for the address space of the calling  
28100 process.

28101 The *posix\_madvise()* function may fail if:

- 28102           [EINVAL]       The value of *addr* is not a multiple of the value returned by *sysconf()* when the  
28103                           name value `_SC_PAGESIZE` is used.
- 28104           [EINVAL]       The value of *len* is zero.
- 28105 **EXAMPLES**
- 28106           None.
- 28107 **APPLICATION USAGE**
- 28108           The *posix\_madvise()* function is part of the Advisory Information option and need not be  
28109           provided on all implementations.
- 28110 **RATIONALE**
- 28111           None.

28120 **NAME**

28121 posix\_mem\_offset — find offset and length of a mapped typed memory block (**ADVANCED**  
28122 **REALTIME**)

28123 **SYNOPSIS**

28124 TYM #include <sys/mman.h>

```
28125 int posix_mem_offset(const void *restrict addr, size_t len,
28126 off_t *restrict off, size_t *restrict contig_len,
28127 int *restrict fildes);
28128
```

28129 **DESCRIPTION**

28130 The *posix\_mem\_offset()* function shall return in the variable pointed to by *off* a value that  
28131 identifies the offset (or location), within a memory object, of the memory block currently  
28132 mapped at *addr*. The function shall return in the variable pointed to by *fildes*, the descriptor used  
28133 (via *mmap()*) to establish the mapping which contains *addr*. If that descriptor was closed since  
28134 the mapping was established, the returned value of *fildes* shall be  $-1$ . The *len* argument specifies  
28135 the length of the block of the memory object the user wishes the offset for; upon return, the value  
28136 pointed to by *contig\_len* shall equal either *len*, or the length of the largest contiguous block of the  
28137 memory object that is currently mapped to the calling process starting at *addr*, whichever is  
28138 smaller.

28139 If the memory object mapped at *addr* is a typed memory object, then if the *off* and *contig\_len*  
28140 values obtained by calling *posix\_mem\_offset()* are used in a call to *mmap()* with a file descriptor  
28141 that refers to the same memory pool as *fildes* (either through the same port or through a different  
28142 port), and that was opened with neither the `POSIX_TYPED_MEM_ALLOCATE` nor the  
28143 `POSIX_TYPED_MEM_ALLOCATE_CONTIG` flag, the typed memory area that is mapped shall  
28144 be exactly the same area that was mapped at *addr* in the address space of the process that called  
28145 *posix\_mem\_offset()*.

28146 If the memory object specified by *fildes* is not a typed memory object, then the behavior of this  
28147 function is implementation-defined.

28148 **RETURN VALUE**

28149 Upon successful completion, the *posix\_mem\_offset()* function shall return zero; otherwise, the  
28150 corresponding error status value shall be returned.

28151 **ERRORS**

28152 The *posix\_mem\_offset()* function shall fail if:

28153 [EACCES] The process has not mapped a memory object supported by this function at  
28154 the given address *addr*.

28155 This function shall not return an error code of [EINTR].

28156 **EXAMPLES**

28157 None.

28158 **APPLICATION USAGE**

28159 None.

28160 **RATIONALE**

28161 None.

28162 **FUTURE DIRECTIONS**

28163       None.

28164 **SEE ALSO**

28166       <**sys/mman.h**>

28167 **CHANGE HISTORY**

28168       First released in Issue 6. Derived from IEEE Std 1003.1j-2000.

28169 **NAME**

28170 posix\_memalign — aligned memory allocation (**ADVANCED REALTIME**)

28171 **SYNOPSIS**

28172 ADV `#include <stdlib.h>`

28173 `int posix_memalign(void **memptr, size_t alignment, size_t size);`

28174

28175 **DESCRIPTION**

28176 The `posix_memalign()` function shall allocate *size* bytes aligned on a boundary specified by  
28177 *alignment*, and shall return a pointer to the allocated memory in *memptr*. The value of *alignment*  
28178 shall be a multiple of `sizeof(void *)`, that is also a power of two. Upon successful completion, the  
28179 value pointed to by *memptr* shall be a multiple of *alignment*.

28180 CX The `free()` function shall deallocate memory that has previously been allocated by  
28181 `posix_memalign()`.

28182 **RETURN VALUE**

28183 Upon successful completion, `posix_memalign()` shall return zero; otherwise, an error number  
28184 shall be returned to indicate the error.

28185 **ERRORS**

28186 The `posix_memalign()` function shall fail if:

28187 [EINVAL] The value of the alignment parameter is not a power of two multiple of  
28188 `sizeof(void *)`.

28189 [ENOMEM] There is insufficient memory available with the requested alignment.

28190 **EXAMPLES**

28191 None.

28192 **APPLICATION USAGE**

28193 The `posix_memalign()` function is part of the Advisory Information option and need not be  
28194 provided on all implementations.

28195 **RATIONALE**

28196 None.

28197 **FUTURE DIRECTIONS**

28198 None.

28199 **SEE ALSO**

28200 `free()`, `malloc()`, the Base Definitions volume of IEEE Std 1003.1-2001, `<stdlib.h>`

28201 **CHANGE HISTORY**

28202 First released in Issue 6. Derived from IEEE Std 1003.1d-1999.

28203 In the SYNOPSIS, the inclusion of `<sys/types.h>` is no longer required.

28204 **NAME**

28205        **posix\_openpt** — open a pseudo-terminal device

28206 **SYNOPSIS**

28207 XSI     #include <stdlib.h>

28208        #include <fcntl.h>

28209        int posix\_openpt(int oflag);

28210

28211 **DESCRIPTION**

28212        The *posix\_openpt()* function shall establish a connection between a master device for a pseudo-terminal and a file descriptor. The file descriptor is used by other I/O functions that refer to that pseudo-terminal.

28215        The file status flags and file access modes of the open file description shall be set according to the value of *oflag*.

28217        Values for *oflag* are constructed by a bitwise-inclusive OR of flags from the following list, defined in <fcntl.h>:

28219        O\_RDWR        Open for reading and writing.

28220        O\_NOCTTY      If set *posix\_openpt()* shall not cause the terminal device to become the controlling terminal for the process.

28222        The behavior of other values for the *oflag* argument is unspecified.

28223 **RETURN VALUE**

28224        Upon successful completion, the *posix\_openpt()* function shall open a master pseudo-terminal device and return a non-negative integer representing the lowest numbered unused file descriptor. Otherwise, -1 shall be returned and *errno* set to indicate the error.

28227 **ERRORS**

28228        The *posix\_openpt()* function shall fail if:

28229        [EMFILE]      {OPEN\_MAX} file descriptors are currently open in the calling process.

28230        [ENFILE]      The maximum allowable number of files is currently open in the system.

28231        The *posix\_openpt()* function may fail if:

28232        [EINVAL]      The value of *oflag* is not valid.

28233        [EAGAIN]      Out of pseudo-terminal resources.

28234 XSR     [ENOSR]      Out of STREAMS resources.

28235 **EXAMPLES**

28236        **Opening a Pseudo-Terminal and Returning the Name of the Slave Device and a File Descriptor**

28238        #include <fcntl.h>

28239        #include <stdio.h>

28240        int masterfd, slavefd;

28241        char \*slavedevice;

28242        masterfd = posix\_openpt(O\_RDWR|O\_NOCTTY);

28243        if (masterfd == -1

28244            || grantpt (masterfd) == -1

```
28245     || unlockpt (masterfd) == -1
28246     || (slavedevice = ptsname (masterfd)) == NULL)
28247     return -1;
```

```
28248     printf("slave device is: %s\n", slavedevice);
```

```
28249     slavefd = open(slave, O_RDWR|O_NOCTTY);
```

```
28250     if (slavefd < 0)
```

```
28251         return -1;
```

#### 28252 APPLICATION USAGE

28253 This function is a method for portably obtaining a file descriptor of a master terminal device for  
28254 a pseudo-terminal. The *grantpt()* and *ptsname()* functions can be used to manipulate mode and  
28255 ownership permissions, and to obtain the name of the slave device, respectively.

#### 28256 RATIONALE

28257 The standard developers considered the matter of adding a special device for cloning master  
28258 pseudo-terminals: the */dev/ptmx* device. However, consensus could not be reached, and it was  
28259 felt that adding a new function would permit other implementations. The *posix\_openpt()*  
28260 function is designed to complement the *grantpt()*, *ptsname()*, and *unlockpt()* functions.

28261 On implementations supporting the */dev/ptmx* clone device, opening the master device of a  
28262 pseudo-terminal is simply:

```
28263     mfdp = open("/dev/ptmx", oflag );
```

```
28264     if (mfdp < 0)
```

```
28265         return -1;
```

#### 28266 FUTURE DIRECTIONS

28267 None.

#### 28268 SEE ALSO

28269 *grantpt()*, *open()*, *ptsname()*, *unlockpt()*, the Base Definitions volume of IEEE Std 1003.1-2001,  
28270 <fcntl.h>

#### 28271 CHANGE HISTORY

28272 First released in Issue 6.

28273 **NAME**

28274 posix\_spawn, posix\_spawnnp — spawn a process (**ADVANCED REALTIME**)

28275 **SYNOPSIS**

```
28276 SPN #include <spawn.h>
28277 int posix_spawn(pid_t *restrict pid, const char *restrict path,
28278 const posix_spawn_file_actions_t *file_actions,
28279 const posix_spawnattr_t *restrict attrp,
28280 char *const argv[restrict], char *const envp[restrict]);
28281 int posix_spawnnp(pid_t *restrict pid, const char *restrict file,
28282 const posix_spawn_file_actions_t *file_actions,
28283 const posix_spawnattr_t *restrict attrp,
28284 char *const argv[restrict], char * const envp[restrict]);
28285
```

28286 **DESCRIPTION**

28287 The *posix\_spawn()* and *posix\_spawnnp()* functions shall create a new process (child process) from  
 28288 the specified process image. The new process image shall be constructed from a regular  
 28289 executable file called the new process image file.

28290 When a C program is executed as the result of this call, it shall be entered as a C-language  
 28291 function call as follows:

```
28292 int main(int argc, char *argv[]);
```

28293 where *argc* is the argument count and *argv* is an array of character pointers to the arguments  
 28294 themselves. In addition, the following variable:

```
28295 extern char **environ;
```

28296 shall be initialized as a pointer to an array of character pointers to the environment strings.

28297 The argument *argv* is an array of character pointers to null-terminated strings. The last member  
 28298 of this array shall be a null pointer and is not counted in *argc*. These strings constitute the  
 28299 argument list available to the new process image. The value in *argv*[0] should point to a filename  
 28300 that is associated with the process image being started by the *posix\_spawn()* or *posix\_spawnnp()*  
 28301 function.

28302 The argument *envp* is an array of character pointers to null-terminated strings. These strings  
 28303 constitute the environment for the new process image. The environment array is terminated by a  
 28304 null pointer.

28305 The number of bytes available for the child process' combined argument and environment lists  
 28306 is {ARG\_MAX}. The implementation shall specify in the system documentation (see the Base  
 28307 Definitions volume of IEEE Std 1003.1-2001, Chapter 2, Conformance) whether any list  
 28308 overhead, such as length words, null terminators, pointers, or alignment bytes, is included in  
 28309 this total.

28310 The *path* argument to *posix\_spawn()* is a pathname that identifies the new process image file to  
 28311 execute.

28312 The *file* parameter to *posix\_spawnnp()* shall be used to construct a pathname that identifies the  
 28313 new process image file. If the *file* parameter contains a slash character, the *file* parameter shall be  
 28314 used as the pathname for the new process image file. Otherwise, the path prefix for this file shall  
 28315 be obtained by a search of the directories passed as the environment variable *PATH* (see the Base  
 28316 Definitions volume of IEEE Std 1003.1-2001, Chapter 8, Environment Variables). If this  
 28317 environment variable is not defined, the results of the search are implementation-defined.

28318 If *file\_actions* is a null pointer, then file descriptors open in the calling process shall remain open  
 28319 in the child process, except for those whose close-on-exec flag FD\_CLOEXEC is set (see *fcntl()*).  
 28320 For those file descriptors that remain open, all attributes of the corresponding open file  
 28321 descriptions, including file locks (see *fcntl()*), shall remain unchanged.

28322 If *file\_actions* is not NULL, then the file descriptors open in the child process shall be those open  
 28323 in the calling process as modified by the spawn file actions object pointed to by *file\_actions* and  
 28324 the FD\_CLOEXEC flag of each remaining open file descriptor after the spawn file actions have  
 28325 been processed. The effective order of processing the spawn file actions shall be:

- 28326 1. The set of open file descriptors for the child process shall initially be the same set as is  
 28327 open for the calling process. All attributes of the corresponding open file descriptions,  
 28328 including file locks (see *fcntl()*), shall remain unchanged.
- 28329 2. The signal mask, signal default actions, and the effective user and group IDs for the child  
 28330 process shall be changed as specified in the attributes object referenced by *attrp*.
- 28331 3. The file actions specified by the spawn file actions object shall be performed in the order in  
 28332 which they were added to the spawn file actions object.
- 28333 4. Any file descriptor that has its FD\_CLOEXEC flag set (see *fcntl()*) shall be closed.

28334 The **posix\_spawnattr\_t** spawn attributes object type is defined in `<spawn.h>`. It shall contain at  
 28335 least the attributes defined below.

28336 If the POSIX\_SPAWN\_SETPGROUP flag is set in the *spawn\_flags* attribute of the object  
 28337 referenced by *attrp*, and the *spawn-pgroup* attribute of the same object is non-zero, then the  
 28338 child's process group shall be as specified in the *spawn-pgroup* attribute of the object referenced  
 28339 by *attrp*.

28340 As a special case, if the POSIX\_SPAWN\_SETPGROUP flag is set in the *spawn\_flags* attribute of  
 28341 the object referenced by *attrp*, and the *spawn-pgroup* attribute of the same object is set to zero,  
 28342 then the child shall be in a new process group with a process group ID equal to its process ID.

28343 If the POSIX\_SPAWN\_SETPGROUP flag is not set in the *spawn\_flags* attribute of the object  
 28344 referenced by *attrp*, the new child process shall inherit the parent's process group.

28345 PS If the POSIX\_SPAWN\_SETSCHEDPARAM flag is set in the *spawn\_flags* attribute of the object  
 28346 referenced by *attrp*, but POSIX\_SPAWN\_SETSCHEDULER is not set, the new process image  
 28347 shall initially have the scheduling policy of the calling process with the scheduling parameters  
 28348 specified in the *spawn-schedparam* attribute of the object referenced by *attrp*.

28349 If the POSIX\_SPAWN\_SETSCHEDULER flag is set in the *spawn\_flags* attribute of the object  
 28350 referenced by *attrp* (regardless of the setting of the POSIX\_SPAWN\_SETSCHEDPARAM flag),  
 28351 the new process image shall initially have the scheduling policy specified in the *spawn-*  
 28352 *schedpolicy* attribute of the object referenced by *attrp* and the scheduling parameters specified in  
 28353 the *spawn-schedparam* attribute of the same object.

28354 The POSIX\_SPAWN\_RESETPID flag in the *spawn\_flags* attribute of the object referenced by *attrp*  
 28355 governs the effective user ID of the child process. If this flag is not set, the child process shall  
 28356 inherit the parent process' effective user ID. If this flag is set, the child process' effective user ID  
 28357 shall be reset to the parent's real user ID. In either case, if the set-user-ID mode bit of the new  
 28358 process image file is set, the effective user ID of the child process shall become that file's owner  
 28359 ID before the new process image begins execution.

28360 The POSIX\_SPAWN\_RESETPID flag in the *spawn\_flags* attribute of the object referenced by *attrp*  
 28361 also governs the effective group ID of the child process. If this flag is not set, the child process  
 28362 shall inherit the parent process' effective group ID. If this flag is set, the child process' effective  
 28363 group ID shall be reset to the parent's real group ID. In either case, if the set-group-ID mode bit

28364 of the new process image file is set, the effective group ID of the child process shall become that  
28365 file's group ID before the new process image begins execution.

28366 If the POSIX\_SPAWN\_SETSIGMASK flag is set in the *spawn\_flags* attribute of the object  
28367 referenced by *attrp*, the child process shall initially have the signal mask specified in the *spawn-*  
28368 *sigmask* attribute of the object referenced by *attrp*.

28369 If the POSIX\_SPAWN\_SETSIGDEF flag is set in the *spawn\_flags* attribute of the object referenced  
28370 by *attrp*, the signals specified in the *spawn\_sigdefault* attribute of the same object shall be set to  
28371 their default actions in the child process. Signals set to the default action in the parent process  
28372 shall be set to the default action in the child process.

28373 Signals set to be caught by the calling process shall be set to the default action in the child  
28374 process.

28375 Except for SIGCHLD, signals set to be ignored by the calling process image shall be set to be  
28376 ignored by the child process, unless otherwise specified by the POSIX\_SPAWN\_SETSIGDEF flag  
28377 being set in the *spawn\_flags* attribute of the object referenced by *attrp* and the signals being  
28378 indicated in the *spawn\_sigdefault* attribute of the object referenced by *attrp*.

28379 If the SIGCHLD signal is set to be ignored by the calling process, it is unspecified whether the  
28380 SIGCHLD signal is set to be ignored or to the default action in the child process, unless  
28381 otherwise specified by the POSIX\_SPAWN\_SETSIGDEF flag being set in the *spawn\_flags*  
28382 attribute of the object referenced by *attrp* and the SIGCHLD signal being indicated in the  
28383 *spawn\_sigdefault* attribute of the object referenced by *attrp*.

28384 If the value of the *attrp* pointer is NULL, then the default values are used.

28385 All process attributes, other than those influenced by the attributes set in the object referenced  
28386 by *attrp* as specified above or by the file descriptor manipulations specified in *file\_actions*, shall  
28387 appear in the new process image as though *fork()* had been called to create a child process and  
28388 then a member of the *exec* family of functions had been called by the child process to execute the  
28389 new process image.

28390 THR It is implementation-defined whether the fork handlers are run when *posix\_spawn()* or  
28391 *posix\_spawnnp()* is called.

28392 **RETURN VALUE**

28393 Upon successful completion, *posix\_spawn()* and *posix\_spawnnp()* shall return the process ID of the  
28394 child process to the parent process, in the variable pointed to by a non-NULL *pid* argument, and  
28395 shall return zero as the function return value. Otherwise, no child process shall be created, the  
28396 value stored into the variable pointed to by a non-NULL *pid* is unspecified, and an error number  
28397 shall be returned as the function return value to indicate the error. If the *pid* argument is a null  
28398 pointer, the process ID of the child is not returned to the caller.

28399 **ERRORS**

28400 The *posix\_spawn()* and *posix\_spawnnp()* functions may fail if:

28401 [EINVAL] The value specified by *file\_actions* or *attrp* is invalid.

28402 If this error occurs after the calling process successfully returns from the *posix\_spawn()* or  
28403 *posix\_spawnnp()* function, the child process may exit with exit status 127.

28404 If *posix\_spawn()* or *posix\_spawnnp()* fail for any of the reasons that would cause *fork()* or one of  
28405 the *exec* family of functions to fail, an error value shall be returned as described by *fork()* and  
28406 *exec*, respectively (or, if the error occurs after the calling process successfully returns, the child  
28407 process shall exit with exit status 127).

28408 If POSIX\_SPAWN\_SETPGROUP is set in the *spawn-flags* attribute of the object referenced by  
 28409 *attrp*, and *posix\_spawn()* or *posix\_spawnp()* fails while changing the child's process group, an  
 28410 error value shall be returned as described by *setpgid()* (or, if the error occurs after the calling  
 28411 process successfully returns, the child process shall exit with exit status 127).

28412 PS If POSIX\_SPAWN\_SETSCHEDPARAM is set and POSIX\_SPAWN\_SETSCHEDULER is not set  
 28413 in the *spawn-flags* attribute of the object referenced by *attrp*, then if *posix\_spawn()* or  
 28414 *posix\_spawnp()* fails for any of the reasons that would cause *sched\_setparam()* to fail, an error  
 28415 value shall be returned as described by *sched\_setparam()* (or, if the error occurs after the calling  
 28416 process successfully returns, the child process shall exit with exit status 127).

28417 If POSIX\_SPAWN\_SETSCHEDULER is set in the *spawn-flags* attribute of the object referenced by  
 28418 *attrp*, and if *posix\_spawn()* or *posix\_spawnp()* fails for any of the reasons that would cause  
 28419 *sched\_setscheduler()* to fail, an error value shall be returned as described by *sched\_setscheduler()*  
 28420 (or, if the error occurs after the calling process successfully returns, the child process shall exit  
 28421 with exit status 127).

28422 If the *file\_actions* argument is not NULL, and specifies any *close*, *dup2*, or *open* actions to be  
 28423 performed, and if *posix\_spawn()* or *posix\_spawnp()* fails for any of the reasons that would cause  
 28424 *close()*, *dup2()*, or *open()* to fail, an error value shall be returned as described by *close()*,  
 28425 *dup2()*, and *open()*, respectively (or, if the error occurs after the calling process successfully returns, the  
 28426 child process shall exit with exit status 127). An open file action may, by itself, result in any of  
 28427 the errors described by *close()* or *dup2()*, in addition to those described by *open()*.

#### 28428 EXAMPLES

28429 None.

#### 28430 APPLICATION USAGE

28431 These functions are part of the Spawn option and need not be provided on all implementations.

#### 28432 RATIONALE

28433 The *posix\_spawn()* function and its close relation *posix\_spawnp()* have been introduced to  
 28434 overcome the following perceived difficulties with *fork()*: the *fork()* function is difficult or  
 28435 impossible to implement without swapping or dynamic address translation.

- 28436 • Swapping is generally too slow for a realtime environment.
- 28437 • Dynamic address translation is not available everywhere that POSIX might be useful.
- 28438 • Processes are too useful to simply option out of POSIX whenever it must run without  
 28439 address translation or other MMU services.

28440 Thus, POSIX needs process creation and file execution primitives that can be efficiently  
 28441 implemented without address translation or other MMU services.

28442 The *posix\_spawn()* function is implementable as a library routine, but both *posix\_spawn()* and  
 28443 *posix\_spawnp()* are designed as kernel operations. Also, although they may be an efficient  
 28444 replacement for many *fork()/exec* pairs, their goal is to provide useful process creation  
 28445 primitives for systems that have difficulty with *fork()*, not to provide drop-in replacements for  
 28446 *fork()/exec*.

28447 This view of the role of *posix\_spawn()* and *posix\_spawnp()* influenced the design of their API. It  
 28448 does not attempt to provide the full functionality of *fork()/exec* in which arbitrary user-specified  
 28449 operations of any sort are permitted between the creation of the child process and the execution  
 28450 of the new process image; any attempt to reach that level would need to provide a programming  
 28451 language as parameters. Instead, *posix\_spawn()* and *posix\_spawnp()* are process creation  
 28452 primitives like the *Start\_Process* and *Start\_Process\_Search* Ada language bindings package  
 28453 *POSIX\_Process\_Primitives* and also like those in many operating systems that are not UNIX

28454 systems, but with some POSIX-specific additions.

28455 To achieve its coverage goals, *posix\_spawn()* and *posix\_spawnp()* have control of six types of  
 28456 inheritance: file descriptors, process group ID, user and group ID, signal mask, scheduling, and  
 28457 whether each signal ignored in the parent will remain ignored in the child, or be reset to its  
 28458 default action in the child.

28459 Control of file descriptors is required to allow an independently written child process image to  
 28460 access data streams opened by and even generated or read by the parent process without being  
 28461 specifically coded to know which parent files and file descriptors are to be used. Control of the  
 28462 process group ID is required to control how the child process' job control relates to that of the  
 28463 parent.

28464 Control of the signal mask and signal defaulting is sufficient to support the implementation of  
 28465 *system()*. Although support for *system()* is not explicitly one of the goals for *posix\_spawn()* and  
 28466 *posix\_spawnp()*, it is covered under the "at least 50%" coverage goal.

28467 The intention is that the normal file descriptor inheritance across *fork()*, the subsequent effect of  
 28468 the specified spawn file actions, and the normal file descriptor inheritance across one of the *exec*  
 28469 family of functions should fully specify open file inheritance. The implementation need make no  
 28470 decisions regarding the set of open file descriptors when the child process image begins  
 28471 execution, those decisions having already been made by the caller and expressed as the set of  
 28472 open file descriptors and their *FD\_CLOEXEC* flags at the time of the call and the spawn file  
 28473 actions object specified in the call. We have been assured that in cases where the POSIX  
 28474 *Start\_Process* Ada primitives have been implemented in a library, this method of controlling file  
 28475 descriptor inheritance may be implemented very easily.

28476 We can identify several problems with *posix\_spawn()* and *posix\_spawnp()*, but there does not  
 28477 appear to be a solution that introduces fewer problems. Environment modification for child  
 28478 process attributes not specifiable via the *attrp* or *file\_actions* arguments must be done in the  
 28479 parent process, and since the parent generally wants to save its context, it is more costly than  
 28480 similar functionality with *fork()/exec*. It is also complicated to modify the environment of a  
 28481 multi-threaded process temporarily, since all threads must agree when it is safe for the  
 28482 environment to be changed. However, this cost is only borne by those invocations of  
 28483 *posix\_spawn()* and *posix\_spawnp()* that use the additional functionality. Since extensive  
 28484 modifications are not the usual case, and are particularly unlikely in time-critical code, keeping  
 28485 much of the environment control out of *posix\_spawn()* and *posix\_spawnp()* is appropriate design.

28486 The *posix\_spawn()* and *posix\_spawnp()* functions do not have all the power of *fork()/exec*. This is  
 28487 to be expected. The *fork()* function is a wonderfully powerful operation. We do not expect to  
 28488 duplicate its functionality in a simple, fast function with no special hardware requirements. It is  
 28489 worth noting that *posix\_spawn()* and *posix\_spawnp()* are very similar to the process creation  
 28490 operations on many operating systems that are not UNIX systems.

28491 **Requirements**

28492 The requirements for *posix\_spawn()* and *posix\_spawnp()* are:

- 28493 • They must be implementable without an MMU or unusual hardware.
- 28494 • They must be compatible with existing POSIX standards.

28495 Additional goals are:

- 28496 • They should be efficiently implementable.
- 28497 • They should be able to replace at least 50% of typical executions of *fork()*.

28498           • A system with *posix\_spawn()* and *posix\_spawnp()* and without *fork()* should be useful, at least  
28499           for realtime applications.

28500           • A system with *fork()* and the *exec* family should be able to implement *posix\_spawn()* and  
28501           *posix\_spawnp()* as library routines.

## 28502           **Two-Syntax**

28503           POSIX *exec* has several calling sequences with approximately the same functionality. These  
28504           appear to be required for compatibility with existing practice. Since the existing practice for the  
28505           *posix\_spawn\*()* functions is otherwise substantially unlike POSIX, we feel that simplicity  
28506           outweighs compatibility. There are, therefore, only two names for the *posix\_spawn\*()* functions.

28507           The parameter list does not differ between *posix\_spawn()* and *posix\_spawnp()*; *posix\_spawnp()*  
28508           interprets the second parameter more elaborately than *posix\_spawn()*.

## 28509           **Compatibility with POSIX.5 (Ada)**

28510           The *Start\_Process* and *Start\_Process\_Search* procedures from the *POSIX\_Process\_Primitives*  
28511           package from the Ada language binding to POSIX.1 encapsulate *fork()* and *exec* functionality in a  
28512           manner similar to that of *posix\_spawn()* and *posix\_spawnp()*. Originally, in keeping with our  
28513           simplicity goal, the standard developers had limited the capabilities of *posix\_spawn()* and  
28514           *posix\_spawnp()* to a subset of the capabilities of *Start\_Process* and *Start\_Process\_Search*; certain  
28515           non-default capabilities were not supported. However, based on suggestions by the ballot group  
28516           to improve file descriptor mapping or drop it, and on the advice of an Ada Language Bindings  
28517           working group member, the standard developers decided that *posix\_spawn()* and *posix\_spawnp()*  
28518           should be sufficiently powerful to implement *Start\_Process* and *Start\_Process\_Search*. The  
28519           rationale is that if the Ada language binding to such a primitive had already been approved as  
28520           an IEEE standard, there can be little justification for not approving the functionally-equivalent  
28521           parts of a C binding. The only three capabilities provided by *posix\_spawn()* and *posix\_spawnp()*  
28522           that are not provided by *Start\_Process* and *Start\_Process\_Search* are optionally specifying the  
28523           child's process group ID, the set of signals to be reset to default signal handling in the child  
28524           process, and the child's scheduling policy and parameters.

28525           For the Ada language binding for *Start\_Process* to be implemented with *posix\_spawn()*, that  
28526           binding would need to explicitly pass an empty signal mask and the parent's environment to  
28527           *posix\_spawn()* whenever the caller of *Start\_Process* allowed these arguments to default, since  
28528           *posix\_spawn()* does not provide such defaults. The ability of *Start\_Process* to mask user-specified  
28529           signals during its execution is functionally unique to the Ada language binding and must be  
28530           dealt with in the binding separately from the call to *posix\_spawn()*.

## 28531           **Process Group**

28532           The process group inheritance field can be used to join the child process with an existing process  
28533           group. By assigning a value of zero to the *spawn-pgroup* attribute of the object referenced by  
28534           *attrp*, the *setpgid()* mechanism will place the child process in a new process group.

28535 **Threads**

28536 Without the *posix\_spawn()* and *posix\_spawnp()* functions, systems without address translation  
 28537 can still use threads to give an abstraction of concurrency. In many cases, thread creation  
 28538 suffices, but it is not always a good substitute. The *posix\_spawn()* and *posix\_spawnp()* functions  
 28539 are considerably “heavier” than thread creation. Processes have several important attributes that  
 28540 threads do not. Even without address translation, a process may have base-and-bound memory  
 28541 protection. Each process has a process environment including security attributes and file  
 28542 capabilities, and powerful scheduling attributes. Processes abstract the behavior of non-  
 28543 uniform-memory-architecture multi-processors better than threads, and they are more  
 28544 convenient to use for activities that are not closely linked.

28545 The *posix\_spawn()* and *posix\_spawnp()* functions may not bring support for multiple processes to  
 28546 every configuration. Process creation is not the only piece of operating system support required  
 28547 to support multiple processes. The total cost of support for multiple processes may be quite high  
 28548 in some circumstances. Existing practice shows that support for multiple processes is  
 28549 uncommon and threads are common among “tiny kernels”. There should, therefore, probably  
 28550 continue to be AEPs for operating systems with only one process.

28551 **Asynchronous Error Notification**

28552 A library implementation of *posix\_spawn()* or *posix\_spawnp()* may not be able to detect all  
 28553 possible errors before it forks the child process. IEEE Std 1003.1-2001 provides for an error  
 28554 indication returned from a child process which could not successfully complete the spawn  
 28555 operation via a special exit status which may be detected using the status value returned by  
 28556 *wait()* and *waitpid()*.

28557 The *stat\_val* interface and the macros used to interpret it are not well suited to the purpose of  
 28558 returning API errors, but they are the only path available to a library implementation. Thus, an  
 28559 implementation may cause the child process to exit with exit status 127 for any error detected  
 28560 during the spawn process after the *posix\_spawn()* or *posix\_spawnp()* function has successfully  
 28561 returned.

28562 The standard developers had proposed using two additional macros to interpret *stat\_val*. The  
 28563 first, WIFSPAWNFAIL, would have detected a status that indicated that the child exited because  
 28564 of an error detected during the *posix\_spawn()* or *posix\_spawnp()* operations rather than during  
 28565 actual execution of the child process image; the second, WSPAWNERRNO, would have  
 28566 extracted the error value if WIFSPAWNFAIL indicated a failure. Unfortunately, the ballot group  
 28567 strongly opposed this because it would make a library implementation of *posix\_spawn()* or  
 28568 *posix\_spawnp()* dependent on kernel modifications to *waitpid()* to be able to embed special  
 28569 information in *stat\_val* to indicate a spawn failure.

28570 The 8 bits of child process exit status that are guaranteed by IEEE Std 1003.1-2001 to be  
 28571 accessible to the waiting parent process are insufficient to disambiguate a spawn error from any  
 28572 other kind of error that may be returned by an arbitrary process image. No other bits of the exit  
 28573 status are required to be visible in *stat\_val*, so these macros could not be strictly implemented at  
 28574 the library level. Reserving an exit status of 127 for such spawn errors is consistent with the use  
 28575 of this value by *system()* and *popen()* to signal failures in these operations that occur after the  
 28576 function has returned but before a shell is able to execute. The exit status of 127 does not  
 28577 uniquely identify this class of error, nor does it provide any detailed information on the nature  
 28578 of the failure. Note that a kernel implementation of *posix\_spawn()* or *posix\_spawnp()* is permitted  
 28579 (and encouraged) to return any possible error as the function value, thus providing more  
 28580 detailed failure information to the parent process.

28581 Thus, no special macros are available to isolate asynchronous *posix\_spawn()* or *posix\_spawnp()*  
 28582 errors. Instead, errors detected by the *posix\_spawn()* or *posix\_spawnp()* operations in the context

28583 of the child process before the new process image executes are reported by setting the child's  
28584 exit status to 127. The calling process may use the WIFEXITED and WEXITSTATUS macros on  
28585 the *stat\_val* stored by the *wait()* or *waitpid()* functions to detect spawn failures to the extent that  
28586 other status values with which the child process image may exit (before the parent can  
28587 conclusively determine that the child process image has begun execution) are distinct from exit  
28588 status 127.

#### 28602 CHANGE HISTORY

28603 First released in Issue 6. Derived from IEEE Std 1003.1d-1999.

28604 IEEE PASC Interpretation 1003.1 #103 is applied, noting that the signal default actions are  
28605 changed as well as the signal mask in step 2.

28606 IEEE PASC Interpretation 1003.1 #132 is applied.

28607 **NAME**

28608 posix\_spawn\_file\_actions\_addclose, posix\_spawn\_file\_actions\_addopen — add close or open  
 28609 action to spawn file actions object (**ADVANCED REALTIME**)

28610 **SYNOPSIS**

```
28611 SPN #include <spawn.h>
28612 int posix_spawn_file_actions_addclose(posix_spawn_file_actions_t *
28613     file_actions, int fildes);
28614 int posix_spawn_file_actions_addopen(posix_spawn_file_actions_t *
28615     restrict file_actions, int fildes,
28616     const char *restrict path, int oflag, mode_t mode);
28617
```

28618 **DESCRIPTION**

28619 These functions shall add or delete a close or open action to a spawn file actions object.

28620 A spawn file actions object is of type **posix\_spawn\_file\_actions\_t** (defined in <spawn.h>) and is  
 28621 used to specify a series of actions to be performed by a *posix\_spawn()* or *posix\_spawnp()*  
 28622 operation in order to arrive at the set of open file descriptors for the child process given the set of  
 28623 open file descriptors of the parent. IEEE Std 1003.1-2001 does not define comparison or  
 28624 assignment operators for the type **posix\_spawn\_file\_actions\_t**.

28625 A spawn file actions object, when passed to *posix\_spawn()* or *posix\_spawnp()*, shall specify how  
 28626 the set of open file descriptors in the calling process is transformed into a set of potentially open  
 28627 file descriptors for the spawned process. This transformation shall be as if the specified sequence  
 28628 of actions was performed exactly once, in the context of the spawned process (prior to execution  
 28629 of the new process image), in the order in which the actions were added to the object;  
 28630 additionally, when the new process image is executed, any file descriptor (from this new set)  
 28631 which has its FD\_CLOEXEC flag set shall be closed (see *posix\_spawn()*).

28632 The *posix\_spawn\_file\_actions\_addclose()* function shall add a *close* action to the object referenced  
 28633 by *file\_actions* that shall cause the file descriptor *fildes* to be closed (as if *close(fildes)* had been  
 28634 called) when a new process is spawned using this file actions object.

28635 The *posix\_spawn\_file\_actions\_addopen()* function shall add an *open* action to the object referenced  
 28636 by *file\_actions* that shall cause the file named by *path* to be opened (as if *open(path, oflag, mode)*  
 28637 had been called, and the returned file descriptor, if not *fildes*, had been changed to *fildes*) when a  
 28638 new process is spawned using this file actions object. If *fildes* was already an open file descriptor,  
 28639 it shall be closed before the new file is opened.

28640 The string described by *path* shall be copied by the *posix\_spawn\_file\_actions\_addopen()* function.

28641 **RETURN VALUE**

28642 Upon successful completion, these functions shall return zero; otherwise, an error number shall  
 28643 be returned to indicate the error.

28644 **ERRORS**

28645 These functions shall fail if:

28646 [EBADF] The value specified by *fildes* is negative or greater than or equal to  
 28647 {OPEN\_MAX}.

28648 These functions may fail if:

28649 [EINVAL] The value specified by *file\_actions* is invalid.

28650 [ENOMEM] Insufficient memory exists to add to the spawn file actions object.

28651 It shall not be considered an error for the *fildev* argument passed to these functions to specify a  
 28652 file descriptor for which the specified operation could not be performed at the time of the call.  
 28653 Any such error will be detected when the associated file actions object is later used during a  
 28654 *posix\_spawn()* or *posix\_spawnnp()* operation.

#### 28655 EXAMPLES

28656 None.

#### 28657 APPLICATION USAGE

28658 These functions are part of the Spawn option and need not be provided on all implementations.

#### 28659 RATIONALE

28660 A spawn file actions object may be initialized to contain an ordered sequence of *close()*, *dup2()*,  
 28661 and *open()* operations to be used by *posix\_spawn()* or *posix\_spawnnp()* to arrive at the set of open  
 28662 file descriptors inherited by the spawned process from the set of open file descriptors in the  
 28663 parent at the time of the *posix\_spawn()* or *posix\_spawnnp()* call. It had been suggested that the  
 28664 *close()* and *dup2()* operations alone are sufficient to rearrange file descriptors, and that files  
 28665 which need to be opened for use by the spawned process can be handled either by having the  
 28666 calling process open them before the *posix\_spawn()* or *posix\_spawnnp()* call (and close them after),  
 28667 or by passing filenames to the spawned process (in *argv*) so that it may open them itself. The  
 28668 standard developers recommend that applications use one of these two methods when practical,  
 28669 since detailed error status on a failed open operation is always available to the application this  
 28670 way. However, the standard developers feel that allowing a spawn file actions object to specify  
 28671 open operations is still appropriate because:

- 28672 1. It is consistent with equivalent POSIX.5 (Ada) functionality.
- 28673 2. It supports the I/O redirection paradigm commonly employed by POSIX programs  
 28674 designed to be invoked from a shell. When such a program is the child process, it may not  
 28675 be designed to open files on its own.
- 28676 3. It allows file opens that might otherwise fail or violate file ownership/access rights if  
 28677 executed by the parent process.

28678 Regarding 2. above, note that the spawn open file action provides to *posix\_spawn()* and  
 28679 *posix\_spawnnp()* the same capability that the shell redirection operators provide to *system()*, only  
 28680 without the intervening execution of a shell; for example:

```
28681 system ("myprog <file1 3<file2");
```

28682 Regarding 3. above, note that if the calling process needs to open one or more files for access by  
 28683 the spawned process, but has insufficient spare file descriptors, then the open action is necessary  
 28684 to allow the *open()* to occur in the context of the child process after other file descriptors have  
 28685 been closed (that must remain open in the parent).

28686 Additionally, if a parent is executed from a file having a “set-user-id” mode bit set and the  
 28687 POSIX\_SPAWN\_RESETEUIDS flag is set in the spawn attributes, a file created within the parent  
 28688 process will (possibly incorrectly) have the parent’s effective user ID as its owner, whereas a file  
 28689 created via an *open()* action during *posix\_spawn()* or *posix\_spawnnp()* will have the parent’s real  
 28690 ID as its owner; and an open by the parent process may successfully open a file to which the real  
 28691 user should not have access or fail to open a file to which the real user should have access.

28692 **File Descriptor Mapping**

28693 The standard developers had originally proposed using an array which specified the mapping of  
 28694 child file descriptors back to those of the parent. It was pointed out by the ballot group that it is  
 28695 not possible to reshuffle file descriptors arbitrarily in a library implementation of *posix\_spawn()*  
 28696 or *posix\_spawnnp()* without provision for one or more spare file descriptor entries (which simply  
 28697 may not be available). Such an array requires that an implementation develop a complex  
 28698 strategy to achieve the desired mapping without inadvertently closing the wrong file descriptor  
 28699 at the wrong time.

28700 It was noted by a member of the Ada Language Bindings working group that the approved Ada  
 28701 Language *Start\_Process* family of POSIX process primitives use a caller-specified set of file  
 28702 actions to alter the normal *fork()/exec* semantics for inheritance of file descriptors in a very  
 28703 flexible way, yet no such problems exist because the burden of determining how to achieve the  
 28704 final file descriptor mapping is completely on the application. Furthermore, although the file  
 28705 actions interface appears frightening at first glance, it is actually quite simple to implement in  
 28706 either a library or the kernel.

28707 **FUTURE DIRECTIONS**

28708 None.

 28712 IEEE Std 1003.1-2001, <spawn.h>

28713 **CHANGE HISTORY**

28714 First released in Issue 6. Derived from IEEE Std 1003.1d-1999.

28715 IEEE PASC Interpretation 1003.1 #105 is applied, adding a note to the DESCRIPTION that the  
 28716 string pointed to by *path* is copied by the *posix\_spawn\_file\_actions\_addopen()* function.

28717 **NAME**

28718        posix\_spawn\_file\_actions\_adddup2 — add dup2 action to spawn file actions object  
 28719        (ADVANCED REALTIME)

28720 **SYNOPSIS**

```
28721 SPN    #include <spawn.h>

28722        int posix_spawn_file_actions_adddup2(posix_spawn_file_actions_t *
28723            file_actions, int fildes, int newfildes);
28724
```

28725 **DESCRIPTION**

28726        The *posix\_spawn\_file\_actions\_adddup2()* function shall add a *dup2()* action to the object  
 28727        referenced by *file\_actions* that shall cause the file descriptor *fildes* to be duplicated as *newfildes* (as  
 28728        if *dup2(fildes, newfildes)* had been called) when a new process is spawned using this file actions  
 28729        object.

28730        A spawn file actions object is as defined in *posix\_spawn\_file\_actions\_addclose()*.

28731 **RETURN VALUE**

28732        Upon successful completion, the *posix\_spawn\_file\_actions\_adddup2()* function shall return zero;  
 28733        otherwise, an error number shall be returned to indicate the error.

28734 **ERRORS**

28735        The *posix\_spawn\_file\_actions\_adddup2()* function shall fail if:

28736        [EBADF]        The value specified by *fildes* or *newfildes* is negative or greater than or equal to  
 28737        {OPEN\_MAX}.

28738        [ENOMEM]       Insufficient memory exists to add to the spawn file actions object.

28739        The *posix\_spawn\_file\_actions\_adddup2()* function may fail if:

28740        [EINVAL]       The value specified by *file\_actions* is invalid.

28741        It shall not be considered an error for the *fildes* argument passed to the  
 28742        *posix\_spawn\_file\_actions\_adddup2()* function to specify a file descriptor for which the specified  
 28743        operation could not be performed at the time of the call. Any such error will be detected when  
 28744        the associated file actions object is later used during a *posix\_spawn()* or *posix\_spawnnp()*  
 28745        operation.

28746 **EXAMPLES**

28747        None.

28748 **APPLICATION USAGE**

28749        The *posix\_spawn\_file\_actions\_adddup2()* function is part of the Spawn option and need not be  
 28750        provided on all implementations.

28751 **RATIONALE**

28752        Refer to the RATIONALE in *posix\_spawn\_file\_actions\_addclose()*.

28753 **FUTURE DIRECTIONS**

28754        None.

28755 **SEE ALSO**

## 28758 CHANGE HISTORY

- 28759 First released in Issue 6. Derived from IEEE Std 1003.1d-1999.
- 28760 IEEE PASC Interpretation 1003.1 #104 is applied, noting that the [EBADF] error can apply to the *newfildes* argument in addition to *fildes*.
- 28761

28762 **NAME**

28763 posix\_spawn\_file\_actions\_addopen — add open action to spawn file actions object  
28764 (ADVANCED REALTIME)

28765 **SYNOPSIS**

```
28766 SPN #include <spawn.h>
28767 int posix_spawn_file_actions_addopen(posix_spawn_file_actions_t *
28768     restrict file_actions, int fildes,
28769     const char *restrict path, int oflag, mode_t mode);
28770
```

28771 **DESCRIPTION**

28772 Refer to *posix\_spawn\_file\_actions\_addclose()*.

## 28773 NAME

28774 `posix_spawn_file_actions_destroy`, `posix_spawn_file_actions_init` — destroy and initialize  
 28775 spawn file actions object (**ADVANCED REALTIME**)

## 28776 SYNOPSIS

```
28777 SPN    #include <spawn.h>

28778    int posix_spawn_file_actions_destroy(posix_spawn_file_actions_t *
28779        file_actions);
28780    int posix_spawn_file_actions_init(posix_spawn_file_actions_t *
28781        file_actions);
28782
```

## 28783 DESCRIPTION

28784 The `posix_spawn_file_actions_destroy()` function shall destroy the object referenced by `file_actions`;  
 28785 the object becomes, in effect, uninitialized. An implementation may cause  
 28786 `posix_spawn_file_actions_destroy()` to set the object referenced by `file_actions` to an invalid value. A  
 28787 destroyed spawn file actions object can be reinitialized using `posix_spawn_file_actions_init()`; the  
 28788 results of otherwise referencing the object after it has been destroyed are undefined.

28789 The `posix_spawn_file_actions_init()` function shall initialize the object referenced by `file_actions` to  
 28790 contain no file actions for `posix_spawn()` or `posix_spawnnp()` to perform.

28791 A spawn file actions object is as defined in `posix_spawn_file_actions_addclose()`.

28792 The effect of initializing an already initialized spawn file actions object is undefined.

## 28793 RETURN VALUE

28794 Upon successful completion, these functions shall return zero; otherwise, an error number shall  
 28795 be returned to indicate the error.

## 28796 ERRORS

28797 The `posix_spawn_file_actions_init()` function shall fail if:

28798 [ENOMEM] Insufficient memory exists to initialize the spawn file actions object.

28799 The `posix_spawn_file_actions_destroy()` function may fail if:

28800 [EINVAL] The value specified by `file_actions` is invalid.

## 28801 EXAMPLES

28802 None.

## 28803 APPLICATION USAGE

28804 These functions are part of the Spawn option and need not be provided on all implementations.

## 28805 RATIONALE

28806 Refer to the RATIONALE in `posix_spawn_file_actions_addclose()`.

## 28807 FUTURE DIRECTIONS

28808 None.

## 28809 SEE ALSO

28810 `posix_spawn()`, `posix_spawnnp()`, the Base Definitions volume of IEEE Std 1003.1-2001, `<spawn.h>`

## 28811 CHANGE HISTORY

28812 First released in Issue 6. Derived from IEEE Std 1003.1d-1999.

28813 In the SYNOPSIS, the inclusion of `<sys/types.h>` is no longer required.

28814 **NAME**

28815 posix\_spawnattr\_destroy, posix\_spawnattr\_init — destroy and initialize spawn attributes object  
 28816 (**ADVANCED REALTIME**)

28817 **SYNOPSIS**

28818 SPN `#include <spawn.h>`

28819 `int posix_spawnattr_destroy(posix_spawnattr_t *attr);`

28820 `int posix_spawnattr_init(posix_spawnattr_t *attr);`

28821

28822 **DESCRIPTION**

28823 The *posix\_spawnattr\_destroy()* function shall destroy a spawn attributes object. A destroyed *attr*  
 28824 attributes object can be reinitialized using *posix\_spawnattr\_init()*; the results of otherwise  
 28825 referencing the object after it has been destroyed are undefined. An implementation may cause  
 28826 *posix\_spawnattr\_destroy()* to set the object referenced by *attr* to an invalid value.

28827 The *posix\_spawnattr\_init()* function shall initialize a spawn attributes object *attr* with the default  
 28828 value for all of the individual attributes used by the implementation. Results are undefined if  
 28829 *posix\_spawnattr\_init()* is called specifying an already initialized *attr* attributes object.

28830 A spawn attributes object is of type **posix\_spawnattr\_t** (defined in `<spawn.h>`) and is used to  
 28831 specify the inheritance of process attributes across a spawn operation. IEEE Std 1003.1-2001 does  
 28832 not define comparison or assignment operators for the type **posix\_spawnattr\_t**.

28833 Each implementation shall document the individual attributes it uses and their default values  
 28834 unless these values are defined by IEEE Std 1003.1-2001. Attributes not defined by  
 28835 IEEE Std 1003.1-2001, their default values, and the names of the associated functions to get and  
 28836 set those attribute values are implementation-defined.

28837 The resulting spawn attributes object (possibly modified by setting individual attribute values),  
 28838 is used to modify the behavior of *posix\_spawn()* or *posix\_spawnp()*. After a spawn attributes  
 28839 object has been used to spawn a process by a call to a *posix\_spawn()* or *posix\_spawnp()*, any  
 28840 function affecting the attributes object (including destruction) shall not affect any process that  
 28841 has been spawned in this way.

28842 **RETURN VALUE**

28843 Upon successful completion, *posix\_spawnattr\_destroy()* and *posix\_spawnattr\_init()* shall return  
 28844 zero; otherwise, an error number shall be returned to indicate the error.

28845 **ERRORS**

28846 The *posix\_spawnattr\_init()* function shall fail if:

28847 [ENOMEM] Insufficient memory exists to initialize the spawn attributes object.

28848 The *posix\_spawnattr\_destroy()* function may fail if:

28849 [EINVAL] The value specified by *attr* is invalid.

28850 **EXAMPLES**

28851 None.

28852 **APPLICATION USAGE**

28853 These functions are part of the Spawn option and need not be provided on all implementations.

28854 **RATIONALE**

28855 The original spawn interface proposed in IEEE Std 1003.1-2001 defined the attributes that specify  
 28856 the inheritance of process attributes across a spawn operation as a structure. In order to be able  
 28857 to separate optional individual attributes under their appropriate options (that is, the *spawn-*  
 28858 *schedparam* and *spawn-schedpolicy* attributes depending upon the Process Scheduling option), and

28859 also for extensibility and consistency with the newer POSIX interfaces, the attributes interface  
28860 has been changed to an opaque data type. This interface now consists of the type  
28861 **posix\_spawnattr\_t**, representing a spawn attributes object, together with associated functions to  
28862 initialize or destroy the attributes object, and to set or get each individual attribute. Although the  
28863 new object-oriented interface is more verbose than the original structure, it is simple to use,  
28864 more extensible, and easy to implement.

**28865 FUTURE DIRECTIONS**

28866 None.

**28867 SEE ALSO**

28868 *posix\_spawn()*, *posix\_spawnattr\_getsigdefault()*, *posix\_spawnattr\_getflags()*,  
28869 *posix\_spawnattr\_getpgroup()*, *posix\_spawnattr\_getschedparam()*, *posix\_spawnattr\_getschedpolicy()*,  
28870 *posix\_spawnattr\_getsigmask()*, *posix\_spawnattr\_setsigdefault()*, *posix\_spawnattr\_setflags()*,  
28871 *posix\_spawnattr\_setpgroup()*, *posix\_spawnattr\_setsigmask()*, *posix\_spawnattr\_setschedpolicy()*,  
28872 *posix\_spawnattr\_setschedparam()*, *posix\_spawn()*, the Base Definitions volume of  
28873 IEEE Std 1003.1-2001, <spawn.h>

**28874 CHANGE HISTORY**

28875 First released in Issue 6. Derived from IEEE Std 1003.1d-1999.

28876 IEEE PASC Interpretation 1003.1 #106 is applied, noting that the effect of initializing an already  
28877 initialized spawn attributes option is undefined.

28878 **NAME**

28879 `posix_spawnattr_getflags`, `posix_spawnattr_setflags` — get and set the spawn-flags attribute of a  
 28880 spawn attributes object (**ADVANCED REALTIME**)

28881 **SYNOPSIS**

```
28882 SPN #include <spawn.h>
28883
28884 int posix_spawnattr_getflags(const posix_spawnattr_t *restrict attr,
28885                             short *restrict flags);
28886 int posix_spawnattr_setflags(posix_spawnattr_t *attr, short flags);
```

28887 **DESCRIPTION**

28888 The `posix_spawnattr_getflags()` function shall obtain the value of the *spawn-flags* attribute from  
 28889 the attributes object referenced by *attr*.

28890 The `posix_spawnattr_setflags()` function shall set the *spawn-flags* attribute in an initialized  
 28891 attributes object referenced by *attr*.

28892 The *spawn-flags* attribute is used to indicate which process attributes are to be changed in the  
 28893 new process image when invoking `posix_spawn()` or `posix_spawnp()`. It is the bitwise-inclusive  
 28894 OR of zero or more of the following flags:

```
28895 POSIX_SPAWN_RESETEIDS
28896 POSIX_SPAWN_SETPGROUP
28897 POSIX_SPAWN_SETSIGDEF
28898 POSIX_SPAWN_SETSIGMASK
28899 PS  POSIX_SPAWN_SETSCHEDPARAM
28900 POSIX_SPAWN_SETSCHEDULER
```

28902 These flags are defined in `<spawn.h>`. The default value of this attribute shall be as if no flags  
 28903 were set.

28904 **RETURN VALUE**

28905 Upon successful completion, `posix_spawnattr_getflags()` shall return zero and store the value of  
 28906 the *spawn-flags* attribute of *attr* into the object referenced by the *flags* parameter; otherwise, an  
 28907 error number shall be returned to indicate the error.

28908 Upon successful completion, `posix_spawnattr_setflags()` shall return zero; otherwise, an error  
 28909 number shall be returned to indicate the error.

28910 **ERRORS**

28911 These functions may fail if:

28912 [EINVAL] The value specified by *attr* is invalid.

28913 The `posix_spawnattr_setflags()` function may fail if:

28914 [EINVAL] The value of the attribute being set is not valid.

28915 **EXAMPLES**

28916           None.

28917 **APPLICATION USAGE**

28918           These functions are part of the Spawn option and need not be provided on all implementations.

28919 **RATIONALE**

28920           None.

28921 **FUTURE DIRECTIONS**

28922           None.

28923 **SEE ALSO**

28924           *posix\_spawn()*, *posix\_spawnattr\_destroy()*, *posix\_spawnattr\_init()*, *posix\_spawnattr\_getsigdefault()*,  
28925           *posix\_spawnattr\_getpgroup()*, *posix\_spawnattr\_getschedparam()*, *posix\_spawnattr\_getschedpolicy()*,  
28926           *posix\_spawnattr\_getsigmask()*, *posix\_spawnattr\_setsigdefault()*, *posix\_spawnattr\_setpgroup()*,  
28927           *posix\_spawnattr\_setschedparam()*, *posix\_spawnattr\_setschedpolicy()*, *posix\_spawnattr\_setsigmask()*,  
28928           *posix\_spawnnp()*, the Base Definitions volume of IEEE Std 1003.1-2001, <spawn.h>

28929 **CHANGE HISTORY**

28930           First released in Issue 6. Derived from IEEE Std 1003.1d-1999.

28931 **NAME**

28932 posix\_spawnattr\_getpgroup, posix\_spawnattr\_setpgroup — get and set the spawn-pgroup  
 28933 attribute of a spawn attributes object (**ADVANCED REALTIME**)

28934 **SYNOPSIS**

```
28935 SPN    #include <spawn.h>

28936    int posix_spawnattr_getpgroup(const posix_spawnattr_t *restrict attr,
28937                                pid_t *restrict pgroup);
28938    int posix_spawnattr_setpgroup(posix_spawnattr_t *attr, pid_t pgroup);
28939
```

28940 **DESCRIPTION**

28941 The *posix\_spawnattr\_getpgroup()* function shall obtain the value of the *spawn-pgroup* attribute  
 28942 from the attributes object referenced by *attr*.

28943 The *posix\_spawnattr\_setpgroup()* function shall set the *spawn-pgroup* attribute in an initialized  
 28944 attributes object referenced by *attr*.

28945 The *spawn-pgroup* attribute represents the process group to be joined by the new process image  
 28946 in a spawn operation (if POSIX\_SPAWN\_SETPGROUP is set in the *spawn-flags* attribute). The  
 28947 default value of this attribute shall be zero.

28948 **RETURN VALUE**

28949 Upon successful completion, *posix\_spawnattr\_getpgroup()* shall return zero and store the value of  
 28950 the *spawn-pgroup* attribute of *attr* into the object referenced by the *pgroup* parameter; otherwise,  
 28951 an error number shall be returned to indicate the error.

28952 Upon successful completion, *posix\_spawnattr\_setpgroup()* shall return zero; otherwise, an error  
 28953 number shall be returned to indicate the error.

28954 **ERRORS**

28955 These functions may fail if:

28956 [EINVAL] The value specified by *attr* is invalid.

28957 The *posix\_spawnattr\_setpgroup()* function may fail if:

28958 [EINVAL] The value of the attribute being set is not valid.

28959 **EXAMPLES**

28960 None.

28961 **APPLICATION USAGE**

28962 These functions are part of the Spawn option and need not be provided on all implementations.

28963 **RATIONALE**

28964 None.

28965 **FUTURE DIRECTIONS**

28966 None.

28967 **SEE ALSO**

28968 *posix\_spawn()*, *posix\_spawnattr\_destroy()*, *posix\_spawnattr\_init()*, *posix\_spawnattr\_getsigdefault()*,

 28970 *posix\_spawnattr\_getsigmask()*, *posix\_spawnattr\_setsigdefault()*, *posix\_spawnattr\_setflags()*,  
 28971 *posix\_spawnattr\_setschedparam()*, *posix\_spawnattr\_setschedpolicy()*, *posix\_spawnattr\_setsigmask()*,  
 28972 *posix\_spawnnp()*, the Base Definitions volume of IEEE Std 1003.1-2001, <spawn.h>

28973 **CHANGE HISTORY**

28974 First released in Issue 6. Derived from IEEE Std 1003.1d-1999.

28975 **NAME**

28976 `posix_spawnattr_getschedparam`, `posix_spawnattr_setschedparam` — get and set the spawn-  
 28977 `schedparam` attribute of a spawn attributes object (**ADVANCED REALTIME**)

28978 **SYNOPSIS**

28979 SPN PS `#include <spawn.h>`

28980 `#include <sched.h>`

```
28981 int posix_spawnattr_getschedparam(const posix_spawnattr_t *
28982     restrict attr, struct sched_param *restrict schedparam);
28983 int posix_spawnattr_setschedparam(posix_spawnattr_t *restrict attr,
28984     const struct sched_param *restrict schedparam);
28985
```

28986 **DESCRIPTION**

28987 The `posix_spawnattr_getschedparam()` function shall obtain the value of the `spawn-schedparam`  
 28988 attribute from the attributes object referenced by `attr`.

28989 The `posix_spawnattr_setschedparam()` function shall set the `spawn-schedparam` attribute in an  
 28990 initialized attributes object referenced by `attr`.

28991 The `spawn-schedparam` attribute represents the scheduling parameters to be assigned to the new  
 28992 process image in a spawn operation (if `POSIX_SPAWN_SETSCHEDULER` or  
 28993 `POSIX_SPAWN_SETSCHEDPARAM` is set in the `spawn-flags` attribute). The default value of this  
 28994 attribute is unspecified.

28995 **RETURN VALUE**

28996 Upon successful completion, `posix_spawnattr_getschedparam()` shall return zero and store the  
 28997 value of the `spawn-schedparam` attribute of `attr` into the object referenced by the `schedparam`  
 28998 parameter; otherwise, an error number shall be returned to indicate the error.

28999 Upon successful completion, `posix_spawnattr_setschedparam()` shall return zero; otherwise, an  
 29000 error number shall be returned to indicate the error.

29001 **ERRORS**

29002 These functions may fail if:

29003 [EINVAL] The value specified by `attr` is invalid.

29004 The `posix_spawnattr_setschedparam()` function may fail if:

29005 [EINVAL] The value of the attribute being set is not valid.

29006 **EXAMPLES**

29007 None.

29008 **APPLICATION USAGE**

29009 These functions are part of the Spawn and Process Scheduling options and need not be provided  
 29010 on all implementations.

29011 **RATIONALE**

29012 None.

29013 **FUTURE DIRECTIONS**

29014 None.

 29018 `posix_spawnattr_getsigmask()`, `posix_spawnattr_setsigdefault()`, `posix_spawnattr_setflags()`,

29019 *posix\_spawnattr\_setpgroup()*, *posix\_spawnattr\_setschedpolicy()*, *posix\_spawnattr\_setsigmask()*,  
29020 *posix\_spawnnp()*, the Base Definitions volume of IEEE Std 1003.1-2001, <sched.h>, <spawn.h>

29021 **CHANGE HISTORY**

29022 First released in Issue 6. Derived from IEEE Std 1003.1d-1999.

29023 **NAME**

29024 `posix_spawnattr_getschedpolicy`, `posix_spawnattr_setschedpolicy` — get and set the spawn-  
 29025 `schedpolicy` attribute of a spawn attributes object (**ADVANCED REALTIME**)

29026 **SYNOPSIS**

29027 SPN PS `#include <spawn.h>`

29028 `#include <sched.h>`

```
29029 int posix_spawnattr_getschedpolicy(const posix_spawnattr_t *
29030     restrict attr, int *restrict schedpolicy);
29031 int posix_spawnattr_setschedpolicy(posix_spawnattr_t *attr,
29032     int schedpolicy);
29033
```

29034 **DESCRIPTION**

29035 The `posix_spawnattr_getschedpolicy()` function shall obtain the value of the `spawn-schedpolicy`  
 29036 attribute from the attributes object referenced by `attr`.

29037 The `posix_spawnattr_setschedpolicy()` function shall set the `spawn-schedpolicy` attribute in an  
 29038 initialized attributes object referenced by `attr`.

29039 The `spawn-schedpolicy` attribute represents the scheduling policy to be assigned to the new  
 29040 process image in a spawn operation (if `POSIX_SPAWN_SETSCHEDULER` is set in the `spawn-`  
 29041 `flags` attribute). The default value of this attribute is unspecified.

29042 **RETURN VALUE**

29043 Upon successful completion, `posix_spawnattr_getschedpolicy()` shall return zero and store the  
 29044 value of the `spawn-schedpolicy` attribute of `attr` into the object referenced by the `schedpolicy`  
 29045 parameter; otherwise, an error number shall be returned to indicate the error.

29046 Upon successful completion, `posix_spawnattr_setschedpolicy()` shall return zero; otherwise, an  
 29047 error number shall be returned to indicate the error.

29048 **ERRORS**

29049 These functions may fail if:

29050 [EINVAL] The value specified by `attr` is invalid.

29051 The `posix_spawnattr_setschedpolicy()` function may fail if:

29052 [EINVAL] The value of the attribute being set is not valid.

29053 **EXAMPLES**

29054 None.

29055 **APPLICATION USAGE**

29056 These functions are part of the Spawn and Process Scheduling options and need not be provided  
 29057 on all implementations.

29058 **RATIONALE**

29059 None.

- 29068 **CHANGE HISTORY**
- 29069            First released in Issue 6. Derived from IEEE Std 1003.1d-1999.

29070 **NAME**

29071 `posix_spawnattr_getsigdefault`, `posix_spawnattr_setsigdefault` — get and set the spawn-  
 29072 `sigdefault` attribute of a spawn attributes object (**ADVANCED REALTIME**)

29073 **SYNOPSIS**

```
29074 SPN #include <signal.h>
29075 #include <spawn.h>

29076 int posix_spawnattr_getsigdefault(const posix_spawnattr_t *
29077     restrict attr, sigset_t *restrict sigdefault);
29078 int posix_spawnattr_setsigdefault(posix_spawnattr_t *restrict attr,
29079     const sigset_t *restrict sigdefault);
29080
```

29081 **DESCRIPTION**

29082 The `posix_spawnattr_getsigdefault()` function shall obtain the value of the `spawn-sigdefault`  
 29083 attribute from the attributes object referenced by `attr`.

29084 The `posix_spawnattr_setsigdefault()` function shall set the `spawn-sigdefault` attribute in an  
 29085 initialized attributes object referenced by `attr`.

29086 The `spawn-sigdefault` attribute represents the set of signals to be forced to default signal handling  
 29087 in the new process image (if `POSIX_SPAWN_SETSIGDEF` is set in the `spawn-flags` attribute) by a  
 29088 spawn operation. The default value of this attribute shall be an empty signal set.

29089 **RETURN VALUE**

29090 Upon successful completion, `posix_spawnattr_getsigdefault()` shall return zero and store the value  
 29091 of the `spawn-sigdefault` attribute of `attr` into the object referenced by the `sigdefault` parameter;  
 29092 otherwise, an error number shall be returned to indicate the error.

29093 Upon successful completion, `posix_spawnattr_setsigdefault()` shall return zero; otherwise, an error  
 29094 number shall be returned to indicate the error.

29095 **ERRORS**

29096 These functions may fail if:

29097 [EINVAL] The value specified by `attr` is invalid.

29098 The `posix_spawnattr_setsigdefault()` function may fail if:

29099 [EINVAL] The value of the attribute being set is not valid.

29100 **EXAMPLES**

29101 None.

29102 **APPLICATION USAGE**

29103 These functions are part of the Spawn option and need not be provided on all implementations.

29104 **RATIONALE**

29105 None.

29106 **FUTURE DIRECTIONS**

29107 None.

29108 **SEE ALSO**

29109 `posix_spawn()`, `posix_spawnattr_destroy()`, `posix_spawnattr_init()`, `posix_spawnattr_getflags()`,

29114 **CHANGE HISTORY**

29115 First released in Issue 6. Derived from IEEE Std 1003.1d-1999.

29116 **NAME**

29117 `posix_spawnattr_getsigmask`, `posix_spawnattr_setsigmask` — get and set the spawn-sigmask  
 29118 attribute of a spawn attributes object (**ADVANCED REALTIME**)

29119 **SYNOPSIS**

```
29120 SPN #include <signal.h>
29121 #include <spawn.h>

29122 int posix_spawnattr_getsigmask(const posix_spawnattr_t *restrict attr,
29123 sigset_t *restrict sigmask);
29124 int posix_spawnattr_setsigmask(posix_spawnattr_t *restrict attr,
29125 const sigset_t *restrict sigmask);
29126
```

29127 **DESCRIPTION**

29128 The `posix_spawnattr_getsigmask()` function shall obtain the value of the `spawn-sigmask` attribute  
 29129 from the attributes object referenced by `attr`.

29130 The `posix_spawnattr_setsigmask()` function shall set the `spawn-sigmask` attribute in an initialized  
 29131 attributes object referenced by `attr`.

29132 The `spawn-sigmask` attribute represents the signal mask in effect in the new process image of a  
 29133 spawn operation (if `POSIX_SPAWN_SETSIGMASK` is set in the `spawn-flags` attribute). The  
 29134 default value of this attribute is unspecified.

29135 **RETURN VALUE**

29136 Upon successful completion, `posix_spawnattr_getsigmask()` shall return zero and store the value  
 29137 of the `spawn-sigmask` attribute of `attr` into the object referenced by the `sigmask` parameter;  
 29138 otherwise, an error number shall be returned to indicate the error.

29139 Upon successful completion, `posix_spawnattr_setsigmask()` shall return zero; otherwise, an error  
 29140 number shall be returned to indicate the error.

29141 **ERRORS**

29142 These functions may fail if:

29143 [EINVAL] The value specified by `attr` is invalid.

29144 The `posix_spawnattr_setsigmask()` function may fail if:

29145 [EINVAL] The value of the attribute being set is not valid.

29146 **EXAMPLES**

29147 None.

29148 **APPLICATION USAGE**

29149 These functions are part of the Spawn option and need not be provided on all implementations.

29150 **RATIONALE**

29151 None.

29152 **FUTURE DIRECTIONS**

29153 None.

29160 **CHANGE HISTORY**

29161 First released in Issue 6. Derived from IEEE Std 1003.1d-1999.

29162 **NAME**29163        `posix_spawnattr_init` — initialize the spawn attributes object (**ADVANCED REALTIME**)29164 **SYNOPSIS**29165 SPN        `#include <spawn.h>`29166        `int posix_spawnattr_init(posix_spawnattr_t *attr);`

29167

29168 **DESCRIPTION**29169        Refer to `posix_spawnattr_destroy()`.

29170 **NAME**

29171        posix\_spawnattr\_setflags — set the spawn-flags attribute of a spawn attributes object  
29172        (ADVANCED REALTIME)

29173 **SYNOPSIS**

29174 SPN    #include <spawn.h>

29175        int posix\_spawnattr\_setflags(posix\_spawnattr\_t \*attr, short flags);

29176

29177 **DESCRIPTION**

29178        Refer to *posix\_spawnattr\_getflags()*.

29179 **NAME**

29180 `posix_spawnattr_setpgroup` — set the spawn-pgroup attribute of a spawn attributes object  
29181 (**ADVANCED REALTIME**)

29182 **SYNOPSIS**

29183 SPN `#include <spawn.h>`

29184 `int posix_spawnattr_setpgroup(posix_spawnattr_t *attr, pid_t pgroup);`

29185

29186 **DESCRIPTION**

29187 Refer to `posix_spawnattr_getpgroup()`.

29188 **NAME**

29189        `posix_spawnattr_setschedparam` — set the spawn-schedparam attribute of a spawn attributes  
29190        object (**ADVANCED REALTIME**)

29191 **SYNOPSIS**

29192 SPN PS    `#include <sched.h>`

29193        `#include <spawn.h>`

```
29194        int posix_spawnattr_setschedparam(posix_spawnattr_t *restrict attr,  
29195                                          const struct sched_param *restrict schedparam);
```

29196

29197 **DESCRIPTION**

29198        Refer to `posix_spawnattr_getschedparam()`.

29199 **NAME**

29200 `posix_spawnattr_setschedpolicy` — set the spawn-schedpolicy attribute of a spawn attributes  
29201 object (**ADVANCED REALTIME**)

29202 **SYNOPSIS**

```
29203 SPN PS #include <sched.h>
```

```
29204 #include <spawn.h>
```

```
29205 int posix_spawnattr_setschedpolicy(posix_spawnattr_t *attr,  
29206 int schedpolicy);
```

```
29207
```

29208 **DESCRIPTION**

29209 Refer to `posix_spawnattr_getschedpolicy()`.

29210 **NAME**

29211 `posix_spawnattr_setsigdefault` — set the spawn-sigdefault attribute of a spawn attributes object  
29212 (**ADVANCED REALTIME**)

29213 **SYNOPSIS**

29214 SPN `#include <signal.h>`

29215 `#include <spawn.h>`

```
29216 int posix_spawnattr_setsigdefault(posix_spawnattr_t *restrict attr,  
29217     const sigset_t *restrict sigdefault);
```

29218

29219 **DESCRIPTION**

29220 Refer to `posix_spawnattr_getsigdefault()`.

29221 **NAME**

29222 posix\_spawnattr\_setsigmask — set the spawn-sigmask attribute of a spawn attributes object  
29223 (**ADVANCED REALTIME**)

29224 **SYNOPSIS**

29225 SPN #include <signal.h>

29226 #include <spawn.h>

```
29227 int posix_spawnattr_setsigmask(posix_spawnattr_t *restrict attr,  
29228     const sigset_t *restrict sigmask);
```

29229

29230 **DESCRIPTION**

29231 Refer to *posix\_spawnattr\_getsigmask()*.

29232 **NAME**

29233        `posix_spawnnp` — spawn a process (**ADVANCED REALTIME**)

29234 **SYNOPSIS**

29235 SPN        `#include <spawn.h>`

```
29236        int posix_spawnnp(pid_t *restrict pid, const char *restrict file,  
29237                      const posix_spawn_file_actions_t *file_actions,  
29238                      const posix_spawnattr_t *restrict attrp,  
29239                      char *const argv[restrict], char *const envp[restrict]);
```

29240

29241 **DESCRIPTION**

29242        Refer to `posix_spawn()`.

29243 **NAME**

29244 posix\_trace\_attr\_destroy, posix\_trace\_attr\_init — destroy and initialize the trace stream  
 29245 attributes object (**TRACING**)

29246 **SYNOPSIS**

```
29247 TRC #include <trace.h>
```

```
29248 int posix_trace_attr_destroy(trace_attr_t *attr);
```

```
29249 int posix_trace_attr_init(trace_attr_t *attr);
```

29250

29251 **DESCRIPTION**

29252 The *posix\_trace\_attr\_destroy()* function shall destroy an initialized trace attributes object. A  
 29253 destroyed *attr* attributes object can be reinitialized using *posix\_trace\_attr\_init()*; the results of  
 29254 otherwise referencing the object after it has been destroyed are undefined.

29255 The *posix\_trace\_attr\_init()* function shall initialize a trace attributes object *attr* with the default  
 29256 value for all of the individual attributes used by a given implementation. The read-only  
 29257 *generation-version* and *clock-resolution* attributes of the newly initialized trace attributes object  
 29258 shall be set to their appropriate values (see Section 2.11.1.2 (on page 75)).

29259 Results are undefined if *posix\_trace\_attr\_init()* is called specifying an already initialized *attr*  
 29260 attributes object.

29261 Implementations may add extensions to the trace attributes object structure as permitted in the  
 29262 Base Definitions volume of IEEE Std 1003.1-2001, Chapter 2, Conformance.

29263 The resulting attributes object (possibly modified by setting individual attributes values), when  
 29264 used by *posix\_trace\_create()*, defines the attributes of the trace stream created. A single attributes  
 29265 object can be used in multiple calls to *posix\_trace\_create()*. After one or more trace streams have  
 29266 been created using an attributes object, any function affecting that attributes object, including  
 29267 destruction, shall not affect any trace stream previously created. An initialized attributes object  
 29268 also serves to receive the attributes of an existing trace stream or trace log when calling the  
 29269 *posix\_trace\_get\_attr()* function.

29270 **RETURN VALUE**

29271 Upon successful completion, these functions shall return a value of zero. Otherwise, they shall  
 29272 return the corresponding error number.

29273 **ERRORS**

29274 The *posix\_trace\_attr\_destroy()* function may fail if:

29275 [EINVAL] The value of *attr* is invalid.

29276 The *posix\_trace\_attr\_init()* function shall fail if:

29277 [ENOMEM] Insufficient memory exists to initialize the trace attributes object.

29278 **EXAMPLES**

29279 None.

29280 **APPLICATION USAGE**

29281 None.

29282 **RATIONALE**

29283 None.

29284 **FUTURE DIRECTIONS**

29285       None.

29286 **SEE ALSO**

29287       *posix\_trace\_create()*, *posix\_trace\_get\_attr()*, *uname()*, the Base Definitions volume of  
29288       IEEE Std 1003.1-2001, <**trace.h**>

29289 **CHANGE HISTORY**

29290       First released in Issue 6. Derived from IEEE Std 1003.1q-2000.

29291       IEEE PASC Interpretation 1003.1 #123 is applied.

29292 **NAME**

29293 `posix_trace_attr_getclockres`, `posix_trace_attr_getcreatetime`, `posix_trace_attr_getgenversion`,  
 29294 `posix_trace_attr_getname`, `posix_trace_attr_setname` — retrieve and set information about a  
 29295 trace stream (**TRACING**)

29296 **SYNOPSIS**

```
29297 TRC #include <time.h>
29298 #include <trace.h>

29299 int posix_trace_attr_getclockres(const trace_attr_t *attr,
29300     struct timespec *resolution);
29301 int posix_trace_attr_getcreatetime(const trace_attr_t *attr,
29302     struct timespec *createtime);

29303 #include <trace.h>

29304 int posix_trace_attr_getgenversion(const trace_attr_t *attr,
29305     char *genversion);
29306 int posix_trace_attr_getname(const trace_attr_t *attr,
29307     char *tracename);
29308 int posix_trace_attr_setname(trace_attr_t *attr,
29309     const char *tracename);
29310
```

29311 **DESCRIPTION**

29312 The `posix_trace_attr_getclockres()` function shall copy the clock resolution of the clock used to  
 29313 generate timestamps from the *clock-resolution* attribute of the attributes object pointed to by the  
 29314 *attr* argument into the structure pointed to by the *resolution* argument.

29315 The `posix_trace_attr_getcreatetime()` function shall copy the trace stream creation time from the  
 29316 *creation-time* attribute of the attributes object pointed to by the *attr* argument into the structure  
 29317 pointed to by the *createtime* argument. The *creation-time* attribute shall represent the time of  
 29318 creation of the trace stream.

29319 The `posix_trace_attr_getgenversion()` function shall copy the string containing version information  
 29320 from the *generation-version* attribute of the attributes object pointed to by the *attr* argument into  
 29321 the string pointed to by the *genversion* argument. The *genversion* argument shall be the address of  
 29322 a character array which can store at least {TRACE\_NAME\_MAX} characters.

29323 The `posix_trace_attr_getname()` function shall copy the string containing the trace name from the  
 29324 *trace-name* attribute of the attributes object pointed to by the *attr* argument into the string  
 29325 pointed to by the *tracename* argument. The *tracename* argument shall be the address of a character  
 29326 array which can store at least {TRACE\_NAME\_MAX} characters.

29327 The `posix_trace_attr_setname()` function shall set the name in the *trace-name* attribute of the  
 29328 attributes object pointed to by the *attr* argument, using the trace name string supplied by the  
 29329 *tracename* argument. If the supplied string contains more than {TRACE\_NAME\_MAX}  
 29330 characters, the name copied into the *trace-name* attribute may be truncated to one less than the  
 29331 length of {TRACE\_NAME\_MAX} characters. The default value is a null string.

29332 **RETURN VALUE**

29333 Upon successful completion, these functions shall return a value of zero. Otherwise, they shall  
 29334 return the corresponding error number.

29335 If successful, the `posix_trace_attr_getclockres()` function stores the *clock-resolution* attribute value  
 29336 in the object pointed to by *resolution*. Otherwise, the content of this object is unspecified.

29337 If successful, the *posix\_trace\_attr\_getcreatetime()* function stores the trace stream creation time in  
29338 the object pointed to by *createtime*. Otherwise, the content of this object is unspecified.

29339 If successful, the *posix\_trace\_attr\_getgenversion()* function stores the trace version information in  
29340 the string pointed to by *genversion*. Otherwise, the content of this string is unspecified.

29341 If successful, the *posix\_trace\_attr\_getname()* function stores the trace name in the string pointed  
29342 to by *tracename*. Otherwise, the content of this string is unspecified.

## 29343 ERRORS

29344 The *posix\_trace\_attr\_getclockres()*, *posix\_trace\_attr\_getcreatetime()*, *posix\_trace\_attr\_getgenversion()*,  
29345 and *posix\_trace\_attr\_getname()* functions may fail if:

29346 [EINVAL] The value specified by one of the arguments is invalid.

## 29347 EXAMPLES

29373 TRC TRI int posix_trace_attr_setinherited(trace_attr_t *attr,
29374 int inheritancepolicy);
29375 TRC TRL int posix_trace_attr_setlogfullpolicy(trace_attr_t *attr,
29376 int logpolicy);
29377 TRC int posix_trace_attr_setstreamfullpolicy(trace_attr_t *attr,
29378 int streampolicy);
29379
```

## 29380 DESCRIPTION

29381 TRI The *posix\_trace\_attr\_getinherited()* and *posix\_trace\_attr\_setinherited()* functions, respectively, shall  
 29382 get and set the inheritance policy stored in the *inheritance* attribute for traced processes across  
 29383 the *fork()* and *spawn()* operations. The *inheritance* attribute of the attributes object pointed to by  
 29384 the *attr* argument shall be set to one of the following values defined by manifest constants in the  
 29385 **<trace.h>** header:

## 29386 POSIX\_TRACE\_CLOSE\_FOR\_CHILD

29387 After a *fork()* or *spawn()* operation, the child shall not be traced, and tracing of the parent  
 29388 shall continue.

## 29389 POSIX\_TRACE\_INHERITED

29390 After a *fork()* or *spawn()* operation, if the parent is being traced, its child shall be  
 29391 concurrently traced using the same trace stream.

29392 The default value for the *inheritance* attribute is **POSIX\_TRACE\_CLOSE\_FOR\_CHILD**.

29393 TRL The *posix\_trace\_attr\_getlogfullpolicy()* and *posix\_trace\_attr\_setlogfullpolicy()* functions,  
 29394 respectively, shall get and set the trace log full policy stored in the *log-full-policy* attribute of the  
 29395 attributes object pointed to by the *attr* argument.

29396 The *log-full-policy* attribute shall be set to one of the following values defined by manifest  
 29397 constants in the **<trace.h>** header:

## 29398 POSIX\_TRACE\_LOOP

29399 The trace log shall loop until the associated trace stream is stopped. This policy means that  
 29400 when the trace log gets full, the file system shall reuse the resources allocated to the oldest  
 29401 trace events that were recorded. In this way, the trace log will always contain the most  
 29402 recent trace events flushed.

## 29403 POSIX\_TRACE\_UNTIL\_FULL

29404 The trace stream shall be flushed to the trace log until the trace log is full. This condition can  
 29405 be deduced from the *posix\_log\_full\_status* member status (see the **posix\_trace\_status\_info**  
 29406 structure defined in **<trace.h>**). The last recorded trace event shall be the

29407 POSIX\_TRACE\_STOP trace event.

29408 POSIX\_TRACE\_APPEND

29409 The associated trace stream shall be flushed to the trace log without log size limitation. If

29410 the application specifies POSIX\_TRACE\_APPEND, the implementation shall ignore the

29411 *log-max-size* attribute.

29412 The default value for the *log-full-policy* attribute is POSIX\_TRACE\_LOOP.

29413 The *posix\_trace\_attr\_getstreamfullpolicy()* and *posix\_trace\_attr\_setstreamfullpolicy()* functions,

29414 respectively, shall get and set the trace stream full policy stored in the *stream-full-policy* attribute

29415 of the attributes object pointed to by the *attr* argument.

29416 The *stream-full-policy* attribute shall be set to one of the following values defined by manifest

29417 constants in the <trace.h> header:

29418 POSIX\_TRACE\_LOOP

29419 The trace stream shall loop until explicitly stopped by the *posix\_trace\_stop()* function. This

29420 policy means that when the trace stream is full, the trace system shall reuse the resources

29421 allocated to the oldest trace events recorded. In this way, the trace stream will always

29422 contain the most recent trace events recorded.

29423 POSIX\_TRACE\_UNTIL\_FULL

29424 The trace stream will run until the trace stream resources are exhausted. Then the trace

29425 stream will stop. This condition can be deduced from *posix\_stream\_status* and

29426 *posix\_stream\_full\_status* (see the **posix\_trace\_status\_info** structure defined in <trace.h>).

29427 When this trace stream is read, a POSIX\_TRACE\_STOP trace event shall be reported after

29428 reporting the last recorded trace event. The trace system shall reuse the resources allocated

29429 to any trace events already reported—see the *posix\_trace\_getnext\_event()*,

29430 *posix\_trace\_trygetnext\_event()*, and *posix\_trace\_timedgetnext\_event()* functions—or already

29431 flushed for an active trace stream with log if the Trace Log option is supported; see the

29432 *posix\_trace\_flush()* function. The trace system shall restart the trace stream when it is empty

29433 and may restart it sooner. A POSIX\_TRACE\_START trace event shall be reported before

29434 reporting the next recorded trace event.

29435 TRL POSIX\_TRACE\_FLUSH

29436 If the Trace Log option is supported, this policy is identical to the

29437 POSIX\_TRACE\_UNTIL\_FULL trace stream full policy except that the trace stream shall be

29438 flushed regularly as if *posix\_trace\_flush()* had been explicitly called. Defining this policy for

29439 an active trace stream without log shall be invalid.

29440 The default value for the *stream-full-policy* attribute shall be POSIX\_TRACE\_LOOP for an active

29441 trace stream without log.

29442 TRL If the Trace Log option is supported, the default value for the *stream-full-policy* attribute shall be

29443 POSIX\_TRACE\_FLUSH for an active trace stream with log.

29444 **RETURN VALUE**

29445 Upon successful completion, these functions shall return a value of zero. Otherwise, they shall

29446 return the corresponding error number.

29447 TRI If successful, the *posix\_trace\_attr\_getinherited()* function shall store the *inheritance* attribute value

29448 in the object pointed to by *inheritancepolicy*. Otherwise, the content of this object is undefined.

29449 TRL If successful, the *posix\_trace\_attr\_getlogfullpolicy()* function shall store the *log-full-policy* attribute

29450 value in the object pointed to by *logpolicy*. Otherwise, the content of this object is undefined.

29451 If successful, the *posix\_trace\_attr\_getstreamfullpolicy()* function shall store the *stream-full-policy*

29452 attribute value in the object pointed to by *streampolicy*. Otherwise, the content of this object is

29453 undefined.

29454 **ERRORS**

29455 These functions may fail if:

29456 [EINVAL] The value specified by at least one of the arguments is invalid.

29491 TRC TRL int posix_trace_attr_setlogsize(trace_attr_t *attr,
29492 size_t logsize);
29493 TRC int posix_trace_attr_setmaxdatasize(trace_attr_t *attr,
29494 size_t maxdatasize);
29495 int posix_trace_attr_setstreamsize(trace_attr_t *attr,
29496 size_t streamsize);
29497
    
```

29498 **DESCRIPTION**

29499 TRL The *posix\_trace\_attr\_getlogsize()* function shall copy the log size, in bytes, from the *log-max-size*  
 29500 attribute of the attributes object pointed to by the *attr* argument into the variable pointed to by  
 29501 the *logsize* argument. This log size is the maximum total of bytes that shall be allocated for  
 29502 system and user trace events in the trace log. The default value for the *log-max-size* attribute is  
 29503 implementation-defined.

29504 The *posix\_trace\_attr\_setlogsize()* function shall set the maximum allowed size, in bytes, in the  
 29505 *log-max-size* attribute of the attributes object pointed to by the *attr* argument, using the size value  
 29506 supplied by the *logsize* argument.

29507 The trace log size shall be used if the *log-full-policy* attribute is set to *POSIX\_TRACE\_LOOP* or  
 29508 *POSIX\_TRACE\_UNTIL\_FULL*. If the *log-full-policy* attribute is set to *POSIX\_TRACE\_APPEND*,  
 29509 the implementation shall ignore the *log-max-size* attribute.

29510 The *posix\_trace\_attr\_getmaxdatasize()* function shall copy the maximum user trace event data  
 29511 size, in bytes, from the *max-data-size* attribute of the attributes object pointed to by the *attr*  
 29512 argument into the variable pointed to by the *maxdatasize* argument. The default value for the  
 29513 *max-data-size* attribute is implementation-defined.

29514 The *posix\_trace\_attr\_getmaxsystemeventsize()* function shall calculate the maximum memory size,  
 29515 in bytes, required to store a single system trace event. This value is calculated for the trace  
 29516 stream attributes object pointed to by the *attr* argument and is returned in the variable pointed  
 29517 to by the *eventsize* argument.

29518 The values returned as the maximum memory sizes of the user and system trace events shall be  
 29519 such that if the sum of the maximum memory sizes of a set of the trace events that may be  
 29520 recorded in a trace stream is less than or equal to the *stream-min-size* attribute of that trace  
 29521 stream, the system provides the necessary resources for recording all those trace events, without  
 29522 loss.

29523 The *posix\_trace\_attr\_getmaxusereventsize()* function shall calculate the maximum memory size, in  
 29524 bytes, required to store a single user trace event generated by a call to *posix\_trace\_event()* with a  
 29525 *data\_len* parameter equal to the *data\_len* value specified in this call. This value is calculated for  
 29526 the trace stream attributes object pointed to by the *attr* argument and is returned in the variable  
 29527 pointed to by the *eventsize* argument.

29528 The *posix\_trace\_attr\_getstreamsize()* function shall copy the stream size, in bytes, from the  
 29529 *stream-min-size* attribute of the attributes object pointed to by the *attr* argument into the variable  
 29530 pointed to by the *streamsize* argument.

29531 This stream size is the current total memory size reserved for system and user trace events in the  
 29532 trace stream. The default value for the *stream-min-size* attribute is implementation-defined. The  
 29533 stream size refers to memory used to store trace event records. Other stream data (for example,  
 29534 trace attribute values) shall not be included in this size.

29535 The *posix\_trace\_attr\_setmaxdatasize()* function shall set the maximum allowed size, in bytes, in  
 29536 the *max-data-size* attribute of the attributes object pointed to by the *attr* argument, using the size  
 29537 value supplied by the *maxdatasize* argument. This maximum size is the maximum allowed size  
 29538 for the user data argument which may be passed to *posix\_trace\_event()*. The implementation  
 29539 shall be allowed to truncate data passed to *trace\_user\_event* which is longer than *maxdatasize*.

29540 The *posix\_trace\_attr\_setstreamsize()* function shall set the minimum allowed size, in bytes, in the  
 29541 *stream-min-size* attribute of the attributes object pointed to by the *attr* argument, using the size  
 29542 value supplied by the *streamsize* argument.

#### 29543 RETURN VALUE

29544 Upon successful completion, these functions shall return a value of zero. Otherwise, they shall  
 29545 return the corresponding error number.

29546 TRL The *posix\_trace\_attr\_getlogsize()* function stores the maximum trace log allowed size in the object  
 29547 pointed to by *logsize*, if successful.

29548 The *posix\_trace\_attr\_getmaxdatasize()* function stores the maximum trace event record memory  
 29549 size in the object pointed to by *maxdatasize*, if successful.

29550 The *posix\_trace\_attr\_getmaxsystemeventsize()* function stores the maximum memory size to store  
 29551 a single system trace event in the object pointed to by *eventsize*, if successful.

29552 The *posix\_trace\_attr\_getmaxusereventsize()* function stores the maximum memory size to store a  
 29553 single user trace event in the object pointed to by *eventsize*, if successful.

29554 The *posix\_trace\_attr\_getstreamsize()* function stores the maximum trace stream allowed size in  
 29555 the object pointed to by *streamsize*, if successful.

#### 29556 ERRORS

29557 These functions may fail if:

29558 [EINVAL] The value specified by one of the arguments is invalid.

29559 **EXAMPLES**

29560           None.

29656 TRC     #include &lt;sys/types.h&gt;

29657        #include &lt;trace.h&gt;

29658        int posix\_trace\_attr\_setstreamsize(trace\_attr\_t \*attr,  
29659                                          size\_t streamsize);

29660

29661 **DESCRIPTION**29662        Refer to *posix\_trace\_attr\_getlogsize()*.

29663 **NAME**

29664 `posix_trace_clear` — clear trace stream and trace log (**TRACING**)

29665 **SYNOPSIS**

29666 TRC `#include <sys/types.h>`

29667 `#include <trace.h>`

29668 `int posix_trace_clear(trace_id_t trid);`

29669

29670 **DESCRIPTION**

29671 The `posix_trace_clear()` function shall reinitialize the trace stream identified by the argument `trid`  
 29672 as if it were returning from the `posix_trace_create()` function, except that the same allocated  
 29673 resources shall be reused, the mapping of trace event type identifiers to trace event names shall  
 29674 be unchanged, and the trace stream status shall remain unchanged (that is, if it was running, it  
 29675 remains running and if it was suspended, it remains suspended).

29676 All trace events in the trace stream recorded before the call to `posix_trace_clear()` shall be lost.  
 29677 The `posix_stream_full_status` status shall be set to `POSIX_TRACE_NOT_FULL`. There is no  
 29678 guarantee that all trace events that occurred during the `posix_trace_clear()` call are recorded; the  
 29679 behavior with respect to trace points that may occur during this call is unspecified.

29680 TRL If the Trace Log option is supported and the trace stream has been created with a log, the  
 29681 `posix_trace_clear()` function shall reinitialize the trace stream with the same behavior as if the  
 29682 trace stream was created without the log, plus it shall reinitialize the trace log associated with  
 29683 the trace stream identified by the argument `trid` as if it were returning from the  
 29684 `posix_trace_create_withlog()` function, except that the same allocated resources, for the trace log,  
 29685 may be reused and the associated trace stream status remains unchanged. The first trace event  
 29686 recorded in the trace log after the call to `posix_trace_clear()` shall be the same as the first trace  
 29687 event recorded in the active trace stream after the call to `posix_trace_clear()`. The  
 29688 `posix_log_full_status` status shall be set to `POSIX_TRACE_NOT_FULL`. There is no guarantee that  
 29689 all trace events that occurred during the `posix_trace_clear()` call are recorded in the trace log; the  
 29690 behavior with respect to trace points that may occur during this call is unspecified. If the log full  
 29691 policy is `POSIX_TRACE_APPEND`, the effect of a call to this function is unspecified for the trace  
 29692 log associated with the trace stream identified by the `trid` argument.

29693 **RETURN VALUE**

29694 Upon successful completion, the `posix_trace_clear()` function shall return a value of zero.  
 29695 Otherwise, it shall return the corresponding error number.

29696 **ERRORS**

29697 The `posix_trace_clear()` function shall fail if:

29698 [EINVAL] The value of the `trid` argument does not correspond to an active trace stream.

29699 **EXAMPLES**

29700 None.

29701 **APPLICATION USAGE**

29702 None.

29703 **RATIONALE**

29704 None.

29705 **FUTURE DIRECTIONS**

29706 None.

29707 **SEE ALSO**

29708 *posix\_trace\_attr\_init()*, *posix\_trace\_create()*, *posix\_trace\_flush()*, *posix\_trace\_get\_attr()*, the Base  
29709 Definitions volume of IEEE Std 1003.1-2001, <sys/types.h>, <trace.h>

29710 **CHANGE HISTORY**

29711 First released in Issue 6. Derived from IEEE Std 1003.1q-2000.

29712 IEEE PASC Interpretation 1003.1 #123 is applied.

29713 **NAME**

29714 posix\_trace\_close, posix\_trace\_open, posix\_trace\_rewind — trace log management (**TRACING**)

29715 **SYNOPSIS**

29716 TRC TRL #include <trace.h>

```
29717 int posix_trace_close(trace_id_t trid);
29718 int posix_trace_open(int file_desc, trace_id_t *trid);
29719 int posix_trace_rewind(trace_id_t trid);
29720
```

29721 **DESCRIPTION**

29722 The *posix\_trace\_close()* function shall deallocate the trace log identifier indicated by *trid*, and all  
 29723 of its associated resources. If there is no valid trace log pointed to by the *trid*, this function shall  
 29724 fail.

29725 The *posix\_trace\_open()* function shall allocate the necessary resources and establish the  
 29726 connection between a trace log identified by the *file\_desc* argument and a trace stream identifier  
 29727 identified by the object pointed to by the *trid* argument. The *file\_desc* argument should be a valid  
 29728 open file descriptor that corresponds to a trace log. The *file\_desc* argument shall be open for  
 29729 reading. The current trace event timestamp, which specifies the timestamp of the trace event  
 29730 that will be read by the next call to *posix\_trace\_getnext\_event()*, shall be set to the timestamp of  
 29731 the oldest trace event recorded in the trace log identified by *trid*.

29732 The *posix\_trace\_open()* function shall return a trace stream identifier in the variable pointed to by  
 29733 the *trid* argument, that may only be used by the following functions:

|       |                                               |                                    |
|-------|-----------------------------------------------|------------------------------------|
| 29734 | <i>posix_trace_close()</i>                    | <i>posix_trace_get_attr()</i>      |
| 29735 | <i>posix_trace_eventid_equal()</i>            | <i>posix_trace_get_status()</i>    |
| 29736 | <i>posix_trace_eventid_get_name()</i>         | <i>posix_trace_getnext_event()</i> |
| 29737 | <i>posix_trace_eventtypelist_getnext_id()</i> | <i>posix_trace_rewind()</i>        |
| 29738 | <i>posix_trace_eventtypelist_rewind()</i>     |                                    |

29739 In particular, notice that the operations normally used by a trace controller process, such as  
 29740 *posix\_trace\_start()*, *posix\_trace\_stop()*, or *posix\_trace\_shutdown()*, cannot be invoked using the  
 29741 trace stream identifier returned by the *posix\_trace\_open()* function.

29742 The *posix\_trace\_rewind()* function shall reset the current trace event timestamp, which specifies  
 29743 the timestamp of the trace event that will be read by the next call to *posix\_trace\_getnext\_event()*,  
 29744 to the timestamp of the oldest trace event recorded in the trace log identified by *trid*.

29745 **RETURN VALUE**

29746 Upon successful completion, these functions shall return a value of zero. Otherwise, they shall  
 29747 return the corresponding error number.

29748 If successful, the *posix\_trace\_open()* function stores the trace stream identifier value in the object  
 29749 pointed to by *trid*.

29750 **ERRORS**

29751 The *posix\_trace\_open()* function shall fail if:

- 29752 [EINTR] The operation was interrupted by a signal and thus no trace log was opened.
- 29753 [EINVAL] The object pointed to by *file\_desc* does not correspond to a valid trace log.

29754 The *posix\_trace\_close()* and *posix\_trace\_rewind()* functions may fail if:

- 29755 [EINVAL] The object pointed to by *trid* does not correspond to a valid trace log.

29756 **EXAMPLES**

29757 None.

29758 **APPLICATION USAGE**

29759 None.

29760 **RATIONALE**

29761 None.

29762 **FUTURE DIRECTIONS**

29763 None.

29769 IEEE PASC Interpretation 1003.1 #123 is applied.

29770 **NAME**

29771 posix\_trace\_create, posix\_trace\_create\_withlog, posix\_trace\_flush, posix\_trace\_shutdown —  
 29772 trace stream initialization, flush, and shutdown from a process (**TRACING**)

29773 **SYNOPSIS**

```

29774 TRC #include <sys/types.h>
29775 #include <trace.h>

29776 int posix_trace_create(pid_t pid,
29777     const trace_attr_t *restrict attr,
29778     trace_id_t *restrict trid);
29779 TRC TRL int posix_trace_create_withlog(pid_t pid,
29780     const trace_attr_t *restrict attr, int file_desc,
29781     trace_id_t *restrict trid);
29782 int posix_trace_flush(trace_id_t trid);
29783 TRC int posix_trace_shutdown(trace_id_t trid);
29784
    
```

29785 **DESCRIPTION**

29786 The *posix\_trace\_create()* function shall create an active trace stream. It allocates all the resources  
 29787 needed by the trace stream being created for tracing the process specified by *pid* in accordance  
 29788 with the *attr* argument. The *attr* argument represents the initial attributes of the trace stream and  
 29789 shall have been initialized by the function *posix\_trace\_attr\_init()* prior to the *posix\_trace\_create()*  
 29790 call. If the argument *attr* is NULL, the default attributes shall be used. The *attr* attributes object  
 29791 shall be manipulated through a set of functions described in the *posix\_trace\_attr* family of  
 29792 functions. If the attributes of the object pointed to by *attr* are modified later, the attributes of the  
 29793 trace stream shall not be affected. The *creation-time* attribute of the newly created trace stream  
 29794 shall be set to the value of the system clock, if the Timers option is not supported, or to the value  
 29795 of the CLOCK\_REALTIME clock, if the Timers option is supported.

29796 The *pid* argument represents the target process to be traced. If the process executing this  
 29797 function does not have appropriate privileges to trace the process identified by *pid*, an error shall  
 29798 be returned. If the *pid* argument is zero, the calling process shall be traced.

29799 The *posix\_trace\_create()* function shall store the trace stream identifier of the new trace stream in  
 29800 the object pointed to by the *trid* argument. This trace stream identifier shall be used in  
 29801 subsequent calls to control tracing. The *trid* argument may only be used by the following  
 29802 functions:

|       |                                               |                                         |
|-------|-----------------------------------------------|-----------------------------------------|
| 29803 | <i>posix_trace_clear()</i>                    | <i>posix_trace_getnext_event()</i>      |
| 29804 | <i>posix_trace_eventid_equal()</i>            | <i>posix_trace_shutdown()</i>           |
| 29805 | <i>posix_trace_eventid_get_name()</i>         | <i>posix_trace_start()</i>              |
| 29806 | <i>posix_trace_eventtypelist_getnext_id()</i> | <i>posix_trace_stop()</i>               |
| 29807 | <i>posix_trace_eventtypelist_rewind()</i>     | <i>posix_trace_timedgetnext_event()</i> |
| 29808 | <i>posix_trace_get_attr()</i>                 | <i>posix_trace_trid_eventid_open()</i>  |
| 29809 | <i>posix_trace_get_status()</i>               | <i>posix_trace_trygetnext_event()</i>   |

29810 TEF If the Trace Event Filter option is supported, the following additional functions may use the *trid*  
 29811 argument:

```

29812 posix_trace_get_filter()    posix_trace_set_filter()
    
```

29813

29814 In particular, notice that the operations normally used by a trace analyzer process, such as  
 29815 *posix\_trace\_rewind()* or *posix\_trace\_close()*, cannot be invoked using the trace stream identifier  
 29816 returned by the *posix\_trace\_create()* function.

29817 TEF A trace stream shall be created in a suspended state. If the Trace Event Filter option is  
 29818 supported, its trace event type filter shall be empty.

29819 The *posix\_trace\_create()* function may be called multiple times from the same or different  
 29820 processes, with the system-wide limit indicated by the runtime invariant value  
 29821 {TRACE\_SYS\_MAX}, which has the minimum value {\_POSIX\_TRACE\_SYS\_MAX}.

29822 The trace stream identifier returned by the *posix\_trace\_create()* function in the argument pointed  
 29823 to by *trid* is valid only in the process that made the function call. If it is used from another  
 29824 process, that is a child process, in functions defined in IEEE Std 1003.1-2001, these functions shall  
 29825 return with the error [EINVAL].

29826 TRL The *posix\_trace\_create\_withlog()* function shall be equivalent to *posix\_trace\_create()*, except that it  
 29827 associates a trace log with this stream. The *file\_desc* argument shall be the file descriptor  
 29828 designating the trace log destination. The function shall fail if this file descriptor refers to a file  
 29829 with a file type that is not compatible with the log policy associated with the trace log. The list of  
 29830 the appropriate file types that are compatible with each log policy is implementation-defined.

29831 The *posix\_trace\_create\_withlog()* function shall return in the parameter pointed to by *trid* the trace  
 29832 stream identifier, which uniquely identifies the newly created trace stream, and shall be used in  
 29833 subsequent calls to control tracing. The *trid* argument may only be used by the following  
 29834 functions:

|       |                                               |                                         |
|-------|-----------------------------------------------|-----------------------------------------|
| 29835 | <i>posix_trace_clear()</i>                    | <i>posix_trace_getnext_event()</i>      |
| 29836 | <i>posix_trace_eventid_equal()</i>            | <i>posix_trace_shutdown()</i>           |
| 29837 | <i>posix_trace_eventid_get_name()</i>         | <i>posix_trace_start()</i>              |
| 29838 | <i>posix_trace_eventtypelist_getnext_id()</i> | <i>posix_trace_stop()</i>               |
| 29839 | <i>posix_trace_eventtypelist_rewind()</i>     | <i>posix_trace_timedgetnext_event()</i> |
| 29840 | <i>posix_trace_flush()</i>                    | <i>posix_trace_trid_eventid_open()</i>  |
| 29841 | <i>posix_trace_get_attr()</i>                 | <i>posix_trace_trygetnext_event()</i>   |
| 29842 | <i>posix_trace_get_status()</i>               |                                         |

29843

29844 TRL TEF If the Trace Event Filter option is supported, the following additional functions may use the *trid*  
 29845 argument:

29846 *posix\_trace\_get\_filter()*    *posix\_trace\_set\_filter()*

29847

29848 TRL In particular, notice that the operations normally used by a trace analyzer process, such as  
 29849 *posix\_trace\_rewind()* or *posix\_trace\_close()*, cannot be invoked using the trace stream identifier  
 29850 returned by the *posix\_trace\_create\_withlog()* function.

29851 The *posix\_trace\_flush()* function shall initiate a flush operation which copies the contents of the  
 29852 trace stream identified by the argument *trid* into the trace log associated with the trace stream at  
 29853 the creation time. If no trace log has been associated with the trace stream pointed to by *trid*, this  
 29854 function shall return an error. The termination of the flush operation can be polled by the  
 29855 *posix\_trace\_get\_status()* function. During the flush operation, it shall be possible to trace new  
 29856 trace events up to the point when the trace stream becomes full. After flushing is completed, the  
 29857 space used by the flushed trace events shall be available for tracing new trace events.

29858 If flushing the trace stream causes the resulting trace log to become full, the trace log full policy  
 29859 shall be applied. If the trace *log-full-policy* attribute is set, the following occurs:

29860 POSIX\_TRACE\_UNTIL\_FULL  
 29861 The trace events that have not yet been flushed shall be discarded.

29862 POSIX\_TRACE\_LOOP  
 29863 The trace events that have not yet been flushed shall be written to the beginning of the trace  
 29864 log, overwriting previous trace events stored there.

29865 POSIX\_TRACE\_APPEND  
 29866 The trace events that have not yet been flushed shall be appended to the trace log.  
 29867

29868 The *posix\_trace\_shutdown()* function shall stop the tracing of trace events in the trace stream  
 29869 identified by *trid*, as if *posix\_trace\_stop()* had been invoked. The *posix\_trace\_shutdown()* function  
 29870 shall free all the resources associated with the trace stream.

29871 The *posix\_trace\_shutdown()* function shall not return until all the resources associated with the  
 29872 trace stream have been freed. When the *posix\_trace\_shutdown()* function returns, the *trid*  
 29873 argument becomes an invalid trace stream identifier. A call to this function shall unconditionally  
 29874 deallocate the resources regardless of whether all trace events have been retrieved by the  
 29875 analyzer process. Any thread blocked on one of the *trace\_getnext\_event()* functions (which  
 29876 specified this *trid*) before this call is unblocked with the error [EINVAL].

29877 If the process exits, invokes a member of the *exec* family of functions, or is terminated, the trace  
 29878 streams that the process had created and that have not yet been shut down, shall be  
 29879 automatically shut down as if an explicit call were made to the *posix\_trace\_shutdown()* function.

29880 TRL For an active trace stream with log, when the *posix\_trace\_shutdown()* function is called, all trace  
 29881 events that have not yet been flushed to the trace log shall be flushed, as in the  
 29882 *posix\_trace\_flush()* function, and the trace log shall be closed.

29883 When a trace log is closed, all the information that may be retrieved later from the trace log  
 29884 through the trace interface shall have been written to the trace log. This information includes the  
 29885 trace attributes, the list of trace event types (with the mapping between trace event names and  
 29886 trace event type identifiers), and the trace status.

29887 In addition, unspecified information shall be written to the trace log to allow detection of a valid  
 29888 trace log during the *posix\_trace\_open()* operation.

29889 The *posix\_trace\_shutdown()* function shall not return until all trace events have been flushed.

29890 **RETURN VALUE**

29891 Upon successful completion, these functions shall return a value of zero. Otherwise, they shall  
 29892 return the corresponding error number.

29893 TRL The *posix\_trace\_create()* and *posix\_trace\_create\_withlog()* functions store the trace stream  
 29894 identifier value in the object pointed to by *trid*, if successful.

29895 **ERRORS**

29896 TRL The *posix\_trace\_create()* and *posix\_trace\_create\_withlog()* functions shall fail if:

29897 [EAGAIN] No more trace streams can be started now. {TRACE\_SYS\_MAX} has been  
 29898 exceeded.

29899 [EINTR] The operation was interrupted by a signal. No trace stream was created.

29900 [EINVAL] One or more of the trace parameters specified by the *attr* parameter is invalid.

|       |          |                                                                                                                                                  |
|-------|----------|--------------------------------------------------------------------------------------------------------------------------------------------------|
| 29901 | [ENOMEM] | The implementation does not currently have sufficient memory to create the trace stream with the specified parameters.                           |
| 29902 |          |                                                                                                                                                  |
| 29903 | [EPERM]  | The caller does not have appropriate privilege to trace the process specified by <i>pid</i> .                                                    |
| 29904 |          |                                                                                                                                                  |
| 29905 | [ESRCH]  | The <i>pid</i> argument does not refer to an existing process.                                                                                   |
| 29906 | TRL      | The <i>posix_trace_create_withlog()</i> function shall fail if:                                                                                  |
| 29907 | [EBADF]  | The <i>file_desc</i> argument is not a valid file descriptor open for writing.                                                                   |
| 29908 | [EINVAL] | The <i>file_desc</i> argument refers to a file with a file type that does not support the log policy associated with the trace log.              |
| 29909 |          |                                                                                                                                                  |
| 29910 | [ENOSPC] | No space left on device. The device corresponding to the argument <i>file_desc</i> does not contain the space required to create this trace log. |
| 29911 |          |                                                                                                                                                  |
| 29912 |          |                                                                                                                                                  |
| 29913 | TRL      | The <i>posix_trace_flush()</i> and <i>posix_trace_shutdown()</i> functions shall fail if:                                                        |
| 29914 | [EINVAL] | The value of the <i>trid</i> argument does not correspond to an active trace stream with log.                                                    |
| 29915 |          |                                                                                                                                                  |
| 29916 | [EFBIG]  | The trace log file has attempted to exceed an implementation-defined maximum file size.                                                          |
| 29917 |          |                                                                                                                                                  |
| 29918 | [ENOSPC] | No space left on device.                                                                                                                         |
| 29919 |          |                                                                                                                                                  |

29935 **CHANGE HISTORY**

29936 First released in Issue 6. Derived from IEEE Std 1003.1q-2000.

29937 **NAME**

29938 posix\_trace\_event, posix\_trace\_eventid\_open — trace functions for instrumenting application  
 29939 code (**TRACING**)

29940 **SYNOPSIS**

```

29941 TRC #include <sys/types.h>
29942 #include <trace.h>

29943 void posix_trace_event(trace_event_id_t event_id,
29944     const void *restrictdata_ptr, size_t data_len);
29945 int posix_trace_eventid_open(const char *restrict event_name,
29946     trace_event_id_t *restrict event_id);
29947
    
```

29948 **DESCRIPTION**

29949 The *posix\_trace\_event()* function shall record the *event\_id* and the user data pointed to by *data\_ptr*  
 29950 in the trace stream into which the calling process is being traced and in which *event\_id* is not  
 29951 filtered out. If the total size of the user trace event data represented by *data\_len* is not greater  
 29952 than the declared maximum size for user trace event data, then the *truncation-status* attribute of  
 29953 the trace event recorded is POSIX\_TRACE\_NOT\_TRUNCATED. Otherwise, the user trace event  
 29954 data is truncated to this declared maximum size and the *truncation-status* attribute of the trace  
 29955 event recorded is POSIX\_TRACE\_TRUNCATED\_RECORD.

29956 If there is no trace stream created for the process or if the created trace stream is not running, or  
 29957 if the trace event specified by *event\_id* is filtered out in the trace stream, the *posix\_trace\_event()*  
 29958 function shall have no effect.

29959 The *posix\_trace\_eventid\_open()* function shall associate a user trace event name with a trace event  
 29960 type identifier for the calling process. The trace event name is the string pointed to by the  
 29961 argument *event\_name*. It shall have a maximum of {TRACE\_EVENT\_NAME\_MAX} characters  
 29962 (which has the minimum value {\_POSIX\_TRACE\_EVENT\_NAME\_MAX}). The number of user  
 29963 trace event type identifiers that can be defined for any given process is limited by the maximum  
 29964 value {TRACE\_USER\_EVENT\_MAX}, which has the minimum value  
 29965 {POSIX\_TRACE\_USER\_EVENT\_MAX}.

29966 If the Trace Inherit option is not supported, the *posix\_trace\_eventid\_open()* function shall  
 29967 associate the user trace event name pointed to by the *event\_name* argument with a trace event  
 29968 type identifier that is unique for the traced process, and is returned in the variable pointed to by  
 29969 the *event\_id* argument. If the user trace event name has already been mapped for the traced  
 29970 process, then the previously assigned trace event type identifier shall be returned. If the per-  
 29971 process user trace event name limit represented by {TRACE\_USER\_EVENT\_MAX} has been  
 29972 reached, the pre-defined POSIX\_TRACE\_UNNAMED\_USEREVENT (see Table 2-7 (on page 79))  
 29973 user trace event shall be returned.

29974 TRI If the Trace Inherit option is supported, the *posix\_trace\_eventid\_open()* function shall associate the  
 29975 user trace event name pointed to by the *event\_name* argument with a trace event type identifier  
 29976 that is unique for all the processes being traced in this same trace stream, and is returned in the  
 29977 variable pointed to by the *event\_id* argument. If the user trace event name has already been  
 29978 mapped for the traced processes, then the previously assigned trace event type identifier shall be  
 29979 returned. If the per-process user trace event name limit represented by  
 29980 {TRACE\_USER\_EVENT\_MAX} has been reached, the pre-defined  
 29981 POSIX\_TRACE\_UNNAMED\_USEREVENT (Table 2-7 (on page 79)) user trace event shall be  
 29982 returned.

29983 **Note:** The above procedure, together with the fact that multiple processes can only be traced into the  
 29984 same trace stream by inheritance, ensure that all the processes that are traced into a trace  
 29985 stream have the same mapping of trace event names to trace event type identifiers.

29986

29987 If there is no trace stream created, the *posix\_trace\_eventid\_open()* function shall store this  
29988 information for future trace streams created for this process.

**29989 RETURN VALUE**

29990 No return value is defined for the *posix\_trace\_event()* function.

29991 Upon successful completion, the *posix\_trace\_eventid\_open()* function shall return a value of zero.  
29992 Otherwise, it shall return the corresponding error number. The *posix\_trace\_eventid\_open()*  
29993 function stores the trace event type identifier value in the object pointed to by *event\_id*, if  
29994 successful.

**29995 ERRORS**

29996 The *posix\_trace\_eventid\_open()* function shall fail if:

29997 [ENAMETOOLONG]

29998 The size of the name pointed to by the *event\_name* argument was longer than  
29999 the implementation-defined value {TRACE\_EVENT\_NAME\_MAX}.

30010 volume of IEEE Std 1003.1-2001, <sys/types.h>, <trace.h>

**30011 CHANGE HISTORY**

30012 First released in Issue 6. Derived from IEEE Std 1003.1q-2000.

30013 IEEE PASC Interpretation 1003.1 #123 is applied.

30014 IEEE PASC Interpretation 1003.1 #127 is applied, correcting some editorial errors in the names of  
30015 the *posix\_trace\_eventid\_open()* function and the *event\_id* argument.

30016 **NAME**

30017 posix\_trace\_eventid\_equal, posix\_trace\_eventid\_get\_name, posix\_trace\_trid\_eventid\_open —  
 30018 manipulate the trace event type identifier (**TRACING**)

30019 **SYNOPSIS**

```
30020 TRC #include <trace.h>
30021
30022 int posix_trace_eventid_equal(trace_id_t trid, trace_event_id_t event1,
30023                             trace_event_id_t event2);
30024 int posix_trace_eventid_get_name(trace_id_t trid,
30025                                 trace_event_id_t event, char *event_name);
30026 TRC TEF int posix_trace_trid_eventid_open(trace_id_t trid,
30027                                           const char *restrict event_name,
30028                                           trace_event_id_t *restrict event);
```

30029 **DESCRIPTION**

30030 The *posix\_trace\_eventid\_equal()* function shall compare the trace event type identifiers *event1* and  
 30031 *event2* from the same trace stream or the same trace log identified by the *trid* argument. If the  
 30032 trace event type identifiers *event1* and *event2* are from different trace streams, the return value  
 30033 shall be unspecified.

30034 The *posix\_trace\_eventid\_get\_name()* function shall return, in the argument pointed to by  
 30035 *event\_name*, the trace event name associated with the trace event type identifier identified by the  
 30036 argument *event*, for the trace stream or for the trace log identified by the *trid* argument. The  
 30037 name of the trace event shall have a maximum of {TRACE\_EVENT\_NAME\_MAX} characters  
 30038 (which has the minimum value {\_POSIX\_TRACE\_EVENT\_NAME\_MAX}). Successive calls to  
 30039 this function with the same trace event type identifier and the same trace stream identifier shall  
 30040 return the same event name.

30041 TEF The *posix\_trace\_trid\_eventid\_open()* function shall associate a user trace event name with a trace  
 30042 event type identifier for a given trace stream. The trace stream is identified by the *trid* argument,  
 30043 and it shall be an active trace stream. The trace event name is the string pointed to by the  
 30044 argument *event\_name*. It shall have a maximum of {TRACE\_EVENT\_NAME\_MAX} characters  
 30045 (which has the minimum value {\_POSIX\_TRACE\_EVENT\_NAME\_MAX}). The number of user  
 30046 trace event type identifiers that can be defined for any given process is limited by the maximum  
 30047 value {TRACE\_USER\_EVENT\_MAX}, which has the minimum value  
 30048 {\_POSIX\_TRACE\_USER\_EVENT\_MAX}.

30049 If the Trace Inherit option is not supported, the *posix\_trace\_trid\_eventid\_open()* function shall  
 30050 associate the user trace event name pointed to by the *event\_name* argument with a trace event  
 30051 type identifier that is unique for the process being traced in the trace stream identified by the *trid*  
 30052 argument, and is returned in the variable pointed to by the *event* argument. If the user trace  
 30053 event name has already been mapped for the traced process, then the previously assigned trace  
 30054 event type identifier shall be returned. If the per-process user trace event name limit represented  
 30055 by {TRACE\_USER\_EVENT\_MAX} has been reached, the pre-defined  
 30056 POSIX\_TRACE\_UNNAMED\_USEREVENT (see Table 2-7 (on page 79)) user trace event shall be  
 30057 returned.

30058 TEF TRI If the Trace Inherit option is supported, the *posix\_trace\_trid\_eventid\_open()* function shall  
 30059 associate the user trace event name pointed to by the *event\_name* argument with a trace event  
 30060 type identifier that is unique for all the processes being traced in the trace stream identified by  
 30061 the *trid* argument, and is returned in the variable pointed to by the *event* argument. If the user  
 30062 trace event name has already been mapped for the traced processes, then the previously  
 30063 assigned trace event type identifier shall be returned. If the per-process user trace event name  
 30064 limit represented by {TRACE\_USER\_EVENT\_MAX} has been reached, the pre-defined

30065 POSIX\_TRACE\_UNNAMED\_USEREVENT (see Table 2-7 (on page 79)) user trace event shall be  
 30066 returned.

#### 30067 RETURN VALUE

30068 TEF Upon successful completion, the *posix\_trace\_eventid\_get\_name()* and  
 30069 *posix\_trace\_trid\_eventid\_open()* functions shall return a value of zero. Otherwise, they shall return  
 30070 the corresponding error number.

30071 The *posix\_trace\_eventid\_equal()* function shall return a non-zero value if *event1* and *event2* are  
 30072 equal; otherwise, a value of zero shall be returned. No errors are defined. If either *event1* or  
 30073 *event2* are not valid trace event type identifiers for the trace stream specified by *trid* or if the *trid*  
 30074 is invalid, the behavior shall be unspecified.

30075 The *posix\_trace\_eventid\_get\_name()* function stores the trace event name value in the object  
 30076 pointed to by *event\_name*, if successful.

30077 TEF The *posix\_trace\_trid\_eventid\_open()* function stores the trace event type identifier value in the  
 30078 object pointed to by *event*, if successful.

#### 30079 ERRORS

30080 TEF The *posix\_trace\_eventid\_get\_name()* and *posix\_trace\_trid\_eventid\_open()* functions shall fail if:

30081 [EINVAL] The *trid* argument was not a valid trace stream identifier.

30082 TEF The *posix\_trace\_trid\_eventid\_open()* function shall fail if:

30083 TEF [ENAMETOOLONG]

30084 The size of the name pointed to by the *event\_name* argument was longer than  
 30085 the implementation-defined value {TRACE\_EVENT\_NAME\_MAX}.

30086 The *posix\_trace\_eventid\_get\_name()* function shall fail if:

30087 [EINVAL] The trace event type identifier *event* was not associated with any name.

#### 30088 EXAMPLES

30089 None.

#### 30090 APPLICATION USAGE

30091 None.

#### 30092 RATIONALE

30093 None.

#### 30094 FUTURE DIRECTIONS

30095 None.

#### 30099 CHANGE HISTORY

30100 First released in Issue 6. Derived from IEEE Std 1003.1q-2000.

30101 IEEE PASC Interpretations 1003.1 #123 and #129 are applied.

30102 **NAME**

30103        posix\_trace\_eventid\_open — trace functions for instrumenting application code (**TRACING**)

30104 **SYNOPSIS**

30105 TRC     #include <sys/types.h>

30106        #include <trace.h>

30107        int posix\_trace\_eventid\_open(const char \*restrict event\_name,

30108                                    trace\_event\_id\_t \*restrict event\_id);

30109

30110 **DESCRIPTION**

30111        Refer to *posix\_trace\_event()*.

## 30112 NAME

30113 posix\_trace\_eventset\_add, posix\_trace\_eventset\_del, posix\_trace\_eventset\_empty,  
 30114 posix\_trace\_eventset\_fill, posix\_trace\_eventset\_ismember — manipulate trace event type sets  
 30115 (TRACING)

## 30116 SYNOPSIS

```
30117 TRC TEF #include <trace.h>
30118 int posix_trace_eventset_add(trace_event_id_t event_id,
30119     trace_event_set_t *set);
30120 int posix_trace_eventset_del(trace_event_id_t event_id,
30121     trace_event_set_t *set);
30122 int posix_trace_eventset_empty(trace_event_set_t *set);
30123 int posix_trace_eventset_fill(trace_event_set_t *set, int what);
30124 int posix_trace_eventset_ismember(trace_event_id_t event_id,
30125     const trace_event_set_t *restrict set, int *restrict ismember);
30126
```

## 30127 DESCRIPTION

30128 These primitives manipulate sets of trace event types. They operate on data objects addressable  
 30129 by the application, not on the current trace event filter of any trace stream.

30130 The *posix\_trace\_eventset\_add()* and *posix\_trace\_eventset\_del()* functions, respectively, shall add or  
 30131 delete the individual trace event type specified by the value of the argument *event\_id* to or from  
 30132 the trace event type set pointed to by the argument *set*. Adding a trace event type already in the  
 30133 set or deleting a trace event type not in the set shall not be considered an error.

30134 The *posix\_trace\_eventset\_empty()* function shall initialize the trace event type set pointed to by  
 30135 the *set* argument such that all trace event types defined, both system and user, shall be excluded  
 30136 from the set.

30137 The *posix\_trace\_eventset\_fill()* function shall initialize the trace event type set pointed to by the  
 30138 argument *set*, such that the set of trace event types defined by the argument *what* shall be  
 30139 included in the set. The value of the argument *what* shall consist of one of the following values,  
 30140 as defined in the `<trace.h>` header:

## 30141 POSIX\_TRACE\_WOPID\_EVENTS

30142 All the process-independent implementation-defined system trace event types are included  
 30143 in the set.

## 30144 POSIX\_TRACE\_SYSTEM\_EVENTS

30145 All the implementation-defined system trace event types are included in the set, as are those  
 30146 defined in IEEE Std 1003.1-2001.

## 30147 POSIX\_TRACE\_ALL\_EVENTS

30148 All trace event types defined, both system and user, are included in the set.

30149 Applications shall call either *posix\_trace\_eventset\_empty()* or *posix\_trace\_eventset\_fill()* at least  
 30150 once for each object of type `trace_event_set_t` prior to any other use of that object. If such an  
 30151 object is not initialized in this way, but is nonetheless supplied as an argument to any of the  
 30152 *posix\_trace\_eventset\_add()*, *posix\_trace\_eventset\_del()*, or *posix\_trace\_eventset\_ismember()* functions,  
 30153 the results are undefined.

30154 The *posix\_trace\_eventset\_ismember()* function shall test whether the trace event type specified by  
 30155 the value of the argument *event\_id* is a member of the set pointed to by the argument *set*. The  
 30156 value returned in the object pointed to by *ismember* argument is zero if the trace event type  
 30157 identifier is not a member of the set and a value different from zero if it is a member of the set.

## 30158 RETURN VALUE

30159       Upon successful completion, these functions shall return a value of zero. Otherwise, they shall  
30160       return the corresponding error number.

## 30161 ERRORS

30162       These functions may fail if:

30163       [EINVAL]       The value of one of the arguments is invalid.

## 30164 EXAMPLES

30165       None.

## 30166 APPLICATION USAGE

30167       None.

## 30168 RATIONALE

30169       None.

## 30170 FUTURE DIRECTIONS

30171       None.

## 30172 SEE ALSO

30173       *posix\_trace\_set\_filter()*, *posix\_trace\_trid\_eventid\_open()*, the Base Definitions volume of  
30174       IEEE Std 1003.1-2001, <trace.h>

## 30175 CHANGE HISTORY

30176       First released in Issue 6. Derived from IEEE Std 1003.1q-2000.

30177 **NAME**

30178        posix\_trace\_eventtypelist\_getnext\_id, posix\_trace\_eventtypelist\_rewind — iterate over a  
30179        mapping of trace event types (**TRACING**)

30180 **SYNOPSIS**

30181 TRC     #include <trace.h>

```
30182     int posix_trace_eventtypelist_getnext_id(trace_id_t trid,
30183         trace_event_id_t *restrict event, int *restrict unavailable);
30184     int posix_trace_eventtypelist_rewind(trace_id_t trid);
```

30185

30186 **DESCRIPTION**

30187        The first time *posix\_trace\_eventtypelist\_getnext\_id()* is called, the function shall return in the  
30188        variable pointed to by *event* the first trace event type identifier of the list of trace events of the  
30189        trace stream identified by the *trid* argument. Successive calls to  
30190        *posix\_trace\_eventtypelist\_getnext\_id()* return in the variable pointed to by *event* the next trace  
30191        event type identifier in that same list. Each time a trace event type identifier is successfully  
30192        written into the variable pointed to by the *event* argument, the variable pointed to by the  
30193        *unavailable* argument shall be set to zero. When no more trace event type identifiers are  
30194        available, and so none is returned, the variable pointed to by the *unavailable* argument shall be  
30195        set to a value different from zero.

30196        The *posix\_trace\_eventtypelist\_rewind()* function shall reset the next trace event type identifier to  
30197        be read to the first trace event type identifier from the list of trace events used in the trace stream  
30198        identified by *trid*.

30199 **RETURN VALUE**

30200        Upon successful completion, these functions shall return a value of zero. Otherwise, they shall  
30201        return the corresponding error number.

30202        The *posix\_trace\_eventtypelist\_getnext\_id()* function stores the trace event type identifier value in  
30203        the object pointed to by *event*, if successful.

30204 **ERRORS**

30205        These functions shall fail if:

30206        [EINVAL]        The *trid* argument was not a valid trace stream identifier.

30207 **EXAMPLES**

30208        None.

30209 **APPLICATION USAGE**

30210        None.

30211 **RATIONALE**

30212        None.

30213 **FUTURE DIRECTIONS**

30214        None.

30215 **SEE ALSO**

30217        Definitions volume of IEEE Std 1003.1-2001, <trace.h>

30218 **CHANGE HISTORY**

30219        First released in Issue 6. Derived from IEEE Std 1003.1q-2000.

30220        IEEE PASC Interpretations 1003.1 #123 and #129 are applied.

30221 **NAME**

30222        `posix_trace_flush` — trace stream flush from a process (**TRACING**)

30223 **SYNOPSIS**

30224 TRC     `#include <sys/types.h>`

30225        `#include <trace.h>`

30226        `int posix_trace_flush(trace_id_t trid);`

30227

30228 **DESCRIPTION**

30229        Refer to `posix_trace_create()`.

## 30230 NAME

30231 posix\_trace\_get\_attr, posix\_trace\_get\_status — retrieve the trace attributes or trace status  
30232 (TRACING)

## 30233 SYNOPSIS

30234 TRC #include <trace.h>

30235 int posix\_trace\_get\_attr(trace\_id\_t trid, trace\_attr\_t \*attr);

30236 int posix\_trace\_get\_status(trace\_id\_t trid,

30237 struct posix\_trace\_status\_info \*statusinfo);

30238

## 30239 DESCRIPTION

30240 The *posix\_trace\_get\_attr()* function shall copy the attributes of the active trace stream identified  
30241 TRL by *trid* into the object pointed to by the *attr* argument. If the Trace Log option is supported, *trid*  
30242 may represent a pre-recorded trace log.

30243 The *posix\_trace\_get\_status()* function shall return, in the structure pointed to by the *statusinfo*  
30244 argument, the current trace status for the trace stream identified by the *trid* argument. These  
30245 status values returned in the structure pointed to by *statusinfo* shall have been appropriately  
30246 TRL read to ensure that the returned values are consistent. If the Trace Log option is supported and  
30247 the *trid* argument refers to a pre-recorded trace stream, the status shall be the status of the  
30248 completed trace stream.

30249 Each time the *posix\_trace\_get\_status()* function is used, the overrun status of the trace stream  
30250 TRL shall be reset to POSIX\_TRACE\_NO\_OVERRUN immediately after the call completes. If the  
30251 Trace Log option is supported, the *posix\_trace\_get\_status()* function shall behave the same as  
30252 when the option is not supported except for the following differences:

- 30253 • If the *trid* argument refers to a trace stream with log, each time the *posix\_trace\_get\_status()*  
30254 function is used, the log overrun status of the trace stream shall be reset to  
30255 POSIX\_TRACE\_NO\_OVERRUN and the *flush\_error* status shall be reset to zero immediately  
30256 after the call completes.
- 30257 • If the *trid* argument refers to a pre-recorded trace stream, the status returned shall be the  
30258 status of the completed trace stream and the status values of the trace stream shall not be  
30259 reset.

30260

## 30261 RETURN VALUE

30262 Upon successful completion, these functions shall return a value of zero. Otherwise, they shall  
30263 return the corresponding error number.

30264 The *posix\_trace\_get\_attr()* function stores the trace attributes in the object pointed to by *attr*, if  
30265 successful.

30266 The *posix\_trace\_get\_status()* function stores the trace status in the object pointed to by *statusinfo*,  
30267 if successful.

## 30268 ERRORS

30269 These functions shall fail if:

30270 [EINVAL] The trace stream argument *trid* does not correspond to a valid active trace  
30271 stream or a valid trace log.

30272 **EXAMPLES**

30273 None.

30274 **APPLICATION USAGE**

30275 None.

30276 **RATIONALE**

30277 None.

30278 **FUTURE DIRECTIONS**

30279 None.

30282 Definitions volume of IEEE Std 1003.1-2001, <trace.h>

30283 **CHANGE HISTORY**

30284 First released in Issue 6. Derived from IEEE Std 1003.1q-2000.

30285 IEEE PASC Interpretation 1003.1 #123 is applied.

30286 **NAME**

30287 posix\_trace\_get\_filter, posix\_trace\_set\_filter — retrieve and set the filter of an initialized trace  
 30288 stream (**TRACING**)

30289 **SYNOPSIS**

30290 TRC TEF #include <trace.h>

30291 int posix\_trace\_get\_filter(trace\_id\_t trid, trace\_event\_set\_t \*set);

30292 int posix\_trace\_set\_filter(trace\_id\_t trid,

30293 const trace\_event\_set\_t \*set, int how);

30294

30295 **DESCRIPTION**

30296 The *posix\_trace\_get\_filter()* function shall retrieve, into the argument pointed to by *set*, the actual  
 30297 trace event filter from the trace stream specified by *trid*.

30298 The *posix\_trace\_set\_filter()* function shall change the set of filtered trace event types after a trace  
 30299 stream identified by the *trid* argument is created. This function may be called prior to starting  
 30300 the trace stream, or while the trace stream is active. By default, if no call is made to  
 30301 *posix\_trace\_set\_filter()*, all trace events shall be recorded (that is, none of the trace event types are  
 30302 filtered out).

30303 If this function is called while the trace is in progress, a special system trace event,  
 30304 POSIX\_TRACE\_FILTER, shall be recorded in the trace indicating both the old and the new sets  
 30305 of filtered trace event types (see Table 2-4 (on page 78) and Table 2-6 (on page 79)).

30306 If the *posix\_trace\_set\_filter()* function is interrupted by a signal, an error shall be returned and the  
 30307 filter shall not be changed. In this case, the state of the trace stream shall not be changed.

30308 The value of the argument *how* indicates the manner in which the set is to be changed and shall  
 30309 have one of the following values, as defined in the <**trace.h**> header:

30310 POSIX\_TRACE\_SET\_EVENTSET

30311 The resulting set of trace event types to be filtered shall be the trace event type set pointed  
 30312 to by the argument *set*.

30313 POSIX\_TRACE\_ADD\_EVENTSET

30314 The resulting set of trace event types to be filtered shall be the union of the current set and  
 30315 the trace event type set pointed to by the argument *set*.

30316 POSIX\_TRACE\_SUB\_EVENTSET

30317 The resulting set of trace event types to be filtered shall be all trace event types in the  
 30318 current set that are not in the set pointed to by the argument *set*; that is, remove each  
 30319 element of the specified set from the current filter.

30320 **RETURN VALUE**

30321 Upon successful completion, these functions shall return a value of zero. Otherwise, they shall  
 30322 return the corresponding error number.

30323 The *posix\_trace\_get\_filter()* function stores the set of filtered trace event types in *set*, if successful.

30324 **ERRORS**

30325 These functions shall fail if:

30326 [EINVAL] The value of the *trid* argument does not correspond to an active trace stream  
 30327 or the value of the argument pointed to by *set* is invalid.

30328 [EINTR] The operation was interrupted by a signal.

**30329 EXAMPLES**

30330 None.

**30331 APPLICATION USAGE**

30332 None.

**30333 RATIONALE**

30334 None.

**30335 FUTURE DIRECTIONS**

30343 **NAME**

30344        posix\_trace\_get\_status — retrieve the trace status (**TRACING**)

30345 **SYNOPSIS**

30346 TRC     #include <trace.h>

```
30347     int posix_trace_get_status(trace_id_t trid,  
30348         struct posix_trace_status_info *statusinfo);
```

30349

30350 **DESCRIPTION**

30351        Refer to *posix\_trace\_get\_attr()*.

30352 **NAME**

30353 posix\_trace\_getnext\_event, posix\_trace\_timedgetnext\_event, posix\_trace\_trygetnext\_event —  
 30354 retrieve a trace event (**TRACING**)

30355 **SYNOPSIS**

```

30356 TRC #include <sys/types.h>
30357 #include <trace.h>

30358 int posix_trace_getnext_event(trace_id_t trid,
30359 struct posix_trace_event_info *restrict event,
30360 void *restrict data, size_t num_bytes,
30361 size_t *restrict data_len, int *restrict unavailable);
30362 TRC TMO int posix_trace_timedgetnext_event(trace_id_t trid,
30363 struct posix_trace_event_info *restrict event,
30364 void *restrict data, size_t num_bytes,
30365 size_t *restrict data_len, int *restrict unavailable,
30366 const struct timespec *restrict abs_timeout);
30367 TRC int posix_trace_trygetnext_event(trace_id_t trid,
30368 struct posix_trace_event_info *restrict event,
30369 void *restrict data, size_t num_bytes,
30370 size_t *restrict data_len, int *restrict unavailable);
30371
    
```

30372 **DESCRIPTION**

30373 The *posix\_trace\_getnext\_event()* function shall report a recorded trace event either from an active  
 30374 TRL trace stream without log or a pre-recorded trace stream identified by the *trid* argument. The  
 30375 *posix\_trace\_trygetnext\_event()* function shall report a recorded trace event from an active trace  
 30376 stream without log identified by the *trid* argument.

30377 The trace event information associated with the recorded trace event shall be copied by the  
 30378 function into the structure pointed to by the argument *event* and the data associated with the  
 30379 trace event shall be copied into the buffer pointed to by the *data* argument.

30380 The *posix\_trace\_getnext\_event()* function shall block if the *trid* argument identifies an active trace  
 30381 stream and there is currently no trace event ready to be retrieved. When returning, if a recorded  
 30382 trace event was reported, the variable pointed to by the *unavailable* argument shall be set to zero.  
 30383 Otherwise, the variable pointed to by the *unavailable* argument shall be set to a value different  
 30384 from zero.

30385 TMO The *posix\_trace\_timedgetnext\_event()* function shall attempt to get another trace event from an  
 30386 active trace stream without log, as in the *posix\_trace\_getnext\_event()* function. However, if no  
 30387 trace event is available from the trace stream, the implied wait shall be terminated when the  
 30388 timeout specified by the argument *abs\_timeout* expires, and the function shall return the error  
 30389 [ETIMEDOUT].

30390 The timeout shall expire when the absolute time specified by *abs\_timeout* passes, as measured by  
 30391 the clock upon which timeouts are based (that is, when the value of that clock equals or exceeds  
 30392 *abs\_timeout*), or if the absolute time specified by *abs\_timeout* has already passed at the time of the  
 30393 call.

30394 TMO TMR If the Timers option is supported, the timeout shall be based on the CLOCK\_REALTIME clock;  
 30395 if the Timers option is not supported, the timeout shall be based on the system clock as returned  
 30396 by the *time()* function. The resolution of the timeout shall be the resolution of the clock on which  
 30397 it is based. The **timespec** data type is defined in the **<time.h>** header.

30398 TMO Under no circumstance shall the function fail with a timeout if a trace event is immediately  
 30399 available from the trace stream. The validity of the *abs\_timeout* argument need not be checked if

30400 a trace event is immediately available from the trace stream.

30401 The behavior of this function for a pre-recorded trace stream is unspecified.

30402 TRL The *posix\_trace\_trygetnext\_event()* function shall not block. This function shall return an error if  
 30403 the *trid* argument identifies a pre-recorded trace stream. If a recorded trace event was reported,  
 30404 the variable pointed to by the *unavailable* argument shall be set to zero. Otherwise, if no trace  
 30405 event was reported, the variable pointed to by the *unavailable* argument shall be set to a value  
 30406 different from zero.

30407 The argument *num\_bytes* shall be the size of the buffer pointed to by the *data* argument. The  
 30408 argument *data\_len* reports to the application the length in bytes of the data record just  
 30409 transferred. If *num\_bytes* is greater than or equal to the size of the data associated with the trace  
 30410 event pointed to by the *event* argument, all the recorded data shall be transferred. In this case, the  
 30411 *truncation-status* member of the trace event structure shall be either  
 30412 POSIX\_TRACE\_NOT\_TRUNCATED, if the trace event data was recorded without truncation  
 30413 while tracing, or POSIX\_TRACE\_TRUNCATED\_RECORD, if the trace event data was truncated  
 30414 when it was recorded. If the *num\_bytes* argument is less than the length of recorded trace event  
 30415 data, the data transferred shall be truncated to a length of *num\_bytes*, the value stored in the  
 30416 variable pointed to by *data\_len* shall be equal to *num\_bytes*, and the *truncation-status* member of  
 30417 the *event* structure argument shall be set to POSIX\_TRACE\_TRUNCATED\_READ (see the  
 30418 **posix\_trace\_event\_info** structure defined in <trace.h>).

30419 The report of a trace event shall be sequential starting from the oldest recorded trace event. Trace  
 30420 events shall be reported in the order in which they were generated, up to an implementation-  
 30421 defined time resolution that causes the ordering of trace events occurring very close to each  
 30422 other to be unknown. Once reported, a trace event cannot be reported again from an active trace  
 30423 stream. Once a trace event is reported from an active trace stream without log, the trace stream  
 30424 shall make the resources associated with that trace event available to record future generated  
 30425 trace events.

30426 **RETURN VALUE**

30427 Upon successful completion, these functions shall return a value of zero. Otherwise, they shall  
 30428 return the corresponding error number.

30429 If successful, these functions store:

- 30430 • The recorded trace event in the object pointed to by *event*
- 30431 • The trace event information associated with the recorded trace event in the object pointed to  
 30432 by *data*
- 30433 • The length of this trace event information in the object pointed to by *data\_len*
- 30434 • The value of zero in the object pointed to by *unavailable*

30435 **ERRORS**

30436 These functions shall fail if:

30437 [EINVAL] The trace stream identifier argument *trid* is invalid.

30438 The *posix\_trace\_getnext\_event()* and *posix\_trace\_timedgetnext\_event()* functions shall fail if:

30439 [EINTR] The operation was interrupted by a signal, and so the call had no effect.

30440 The *posix\_trace\_trygetnext\_event()* function shall fail if:

30441 [EINVAL] The trace stream identifier argument *trid* does not correspond to an active  
 30442 trace stream.

30443 TMO The *posix\_trace\_timedgetnext\_event()* function shall fail if:

30444 [EINVAL] There is no trace event immediately available from the trace stream, and the  
30445 *timeout* argument is invalid.

30446 [ETIMEDOUT] No trace event was available from the trace stream before the specified  
30447 timeout *timeout* expired.  
30448

30460 **CHANGE HISTORY**

30461 First released in Issue 6. Derived from IEEE Std 1003.1q-2000.

30462 IEEE PASC Interpretation 1003.1 #123 is applied.

30463 **NAME**30464        posix\_trace\_open, posix\_trace\_rewind — trace log management (**TRACING**)30465 **SYNOPSIS**

30466 TCT TRL #include &lt;trace.h&gt;

30467        int posix\_trace\_open(int *file\_desc*, trace\_id\_t \**trid*);30468        int posix\_trace\_rewind(trace\_id\_t *trid*);

30469

30470 **DESCRIPTION**30471        Refer to *posix\_trace\_close()*.

30472 **NAME**

30473        posix\_trace\_set\_filter — set filter of an initialized trace stream (**TRACING**)

30474 **SYNOPSIS**

30475 TRC TEF #include <trace.h>

```
30476     int posix_trace_set_filter(trace_id_t trid,  
30477                               const trace_event_set_t *set, int how);
```

30478

30479 **DESCRIPTION**

30480        Refer to *posix\_trace\_get\_filter()*.

30481 **NAME**30482        posix\_trace\_shutdown — trace stream shutdown from a process (**TRACING**)30483 **SYNOPSIS**

30484 TRC     #include &lt;sys/types.h&gt;

30485        #include &lt;trace.h&gt;

30486        int posix\_trace\_shutdown(trace\_id\_t *trid*);

30487

30488 **DESCRIPTION**30489        Refer to *posix\_trace\_create()*.

30490 **NAME**

30491            posix\_trace\_start, posix\_trace\_stop — trace start and stop (**TRACING**)

30492 **SYNOPSIS**

30493 TRC        #include <trace.h>

30494            int posix\_trace\_start(trace\_id\_t trid);

30495            int posix\_trace\_stop (trace\_id\_t trid);

30496

30497 **DESCRIPTION**

30498            The *posix\_trace\_start()* and *posix\_trace\_stop()* functions, respectively, shall start and stop the  
30499            trace stream identified by the argument *trid*.

30500            The effect of calling the *posix\_trace\_start()* function shall be recorded in the trace stream as the  
30501            POSIX\_TRACE\_START system trace event and the status of the trace stream shall become  
30502            POSIX\_TRACE\_RUNNING. If the trace stream is in progress when this function is called, the  
30503            POSIX\_TRACE\_START system trace event shall not be recorded and the trace stream shall  
30504            continue to run. If the trace stream is full, the POSIX\_TRACE\_START system trace event shall  
30505            not be recorded and the status of the trace stream shall not be changed.

30506            The effect of calling the *posix\_trace\_stop()* function shall be recorded in the trace stream as the  
30507            POSIX\_TRACE\_STOP system trace event and the status of the trace stream shall become  
30508            POSIX\_TRACE\_SUSPENDED. If the trace stream is suspended when this function is called, the  
30509            POSIX\_TRACE\_STOP system trace event shall not be recorded and the trace stream shall remain  
30510            suspended. If the trace stream is full, the POSIX\_TRACE\_STOP system trace event shall not be  
30511            recorded and the status of the trace stream shall not be changed.

30512 **RETURN VALUE**

30513            Upon successful completion, these functions shall return a value of zero. Otherwise, they shall  
30514            return the corresponding error number.

30515 **ERRORS**

30516            These functions shall fail if:

30517            [EINVAL]            The value of the argument *trid* does not correspond to an active trace stream  
30518            and thus no trace stream was started or stopped.

30519            [EINTR]            The operation was interrupted by a signal and thus the trace stream was not  
30520            necessarily started or stopped.

30521 **EXAMPLES**

30522            None.

30523 **APPLICATION USAGE**

30524            None.

30525 **RATIONALE**

30526            None.

30527 **FUTURE DIRECTIONS**

30528            None.

30529 **SEE ALSO**

30530            *posix\_trace\_create()*, the Base Definitions volume of IEEE Std 1003.1-2001, <trace.h>

30531 **CHANGE HISTORY**

30532           First released in Issue 6. Derived from IEEE Std 1003.1q-2000.

30533           IEEE PASC Interpretation 1003.1 #123 is applied.

30534 **NAME**

30535        posix\_trace\_timedgetnext\_event, — retrieve a trace event (**TRACING**)

30536 **SYNOPSIS**

30537 TRC TMO #include <sys/types.h>

30538        #include <trace.h>

```
30539        int posix_trace_timedgetnext_event(trace_id_t trid,  
30540        struct posix_trace_event_info *restrict event,  
30541        void *restrict data, size_t num_bytes,  
30542        size_t *restrict data_len, int *restrict unavailable,  
30543        const struct timespec *restrict abs_timeout);  
30544
```

30545 **DESCRIPTION**

30546        Refer to *posix\_trace\_getnext\_event()*.

30547 **NAME**30548        `posix_trace_trid_eventid_open` — open a trace event type identifier (**TRACING**)30549 **SYNOPSIS**30550 TRC TEF    `#include <trace.h>`

```
30551        int posix_trace_trid_eventid_open(trace_id_t trid,  
30552                      const char *restrict event_name,  
30553                      trace_event_id_t *restrict event);
```

30554

30555 **DESCRIPTION**30556        Refer to `posix_trace_eventid_equal()`.

30557 **NAME**

30558        posix\_trace\_trygetnext\_event — retrieve a trace event (**TRACING**)

30559 **SYNOPSIS**

30560 TRC     #include <sys/types.h>

30561        #include <trace.h>

```
30562        int posix_trace_trygetnext_event(trace_id_t trid,  
30563                                        struct posix_trace_event_info *restrict event,  
30564                                        void *restrict data, size_t num_bytes,  
30565                                        size_t *restrict data_len, int *restrict unavailable);  
30566
```

30567 **DESCRIPTION**

30568        Refer to *posix\_trace\_getnext\_event()*.

30569 **NAME**30570 `posix_typed_mem_get_info` — query typed memory information (**ADVANCED REALTIME**)30571 **SYNOPSIS**30572 `TYM` `#include <sys/mman.h>`30573 `int posix_typed_mem_get_info(int fildes,`  
30574 `struct posix_typed_mem_info *info);`

30575

30576 **DESCRIPTION**

30577 The `posix_typed_mem_get_info()` function shall return, in the `posix_tmi_length` field of the  
 30578 **posix\_typed\_mem\_info** structure pointed to by `info`, the maximum length which may be  
 30579 successfully allocated by the typed memory object designated by `fildes`. This maximum length  
 30580 shall take into account the flag `POSIX_TYPED_MEM_ALLOCATE` or  
 30581 `POSIX_TYPED_MEM_ALLOCATE_CONTIG` specified when the typed memory object  
 30582 represented by `fildes` was opened. The maximum length is dynamic; therefore, the value returned  
 30583 is valid only while the current mapping of the corresponding typed memory pool remains  
 30584 unchanged.

30585 If `fildes` represents a typed memory object opened with neither the  
 30586 `POSIX_TYPED_MEM_ALLOCATE` flag nor the `POSIX_TYPED_MEM_ALLOCATE_CONTIG`  
 30587 flag specified, the returned value of `info->posix_tmi_length` is unspecified.

30588 The `posix_typed_mem_get_info()` function may return additional implementation-defined  
 30589 information in other fields of the **posix\_typed\_mem\_info** structure pointed to by `info`.

30590 If the memory object specified by `fildes` is not a typed memory object, then the behavior of this  
 30591 function is undefined.

30592 **RETURN VALUE**

30593 Upon successful completion, the `posix_typed_mem_get_info()` function shall return zero;  
 30594 otherwise, the corresponding error status value shall be returned.

30595 **ERRORS**

30596 The `posix_typed_mem_get_info()` function shall fail if:

30597 `[EBADF]` The `fildes` argument is not a valid open file descriptor.

30598 `[ENODEV]` The `fildes` argument is not connected to a memory object supported by this  
 30599 function.

30600 This function shall not return an error code of `[EINTR]`.

30601 **EXAMPLES**

30602 None.

30603 **APPLICATION USAGE**

30604 None.

30605 **RATIONALE**

30606 An application that needs to allocate a block of typed memory with length dependent upon the  
 30607 amount of memory currently available must either query the typed memory object to obtain the  
 30608 amount available, or repeatedly invoke `mmap()` attempting to guess an appropriate length.  
 30609 While the latter method is existing practice with `malloc()`, it is awkward and imprecise. The  
 30610 `posix_typed_mem_get_info()` function allows an application to immediately determine available  
 30611 memory. This is particularly important for typed memory objects that may in some cases be  
 30612 scarce resources. Note that when a typed memory pool is a shared resource, some form of  
 30613 mutual-exclusion or synchronization may be required while typed memory is being queried and

30614 allocated to prevent race conditions.

30615 The existing *fstat()* function is not suitable for this purpose. We realize that implementations  
30616 may wish to provide other attributes of typed memory objects (for example, alignment  
30617 requirements, page size, and so on). The *fstat()* function returns a structure which is not  
30618 extensible and, furthermore, contains substantial information that is inappropriate for typed  
30619 memory objects.

30620 **FUTURE DIRECTIONS**

30621 None.

30622 **SEE ALSO**

30623 *fstat()*, *mmap()*, *posix\_typed\_mem\_open()*, the Base Definitions volume of IEEE Std 1003.1-2001,  
30624 `<sys/mman.h>`

30625 **CHANGE HISTORY**

30626 First released in Issue 6. Derived from IEEE Std 1003.1j-2000.

30627 **NAME**30628 posix\_typed\_mem\_open — open a typed memory object (**ADVANCED REALTIME**)30629 **SYNOPSIS**

30630 TYM #include &lt;sys/mman.h&gt;

30631 int posix\_typed\_mem\_open(const char \*name, int oflag, int tflag);

30632

30633 **DESCRIPTION**

30634 The *posix\_typed\_mem\_open()* function shall establish a connection between the typed memory  
 30635 object specified by the string pointed to by *name* and a file descriptor. It shall create an open file  
 30636 description that refers to the typed memory object and a file descriptor that refers to that open  
 30637 file description. The file descriptor is used by other functions to refer to that typed memory  
 30638 object. It is unspecified whether the name appears in the file system and is visible to other  
 30639 functions that take pathnames as arguments. The *name* argument shall conform to the  
 30640 construction rules for a pathname. If *name* begins with the slash character, then processes calling  
 30641 *posix\_typed\_mem\_open()* with the same value of *name* shall refer to the same typed memory  
 30642 object. If *name* does not begin with the slash character, the effect is implementation-defined. The  
 30643 interpretation of slash characters other than the leading slash character in *name* is  
 30644 implementation-defined.

30645 Each typed memory object supported in a system shall be identified by a name which specifies  
 30646 not only its associated typed memory pool, but also the path or port by which it is accessed. That  
 30647 is, the same typed memory pool accessed via several different ports shall have several different  
 30648 corresponding names. The binding between names and typed memory objects is established in  
 30649 an implementation-defined manner. Unlike shared memory objects, there is no way within  
 30650 IEEE Std 1003.1-2001 for a program to create a typed memory object.

30651 The value of *tflag* shall determine how the typed memory object behaves when subsequently  
 30652 mapped by calls to *mmap()*. At most, one of the following flags defined in <sys/mman.h> may  
 30653 be specified:

30654 POSIX\_TYPED\_MEM\_ALLOCATE

30655 Allocate on *mmap()*.

30656 POSIX\_TYPED\_MEM\_ALLOCATE\_CONTIG

30657 Allocate contiguously on *mmap()*.

30658 POSIX\_TYPED\_MEM\_MAP\_ALLOCATABLE

30659 Map on *mmap()*, without affecting allocatability.

30660 If *tflag* has the flag POSIX\_TYPED\_MEM\_ALLOCATE specified, any subsequent call to *mmap()*  
 30661 using the returned file descriptor shall result in allocation and mapping of typed memory from  
 30662 the specified typed memory pool. The allocated memory may be a contiguous previously  
 30663 unallocated area of the typed memory pool or several non-contiguous previously unallocated  
 30664 areas (mapped to a contiguous portion of the process address space). If *tflag* has the flag  
 30665 POSIX\_TYPED\_MEM\_ALLOCATE\_CONTIG specified, any subsequent call to *mmap()* using the  
 30666 returned file descriptor shall result in allocation and mapping of a single contiguous previously  
 30667 unallocated area of the typed memory pool (also mapped to a contiguous portion of the process  
 30668 address space). If *tflag* has none of the flags POSIX\_TYPED\_MEM\_ALLOCATE or  
 30669 POSIX\_TYPED\_MEM\_ALLOCATE\_CONTIG specified, any subsequent call to *mmap()* using the  
 30670 returned file descriptor shall map an application-chosen area from the specified typed memory  
 30671 pool such that this mapped area becomes unavailable for allocation until unmapped by all  
 30672 processes. If *tflag* has the flag POSIX\_TYPED\_MEM\_MAP\_ALLOCATABLE specified, any  
 30673 subsequent call to *mmap()* using the returned file descriptor shall map an application-chosen  
 30674 area from the specified typed memory pool without an effect on the availability of that area for

30675 allocation; that is, mapping such an object leaves each byte of the mapped area unallocated if it  
 30676 was unallocated prior to the mapping or allocated if it was allocated prior to the mapping. The  
 30677 appropriate privilege to specify the POSIX\_TYPED\_MEM\_MAP\_ALLOCATABLE flag is  
 30678 implementation-defined.

30679 If successful, *posix\_typed\_mem\_open()* shall return a file descriptor for the typed memory object  
 30680 that is the lowest numbered file descriptor not currently open for that process. The open file  
 30681 description is new, and therefore the file descriptor shall not share it with any other processes. It  
 30682 is unspecified whether the file offset is set. The FD\_CLOEXEC file descriptor flag associated  
 30683 with the new file descriptor shall be cleared.

30684 The behavior of *msync()*, *ftruncate()*, and all file operations other than *mmap()*,  
 30685 *posix\_mem\_offset()*, *posix\_typed\_mem\_get\_info()*, *fstat()*, *dup()*, *dup2()*, and *close()*, is unspecified  
 30686 when passed a file descriptor connected to a typed memory object by this function.

30687 The file status flags of the open file description shall be set according to the value of *oflag*.  
 30688 Applications shall specify exactly one of the three access mode values described below and  
 30689 defined in the <fcntl.h> header, as the value of *oflag*.

- 30690 O\_RDONLY Open for read access only.
- 30691 O\_WRONLY Open for write access only.
- 30692 O\_RDWR Open for read or write access.

30693 **RETURN VALUE**

30694 Upon successful completion, the *posix\_typed\_mem\_open()* function shall return a non-negative  
 30695 integer representing the lowest numbered unused file descriptor. Otherwise, it shall return -1  
 30696 and set *errno* to indicate the error.

30697 **ERRORS**

30698 The *posix\_typed\_mem\_open()* function shall fail if:

- 30699 [EACCES] The typed memory object exists and the permissions specified by *oflag* are  
 30700 denied.
- 30701 [EINTR] The *posix\_typed\_mem\_open()* operation was interrupted by a signal.
- 30702 [EINVAL] The flags specified in *tflag* are invalid (more than one of  
 30703 POSIX\_TYPED\_MEM\_ALLOCATE,  
 30704 POSIX\_TYPED\_MEM\_ALLOCATE\_CONTIG, or  
 30705 POSIX\_TYPED\_MEM\_MAP\_ALLOCATABLE is specified).
- 30706 [EMFILE] Too many file descriptors are currently in use by this process.
- 30707 [ENAMETOOLONG]  
 30708 The length of the *name* argument exceeds {PATH\_MAX} or a pathname  
 30709 component is longer than {NAME\_MAX}.
- 30710 [ENFILE] Too many file descriptors are currently open in the system.
- 30711 [ENOENT] The named typed memory object does not exist.
- 30712 [EPERM] The caller lacks the appropriate privilege to specify the flag  
 30713 POSIX\_TYPED\_MEM\_MAP\_ALLOCATABLE in argument *tflag*.

30726 **CHANGE HISTORY**

30727 First released in Issue 6. Derived from IEEE Std 1003.1j-2000.

30728 **NAME**

30729 pow, powf, powl — power function

30730 **SYNOPSIS**

30731 #include &lt;math.h&gt;

30732 double pow(double x, double y);

30733 float powf(float x, float y);

30734 long double powl(long double x, long double y);

30735 **DESCRIPTION**

30736 **CX** The functionality described on this reference page is aligned with the ISO C standard. Any  
 30737 conflict between the requirements described here and the ISO C standard is unintentional. This  
 30738 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

30739 These functions shall compute the value of  $x$  raised to the power  $y$ ,  $x^y$ . If  $x$  is negative, the  
 30740 application shall ensure that  $y$  is an integer value.

30741 An application wishing to check for error situations should set *errno* to zero and call  
 30742 *feclearexcept*(FE\_ALL\_EXCEPT) before calling these functions. On return, if *errno* is non-zero or  
 30743 *fetestexcept*(FE\_INVALID | FE\_DIVBYZERO | FE\_OVERFLOW | FE\_UNDERFLOW) is non-  
 30744 zero, an error has occurred.

30745 **RETURN VALUE**30746 Upon successful completion, these functions shall return the value of  $x$  raised to the power  $y$ .

30747 **MX** For finite values of  $x < 0$ , and finite non-integer values of  $y$ , a domain error shall occur and either  
 30748 a NaN (if representable), or an implementation-defined value shall be returned.

30749 If the correct value would cause overflow, a range error shall occur and *pow()*, *powf()*, and  
 30750 *powl()* shall return HUGE\_VAL, HUGE\_VALF, and HUGE\_VALL, respectively.

30751 If the correct value would cause underflow, and is not representable, a range error may occur,  
 30752 **MX** and either 0.0 (if supported), or an implementation-defined value shall be returned.

30753 **MX** If  $x$  or  $y$  is a NaN, a NaN shall be returned (unless specified elsewhere in this description).

30754 For any value of  $y$  (including NaN), if  $x$  is +1, 1.0 shall be returned.

30755 For any value of  $x$  (including NaN), if  $y$  is  $\pm 0$ , 1.0 shall be returned.

30756 For any odd integer value of  $y > 0$ , if  $x$  is  $\pm 0$ ,  $\pm 0$  shall be returned.

30757 For  $y > 0$  and not an odd integer, if  $x$  is  $\pm 0$ , +0 shall be returned.

30758 If  $x$  is  $-1$ , and  $y$  is  $\pm \text{Inf}$ , 1.0 shall be returned.

30759 For  $|x| < 1$ , if  $y$  is  $-\text{Inf}$ ,  $+\text{Inf}$  shall be returned.

30760 For  $|x| > 1$ , if  $y$  is  $-\text{Inf}$ , +0 shall be returned.

30761 For  $|x| < 1$ , if  $y$  is  $+\text{Inf}$ , +0 shall be returned.

30762 For  $|x| > 1$ , if  $y$  is  $+\text{Inf}$ ,  $+\text{Inf}$  shall be returned.

30763 For  $y$  an odd integer  $< 0$ , if  $x$  is  $-\text{Inf}$ ,  $-0$  shall be returned.

30764 For  $y < 0$  and not an odd integer, if  $x$  is  $-\text{Inf}$ , +0 shall be returned.

30765 For  $y$  an odd integer  $> 0$ , if  $x$  is  $-\text{Inf}$ ,  $-\text{Inf}$  shall be returned.

30766 For  $y > 0$  and not an odd integer, if  $x$  is  $-\text{Inf}$ ,  $+\text{Inf}$  shall be returned.

- 30767 For  $y < 0$ , if  $x$  is  $+\text{Inf}$ ,  $+0$  shall be returned.
- 30768 For  $y > 0$ , if  $x$  is  $+\text{Inf}$ ,  $+\text{Inf}$  shall be returned.
- 30769 For  $y$  an odd integer  $< 0$ , if  $x$  is  $\pm 0$ , a pole error shall occur and  $\pm\text{HUGE\_VAL}$ ,  $\pm\text{HUGE\_VALF}$ , and  
30770  $\pm\text{HUGE\_VALL}$  shall be returned for  $\text{pow}()$ ,  $\text{powf}()$ , and  $\text{powl}()$ , respectively.
- 30771 For  $y < 0$  and not an odd integer, if  $x$  is  $\pm 0$ , a pole error shall occur and  $\text{HUGE\_VAL}$ ,  
30772  $\text{HUGE\_VALF}$ , and  $\text{HUGE\_VALL}$  shall be returned for  $\text{pow}()$ ,  $\text{powf}()$ , and  $\text{powl}()$ , respectively.
- 30773 If the correct value would cause underflow, and is representable, a range error may occur and  
30774 the correct value shall be returned.

**30775 ERRORS**

- 30776 These functions shall fail if:
- 30777 Domain Error The value of  $x$  is negative and  $y$  is a finite non-integer.
- 30778 If the integer expression  $(\text{math\_errhandling} \ \& \ \text{MATH\_ERRNO})$  is non-zero,  
30779 then *errno* shall be set to  $[\text{EDOM}]$ . If the integer expression  $(\text{math\_errhandling}$   
30780  $\ \& \ \text{MATH\_ERREXCEPT})$  is non-zero, then the invalid floating-point exception  
30781 shall be raised.
- 30782 MX Pole Error The value of  $x$  is zero and  $y$  is negative.
- 30783 If the integer expression  $(\text{math\_errhandling} \ \& \ \text{MATH\_ERRNO})$  is non-zero,  
30784 then *errno* shall be set to  $[\text{ERANGE}]$ . If the integer expression  
30785  $(\text{math\_errhandling} \ \& \ \text{MATH\_ERREXCEPT})$  is non-zero, then the divide-by-  
30786 zero floating-point exception shall be raised.
- 30787 Range Error The result overflows.
- 30788 If the integer expression  $(\text{math\_errhandling} \ \& \ \text{MATH\_ERRNO})$  is non-zero,  
30789 then *errno* shall be set to  $[\text{ERANGE}]$ . If the integer expression  
30790  $(\text{math\_errhandling} \ \& \ \text{MATH\_ERREXCEPT})$  is non-zero, then the overflow  
30791 floating-point exception shall be raised.
- 30792 These functions may fail if:
- 30793 Range Error The result underflows.
- 30794 If the integer expression  $(\text{math\_errhandling} \ \& \ \text{MATH\_ERRNO})$  is non-zero,  
30795 then *errno* shall be set to  $[\text{ERANGE}]$ . If the integer expression  
30796  $(\text{math\_errhandling} \ \& \ \text{MATH\_ERREXCEPT})$  is non-zero, then the underflow  
30797 floating-point exception shall be raised.

**30798 EXAMPLES**

- 30799 None.

**30800 APPLICATION USAGE**

- 30801 On error, the expressions  $(\text{math\_errhandling} \ \& \ \text{MATH\_ERRNO})$  and  $(\text{math\_errhandling} \ \& \ \text{MATH\_ERREXCEPT})$   
30802 are independent of each other, but at least one of them must be non-zero.

**30803 RATIONALE**

- 30804 None.

**30805 FUTURE DIRECTIONS**

- 30806 None.

30807 **SEE ALSO**

30810 **CHANGE HISTORY**

30811 First released in Issue 1. Derived from Issue 1 of the SVID.

30812 **Issue 5**

30813 The DESCRIPTION is updated to indicate how an application should check for an error. This  
30814 text was previously published in the APPLICATION USAGE section.

30815 **Issue 6**

30816 The DESCRIPTION is updated to avoid use of the term “must” for application requirements.

30817 The *powf()* and *powl()* functions are added for alignment with the ISO/IEC 9899:1999 standard.

30818 The DESCRIPTION, RETURN VALUE, ERRORS, and APPLICATION USAGE sections are  
30819 revised to align with the ISO/IEC 9899:1999 standard.

30820 IEC 60559:1989 standard floating-point extensions over the ISO/IEC 9899:1999 standard are  
30821 marked.

30822 **NAME**30823       

```
pread — read from a file
```

30824 **SYNOPSIS**30825 XSI       

```
#include <unistd.h>
```

30826       

```
ssize_t pread(int fd, void *buf, size_t nbyte, off_t offset);
```

30827

30828 **DESCRIPTION**30829       Refer to *read()*.

30830 **NAME**

30831       printf — print formatted output

30832 **SYNOPSIS**

30833       #include <stdio.h>

30834       int printf(const char \*restrict *format*, ...);

30835 **DESCRIPTION**

30836       Refer to *fprintf()*.

30837 **NAME**

30838 pselect, select — synchronous I/O multiplexing

30839 **SYNOPSIS**

```

30840 #include <sys/select.h>

30841 int pselect(int nfds, fd_set *restrict readfds,
30842            fd_set *restrict writefds, fd_set *restrict errorfds,
30843            const struct timespec *restrict timeout,
30844            const sigset_t *restrict sigmask);
30845 int select(int nfds, fd_set *restrict readfds,
30846           fd_set *restrict writefds, fd_set *restrict errorfds,
30847           struct timeval *restrict timeout);
30848 void FD_CLR(int fd, fd_set *fdset);
30849 int FD_ISSET(int fd, fd_set *fdset);
30850 void FD_SET(int fd, fd_set *fdset);
30851 void FD_ZERO(fd_set *fdset);

```

30852 **DESCRIPTION**

30853 The *pselect()* function shall examine the file descriptor sets whose addresses are passed in the  
 30854 *readfds*, *writefds*, and *errorfds* parameters to see whether some of their descriptors are ready for  
 30855 reading, are ready for writing, or have an exceptional condition pending, respectively.

30856 The *select()* function shall be equivalent to the *pselect()* function, except as follows:

- 30857 • For the *select()* function, the timeout period is given in seconds and microseconds in an  
 30858 argument of type **struct timeval**, whereas for the *pselect()* function the timeout period is  
 30859 given in seconds and nanoseconds in an argument of type **struct timespec**.
- 30860 • The *select()* function has no *sigmask* argument; it shall behave as *pselect()* does when *sigmask*  
 30861 is a null pointer.
- 30862 • Upon successful completion, the *select()* function may modify the object pointed to by the  
 30863 *timeout* argument.

30864 The *pselect()* and *select()* functions shall support regular files, terminal and pseudo-terminal  
 30865 XSR devices, **STREAMS**-based files, FIFOs, pipes, and sockets. The behavior of *pselect()* and *select()*  
 30866 on file descriptors that refer to other types of file is unspecified.

30867 The *nfds* argument specifies the range of descriptors to be tested. The first *nfds* descriptors shall  
 30868 be checked in each set; that is, the descriptors from zero through *nfds*–1 in the descriptor sets  
 30869 shall be examined.

30870 If the *readfds* argument is not a null pointer, it points to an object of type **fd\_set** that on input  
 30871 specifies the file descriptors to be checked for being ready to read, and on output indicates  
 30872 which file descriptors are ready to read.

30873 If the *writefds* argument is not a null pointer, it points to an object of type **fd\_set** that on input  
 30874 specifies the file descriptors to be checked for being ready to write, and on output indicates  
 30875 which file descriptors are ready to write.

30876 If the *errorfds* argument is not a null pointer, it points to an object of type **fd\_set** that on input  
 30877 specifies the file descriptors to be checked for error conditions pending, and on output indicates  
 30878 which file descriptors have error conditions pending.

30879 Upon successful completion, the *pselect()* or *select()* function shall modify the objects pointed to  
 30880 by the *readfds*, *writefds*, and *errorfds* arguments to indicate which file descriptors are ready for  
 30881 reading, ready for writing, or have an error condition pending, respectively, and shall return the  
 30882 total number of ready descriptors in all the output sets. For each file descriptor less than *nfds*, the

30883 corresponding bit shall be set on successful completion if it was set on input and the associated  
30884 condition is true for that file descriptor.

30885 If none of the selected descriptors are ready for the requested operation, the *pselect()* or *select()*  
30886 function shall block until at least one of the requested operations becomes ready, until the  
30887 *timeout* occurs, or until interrupted by a signal. The *timeout* parameter controls how long the  
30888 *pselect()* or *select()* function shall take before timing out. If the *timeout* parameter is not a null  
30889 pointer, it specifies a maximum interval to wait for the selection to complete. If the specified  
30890 time interval expires without any requested operation becoming ready, the function shall return.  
30891 If the *timeout* parameter is a null pointer, then the call to *pselect()* or *select()* shall block  
30892 indefinitely until at least one descriptor meets the specified criteria. To effect a poll, the *timeout*  
30893 parameter should not be a null pointer, and should point to a zero-valued **timespec** structure.

30894 The use of a timeout does not affect any pending timers set up by *alarm()*, *ualarm()*, or  
30895 *setitimer()*.

30896 Implementations may place limitations on the maximum timeout interval supported. All  
30897 implementations shall support a maximum timeout interval of at least 31 days. If the *timeout*  
30898 argument specifies a timeout interval greater than the implementation-defined maximum value,  
30899 the maximum value shall be used as the actual timeout value. Implementations may also place  
30900 limitations on the granularity of timeout intervals. If the requested timeout interval requires a  
30901 finer granularity than the implementation supports, the actual timeout interval shall be rounded  
30902 up to the next supported value.

30903 If *sigmask* is not a null pointer, then the *pselect()* function shall replace the signal mask of the  
30904 process by the set of signals pointed to by *sigmask* before examining the descriptors, and shall  
30905 restore the signal mask of the process before returning.

30906 A descriptor shall be considered ready for reading when a call to an input function with  
30907 O\_NONBLOCK clear would not block, whether or not the function would transfer data  
30908 successfully. (The function might return data, an end-of-file indication, or an error other than  
30909 one indicating that it is blocked, and in each of these cases the descriptor shall be considered  
30910 ready for reading.)

30911 A descriptor shall be considered ready for writing when a call to an output function with  
30912 O\_NONBLOCK clear would not block, whether or not the function would transfer data  
30913 successfully.

30914 If a socket has a pending error, it shall be considered to have an exceptional condition pending.  
30915 Otherwise, what constitutes an exceptional condition is file type-specific. For a file descriptor for  
30916 use with a socket, it is protocol-specific except as noted below. For other file types it is  
30917 implementation-defined. If the operation is meaningless for a particular file type, *pselect()* or  
30918 *select()* shall indicate that the descriptor is ready for read or write operations, and shall indicate  
30919 that the descriptor has no exceptional condition pending.

30920 If a descriptor refers to a socket, the implied input function is the *recvmsg()* function with  
30921 parameters requesting normal and ancillary data, such that the presence of either type shall  
30922 cause the socket to be marked as readable. The presence of out-of-band data shall be checked if  
30923 the socket option SO\_OOBINLINE has been enabled, as out-of-band data is enqueued with  
30924 normal data. If the socket is currently listening, then it shall be marked as readable if an  
30925 incoming connection request has been received, and a call to the *accept()* function shall complete  
30926 without blocking.

30927 If a descriptor refers to a socket, the implied output function is the *sendmsg()* function supplying  
30928 an amount of normal data equal to the current value of the SO\_SNDLOWAT option for the  
30929 socket. If a non-blocking call to the *connect()* function has been made for a socket, and the  
30930 connection attempt has either succeeded or failed leaving a pending error, the socket shall be

30931 marked as writable.

30932 A socket shall be considered to have an exceptional condition pending if a receive operation  
 30933 with `O_NONBLOCK` clear for the open file description and with the `MSG_OOB` flag set would  
 30934 return out-of-band data without blocking. (It is protocol-specific whether the `MSG_OOB` flag  
 30935 would be used to read out-of-band data.) A socket shall also be considered to have an  
 30936 exceptional condition pending if an out-of-band data mark is present in the receive queue. Other  
 30937 circumstances under which a socket may be considered to have an exceptional condition  
 30938 pending are protocol-specific and implementation-defined.

30939 If the *readfds*, *writefds*, and *errorfds* arguments are all null pointers and the *timeout* argument is not  
 30940 a null pointer, the *pselect()* or *select()* function shall block for the time specified, or until  
 30941 interrupted by a signal. If the *readfds*, *writefds*, and *errorfds* arguments are all null pointers and the  
 30942 *timeout* argument is a null pointer, the *pselect()* or *select()* function shall block until interrupted  
 30943 by a signal.

30944 File descriptors associated with regular files shall always select true for ready to read, ready to  
 30945 write, and error conditions.

30946 On failure, the objects pointed to by the *readfds*, *writefds*, and *errorfds* arguments shall not be  
 30947 modified. If the timeout interval expires without the specified condition being true for any of the  
 30948 specified file descriptors, the objects pointed to by the *readfds*, *writefds*, and *errorfds* arguments  
 30949 shall have all bits set to 0.

30950 File descriptor masks of type *fd\_set* can be initialized and tested with *FD\_CLR()*, *FD\_ISSET()*,  
 30951 *FD\_SET()*, and *FD\_ZERO()*. It is unspecified whether each of these is a macro or a function. If a  
 30952 macro definition is suppressed in order to access an actual function, or a program defines an  
 30953 external identifier with any of these names, the behavior is undefined.

30954 *FD\_CLR(fd, fdsetp)* shall remove the file descriptor *fd* from the set pointed to by *fdsetp*. If *fd* is not  
 30955 a member of this set, there shall be no effect on the set, nor will an error be returned.

30956 *FD\_ISSET(fd, fdsetp)* shall evaluate to non-zero if the file descriptor *fd* is a member of the set  
 30957 pointed to by *fdsetp*, and shall evaluate to zero otherwise.

30958 *FD\_SET(fd, fdsetp)* shall add the file descriptor *fd* to the set pointed to by *fdsetp*. If the file  
 30959 descriptor *fd* is already in this set, there shall be no effect on the set, nor will an error be returned.

30960 *FD\_ZERO(fdsetp)* shall initialize the descriptor set pointed to by *fdsetp* to the null set. No error is  
 30961 returned if the set is not empty at the time *FD\_ZERO()* is invoked.

30962 The behavior of these macros is undefined if the *fd* argument is less than 0 or greater than or  
 30963 equal to `FD_SETSIZE`, or if *fd* is not a valid file descriptor, or if any of the arguments are  
 30964 expressions with side effects.

30965 **RETURN VALUE**

30966 Upon successful completion, the *pselect()* and *select()* functions shall return the total number of  
 30967 bits set in the bit masks. Otherwise, `-1` shall be returned, and *errno* shall be set to indicate the  
 30968 error.

30969 *FD\_CLR()*, *FD\_SET()*, and *FD\_ZERO()* do not return a value. *FD\_ISSET()* shall return a non-  
 30970 zero value if the bit for the file descriptor *fd* is set in the file descriptor set pointed to by *fdset*, and  
 30971 0 otherwise.

30972 **ERRORS**

30973 Under the following conditions, *pselect()* and *select()* shall fail and set *errno* to:

30974 [EBADF] One or more of the file descriptor sets specified a file descriptor that is not a  
 30975 valid open file descriptor.

- 30976 [EINTR] The function was interrupted before any of the selected events occurred and  
30977 before the timeout interval expired.
- 30978 XSI If SA\_RESTART has been set for the interrupting signal, it is implementation-  
30979 defined whether the function restarts or returns with [EINTR].
- 30980 [EINVAL] An invalid timeout interval was specified.
- 30981 [EINVAL] The *nfds* argument is less than 0 or greater than FD\_SETSIZE.
- 30982 XSR [EINVAL] One of the specified file descriptors refers to a STREAM or multiplexer that is  
30983 linked (directly or indirectly) downstream from a multiplexer.
- 30984 **EXAMPLES**
- 30985 None.
- 30986 **APPLICATION USAGE**
- 30987 None.
- 30988 **RATIONALE**
- 30989 In previous versions of the Single UNIX Specification, the *select()* function was defined in the  
30990 `<sys/time.h>` header. This is now changed to `<sys/select.h>`. The rationale for this change was  
30991 as follows: the introduction of the *pselect()* function included the `<sys/select.h>` header and the  
30992 `<sys/select.h>` header defines all the related definitions for the *pselect()* and *select()* functions.  
30993 Backwards-compatibility to existing XSI implementations is handled by allowing `<sys/time.h>`  
30994 to include `<sys/select.h>`.
- 30995 **FUTURE DIRECTIONS**
- 30996 None.
- 30997 **SEE ALSO**
- 30998 *accept()*, *alarm()*, *connect()*, *fcntl()*, *poll()*, *read()*, *recvmsg()*, *sendmsg()*, *setitimer()*, *ualarm()*,

- 31000 **CHANGE HISTORY**
- 31001 First released in Issue 4, Version 2.
- 31002 **Issue 5**
- 31003 Moved from X/OPEN UNIX extension to BASE.
- 31004 In the ERRORS section, the text has been changed to indicate that [EINVAL] is returned when  
31005 *nfds* is less than 0 or greater than FD\_SETSIZE. It previously stated less than 0, or greater than or  
31006 equal to FD\_SETSIZE.
- 31007 Text about *timeout* is moved from the APPLICATION USAGE section to the DESCRIPTION.
- 31008 **Issue 6**
- 31009 The Open Group Corrigendum U026/6 is applied, changing the occurrences of *readfs* and *writefs*  
31010 in the *select()* DESCRIPTION to be *readfds* and *writefds*.
- 31011 Text referring to sockets is added to the DESCRIPTION.
- 31012 The DESCRIPTION and ERRORS sections are updated so that references to STREAMS are  
31013 marked as part of the XSI STREAMS Option Group.
- 31014 The following new requirements on POSIX implementations derive from alignment with the  
31015 Single UNIX Specification:
- 31016
  - These functions are now mandatory.
- 31017 The *pselect()* function is added for alignment with IEEE Std 1003.1g-2000 and additional detail  
31018 related to sockets semantics is added to the DESCRIPTION.

31019 The *select()* function now requires inclusion of `<sys/select.h>`.

31020 The **restrict** keyword is added to the *select()* prototype for alignment with the

31021 ISO/IEC 9899:1999 standard.

31022 **NAME**

31023 pthread\_atfork — register fork handlers

31024 **SYNOPSIS**

31025 THR #include &lt;pthread.h&gt;

31026 int pthread\_atfork(void (\*prepare)(void), void (\*parent)(void),  
31027 void (\*child)(void));

31028

31029 **DESCRIPTION**

31030 The *pthread\_atfork()* function shall declare fork handlers to be called before and after *fork()*, in  
31031 the context of the thread that called *fork()*. The *prepare* fork handler shall be called before *fork()*  
31032 processing commences. The *parent* fork handle shall be called after *fork()* processing completes  
31033 in the parent process. The *child* fork handler shall be called after *fork()* processing completes in  
31034 the child process. If no handling is desired at one or more of these three points, the  
31035 corresponding fork handler address(es) may be set to NULL.

31036 The order of calls to *pthread\_atfork()* is significant. The *parent* and *child* fork handlers shall be  
31037 called in the order in which they were established by calls to *pthread\_atfork()*. The *prepare* fork  
31038 handlers shall be called in the opposite order.

31039 **RETURN VALUE**

31040 Upon successful completion, *pthread\_atfork()* shall return a value of zero; otherwise, an error  
31041 number shall be returned to indicate the error.

31042 **ERRORS**31043 The *pthread\_atfork()* function shall fail if:

31044 [ENOMEM] Insufficient table space exists to record the fork handler addresses.

31045 The *pthread\_atfork()* function shall not return an error code of [EINTR].31046 **EXAMPLES**

31047 None.

31048 **APPLICATION USAGE**

31049 None.

31050 **RATIONALE**

31051 There are at least two serious problems with the semantics of *fork()* in a multi-threaded  
31052 program. One problem has to do with state (for example, memory) covered by mutexes.  
31053 Consider the case where one thread has a mutex locked and the state covered by that mutex is  
31054 inconsistent while another thread calls *fork()*. In the child, the mutex is in the locked state  
31055 (locked by a nonexistent thread and thus can never be unlocked). Having the child simply  
31056 reinitialize the mutex is unsatisfactory since this approach does not resolve the question about  
31057 how to correct or otherwise deal with the inconsistent state in the child.

31058 It is suggested that programs that use *fork()* call an *exec* function very soon afterwards in the  
31059 child process, thus resetting all states. In the meantime, only a short list of async-signal-safe  
31060 library routines are promised to be available.

31061 Unfortunately, this solution does not address the needs of multi-threaded libraries. Application  
31062 programs may not be aware that a multi-threaded library is in use, and they feel free to call any  
31063 number of library routines between the *fork()* and *exec* calls, just as they always have. Indeed,  
31064 they may be extant single-threaded programs and cannot, therefore, be expected to obey new  
31065 restrictions imposed by the threads library.

31066 On the other hand, the multi-threaded library needs a way to protect its internal state during  
 31067 *fork()* in case it is re-entered later in the child process. The problem arises especially in multi-  
 31068 threaded I/O libraries, which are almost sure to be invoked between the *fork()* and *exec* calls to  
 31069 effect I/O redirection. The solution may require locking mutex variables during *fork()*, or it may  
 31070 entail simply resetting the state in the child after the *fork()* processing completes.

31071 The *pthread\_atfork()* function provides multi-threaded libraries with a means to protect  
 31072 themselves from innocent application programs that call *fork()*, and it provides multi-threaded  
 31073 application programs with a standard mechanism for protecting themselves from *fork()* calls in  
 31074 a library routine or the application itself.

31075 The expected usage is that the *prepare* handler acquires all mutex locks and the other two fork  
 31076 handlers release them.

31077 For example, an application can supply a *prepare* routine that acquires the necessary mutexes the  
 31078 library maintains and supply *child* and *parent* routines that release those mutexes, thus ensuring  
 31079 that the child gets a consistent snapshot of the state of the library (and that no mutexes are left  
 31080 stranded). Alternatively, some libraries might be able to supply just a *child* routine that  
 31081 reinitializes the mutexes in the library and all associated states to some known value (for  
 31082 example, what it was when the image was originally executed).

31083 When *fork()* is called, only the calling thread is duplicated in the child process. Synchronization  
 31084 variables remain in the same state in the child as they were in the parent at the time *fork()* was  
 31085 called. Thus, for example, mutex locks may be held by threads that no longer exist in the child  
 31086 process, and any associated states may be inconsistent. The parent process may avoid this by  
 31087 explicit code that acquires and releases locks critical to the child via *pthread\_atfork()*. In addition,  
 31088 any critical threads need to be recreated and reinitialized to the proper state in the child (also via  
 31089 *pthread\_atfork()*).

31090 A higher-level package may acquire locks on its own data structures before invoking lower-level  
 31091 packages. Under this scenario, the order specified for fork handler calls allows a simple rule of  
 31092 initialization for avoiding package deadlock: a package initializes all packages on which it  
 31093 depends before it calls the *pthread\_atfork()* function for itself.

#### 31098 **CHANGE HISTORY**

31099 First released in Issue 5. Derived from the POSIX Threads Extension.

31100 IEEE PASC Interpretation 1003.1c #4 is applied.

#### 31101 **Issue 6**

31102 The *pthread\_atfork()* function is marked as part of the Threads option.

31103 The <pthread.h> header is added to the SYNOPSIS.

## 31104 NAME

31105 pthread\_attr\_destroy, pthread\_attr\_init — destroy and initialize the thread attributes object

## 31106 SYNOPSIS

31107 THR `#include <pthread.h>`

31108 `int pthread_attr_destroy(pthread_attr_t *attr);`

31109 `int pthread_attr_init(pthread_attr_t *attr);`

31110

## 31111 DESCRIPTION

31112 The *pthread\_attr\_destroy()* function shall destroy a thread attributes object. An implementation  
31113 may cause *pthread\_attr\_destroy()* to set *attr* to an implementation-defined invalid value. A  
31114 destroyed *attr* attributes object can be reinitialized using *pthread\_attr\_init()*; the results of  
31115 otherwise referencing the object after it has been destroyed are undefined.

31116 The *pthread\_attr\_init()* function shall initialize a thread attributes object *attr* with the default  
31117 value for all of the individual attributes used by a given implementation.

31118 The resulting attributes object (possibly modified by setting individual attribute values) when  
31119 used by *pthread\_create()* defines the attributes of the thread created. A single attributes object can  
31120 be used in multiple simultaneous calls to *pthread\_create()*. Results are undefined if  
31121 *pthread\_attr\_init()* is called specifying an already initialized *attr* attributes object.

## 31122 RETURN VALUE

31123 Upon successful completion, *pthread\_attr\_destroy()* and *pthread\_attr\_init()* shall return a value of  
31124 0; otherwise, an error number shall be returned to indicate the error.

## 31125 ERRORS

31126 The *pthread\_attr\_init()* function shall fail if:

31127 [ENOMEM] Insufficient memory exists to initialize the thread attributes object.

31128 These functions shall not return an error code of [EINTR].

## 31129 EXAMPLES

31130 None.

## 31131 APPLICATION USAGE

31132 None.

## 31133 RATIONALE

31134 Attributes objects are provided for threads, mutexes, and condition variables as a mechanism to  
31135 support probable future standardization in these areas without requiring that the function itself  
31136 be changed.

31137 Attributes objects provide clean isolation of the configurable aspects of threads. For example,  
31138 “stack size” is an important attribute of a thread, but it cannot be expressed portably. When  
31139 porting a threaded program, stack sizes often need to be adjusted. The use of attributes objects  
31140 can help by allowing the changes to be isolated in a single place, rather than being spread across  
31141 every instance of thread creation.

31142 Attributes objects can be used to set up “classes” of threads with similar attributes; for example,  
31143 “threads with large stacks and high priority” or “threads with minimal stacks”. These classes  
31144 can be defined in a single place and then referenced wherever threads need to be created.  
31145 Changes to “class” decisions become straightforward, and detailed analysis of each  
31146 *pthread\_create()* call is not required.

31147 The attributes objects are defined as opaque types as an aid to extensibility. If these objects had  
31148 been specified as structures, adding new attributes would force recompilation of all multi-

31149 threaded programs when the attributes objects are extended; this might not be possible if  
31150 different program components were supplied by different vendors.

31151 Additionally, opaque attributes objects present opportunities for improving performance.  
31152 Argument validity can be checked once when attributes are set, rather than each time a thread is  
31153 created. Implementations often need to cache kernel objects that are expensive to create.  
31154 Opaque attributes objects provide an efficient mechanism to detect when cached objects become  
31155 invalid due to attribute changes.

31156 Since assignment is not necessarily defined on a given opaque type, implementation-defined  
31157 default values cannot be defined in a portable way. The solution to this problem is to allow  
31158 attributes objects to be initialized dynamically by attributes object initialization functions, so  
31159 that default values can be supplied automatically by the implementation.

31160 The following proposal was provided as a suggested alternative to the supplied attributes:

- 31161 1. Maintain the style of passing a parameter formed by the bitwise-inclusive OR of flags to  
31162 the initialization routines (*pthread\_create()*, *pthread\_mutex\_init()*, *pthread\_cond\_init()*). The  
31163 parameter containing the flags should be an opaque type for extensibility. If no flags are  
31164 set in the parameter, then the objects are created with default characteristics. An  
31165 implementation may specify implementation-defined flag values and associated behavior.
- 31166 2. If further specialization of mutexes and condition variables is necessary, implementations  
31167 may specify additional procedures that operate on the **pthread\_mutex\_t** and  
31168 **pthread\_cond\_t** objects (instead of on attributes objects).

31169 The difficulties with this solution are:

- 31170 1. A bitmask is not opaque if bits have to be set into bitvector attributes objects using  
31171 explicitly-coded bitwise-inclusive OR operations. If the set of options exceeds an **int**,  
31172 application programmers need to know the location of each bit. If bits are set or read by  
31173 encapsulation (that is, *get* and *set* functions), then the bitmask is merely an  
31174 implementation of attributes objects as currently defined and should not be exposed to the  
31175 programmer.
- 31176 2. Many attributes are not Boolean or very small integral values. For example, scheduling  
31177 policy may be placed in 3-bit or 4-bit, but priority requires 5-bit or more, thereby taking up  
31178 at least 8 bits out of a possible 16 bits on machines with 16-bit integers. Because of this, the  
31179 bitmask can only reasonably control whether particular attributes are set or not, and it  
31180 cannot serve as the repository of the value itself. The value needs to be specified as a  
31181 function parameter (which is non-extensible), or by setting a structure field (which is non-  
31182 opaque), or by *get* and *set* functions (making the bitmask a redundant addition to the  
31183 attributes objects).

31184 Stack size is defined as an optional attribute because the very notion of a stack is inherently  
31185 machine-dependent. Some implementations may not be able to change the size of the stack, for  
31186 example, and others may not need to because stack pages may be discontinuous and can be  
31187 allocated and released on demand.

31188 The attribute mechanism has been designed in large measure for extensibility. Future extensions  
31189 to the attribute mechanism or to any attributes object defined in this volume of  
31190 IEEE Std 1003.1-2001 has to be done with care so as not to affect binary-compatibility.

31191 Attributes objects, even if allocated by means of dynamic allocation functions such as *malloc()*,  
31192 may have their size fixed at compile time. This means, for example, a *pthread\_create()* in an  
31193 implementation with extensions to **pthread\_attr\_t** cannot look beyond the area that the binary  
31194 application assumes is valid. This suggests that implementations should maintain a size field in  
31195 the attributes object, as well as possibly version information, if extensions in different directions

31196 (possibly by different vendors) are to be accommodated.

31197 **FUTURE DIRECTIONS**

31198 None.

31199 **SEE ALSO**

31200 *pthread\_attr\_getstackaddr()*, *pthread\_attr\_getstacksize()*, *pthread\_attr\_getdetachstate()*,  
31201 *pthread\_create()*, the Base Definitions volume of IEEE Std 1003.1-2001, <pthread.h>

31202 **CHANGE HISTORY**

31203 First released in Issue 5. Included for alignment with the POSIX Threads Extension.

31204 **Issue 6**

31205 The *pthread\_attr\_destroy()* and *pthread\_attr\_init()* functions are marked as part of the Threads  
31206 option.

31207 IEEE PASC Interpretation 1003.1 #107 is applied, noting that the effect of initializing an already  
31208 initialized thread attributes object is undefined.

31209 **NAME**

31210 pthread\_attr\_getdetachstate, pthread\_attr\_setdetachstate — get and set the detachstate attribute

31211 **SYNOPSIS**

```
31212 THR #include <pthread.h>
31213
31213 int pthread_attr_getdetachstate(const pthread_attr_t *attr,
31214 int *detachstate);
31215 int pthread_attr_setdetachstate(pthread_attr_t *attr, int detachstate);
31216
```

31217 **DESCRIPTION**

31218 The *detachstate* attribute controls whether the thread is created in a detached state. If the thread  
 31219 is created detached, then use of the ID of the newly created thread by the *pthread\_detach()* or  
 31220 *pthread\_join()* function is an error.

31221 The *pthread\_attr\_getdetachstate()* and *pthread\_attr\_setdetachstate()* functions, respectively, shall  
 31222 get and set the *detachstate* attribute in the *attr* object.

31223 For *pthread\_attr\_getdetachstate()*, *detachstate* shall be set to either  
 31224 PTHREAD\_CREATE\_DETACHED or PTHREAD\_CREATE\_JOINABLE.

31225 For *pthread\_attr\_setdetachstate()*, the application shall set *detachstate* to either  
 31226 PTHREAD\_CREATE\_DETACHED or PTHREAD\_CREATE\_JOINABLE.

31227 A value of PTHREAD\_CREATE\_DETACHED shall cause all threads created with *attr* to be in  
 31228 the detached state, whereas using a value of PTHREAD\_CREATE\_JOINABLE shall cause all  
 31229 threads created with *attr* to be in the joinable state. The default value of the *detachstate* attribute  
 31230 shall be PTHREAD\_CREATE\_JOINABLE.

31231 **RETURN VALUE**

31232 Upon successful completion, *pthread\_attr\_getdetachstate()* and *pthread\_attr\_setdetachstate()* shall  
 31233 return a value of 0; otherwise, an error number shall be returned to indicate the error.

31234 The *pthread\_attr\_getdetachstate()* function stores the value of the *detachstate* attribute in *detachstate*  
 31235 if successful.

31236 **ERRORS**

31237 The *pthread\_attr\_setdetachstate()* function shall fail if:

31238 [EINVAL] The value of *detachstate* was not valid

31239 These functions shall not return an error code of [EINTR].

31240 **EXAMPLES**

31241 None.

31242 **APPLICATION USAGE**

31243 None.

31244 **RATIONALE**

31245 None.

31246 **FUTURE DIRECTIONS**

31247 None.

31248 **SEE ALSO**

31249 *pthread\_attr\_destroy()*, *pthread\_attr\_getstackaddr()*, *pthread\_attr\_getstacksize()*, *pthread\_create()*, the  
 31250 Base Definitions volume of IEEE Std 1003.1-2001, <pthread.h>

31251 **CHANGE HISTORY**

31252 First released in Issue 5. Included for alignment with the POSIX Threads Extension.

31253 **Issue 6**

31254 The *pthread\_attr\_setdetachstate()* and *pthread\_attr\_getdetachstate()* functions are marked as part of  
31255 the Threads option.

31256 The DESCRIPTION is updated to avoid use of the term “must” for application requirements.

31257 **NAME**

31258 pthread\_attr\_getguardsize, pthread\_attr\_setguardsize — get and set the thread guardsize  
 31259 attribute

31260 **SYNOPSIS**

```
31261 xSI #include <pthread.h>
31262
31262 int pthread_attr_getguardsize(const pthread_attr_t *restrict attr,
31263 size_t *restrict guardsize);
31264 int pthread_attr_setguardsize(pthread_attr_t *attr,
31265 size_t guardsize);
31266
```

31267 **DESCRIPTION**

31268 The *pthread\_attr\_getguardsize()* function shall get the *guardsize* attribute in the *attr* object. This  
 31269 attribute shall be returned in the *guardsize* parameter.

31270 The *pthread\_attr\_setguardsize()* function shall set the *guardsize* attribute in the *attr* object. The new  
 31271 value of this attribute shall be obtained from the *guardsize* parameter. If *guardsize* is zero, a guard  
 31272 area shall not be provided for threads created with *attr*. If *guardsize* is greater than zero, a guard  
 31273 area of at least size *guardsize* bytes shall be provided for each thread created with *attr*.

31274 The *guardsize* attribute controls the size of the guard area for the created thread's stack. The  
 31275 *guardsize* attribute provides protection against overflow of the stack pointer. If a thread's stack is  
 31276 created with guard protection, the implementation allocates extra memory at the overflow end  
 31277 of the stack as a buffer against stack overflow of the stack pointer. If an application overflows  
 31278 into this buffer an error shall result (possibly in a SIGSEGV signal being delivered to the thread).

31279 A conforming implementation may round up the value contained in *guardsize* to a multiple of  
 31280 the configurable system variable {PAGESIZE} (see <sys/mman.h>). If an implementation  
 31281 rounds up the value of *guardsize* to a multiple of {PAGESIZE}, a call to *pthread\_attr\_getguardsize()*  
 31282 specifying *attr* shall store in the *guardsize* parameter the guard size specified by the previous  
 31283 *pthread\_attr\_setguardsize()* function call.

31284 The default value of the *guardsize* attribute is {PAGESIZE} bytes. The actual value of {PAGESIZE}  
 31285 is implementation-defined.

31286 If the *stackaddr* or *stack* attribute has been set (that is, the caller is allocating and managing its  
 31287 own thread stacks), the *guardsize* attribute shall be ignored and no protection shall be provided  
 31288 by the implementation. It is the responsibility of the application to manage stack overflow along  
 31289 with stack allocation and management in this case.

31290 **RETURN VALUE**

31291 If successful, the *pthread\_attr\_getguardsize()* and *pthread\_attr\_setguardsize()* functions shall return  
 31292 zero; otherwise, an error number shall be returned to indicate the error.

31293 **ERRORS**

31294 The *pthread\_attr\_getguardsize()* and *pthread\_attr\_setguardsize()* functions shall fail if:

31295 [EINVAL] The attribute *attr* is invalid.

31296 [EINVAL] The parameter *guardsize* is invalid.

31297 These functions shall not return an error code of [EINTR].

## 31298 EXAMPLES

31299 None.

## 31300 APPLICATION USAGE

31301 None.

## 31302 RATIONALE

31303 The *guardsize* attribute is provided to the application for two reasons:

- 31304 1. Overflow protection can potentially result in wasted system resources. An application  
31305 that creates a large number of threads, and which knows its threads never overflow their  
31306 stack, can save system resources by turning off guard areas.
- 31307 2. When threads allocate large data structures on the stack, large guard areas may be needed  
31308 to detect stack overflow.

## 31309 FUTURE DIRECTIONS

31310 None.

## 31311 SEE ALSO

31312 The Base Definitions volume of IEEE Std 1003.1-2001, <pthread.h>, <sys/mman.h>

## 31313 CHANGE HISTORY

31314 First released in Issue 5.

## 31315 Issue 6

31316 In the ERRORS section, a third [EINVAL] error condition is removed as it is covered by the  
31317 second error condition.

31318 The **restrict** keyword is added to the *pthread\_attr\_getguardsize()* prototype for alignment with the  
31319 ISO/IEC 9899:1999 standard.

31320 **NAME**

31321 pthread\_attr\_getinheritsched, pthread\_attr\_setinheritsched — get and set the inheritsched  
 31322 attribute (**REALTIME THREADS**)

31323 **SYNOPSIS**

31324 THR TPS #include <pthread.h>

```
31325 int pthread_attr_getinheritsched(const pthread_attr_t *restrict attr,
31326                               int *restrict inheritsched);
31327 int pthread_attr_setinheritsched(pthread_attr_t *attr,
31328                               int inheritsched);
31329
```

31330 **DESCRIPTION**

31331 The *pthread\_attr\_getinheritsched()*, and *pthread\_attr\_setinheritsched()* functions, respectively, shall  
 31332 get and set the *inheritsched* attribute in the *attr* argument.

31333 When the attributes objects are used by *pthread\_create()*, the *inheritsched* attribute determines  
 31334 how the other scheduling attributes of the created thread shall be set.

31335 **PTHREAD\_INHERIT\_SCHED**

31336 Specifies that the thread scheduling attributes shall be inherited from the creating thread,  
 31337 and the scheduling attributes in this *attr* argument shall be ignored.

31338 **PTHREAD\_EXPLICIT\_SCHED**

31339 Specifies that the thread scheduling attributes shall be set to the corresponding values from  
 31340 this attributes object.

31341 The symbols **PTHREAD\_INHERIT\_SCHED** and **PTHREAD\_EXPLICIT\_SCHED** are defined in  
 31342 the <**pthread.h**> header.

31343 The following thread scheduling attributes defined by IEEE Std 1003.1-2001 are affected by the  
 31344 *inheritsched* attribute: scheduling policy (*schedpolicy*), scheduling parameters (*schedparam*), and  
 31345 scheduling contention scope (*contentionscope*).

31346 **RETURN VALUE**

31347 If successful, the *pthread\_attr\_getinheritsched()* and *pthread\_attr\_setinheritsched()* functions shall  
 31348 return zero; otherwise, an error number shall be returned to indicate the error.

31349 **ERRORS**

31350 The *pthread\_attr\_setinheritsched()* function may fail if:

31351 [EINVAL] The value of *inheritsched* is not valid.

31352 [ENOTSUP] An attempt was made to set the attribute to an unsupported value.

31353 These functions shall not return an error code of [EINTR].

31354 **EXAMPLES**

31355 None.

31356 **APPLICATION USAGE**

31357 After these attributes have been set, a thread can be created with the specified attributes using  
 31358 *pthread\_create()*. Using these routines does not affect the current running thread.

31359 **RATIONALE**

31360 None.

## 31361 FUTURE DIRECTIONS

31362 None.

## 31363 SEE ALSO

31364 *pthread\_attr\_destroy()*, *pthread\_attr\_getscope()*, *pthread\_attr\_getschedpolicy()*,  
31365 *pthread\_attr\_getschedparam()*, *pthread\_create()*, the Base Definitions volume of  
31366 IEEE Std 1003.1-2001, <pthread.h>, <sched.h>

## 31367 CHANGE HISTORY

31368 First released in Issue 5. Included for alignment with the POSIX Threads Extension.

31369 Marked as part of the Realtime Threads Feature Group.

## 31370 Issue 6

31371 The *pthread\_attr\_getinheritsched()* and *pthread\_attr\_setinheritsched()* functions are marked as part  
31372 of the Threads and Thread Execution Scheduling options.

31373 The [ENOSYS] error condition has been removed as stubs need not be provided if an  
31374 implementation does not support the Thread Execution Scheduling option.

31375 The **restrict** keyword is added to the *pthread\_attr\_getinheritsched()* prototype for alignment with  
31376 the ISO/IEC 9899:1999 standard.

31377 **NAME**

31378 pthread\_attr\_getschedparam, pthread\_attr\_setschedparam — get and set the schedparam  
 31379 attribute

31380 **SYNOPSIS**

```
31381 THR #include <pthread.h>

31382 int pthread_attr_getschedparam(const pthread_attr_t *restrict attr,
31383 struct sched_param *restrict param);
31384 int pthread_attr_setschedparam(pthread_attr_t *restrict attr,
31385 const struct sched_param *restrict param);
31386
```

31387 **DESCRIPTION**

31388 The *pthread\_attr\_getschedparam()*, and *pthread\_attr\_setschedparam()* functions, respectively, shall  
 31389 get and set the scheduling parameter attributes in the *attr* argument. The contents of the *param*  
 31390 structure are defined in the <**sched.h**> header. For the SCHED\_FIFO and SCHED\_RR policies,  
 31391 the only required member of *param* is *sched\_priority*.

31392 TSP For the SCHED\_SPORADIC policy, the required members of the *param* structure are  
 31393 *sched\_priority*, *sched\_ss\_low\_priority*, *sched\_ss\_repl\_period*, *sched\_ss\_init\_budget*, and  
 31394 *sched\_ss\_max\_repl*. The specified *sched\_ss\_repl\_period* must be greater than or equal to the  
 31395 specified *sched\_ss\_init\_budget* for the function to succeed; if it is not, then the function shall fail.  
 31396 The value of *sched\_ss\_max\_repl* shall be within the inclusive range [1,{SS\_REPL\_MAX}] for the  
 31397 function to succeed; if not, the function shall fail.

31398 **RETURN VALUE**

31399 If successful, the *pthread\_attr\_getschedparam()* and *pthread\_attr\_setschedparam()* functions shall  
 31400 return zero; otherwise, an error number shall be returned to indicate the error.

31401 **ERRORS**

31402 The *pthread\_attr\_setschedparam()* function may fail if:

- 31403 [EINVAL] The value of *param* is not valid.
- 31404 [ENOTSUP] An attempt was made to set the attribute to an unsupported value.
- 31405 These functions shall not return an error code of [EINTR].

31406 **EXAMPLES**

31407 None.

31408 **APPLICATION USAGE**

31409 After these attributes have been set, a thread can be created with the specified attributes using  
 31410 *pthread\_create()*. Using these routines does not affect the current running thread.

31411 **RATIONALE**

31412 None.

31413 **FUTURE DIRECTIONS**

31414 None.

31415 **SEE ALSO**

31416 *pthread\_attr\_destroy()*, *pthread\_attr\_getscope()*, *pthread\_attr\_getinheritsched()*,  
 31417 *pthread\_attr\_getschedpolicy()*, *pthread\_create()*, the Base Definitions volume of  
 31418 IEEE Std 1003.1-2001, <**pthread.h**>, <**sched.h**>

## 31419 CHANGE HISTORY

31420 First released in Issue 5. Included for alignment with the POSIX Threads Extension.

## 31421 Issue 6

31422 The *pthread\_attr\_getschedparam()* and *pthread\_attr\_setschedparam()* functions are marked as part  
31423 of the Threads option.

31424 The SCHED\_SPORADIC scheduling policy is added for alignment with IEEE Std 1003.1d-1999.

31425 The **restrict** keyword is added to the *pthread\_attr\_getschedparam()* and  
31426 *pthread\_attr\_setschedparam()* prototypes for alignment with the ISO/IEC 9899:1999 standard.

31427 **NAME**

31428 pthread\_attr\_getschedpolicy, pthread\_attr\_setschedpolicy — get and set the schedpolicy  
 31429 attribute (**REALTIME THREADS**)

31430 **SYNOPSIS**

31431 THR TPS #include <pthread.h>

```
31432 int pthread_attr_getschedpolicy(const pthread_attr_t *restrict attr,  
31433 int *restrict policy);
```

```
31434 int pthread_attr_setschedpolicy(pthread_attr_t *attr, int policy);
```

31435

31436 **DESCRIPTION**

31437 The *pthread\_attr\_getschedpolicy()* and *pthread\_attr\_setschedpolicy()* functions, respectively, shall  
 31438 get and set the *schedpolicy* attribute in the *attr* argument.

31439 The supported values of *policy* shall include SCHED\_FIFO, SCHED\_RR, and SCHED\_OTHER,  
 31440 which are defined in the <**sched.h**> header. When threads executing with the scheduling policy

31441 TSP SCHED\_FIFO, SCHED\_RR, or SCHED\_SPORADIC are waiting on a mutex, they shall acquire  
 31442 the mutex in priority order when the mutex is unlocked.

31443 **RETURN VALUE**

31444 If successful, the *pthread\_attr\_getschedpolicy()* and *pthread\_attr\_setschedpolicy()* functions shall  
 31445 return zero; otherwise, an error number shall be returned to indicate the error.

31446 **ERRORS**

31447 The *pthread\_attr\_setschedpolicy()* function may fail if:

31448 [EINVAL] The value of *policy* is not valid.

31449 [ENOTSUP] An attempt was made to set the attribute to an unsupported value.

31450 These functions shall not return an error code of [EINTR].

31451 **EXAMPLES**

31452 None.

31453 **APPLICATION USAGE**

31454 After these attributes have been set, a thread can be created with the specified attributes using  
 31455 *pthread\_create()*. Using these routines does not affect the current running thread.

31456 **RATIONALE**

31457 None.

31458 **FUTURE DIRECTIONS**

31459 None.

31460 **SEE ALSO**

31461 *pthread\_attr\_destroy()*, *pthread\_attr\_getscope()*, *pthread\_attr\_getinheritsched()*,  
 31462 *pthread\_attr\_getschedparam()*, *pthread\_create()*, the Base Definitions volume of  
 31463 IEEE Std 1003.1-2001, <**pthread.h**>, <**sched.h**>

31464 **CHANGE HISTORY**

31465 First released in Issue 5. Included for alignment with the POSIX Threads Extension.

31466 Marked as part of the Realtime Threads Feature Group.

31467 **Issue 6**

31468 The *pthread\_attr\_getschedpolicy()* and *pthread\_attr\_setschedpolicy()* functions are marked as part of  
31469 the Threads and Thread Execution Scheduling options.

31470 The [ENOSYS] error condition has been removed as stubs need not be provided if an  
31471 implementation does not support the Thread Execution Scheduling option.

31472 The SCHED\_SPORADIC scheduling policy is added for alignment with IEEE Std 1003.1d-1999.

31473 The **restrict** keyword is added to the *pthread\_attr\_getschedpolicy()* prototype for alignment with  
31474 the ISO/IEC 9899:1999 standard.

31475 **NAME**

31476 pthread\_attr\_getscope, pthread\_attr\_setscope — get and set the contention scope attribute  
 31477 (**REALTIME THREADS**)

31478 **SYNOPSIS**

```
31479 THR TPS #include <pthread.h>
31480
31481 int pthread_attr_getscope(const pthread_attr_t *restrict attr,
31482                          int *restrict contention_scope);
31483 int pthread_attr_setscope(pthread_attr_t *attr, int contention_scope);
31484
```

31484 **DESCRIPTION**

31485 The *pthread\_attr\_getscope()* and *pthread\_attr\_setscope()* functions, respectively, shall get and set  
 31486 the *contention\_scope* attribute in the *attr* object.

31487 The *contention\_scope* attribute may have the values PTHREAD\_SCOPE\_SYSTEM, signifying  
 31488 system scheduling contention scope, or PTHREAD\_SCOPE\_PROCESS, signifying process  
 31489 scheduling contention scope. The symbols PTHREAD\_SCOPE\_SYSTEM and  
 31490 PTHREAD\_SCOPE\_PROCESS are defined in the **<pthread.h>** header.

31491 **RETURN VALUE**

31492 If successful, the *pthread\_attr\_getscope()* and *pthread\_attr\_setscope()* functions shall return zero;  
 31493 otherwise, an error number shall be returned to indicate the error.

31494 **ERRORS**

31495 The *pthread\_attr\_setscope()* function may fail if:

- 31496 [EINVAL] The value of *contention\_scope* is not valid.
- 31497 [ENOTSUP] An attempt was made to set the attribute to an unsupported value.
- 31498 These functions shall not return an error code of [EINTR].

31499 **EXAMPLES**

31500 None.

31501 **APPLICATION USAGE**

31502 After these attributes have been set, a thread can be created with the specified attributes using  
 31503 *pthread\_create()*. Using these routines does not affect the current running thread.

31504 **RATIONALE**

31505 None.

31506 **FUTURE DIRECTIONS**

31507 None.

31508 **SEE ALSO**

31509 *pthread\_attr\_destroy()*, *pthread\_attr\_getinheritsched()*, *pthread\_attr\_getschedpolicy()*,  
 31510 *pthread\_attr\_getschedparam()*, *pthread\_create()*, the Base Definitions volume of  
 31511 IEEE Std 1003.1-2001, **<pthread.h>**, **<sched.h>**

31512 **CHANGE HISTORY**

- 31513 First released in Issue 5. Included for alignment with the POSIX Threads Extension.
- 31514 Marked as part of the Realtime Threads Feature Group.

31515 **Issue 6**

31516 The *pthread\_attr\_getscope()* and *pthread\_attr\_setscope()* functions are marked as part of the  
31517 Threads and Thread Execution Scheduling options.

31518 The [ENOSYS] error condition has been removed as stubs need not be provided if an  
31519 implementation does not support the Thread Execution Scheduling option.

31520 The **restrict** keyword is added to the *pthread\_attr\_getscope()* prototype for alignment with the  
31521 ISO/IEC 9899:1999 standard.

31522 **NAME**

31523 pthread\_attr\_getstack, pthread\_attr\_setstack — get and set stack attributes

31524 **SYNOPSIS**

31525 THR #include &lt;pthread.h&gt;

```
31526 TSA TSS int pthread_attr_getstack(const pthread_attr_t *restrict attr,
31527 void **restrict stackaddr, size_t *restrict stacksize);
31528 int pthread_attr_setstack(pthread_attr_t *attr, void *stackaddr,
31529 size_t stacksize);
31530
```

31531 **DESCRIPTION**

31532 The *pthread\_attr\_getstack()* and *pthread\_attr\_setstack()* functions, respectively, shall get and set  
 31533 the thread creation stack attributes *stackaddr* and *stacksize* in the *attr* object.

31534 The stack attributes specify the area of storage to be used for the created thread's stack. The base  
 31535 (lowest addressable byte) of the storage shall be *stackaddr*, and the size of the storage shall be  
 31536 *stacksize* bytes. The *stacksize* shall be at least {PTHREAD\_STACK\_MIN}. The *stackaddr* shall be  
 31537 aligned appropriately to be used as a stack; for example, *pthread\_attr\_setstack()* may fail with  
 31538 [EINVAL] if (*stackaddr* & 0x7) is not 0. All pages within the stack described by *stackaddr* and  
 31539 *stacksize* shall be both readable and writable by the thread.

31540 **RETURN VALUE**

31541 Upon successful completion, these functions shall return a value of 0; otherwise, an error  
 31542 number shall be returned to indicate the error.

31543 The *pthread\_attr\_getstack()* function shall store the stack attribute values in *stackaddr* and *stacksize*  
 31544 if successful.

31545 **ERRORS**

31546 The *pthread\_attr\_setstack()* function shall fail if:

31547 [EINVAL] The value of *stacksize* is less than {PTHREAD\_STACK\_MIN} or exceeds an  
 31548 implementation-defined limit.

31549 The *pthread\_attr\_setstack()* function may fail if:

31550 [EINVAL] The value of *stackaddr* does not have proper alignment to be used as a stack, or  
 31551 if (*stackaddr* + *stacksize*) lacks proper alignment.

31552 [EACCES] The stack page(s) described by *stackaddr* and *stacksize* are not both readable  
 31553 and writable by the thread.

31554 These functions shall not return an error code of [EINTR].

31555 **EXAMPLES**

31556 None.

31557 **APPLICATION USAGE**

31558 These functions are appropriate for use by applications in an environment where the stack for a  
 31559 thread must be placed in some particular region of memory.

31560 While it might seem that an application could detect stack overflow by providing a protected  
 31561 page outside the specified stack region, this cannot be done portably. Implementations are free  
 31562 to place the thread's initial stack pointer anywhere within the specified region to accommodate  
 31563 the machine's stack pointer behavior and allocation requirements. Furthermore, on some  
 31564 architectures, such as the IA-64, "overflow" might mean that two separate stack pointers  
 31565 allocated within the region will overlap somewhere in the middle of the region.

31566 **RATIONALE**

31567       None.

31568 **FUTURE DIRECTIONS**

31569       None.

31570 **SEE ALSO**

31571       *pthread\_attr\_init()*, *pthread\_attr\_setdetachstate()*, *pthread\_attr\_setstacksize()*, *pthread\_create()*, the  
31572       Base Definitions volume of IEEE Std 1003.1-2001, <limits.h>, <pthread.h>

31573 **CHANGE HISTORY**

31574       First released in Issue 6. Developed as an XSI extension and brought into the BASE by IEEE  
31575       PASC Interpretation 1003.1 #101.

31576 **NAME**

31577 pthread\_attr\_getstackaddr, pthread\_attr\_setstackaddr — get and set the stackaddr attribute

31578 **SYNOPSIS**

31579 THR TSA #include <pthread.h>

```
31580 OB int pthread_attr_getstackaddr(const pthread_attr_t *restrict attr,
31581 void **restrict stackaddr);
31582 int pthread_attr_setstackaddr(pthread_attr_t *attr, void *stackaddr);
31583
```

31584 **DESCRIPTION**

31585 The *pthread\_attr\_getstackaddr()* and *pthread\_attr\_setstackaddr()* functions, respectively, shall get  
31586 and set the thread creation *stackaddr* attribute in the *attr* object.

31587 The *stackaddr* attribute specifies the location of storage to be used for the created thread's stack.  
31588 The size of the storage shall be at least {PTHREAD\_STACK\_MIN}.

31589 **RETURN VALUE**

31590 Upon successful completion, *pthread\_attr\_getstackaddr()* and *pthread\_attr\_setstackaddr()* shall  
31591 return a value of 0; otherwise, an error number shall be returned to indicate the error.

31592 The *pthread\_attr\_getstackaddr()* function stores the *stackaddr* attribute value in *stackaddr* if  
31593 successful.

31594 **ERRORS**

31595 No errors are defined.

31596 These functions shall not return an error code of [EINTR].

31597 **EXAMPLES**

31598 None.

31599 **APPLICATION USAGE**

31600 The specification of the *stackaddr* attribute presents several ambiguities that make portable use of  
31601 these interfaces impossible. The description of the single address parameter as a “stack” does  
31602 not specify a particular relationship between the address and the “stack” implied by that  
31603 address. For example, the address may be taken as the low memory address of a buffer intended  
31604 for use as a stack, or it may be taken as the address to be used as the initial stack pointer register  
31605 value for the new thread. These two are not the same except for a machine on which the stack  
31606 grows “up” from low memory to high, and on which a “push” operation first stores the value in  
31607 memory and then increments the stack pointer register. Further, on a machine where the stack  
31608 grows “down” from high memory to low, interpretation of the address as the “low memory”  
31609 address requires a determination of the intended size of the stack. IEEE Std 1003.1-2001 has  
31610 introduced the new interfaces *pthread\_attr\_setstack()* and *pthread\_attr\_getstack()* to resolve these  
31611 ambiguities.

31612 **RATIONALE**

31613 None.

31614 **FUTURE DIRECTIONS**

31615 None.

31616 **SEE ALSO**

31617 *pthread\_attr\_destroy()*, *pthread\_attr\_getdetachstate()*, *pthread\_attr\_getstack()*,  
31618 *pthread\_attr\_getstacksize()*, *pthread\_attr\_setstack()*, *pthread\_create()*, the Base Definitions volume  
31619 of IEEE Std 1003.1-2001, <limits.h>, <pthread.h>

## 31620 CHANGE HISTORY

31621 First released in Issue 5. Included for alignment with the POSIX Threads Extension.

## 31622 Issue 6

31623 The *pthread\_attr\_getstackaddr()* and *pthread\_attr\_setstackaddr()* functions are marked as part of  
31624 the Threads and Thread Stack Address Attribute options.

31625 The **restrict** keyword is added to the *pthread\_attr\_getstackaddr()* prototype for alignment with the  
31626 ISO/IEC 9899:1999 standard.

31627 These functions are marked obsolescent.

31628 **NAME**

31629 pthread\_attr\_getstacksize, pthread\_attr\_setstacksize — get and set the stacksize attribute

31630 **SYNOPSIS**

31631 THR TSA #include <pthread.h>

```
31632 int pthread_attr_getstacksize(const pthread_attr_t *restrict attr,
31633 size_t *restrict stacksize);
31634 int pthread_attr_setstacksize(pthread_attr_t *attr, size_t stacksize);
31635
```

31636 **DESCRIPTION**

31637 The *pthread\_attr\_getstacksize()* and *pthread\_attr\_setstacksize()* functions, respectively, shall get  
31638 and set the thread creation *stacksize* attribute in the *attr* object.

31639 The *stacksize* attribute shall define the minimum stack size (in bytes) allocated for the created  
31640 threads stack.

31641 **RETURN VALUE**

31642 Upon successful completion, *pthread\_attr\_getstacksize()* and *pthread\_attr\_setstacksize()* shall  
31643 return a value of 0; otherwise, an error number shall be returned to indicate the error.

31644 The *pthread\_attr\_getstacksize()* function stores the *stacksize* attribute value in *stacksize* if  
31645 successful.

31646 **ERRORS**

31647 The *pthread\_attr\_setstacksize()* function shall fail if:

31648 [EINVAL] The value of *stacksize* is less than {PTHREAD\_STACK\_MIN} or exceeds a  
31649 system-imposed limit.

31650 These functions shall not return an error code of [EINTR].

31651 **EXAMPLES**

31652 None.

31653 **APPLICATION USAGE**

31654 None.

31655 **RATIONALE**

31656 None.

31657 **FUTURE DIRECTIONS**

31658 None.

31659 **SEE ALSO**

31660 *pthread\_attr\_destroy()*, *pthread\_attr\_getstackaddr()*, *pthread\_attr\_getdetachstate()*, *pthread\_create()*,  
31661 the Base Definitions volume of IEEE Std 1003.1-2001, <limits.h>, <pthread.h>

31662 **CHANGE HISTORY**

31663 First released in Issue 5. Included for alignment with the POSIX Threads Extension.

31664 **Issue 6**

31665 The *pthread\_attr\_getstacksize()* and *pthread\_attr\_setstacksize()* functions are marked as part of the  
31666 Threads and Thread Stack Address Attribute options.

31667 The **restrict** keyword is added to the *pthread\_attr\_getstacksize()* prototype for alignment with the  
31668 ISO/IEC 9899:1999 standard.

31669 **NAME**

31670 pthread\_attr\_init — initialize the thread attributes object

31671 **SYNOPSIS**

31672 THR #include <pthread.h>

31673 int pthread\_attr\_init(pthread\_attr\_t \*attr);

31674

31675 **DESCRIPTION**

31676 Refer to *pthread\_attr\_destroy()*.

31677 **NAME**

31678 pthread\_attr\_setdetachstate — set the detachstate attribute

31679 **SYNOPSIS**

31680 THR #include &lt;pthread.h&gt;

31681 int pthread\_attr\_setdetachstate(pthread\_attr\_t \*attr, int detachstate);

31682

31683 **DESCRIPTION**31684 Refer to *pthread\_attr\_getdetachstate()*.

31685 **NAME**

31686 pthread\_attr\_setguardsize — set the thread guardsize attribute

31687 **SYNOPSIS**

31688 XSI #include <pthread.h>

```
31689 int pthread_attr_setguardsize(pthread_attr_t *attr,  
31690 size_t guardsize);
```

31691

31692 **DESCRIPTION**

31693 Refer to *pthread\_attr\_getguardsize()*.

31694 **NAME**

31695 pthread\_attr\_setinheritsched — set the inheritsched attribute (**REALTIME THREADS**)

31696 **SYNOPSIS**

```
31697 THR TPS #include <pthread.h>
```

```
31698 int pthread_attr_setinheritsched(pthread_attr_t *attr,  
31699 int inheritsched);
```

31700

31701 **DESCRIPTION**

31702 Refer to *pthread\_attr\_getinheritsched()*.

31703 **NAME**

31704 pthread\_attr\_setschedparam — set the schedparam attribute

31705 **SYNOPSIS**

31706 THR #include <pthread.h>

```
31707 int pthread_attr_setschedparam(pthread_attr_t *restrict attr,  
31708     const struct sched_param *restrict param);
```

31709

31710 **DESCRIPTION**

31711 Refer to *pthread\_attr\_getschedparam()*.

31712 **NAME**31713 pthread\_attr\_setschedpolicy — set the schedpolicy attribute (**REALTIME THREADS**)31714 **SYNOPSIS**

31715 THR TPS #include &lt;pthread.h&gt;

31716 int pthread\_attr\_setschedpolicy(pthread\_attr\_t \*attr, int policy);

31717

31718 **DESCRIPTION**31719 Refer to *pthread\_attr\_getschedpolicy()*.

31720 **NAME**

31721 pthread\_attr\_setscope — set the contentionscope attribute (**REALTIME THREADS**)

31722 **SYNOPSIS**

31723 THR TPS #include <pthread.h>

31724 int pthread\_attr\_setscope(pthread\_attr\_t \*attr, int contentionscope);

31725

31726 **DESCRIPTION**

31727 Refer to *pthread\_attr\_getscope()*.

31728 **NAME**

31729 pthread\_attr\_setstack — set the stack attribute

31730 **SYNOPSIS**

31731 XSI #include &lt;pthread.h&gt;

31732 int pthread\_attr\_setstack(pthread\_attr\_t \*attr, void \*stackaddr,  
31733 size\_t stacksize);

31734

31735 **DESCRIPTION**31736 Refer to *pthread\_attr\_getstack()*.

31737 **NAME**

31738 pthread\_attr\_setstackaddr — set the stackaddr attribute

31739 **SYNOPSIS**

31740 THR TSA #include <pthread.h>

31741 OB int pthread\_attr\_setstackaddr(pthread\_attr\_t \*attr, void \*stackaddr);

31742

31743 **DESCRIPTION**

31744 Refer to *pthread\_attr\_getstackaddr()*.

31745 **NAME**

31746 pthread\_attr\_setstacksize — set the stacksize attribute

31747 **SYNOPSIS**

31748 THR TSA #include &lt;pthread.h&gt;

31749 int pthread\_attr\_setstacksize(pthread\_attr\_t \*attr, size\_t stacksize);

31750

31751 **DESCRIPTION**31752 Refer to *pthread\_attr\_getstacksize()*.

## 31753 NAME

31754 pthread\_barrier\_destroy, pthread\_barrier\_init — destroy and initialize a barrier object  
 31755 (ADVANCED REALTIME THREADS)

## 31756 SYNOPSIS

```
31757 THR BAR #include <pthread.h>
```

```
31758 int pthread_barrier_destroy(pthread_barrier_t *barrier);
31759 int pthread_barrier_init(pthread_barrier_t *restrict barrier,
31760 const pthread_barrierattr_t *restrict attr, unsigned count);
31761
```

## 31762 DESCRIPTION

31763 The *pthread\_barrier\_destroy()* function shall destroy the barrier referenced by *barrier* and release  
 31764 any resources used by the barrier. The effect of subsequent use of the barrier is undefined until  
 31765 the barrier is reinitialized by another call to *pthread\_barrier\_init()*. An implementation may use  
 31766 this function to set *barrier* to an invalid value. The results are undefined if  
 31767 *pthread\_barrier\_destroy()* is called when any thread is blocked on the barrier, or if this function is  
 31768 called with an uninitialized barrier.

31769 The *pthread\_barrier\_init()* function shall allocate any resources required to use the barrier  
 31770 referenced by *barrier* and shall initialize the barrier with attributes referenced by *attr*. If *attr* is  
 31771 NULL, the default barrier attributes shall be used; the effect is the same as passing the address of  
 31772 a default barrier attributes object. The results are undefined if *pthread\_barrier\_init()* is called  
 31773 when any thread is blocked on the barrier (that is, has not returned from the  
 31774 *pthread\_barrier\_wait()* call). The results are undefined if a barrier is used without first being  
 31775 initialized. The results are undefined if *pthread\_barrier\_init()* is called specifying an already  
 31776 initialized barrier.

31777 The *count* argument specifies the number of threads that must call *pthread\_barrier\_wait()* before  
 31778 any of them successfully return from the call. The value specified by *count* must be greater than  
 31779 zero.

31780 If the *pthread\_barrier\_init()* function fails, the barrier shall not be initialized and the contents of  
 31781 *barrier* are undefined.

31782 Only the object referenced by *barrier* may be used for performing synchronization. The result of  
 31783 referring to copies of that object in calls to *pthread\_barrier\_destroy()* or *pthread\_barrier\_wait()* is  
 31784 undefined.

## 31785 RETURN VALUE

31786 Upon successful completion, these functions shall return zero; otherwise, an error number shall  
 31787 be returned to indicate the error.

## 31788 ERRORS

31789 The *pthread\_barrier\_destroy()* function may fail if:

31790 [EBUSY] The implementation has detected an attempt to destroy a barrier while it is in  
 31791 use (for example, while being used in a *pthread\_barrier\_wait()* call) by another  
 31792 thread.

31793 [EINVAL] The value specified by *barrier* is invalid.

31794 The *pthread\_barrier\_init()* function shall fail if:

31795 [EAGAIN] The system lacks the necessary resources to initialize another barrier.

31796 [EINVAL] The value specified by *count* is equal to zero.

- 31797 [ENOMEM] Insufficient memory exists to initialize the barrier.
- 31798 The *pthread\_barrier\_init()* function may fail if:
- 31799 [EBUSY] The implementation has detected an attempt to reinitialize a barrier while it is  
31800 in use (for example, while being used in a *pthread\_barrier\_wait()* call) by  
31801 another thread.
- 31802 [EINVAL] The value specified by *attr* is invalid.
- 31803 These functions shall not return an error code of [EINTR].
- 31804 **EXAMPLES**
- 31805 None.
- 31806 **APPLICATION USAGE**
- 31807 The *pthread\_barrier\_destroy()* and *pthread\_barrier\_init()* functions are part of the Barriers option  
31808 and need not be provided on all implementations.
- 31809 **RATIONALE**
- 31810 None.
- 31811 **FUTURE DIRECTIONS**
- 31812 None.
- 31813 **SEE ALSO**
- 31814 *pthread\_barrier\_wait()*, the Base Definitions volume of IEEE Std 1003.1-2001, <pthread.h>
- 31815 **CHANGE HISTORY**
- 31816 First released in Issue 6. Derived from IEEE Std 1003.1j-2000.

31817 **NAME**31818 pthread\_barrier\_wait — synchronize at a barrier (**ADVANCED REALTIME THREADS**)31819 **SYNOPSIS**

31820 THR BAR #include &lt;pthread.h&gt;

31821 int pthread\_barrier\_wait(pthread\_barrier\_t \*barrier);

31822

31823 **DESCRIPTION**

31824 The *pthread\_barrier\_wait()* function shall synchronize participating threads at the barrier  
31825 referenced by *barrier*. The calling thread shall block until the required number of threads have  
31826 called *pthread\_barrier\_wait()* specifying the barrier.

31827 When the required number of threads have called *pthread\_barrier\_wait()* specifying the barrier,  
31828 the constant PTHREAD\_BARRIER\_SERIAL\_THREAD shall be returned to one unspecified  
31829 thread and zero shall be returned to each of the remaining threads. At this point, the barrier shall  
31830 be reset to the state it had as a result of the most recent *pthread\_barrier\_init()* function that  
31831 referenced it.

31832 The constant PTHREAD\_BARRIER\_SERIAL\_THREAD is defined in <pthread.h> and its value  
31833 shall be distinct from any other value returned by *pthread\_barrier\_wait()*.

31834 The results are undefined if this function is called with an uninitialized barrier.

31835 If a signal is delivered to a thread blocked on a barrier, upon return from the signal handler the  
31836 thread shall resume waiting at the barrier if the barrier wait has not completed (that is, if the  
31837 required number of threads have not arrived at the barrier during the execution of the signal  
31838 handler); otherwise, the thread shall continue as normal from the completed barrier wait. Until  
31839 the thread in the signal handler returns from it, it is unspecified whether other threads may  
31840 proceed past the barrier once they have all reached it.

31841 A thread that has blocked on a barrier shall not prevent any unblocked thread that is eligible to  
31842 use the same processing resources from eventually making forward progress in its execution.  
31843 Eligibility for processing resources shall be determined by the scheduling policy.

31844 **RETURN VALUE**

31845 Upon successful completion, the *pthread\_barrier\_wait()* function shall return  
31846 PTHREAD\_BARRIER\_SERIAL\_THREAD for a single (arbitrary) thread synchronized at the  
31847 barrier and zero for each of the other threads. Otherwise, an error number shall be returned to  
31848 indicate the error.

31849 **ERRORS**

31850 The *pthread\_barrier\_wait()* function may fail if:

31851 [EINVAL] The value specified by *barrier* does not refer to an initialized barrier object.

31852 This function shall not return an error code of [EINTR].

31853 **EXAMPLES**

31854 None.

31855 **APPLICATION USAGE**

31856 Applications using this function may be subject to priority inversion, as discussed in the Base  
31857 Definitions volume of IEEE Std 1003.1-2001, Section 3.285, Priority Inversion.

31858 The *pthread\_barrier\_wait()* function is part of the Barriers option and need not be provided on all  
31859 implementations.

31860 **RATIONALE**

31861           None.

31862 **FUTURE DIRECTIONS**

31863           None.

31864 **SEE ALSO**31865           *pthread\_barrier\_destroy()*, the Base Definitions volume of IEEE Std 1003.1-2001, <pthread.h>31866 **CHANGE HISTORY**

31867           First released in Issue 6. Derived from IEEE Std 1003.1j-2000.

31868           In the SYNOPSIS, the inclusion of &lt;sys/types.h&gt; is no longer required.

31869 **NAME**

31870 pthread\_barrierattr\_destroy, pthread\_barrierattr\_init — destroy and initialize the barrier  
31871 attributes object (**ADVANCED REALTIME THREADS**)

31872 **SYNOPSIS**

```
31873 THR BAR #include <pthread.h>
```

```
31874 int pthread_barrierattr_destroy(pthread_barrierattr_t *attr);
```

```
31875 int pthread_barrierattr_init(pthread_barrierattr_t *attr);
```

```
31876
```

31877 **DESCRIPTION**

31878 The *pthread\_barrierattr\_destroy()* function shall destroy a barrier attributes object. A destroyed  
31879 *attr* attributes object can be reinitialized using *pthread\_barrierattr\_init()*; the results of otherwise  
31880 referencing the object after it has been destroyed are undefined. An implementation may cause  
31881 *pthread\_barrierattr\_destroy()* to set the object referenced by *attr* to an invalid value.

31882 The *pthread\_barrierattr\_init()* function shall initialize a barrier attributes object *attr* with the  
31883 default value for all of the attributes defined by the implementation.

31884 Results are undefined if *pthread\_barrierattr\_init()* is called specifying an already initialized *attr*  
31885 attributes object.

31886 After a barrier attributes object has been used to initialize one or more barriers, any function  
31887 affecting the attributes object (including destruction) shall not affect any previously initialized  
31888 barrier.

31889 **RETURN VALUE**

31890 If successful, the *pthread\_barrierattr\_destroy()* and *pthread\_barrierattr\_init()* functions shall return  
31891 zero; otherwise, an error number shall be returned to indicate the error.

31892 **ERRORS**

31893 The *pthread\_barrierattr\_destroy()* function may fail if:

31894 [EINVAL] The value specified by *attr* is invalid.

31895 The *pthread\_barrierattr\_init()* function shall fail if:

31896 [ENOMEM] Insufficient memory exists to initialize the barrier attributes object.

31897 These functions shall not return an error code of [EINTR].

31898 **EXAMPLES**

31899 None.

31900 **APPLICATION USAGE**

31901 The *pthread\_barrierattr\_destroy()* and *pthread\_barrierattr\_init()* functions are part of the Barriers  
31902 option and need not be provided on all implementations.

31903 **RATIONALE**

31904 None.

31905 **FUTURE DIRECTIONS**

31906 None.

31907 **SEE ALSO**

31908 *pthread\_barrierattr\_getpshared()*, *pthread\_barrierattr\_setpshared()*, the Base Definitions volume of  
31909 IEEE Std 1003.1-2001, <pthread.h>.

31910 **CHANGE HISTORY**

- 31911 First released in Issue 6. Derived from IEEE Std 1003.1j-2000.
- 31912 In the SYNOPSIS, the inclusion of `<sys/types.h>` is no longer required.

## 31913 NAME

31914 pthread\_barrierattr\_getpshared, pthread\_barrierattr\_setpshared — get and set the process-  
 31915 shared attribute of the barrier attributes object (**ADVANCED REALTIME THREADS**)

## 31916 SYNOPSIS

```
31917 THR      #include <pthread.h>
31918 BAR TSH  int pthread_barrierattr_getpshared(const pthread_barrierattr_t *
31919           restrict attr, int *restrict pshared);
31920           int pthread_barrierattr_setpshared(pthread_barrierattr_t *attr,
31921           int pshared);
31922
```

## 31923 DESCRIPTION

31924 The *pthread\_barrierattr\_getpshared()* function shall obtain the value of the *process-shared* attribute  
 31925 from the attributes object referenced by *attr*. The *pthread\_barrierattr\_setpshared()* function shall  
 31926 set the *process-shared* attribute in an initialized attributes object referenced by *attr*.

31927 The *process-shared* attribute is set to PTHREAD\_PROCESS\_SHARED to permit a barrier to be  
 31928 operated upon by any thread that has access to the memory where the barrier is allocated. If the  
 31929 *process-shared* attribute is PTHREAD\_PROCESS\_PRIVATE, the barrier shall only be operated  
 31930 upon by threads created within the same process as the thread that initialized the barrier; if  
 31931 threads of different processes attempt to operate on such a barrier, the behavior is undefined.  
 31932 The default value of the attribute shall be PTHREAD\_PROCESS\_PRIVATE. Both constants  
 31933 PTHREAD\_PROCESS\_SHARED and PTHREAD\_PROCESS\_PRIVATE are defined in  
 31934 **<pthread.h>**.

31935 Additional attributes, their default values, and the names of the associated functions to get and  
 31936 set those attribute values are implementation-defined.

## 31937 RETURN VALUE

31938 If successful, the *pthread\_barrierattr\_getpshared()* function shall return zero and store the value of  
 31939 the *process-shared* attribute of *attr* into the object referenced by the *pshared* parameter. Otherwise,  
 31940 an error number shall be returned to indicate the error.

31941 If successful, the *pthread\_barrierattr\_setpshared()* function shall return zero; otherwise, an error  
 31942 number shall be returned to indicate the error.

## 31943 ERRORS

31944 These functions may fail if:

31945 [EINVAL] The value specified by *attr* is invalid.

31946 The *pthread\_barrierattr\_setpshared()* function may fail if:

31947 [EINVAL] The new value specified for the *process-shared* attribute is not one of the legal  
 31948 values PTHREAD\_PROCESS\_SHARED or PTHREAD\_PROCESS\_PRIVATE.

31949 These functions shall not return an error code of [EINTR].

31950 **EXAMPLES**

31951           None.

31952 **APPLICATION USAGE**

31953           The *pthread\_barrierattr\_getpshared()* and *pthread\_barrierattr\_setpshared()* functions are part of the  
31954           Barriers option and need not be provided on all implementations.

31955 **RATIONALE**

31956           None.

31957 **FUTURE DIRECTIONS**

31958           None.

31959 **SEE ALSO**

31961           Definitions volume of IEEE Std 1003.1-2001, <pthread.h>

31962 **CHANGE HISTORY**

31963           First released in Issue 6. Derived from IEEE Std 1003.1j-2000

31964 **NAME**

31965 pthread\_barrierattr\_init — initialize the barrier attributes object (**ADVANCED REALTIME**  
31966 **THREADS**)

31967 **SYNOPSIS**

31968 THR BAR #include <pthread.h>

31969 int pthread\_barrierattr\_init(pthread\_barrierattr\_t \*attr);

31970

31971 **DESCRIPTION**

31972 Refer to *pthread\_barrierattr\_destroy()*.

31973 **NAME**

31974 pthread\_barrierattr\_setpshared — set the process-shared attribute of the barrier attributes object  
31975 (**ADVANCED REALTIME THREADS**)

31976 **SYNOPSIS**

```
31977 THR #include <pthread.h>
```

```
31978 BAR TSH int pthread_barrierattr_setpshared(pthread_barrierattr_t *attr,  
31979 int pshared);
```

31980

31981 **DESCRIPTION**

31982 Refer to *pthread\_barrierattr\_getpshared()*.

31983 **NAME**

31984 pthread\_cancel — cancel execution of a thread

31985 **SYNOPSIS**

31986 THR #include &lt;pthread.h&gt;

31987 int pthread\_cancel(pthread\_t thread);

31988

31989 **DESCRIPTION**

31990 The *pthread\_cancel()* function shall request that *thread* be canceled. The target thread's  
31991 cancelability state and type determines when the cancelation takes effect. When the cancelation  
31992 is acted on, the cancelation cleanup handlers for *thread* shall be called. When the last cancelation  
31993 cleanup handler returns, the thread-specific data destructor functions shall be called for *thread*.  
31994 When the last destructor function returns, *thread* shall be terminated.

31995 The cancelation processing in the target thread shall run asynchronously with respect to the  
31996 calling thread returning from *pthread\_cancel()*.

31997 **RETURN VALUE**

31998 If successful, the *pthread\_cancel()* function shall return zero; otherwise, an error number shall be  
31999 returned to indicate the error.

32000 **ERRORS**32001 The *pthread\_cancel()* function may fail if:

32002 [ESRCH] No thread could be found corresponding to that specified by the given thread  
32003 ID.

32004 The *pthread\_cancel()* function shall not return an error code of [EINTR].32005 **EXAMPLES**

32006 None.

32007 **APPLICATION USAGE**

32008 None.

32009 **RATIONALE**

32010 Two alternative functions were considered for sending the cancelation notification to a thread.  
32011 One would be to define a new SIGCANCEL signal that had the cancelation semantics when  
32012 delivered; the other was to define the new *pthread\_cancel()* function, which would trigger the  
32013 cancelation semantics.

32014 The advantage of a new signal was that so much of the delivery criteria were identical to that  
32015 used when trying to deliver a signal that making cancelation notification a signal was seen as  
32016 consistent. Indeed, many implementations implement cancelation using a special signal. On the  
32017 other hand, there would be no signal functions that could be used with this signal except  
32018 *pthread\_kill()*, and the behavior of the delivered cancelation signal would be unlike any  
32019 previously existing defined signal.

32020 The benefits of a special function include the recognition that this signal would be defined  
32021 because of the similar delivery criteria and that this is the only common behavior between a  
32022 cancelation request and a signal. In addition, the cancelation delivery mechanism does not have  
32023 to be implemented as a signal. There are also strong, if not stronger, parallels with language  
32024 exception mechanisms than with signals that are potentially obscured if the delivery mechanism  
32025 is visibly closer to signals.

32026 In the end, it was considered that as there were so many exceptions to the use of the new signal  
32027 with existing signals functions it would be misleading. A special function has resolved this

32028 problem. This function was carefully defined so that an implementation wishing to provide the  
32029 cancelation functions on top of signals could do so. The special function also means that  
32030 implementations are not obliged to implement cancelation with signals.

32031 **FUTURE DIRECTIONS**

32032 None.

32033 **SEE ALSO**

32034 *pthread\_exit()*, *pthread\_cond\_timedwait()*, *pthread\_join()*, *pthread\_setcancelstate()*, the Base  
32035 Definitions volume of IEEE Std 1003.1-2001, <pthread.h>

32036 **CHANGE HISTORY**

32037 First released in Issue 5. Included for alignment with the POSIX Threads Extension.

32038 **Issue 6**

32039 The *pthread\_cancel()* function is marked as part of the Threads option.

## 32040 NAME

32041 pthread\_cleanup\_pop, pthread\_cleanup\_push — establish cancelation handlers

## 32042 SYNOPSIS

32043 THR #include &lt;pthread.h&gt;

32044 void pthread\_cleanup\_pop(int execute);

32045 void pthread\_cleanup\_push(void (\*routine)(void\*), void \*arg);

32046

## 32047 DESCRIPTION

32048 The *pthread\_cleanup\_pop()* function shall remove the routine at the top of the calling thread's  
32049 cancelation cleanup stack and optionally invoke it (if *execute* is non-zero).32050 The *pthread\_cleanup\_push()* function shall push the specified cancelation cleanup handler *routine*  
32051 onto the calling thread's cancelation cleanup stack. The cancelation cleanup handler shall be  
32052 popped from the cancelation cleanup stack and invoked with the argument *arg* when:

- 32053 • The thread exits (that is, calls *pthread\_exit()*).
- 32054 • The thread acts upon a cancelation request.
- 32055 • The thread calls *pthread\_cleanup\_pop()* with a non-zero *execute* argument.

32056 These functions may be implemented as macros. The application shall ensure that they appear  
32057 as statements, and in pairs within the same lexical scope (that is, the *pthread\_cleanup\_push()*  
32058 macro may be thought to expand to a token list whose first token is '{' with  
32059 *pthread\_cleanup\_pop()* expanding to a token list whose last token is the corresponding '}').32060 The effect of calling *longjmp()* or *siglongjmp()* is undefined if there have been any calls to  
32061 *pthread\_cleanup\_push()* or *pthread\_cleanup\_pop()* made without the matching call since the jump  
32062 buffer was filled. The effect of calling *longjmp()* or *siglongjmp()* from inside a cancelation  
32063 cleanup handler is also undefined unless the jump buffer was also filled in the cancelation  
32064 cleanup handler.

## 32065 RETURN VALUE

32066 The *pthread\_cleanup\_push()* and *pthread\_cleanup\_pop()* functions shall not return a value.

## 32067 ERRORS

32068 No errors are defined.

32069 These functions shall not return an error code of [EINTR].

## 32070 EXAMPLES

32071 The following is an example using thread primitives to implement a cancelable, writers-priority  
32072 read-write lock:

```

32073 typedef struct {
32074     pthread_mutex_t lock;
32075     pthread_cond_t rcond,
32076         wcond;
32077     int lock_count; /* < 0 .. Held by writer. */
32078                   /* > 0 .. Held by lock_count readers. */
32079                   /* = 0 .. Held by nobody. */
32080     int waiting_writers; /* Count of waiting writers. */
32081 } rwlock;

32082 void
32083 waiting_reader_cleanup(void *arg)
32084 {

```

```
32085         rwlock *l;
32086         l = (rwlock *) arg;
32087         pthread_mutex_unlock(&l->lock);
32088     }
32089 void
32090 lock_for_read(rwlock *l)
32091 {
32092     pthread_mutex_lock(&l->lock);
32093     pthread_cleanup_push(waiting_reader_cleanup, l);
32094     while ((l->lock_count < 0) && (l->waiting_writers != 0))
32095         pthread_cond_wait(&l->rcond, &l->lock);
32096     l->lock_count++;
32097     /*
32098      * Note the pthread_cleanup_pop executes
32099      * waiting_reader_cleanup.
32100      */
32101     pthread_cleanup_pop(1);
32102 }
32103 void
32104 release_read_lock(rwlock *l)
32105 {
32106     pthread_mutex_lock(&l->lock);
32107     if (--l->lock_count == 0)
32108         pthread_cond_signal(&l->wcond);
32109     pthread_mutex_unlock(l);
32110 }
32111 void
32112 waiting_writer_cleanup(void *arg)
32113 {
32114     rwlock *l;
32115     l = (rwlock *) arg;
32116     if ((--l->waiting_writers == 0) && (l->lock_count >= 0)) {
32117         /*
32118          * This only happens if we have been canceled.
32119          */
32120         pthread_cond_broadcast(&l->wcond);
32121     }
32122     pthread_mutex_unlock(&l->lock);
32123 }
32124 void
32125 lock_for_write(rwlock *l)
32126 {
32127     pthread_mutex_lock(&l->lock);
32128     l->waiting_writers++;
32129     pthread_cleanup_push(waiting_writer_cleanup, l);
32130     while (l->lock_count != 0)
32131         pthread_cond_wait(&l->wcond, &l->lock);
32132     l->lock_count = -1;
32133     /*
```

```
32134         * Note the pthread_cleanup_pop executes
32135         * waiting_writer_cleanup.
32136         */
32137         pthread_cleanup_pop(1);
32138     }
32139
32139 void
32140 release_write_lock(rwlock *l)
32141 {
32142     pthread_mutex_lock(&l->lock);
32143     l->lock_count = 0;
32144     if (l->waiting_writers == 0)
32145         pthread_cond_broadcast(&l->rcond)
32146     else
32147         pthread_cond_signal(&l->wcond);
32148     pthread_mutex_unlock(&l->lock);
32149 }
32150
32150 /*
32151  * This function is called to initialize the read/write lock.
32152  */
32153 void
32154 initialize_rwlock(rwlock *l)
32155 {
32156     pthread_mutex_init(&l->lock, pthread_mutexattr_default);
32157     pthread_cond_init(&l->wcond, pthread_condattr_default);
32158     pthread_cond_init(&l->rcond, pthread_condattr_default);
32159     l->lock_count = 0;
32160     l->waiting_writers = 0;
32161 }
32162
32162 reader_thread()
32163 {
32164     lock_for_read(&lock);
32165     pthread_cleanup_push(release_read_lock, &lock);
32166     /*
32167      * Thread has read lock.
32168      */
32169     pthread_cleanup_pop(1);
32170 }
32171
32171 writer_thread()
32172 {
32173     lock_for_write(&lock);
32174     pthread_cleanup_push(release_write_lock, &lock);
32175     /*
32176      * Thread has write lock.
32177      */
32178     pthread_cleanup_pop(1);
32179 }
```

32180 **APPLICATION USAGE**

32181 The two routines that push and pop cancellation cleanup handlers, *pthread\_cleanup\_push()* and  
 32182 *pthread\_cleanup\_pop()*, can be thought of as left and right parentheses. They always need to be  
 32183 matched.

32184 **RATIONALE**

32185 The restriction that the two routines that push and pop cancellation cleanup handlers,  
 32186 *pthread\_cleanup\_push()* and *pthread\_cleanup\_pop()*, have to appear in the same lexical scope  
 32187 allows for efficient macro or compiler implementations and efficient storage management. A  
 32188 sample implementation of these routines as macros might look like this:

```
32189 #define pthread_cleanup_push(rtn,arg) { \
32190     struct _pthread_handler_rec __cleanup_handler, **__head; \
32191     __cleanup_handler.rtn = rtn; \
32192     __cleanup_handler.arg = arg; \
32193     (void) pthread_getspecific(_pthread_handler_key, &__head); \
32194     __cleanup_handler.next = *__head; \
32195     *__head = &__cleanup_handler;

32196 #define pthread_cleanup_pop(ex) \
32197     *__head = __cleanup_handler.next; \
32198     if (ex) (*__cleanup_handler.rtn)(__cleanup_handler.arg); \
32199 }
```

32200 A more ambitious implementation of these routines might do even better by allowing the  
 32201 compiler to note that the cancellation cleanup handler is a constant and can be expanded inline.

32202 This volume of IEEE Std 1003.1-2001 currently leaves unspecified the effect of calling *longjmp()*  
 32203 from a signal handler executing in a POSIX System Interfaces function. If an implementation  
 32204 wants to allow this and give the programmer reasonable behavior, the *longjmp()* function has to  
 32205 call all cancellation cleanup handlers that have been pushed but not popped since the time  
 32206 *setjmp()* was called.

32207 Consider a multi-threaded function called by a thread that uses signals. If a signal were  
 32208 delivered to a signal handler during the operation of *qsort()* and that handler were to call  
 32209 *longjmp()* (which, in turn, did *not* call the cancellation cleanup handlers) the helper threads  
 32210 created by the *qsort()* function would not be canceled. Instead, they would continue to execute  
 32211 and write into the argument array even though the array might have been popped off the stack.

32212 Note that the specified cleanup handling mechanism is especially tied to the C language and,  
 32213 while the requirement for a uniform mechanism for expressing cleanup is language-  
 32214 independent, the mechanism used in other languages may be quite different. In addition, this  
 32215 mechanism is really only necessary due to the lack of a real exception mechanism in the C  
 32216 language, which would be the ideal solution.

32217 There is no notion of a cancellation cleanup-safe function. If an application has no cancellation  
 32218 points in its signal handlers, blocks any signal whose handler may have cancellation points while  
 32219 calling async-unsafe functions, or disables cancellation while calling async-unsafe functions, all  
 32220 functions may be safely called from cancellation cleanup routines.

32221 **FUTURE DIRECTIONS**

32222 None.

## 32226 CHANGE HISTORY

32227 First released in Issue 5. Included for alignment with the POSIX Threads Extension.

## 32228 Issue 6

32229 The *pthread\_cleanup\_pop()* and *pthread\_cleanup\_push()* functions are marked as part of the  
32230 Threads option.

32231 The APPLICATION USAGE section is added.

32232 The DESCRIPTION is updated to avoid use of the term “must” for application requirements.

32233 **NAME**

32234 pthread\_cond\_broadcast, pthread\_cond\_signal — broadcast or signal a condition

32235 **SYNOPSIS**

32236 THR #include &lt;pthread.h&gt;

32237 int pthread\_cond\_broadcast(pthread\_cond\_t \*cond);

32238 int pthread\_cond\_signal(pthread\_cond\_t \*cond);

32239

32240 **DESCRIPTION**

32241 These functions shall unblock threads blocked on a condition variable.

32242 The *pthread\_cond\_broadcast()* function shall unblock all threads currently blocked on the  
32243 specified condition variable *cond*.32244 The *pthread\_cond\_signal()* function shall unblock at least one of the threads that are blocked on  
32245 the specified condition variable *cond* (if any threads are blocked on *cond*).32246 If more than one thread is blocked on a condition variable, the scheduling policy shall determine  
32247 the order in which threads are unblocked. When each thread unblocked as a result of a  
32248 *pthread\_cond\_broadcast()* or *pthread\_cond\_signal()* returns from its call to *pthread\_cond\_wait()* or  
32249 *pthread\_cond\_timedwait()*, the thread shall own the mutex with which it called  
32250 *pthread\_cond\_wait()* or *pthread\_cond\_timedwait()*. The thread(s) that are unblocked shall contend  
32251 for the mutex according to the scheduling policy (if applicable), and as if each had called  
32252 *pthread\_mutex\_lock()*.32253 The *pthread\_cond\_broadcast()* or *pthread\_cond\_signal()* functions may be called by a thread  
32254 whether or not it currently owns the mutex that threads calling *pthread\_cond\_wait()* or  
32255 *pthread\_cond\_timedwait()* have associated with the condition variable during their waits;  
32256 however, if predictable scheduling behavior is required, then that mutex shall be locked by the  
32257 thread calling *pthread\_cond\_broadcast()* or *pthread\_cond\_signal()*.32258 The *pthread\_cond\_broadcast()* and *pthread\_cond\_signal()* functions shall have no effect if there are  
32259 no threads currently blocked on *cond*.32260 **RETURN VALUE**32261 If successful, the *pthread\_cond\_broadcast()* and *pthread\_cond\_signal()* functions shall return zero;  
32262 otherwise, an error number shall be returned to indicate the error.32263 **ERRORS**32264 The *pthread\_cond\_broadcast()* and *pthread\_cond\_signal()* function may fail if:32265 [EINVAL] The value *cond* does not refer to an initialized condition variable.

32266 These functions shall not return an error code of [EINTR].

32267 **EXAMPLES**

32268 None.

32269 **APPLICATION USAGE**32270 The *pthread\_cond\_broadcast()* function is used whenever the shared-variable state has been  
32271 changed in a way that more than one thread can proceed with its task. Consider a single  
32272 producer/multiple consumer problem, where the producer can insert multiple items on a list  
32273 that is accessed one item at a time by the consumers. By calling the *pthread\_cond\_broadcast()*  
32274 function, the producer would notify all consumers that might be waiting, and thereby the  
32275 application would receive more throughput on a multi-processor. In addition,  
32276 *pthread\_cond\_broadcast()* makes it easier to implement a read-write lock. The  
32277 *pthread\_cond\_broadcast()* function is needed in order to wake up all waiting readers when a

32278 writer releases its lock. Finally, the two-phase commit algorithm can use this broadcast function  
32279 to notify all clients of an impending transaction commit.

32280 It is not safe to use the *pthread\_cond\_signal()* function in a signal handler that is invoked  
32281 asynchronously. Even if it were safe, there would still be a race between the test of the Boolean  
32282 *pthread\_cond\_wait()* that could not be efficiently eliminated.

32283 Mutexes and condition variables are thus not suitable for releasing a waiting thread by signaling  
32284 from code running in a signal handler.

### 32285 RATIONALE

#### 32286 Multiple Awakenings by Condition Signal

32287 On a multi-processor, it may be impossible for an implementation of *pthread\_cond\_signal()* to  
32288 avoid the unblocking of more than one thread blocked on a condition variable. For example,  
32289 consider the following partial implementation of *pthread\_cond\_wait()* and *pthread\_cond\_signal()*,  
32290 executed by two threads in the order given. One thread is trying to wait on the condition  
32291 variable, another is concurrently executing *pthread\_cond\_signal()*, while a third thread is already  
32292 waiting.

```
32293 pthread_cond_wait(mutex, cond):
32294     value = cond->value; /* 1 */
32295     pthread_mutex_unlock(mutex); /* 2 */
32296     pthread_mutex_lock(cond->mutex); /* 10 */
32297     if (value == cond->value) { /* 11 */
32298         me->next_cond = cond->waiter;
32299         cond->waiter = me;
32300         pthread_mutex_unlock(cond->mutex);
32301         unable_to_run(me);
32302     } else
32303         pthread_mutex_unlock(cond->mutex); /* 12 */
32304     pthread_mutex_lock(mutex); /* 13 */

32305 pthread_cond_signal(cond):
32306     pthread_mutex_lock(cond->mutex); /* 3 */
32307     cond->value++; /* 4 */
32308     if (cond->waiter) { /* 5 */
32309         sleeper = cond->waiter; /* 6 */
32310         cond->waiter = sleeper->next_cond; /* 7 */
32311         able_to_run(sleeper); /* 8 */
32312     }
32313     pthread_mutex_unlock(cond->mutex); /* 9 */
```

32314 The effect is that more than one thread can return from its call to *pthread\_cond\_wait()* or  
32315 *pthread\_cond\_timedwait()* as a result of one call to *pthread\_cond\_signal()*. This effect is called  
32316 “spurious wakeup”. Note that the situation is self-correcting in that the number of threads that  
32317 are so awakened is finite; for example, the next thread to call *pthread\_cond\_wait()* after the  
32318 sequence of events above blocks.

32319 While this problem could be resolved, the loss of efficiency for a fringe condition that occurs  
32320 only rarely is unacceptable, especially given that one has to check the predicate associated with a  
32321 condition variable anyway. Correcting this problem would unnecessarily reduce the degree of  
32322 concurrency in this basic building block for all higher-level synchronization operations.

32323 An added benefit of allowing spurious wakeups is that applications are forced to code a  
32324 predicate-testing-loop around the condition wait. This also makes the application tolerate

32325           superfluous condition broadcasts or signals on the same condition variable that may be coded in  
32326           some other part of the application. The resulting applications are thus more robust. Therefore,  
32327           IEEE Std 1003.1-2001 explicitly documents that spurious wakeups may occur.

32328 **FUTURE DIRECTIONS**

32329           None.

32333 **CHANGE HISTORY**

32334           First released in Issue 5. Included for alignment with the POSIX Threads Extension.

32335 **Issue 6**

32336           The *pthread\_cond\_broadcast()* and *pthread\_cond\_signal()* functions are marked as part of the  
32337           Threads option.

32338           The APPLICATION USAGE section is added.

## 32339 NAME

32340 pthread\_cond\_destroy, pthread\_cond\_init — destroy and initialize condition variables

## 32341 SYNOPSIS

32342 THR #include &lt;pthread.h&gt;

```

32343 int pthread_cond_destroy(pthread_cond_t *cond);
32344 int pthread_cond_init(pthread_cond_t *restrict cond,
32345     const pthread_condattr_t *restrict attr);
32346 pthread_cond_t cond = PTHREAD_COND_INITIALIZER;
32347

```

## 32348 DESCRIPTION

32349 The *pthread\_cond\_destroy()* function shall destroy the given condition variable specified by *cond*;  
 32350 the object becomes, in effect, uninitialized. An implementation may cause *pthread\_cond\_destroy()*  
 32351 to set the object referenced by *cond* to an invalid value. A destroyed condition variable object can  
 32352 be reinitialized using *pthread\_cond\_init()*; the results of otherwise referencing the object after it  
 32353 has been destroyed are undefined.

32354 It shall be safe to destroy an initialized condition variable upon which no threads are currently  
 32355 blocked. Attempting to destroy a condition variable upon which other threads are currently  
 32356 blocked results in undefined behavior.

32357 The *pthread\_cond\_init()* function shall initialize the condition variable referenced by *cond* with  
 32358 attributes referenced by *attr*. If *attr* is NULL, the default condition variable attributes shall be  
 32359 used; the effect is the same as passing the address of a default condition variable attributes  
 32360 object. Upon successful initialization, the state of the condition variable shall become initialized.

32361 Only *cond* itself may be used for performing synchronization. The result of referring to copies of  
 32362 *cond* in calls to *pthread\_cond\_wait()*, *pthread\_cond\_timedwait()*, *pthread\_cond\_signal()*,  
 32363 *pthread\_cond\_broadcast()*, and *pthread\_cond\_destroy()* is undefined.

32364 Attempting to initialize an already initialized condition variable results in undefined behavior.

32365 In cases where default condition variable attributes are appropriate, the macro  
 32366 PTHREAD\_COND\_INITIALIZER can be used to initialize condition variables that are statically  
 32367 allocated. The effect shall be equivalent to dynamic initialization by a call to *pthread\_cond\_init()*  
 32368 with parameter *attr* specified as NULL, except that no error checks are performed.

## 32369 RETURN VALUE

32370 If successful, the *pthread\_cond\_destroy()* and *pthread\_cond\_init()* functions shall return zero;  
 32371 otherwise, an error number shall be returned to indicate the error.

32372 The [EBUSY] and [EINVAL] error checks, if implemented, shall act as if they were performed  
 32373 immediately at the beginning of processing for the function and caused an error return prior to  
 32374 modifying the state of the condition variable specified by *cond*.

## 32375 ERRORS

32376 The *pthread\_cond\_destroy()* function may fail if:

32377 [EBUSY] The implementation has detected an attempt to destroy the object referenced  
 32378 by *cond* while it is referenced (for example, while being used in a  
 32379 *pthread\_cond\_wait()* or *pthread\_cond\_timedwait()*) by another thread.

32380 [EINVAL] The value specified by *cond* is invalid.

32381 The *pthread\_cond\_init()* function shall fail if:

32382 [EAGAIN] The system lacked the necessary resources (other than memory) to initialize  
 32383 another condition variable.

32384 [ENOMEM] Insufficient memory exists to initialize the condition variable.

32385 The `pthread_cond_init()` function may fail if:

32386 [EBUSY] The implementation has detected an attempt to reinitialize the object  
32387 referenced by `cond`, a previously initialized, but not yet destroyed, condition  
32388 variable.

32389 [EINVAL] The value specified by `attr` is invalid.

32390 These functions shall not return an error code of [EINTR].

### 32391 EXAMPLES

32392 A condition variable can be destroyed immediately after all the threads that are blocked on it are  
32393 awakened. For example, consider the following code:

```
32394 struct list {
32395     pthread_mutex_t lm;
32396     ...
32397 }
32398 struct elt {
32399     key k;
32400     int busy;
32401     pthread_cond_t notbusy;
32402     ...
32403 }
32404 /* Find a list element and reserve it. */
32405 struct elt *
32406 list_find(struct list *lp, key k)
32407 {
32408     struct elt *ep;
32409     pthread_mutex_lock(&lp->lm);
32410     while ((ep = find_elt(l, k) != NULL) && ep->busy)
32411         pthread_cond_wait(&ep->notbusy, &lp->lm);
32412     if (ep != NULL)
32413         ep->busy = 1;
32414     pthread_mutex_unlock(&lp->lm);
32415     return(ep);
32416 }
32417 delete_elt(struct list *lp, struct elt *ep)
32418 {
32419     pthread_mutex_lock(&lp->lm);
32420     assert(ep->busy);
32421     ... remove ep from list ...
32422     ep->busy = 0; /* Paranoid. */
32423 (A) pthread_cond_broadcast(&ep->notbusy);
32424     pthread_mutex_unlock(&lp->lm);
32425 (B) pthread_cond_destroy(&rp->notbusy);
32426     free(ep);
32427 }
```

32428 In this example, the condition variable and its list element may be freed (line B) immediately  
32429 after all threads waiting for it are awakened (line A), since the mutex and the code ensure that no  
32430 other thread can touch the element to be deleted.

## 32431 APPLICATION USAGE

32432 None.

## 32433 RATIONALE

32434 See *pthread\_mutex\_init()*; a similar rationale applies to condition variables.

## 32435 FUTURE DIRECTIONS

32436 None.

## 32437 SEE ALSO

32452 int pthread\_cond\_signal(pthread\_cond\_t \*cond);

32453

32454 **DESCRIPTION**32455 Refer to *pthread\_cond\_broadcast()*.

## 32456 NAME

32457 pthread\_cond\_timedwait, pthread\_cond\_wait — wait on a condition

## 32458 SYNOPSIS

32459 THR #include &lt;pthread.h&gt;

```

32460 int pthread_cond_timedwait(pthread_cond_t *restrict cond,
32461 pthread_mutex_t *restrict mutex,
32462 const struct timespec *restrict abstime);
32463 int pthread_cond_wait(pthread_cond_t *restrict cond,
32464 pthread_mutex_t *restrict mutex);
32465

```

## 32466 DESCRIPTION

32467 The *pthread\_cond\_timedwait()* and *pthread\_cond\_wait()* functions shall block on a condition  
 32468 variable. They shall be called with *mutex* locked by the calling thread or undefined behavior  
 32469 results.

32470 These functions atomically release *mutex* and cause the calling thread to block on the condition  
 32471 variable *cond*; atomically here means “atomically with respect to access by another thread to the  
 32472 mutex and then the condition variable”. That is, if another thread is able to acquire the mutex  
 32473 after the about-to-block thread has released it, then a subsequent call to *pthread\_cond\_broadcast()*  
 32474 or *pthread\_cond\_signal()* in that thread shall behave as if it were issued after the about-to-block  
 32475 thread has blocked.

32476 Upon successful return, the mutex shall have been locked and shall be owned by the calling  
 32477 thread.

32478 When using condition variables there is always a Boolean predicate involving shared variables  
 32479 associated with each condition wait that is true if the thread should proceed. Spurious wakeups  
 32480 from the *pthread\_cond\_timedwait()* or *pthread\_cond\_wait()* functions may occur. Since the return  
 32481 from *pthread\_cond\_timedwait()* or *pthread\_cond\_wait()* does not imply anything about the value  
 32482 of this predicate, the predicate should be re-evaluated upon such return.

32483 The effect of using more than one mutex for concurrent *pthread\_cond\_timedwait()* or  
 32484 *pthread\_cond\_wait()* operations on the same condition variable is undefined; that is, a condition  
 32485 variable becomes bound to a unique mutex when a thread waits on the condition variable, and  
 32486 this (dynamic) binding shall end when the wait returns.

32487 A condition wait (whether timed or not) is a cancelation point. When the cancelability enable  
 32488 state of a thread is set to PTHREAD\_CANCEL\_DEFERRED, a side effect of acting upon a  
 32489 cancelation request while in a condition wait is that the mutex is (in effect) re-acquired before  
 32490 calling the first cancelation cleanup handler. The effect is as if the thread were unblocked,  
 32491 allowed to execute up to the point of returning from the call to *pthread\_cond\_timedwait()* or  
 32492 *pthread\_cond\_wait()*, but at that point notices the cancelation request and instead of returning to  
 32493 the caller of *pthread\_cond\_timedwait()* or *pthread\_cond\_wait()*, starts the thread cancelation  
 32494 activities, which includes calling cancelation cleanup handlers.

32495 A thread that has been unblocked because it has been canceled while blocked in a call to  
 32496 *pthread\_cond\_timedwait()* or *pthread\_cond\_wait()* shall not consume any condition signal that  
 32497 may be directed concurrently at the condition variable if there are other threads blocked on the  
 32498 condition variable.

32499 The *pthread\_cond\_timedwait()* function shall be equivalent to *pthread\_cond\_wait()*, except that an  
 32500 error is returned if the absolute time specified by *abstime* passes (that is, system time equals or  
 32501 exceeds *abstime*) before the condition *cond* is signaled or broadcasted, or if the absolute time  
 32502 specified by *abstime* has already been passed at the time of the call.

32503 cs If the Clock Selection option is supported, the condition variable shall have a clock attribute  
 32504 which specifies the clock that shall be used to measure the time specified by the *abstime*  
 32505 argument. When such timeouts occur, *pthread\_cond\_timedwait()* shall nonetheless release and  
 32506 re-acquire the mutex referenced by *mutex*. The *pthread\_cond\_timedwait()* function is also a  
 32507 cancelation point.

32508 If a signal is delivered to a thread waiting for a condition variable, upon return from the signal  
 32509 handler the thread resumes waiting for the condition variable as if it was not interrupted, or it  
 32510 shall return zero due to spurious wakeup.

#### 32511 RETURN VALUE

32512 Except in the case of [ETIMEDOUT], all these error checks shall act as if they were performed  
 32513 immediately at the beginning of processing for the function and shall cause an error return, in  
 32514 effect, prior to modifying the state of the mutex specified by *mutex* or the condition variable  
 32515 specified by *cond*.

32516 Upon successful completion, a value of zero shall be returned; otherwise, an error number shall  
 32517 be returned to indicate the error.

#### 32518 ERRORS

32519 The *pthread\_cond\_timedwait()* function shall fail if:

32520 [ETIMEDOUT] The time specified by *abstime* to *pthread\_cond\_timedwait()* has passed.

32521 The *pthread\_cond\_timedwait()* and *pthread\_cond\_wait()* functions may fail if:

32522 [EINVAL] The value specified by *cond*, *mutex*, or *abstime* is invalid.

32523 [EINVAL] Different mutexes were supplied for concurrent *pthread\_cond\_timedwait()* or  
 32524 *pthread\_cond\_wait()* operations on the same condition variable.

32525 [EPERM] The mutex was not owned by the current thread at the time of the call.

32526 These functions shall not return an error code of [EINTR].

#### 32527 EXAMPLES

32528 None.

#### 32529 APPLICATION USAGE

32530 None.

#### 32531 RATIONALE

##### 32532 Condition Wait Semantics

32533 It is important to note that when *pthread\_cond\_wait()* and *pthread\_cond\_timedwait()* return  
 32534 without error, the associated predicate may still be false. Similarly, when  
 32535 *pthread\_cond\_timedwait()* returns with the timeout error, the associated predicate may be true  
 32536 due to an unavoidable race between the expiration of the timeout and the predicate state change.

32537 Some implementations, particularly on a multi-processor, may sometimes cause multiple  
 32538 threads to wake up when the condition variable is signaled simultaneously on different  
 32539 processors.

32540 In general, whenever a condition wait returns, the thread has to re-evaluate the predicate  
 32541 associated with the condition wait to determine whether it can safely proceed, should wait  
 32542 again, or should declare a timeout. A return from the wait does not imply that the associated  
 32543 predicate is either true or false.

32544 It is thus recommended that a condition wait be enclosed in the equivalent of a “while loop”  
 32545 that checks the predicate.

32546 **Timed Wait Semantics**

32547 An absolute time measure was chosen for specifying the timeout parameter for two reasons.  
32548 First, a relative time measure can be easily implemented on top of a function that specifies  
32549 absolute time, but there is a race condition associated with specifying an absolute timeout on top  
32550 of a function that specifies relative timeouts. For example, assume that `clock_gettime()` returns  
32551 the current time and `cond_relative_timed_wait()` uses relative timeouts:

```
32552 clock_gettime(CLOCK_REALTIME, &now)  
32553 reltime = sleep_til_this_absolute_time -now;  
32554 cond_relative_timed_wait(c, m, &reltime);
```

32555 If the thread is preempted between the first statement and the last statement, the thread blocks  
32556 for too long. Blocking, however, is irrelevant if an absolute timeout is used. An absolute timeout  
32557 also need not be recomputed if it is used multiple times in a loop, such as that enclosing a  
32558 condition wait.

32559 For cases when the system clock is advanced discontinuously by an operator, it is expected that  
32560 implementations process any timed wait expiring at an intervening time as if that time had  
32561 actually occurred.

32562 **Cancelation and Condition Wait**

32563 A condition wait, whether timed or not, is a cancelation point. That is, the functions  
32564 `pthread_cond_wait()` or `pthread_cond_timedwait()` are points where a pending (or concurrent)  
32565 cancelation request is noticed. The reason for this is that an indefinite wait is possible at these  
32566 points—whatever event is being waited for, even if the program is totally correct, might never  
32567 occur; for example, some input data being awaited might never be sent. By making condition  
32568 wait a cancelation point, the thread can be canceled and perform its cancelation cleanup handler  
32569 even though it may be stuck in some indefinite wait.

32570 A side effect of acting on a cancelation request while a thread is blocked on a condition variable  
32571 is to re-acquire the mutex before calling any of the cancelation cleanup handlers. This is done in  
32572 order to ensure that the cancelation cleanup handler is executed in the same state as the critical  
32573 code that lies both before and after the call to the condition wait function. This rule is also  
32574 required when interfacing to POSIX threads from languages, such as Ada or C++, which may  
32575 choose to map cancelation onto a language exception; this rule ensures that each exception  
32576 handler guarding a critical section can always safely depend upon the fact that the associated  
32577 mutex has already been locked regardless of exactly where within the critical section the  
32578 exception was raised. Without this rule, there would not be a uniform rule that exception  
32579 handlers could follow regarding the lock, and so coding would become very cumbersome.

32580 Therefore, since *some* statement has to be made regarding the state of the lock when a  
32581 cancelation is delivered during a wait, a definition has been chosen that makes application  
32582 coding most convenient and error free.

32583 When acting on a cancelation request while a thread is blocked on a condition variable, the  
32584 implementation is required to ensure that the thread does not consume any condition signals  
32585 directed at that condition variable if there are any other threads waiting on that condition  
32586 variable. This rule is specified in order to avoid deadlock conditions that could occur if these two  
32587 independent requests (one acting on a thread and the other acting on the condition variable)  
32588 were not processed independently.

### 32589 Performance of Mutexes and Condition Variables

32590 Mutexes are expected to be locked only for a few instructions. This practice is almost  
32591 automatically enforced by the desire of programmers to avoid long serial regions of execution  
32592 (which would reduce total effective parallelism).

32593 When using mutexes and condition variables, one tries to ensure that the usual case is to lock the  
32594 mutex, access shared data, and unlock the mutex. Waiting on a condition variable should be a  
32595 relatively rare situation. For example, when implementing a read-write lock, code that acquires a  
32596 read-lock typically needs only to increment the count of readers (under mutual-exclusion) and  
32597 return. The calling thread would actually wait on the condition variable only when there is  
32598 already an active writer. So the efficiency of a synchronization operation is bounded by the cost  
32599 of mutex lock/unlock and not by condition wait. Note that in the usual case there is no context  
32600 switch.

32601 This is not to say that the efficiency of condition waiting is unimportant. Since there needs to be  
32602 at least one context switch per Ada rendezvous, the efficiency of waiting on a condition variable  
32603 is important. The cost of waiting on a condition variable should be little more than the minimal  
32604 cost for a context switch plus the time to unlock and lock the mutex.

### 32605 Features of Mutexes and Condition Variables

32606 It had been suggested that the mutex acquisition and release be decoupled from condition wait.  
32607 This was rejected because it is the combined nature of the operation that, in fact, facilitates  
32608 realtime implementations. Those implementations can atomically move a high-priority thread  
32609 between the condition variable and the mutex in a manner that is transparent to the caller. This  
32610 can prevent extra context switches and provide more deterministic acquisition of a mutex when  
32611 the waiting thread is signaled. Thus, fairness and priority issues can be dealt with directly by the  
32612 scheduling discipline. Furthermore, the current condition wait operation matches existing  
32613 practice.

### 32614 Scheduling Behavior of Mutexes and Condition Variables

32615 Synchronization primitives that attempt to interfere with scheduling policy by specifying an  
32616 ordering rule are considered undesirable. Threads waiting on mutexes and condition variables  
32617 are selected to proceed in an order dependent upon the scheduling policy rather than in some  
32618 fixed order (for example, FIFO or priority). Thus, the scheduling policy determines which  
32619 thread(s) are awakened and allowed to proceed.

### 32620 Timed Condition Wait

32621 The *pthread\_cond\_timedwait()* function allows an application to give up waiting for a particular  
32622 condition after a given amount of time. An example of its use follows:

```
32623 (void) pthread_mutex_lock(&t.mn);
32624         t.waiters++;
32625         clock_gettime(CLOCK_REALTIME, &ts);
32626         ts.tv_sec += 5;
32627         rc = 0;
32628         while (! mypredicate(&t) && rc == 0)
32629             rc = pthread_cond_timedwait(&t.cond, &t.mn, &ts);
32630         t.waiters--;
32631         if (rc == 0) setmystate(&t);
32632 (void) pthread_mutex_unlock(&t.mn);
```

32633 By making the timeout parameter absolute, it does not need to be recomputed each time the  
32634 program checks its blocking predicate. If the timeout was relative, it would have to be  
32635 recomputed before each call. This would be especially difficult since such code would need to  
32636 take into account the possibility of extra wakeups that result from extra broadcasts or signals on  
32637 the condition variable that occur before either the predicate is true or the timeout is due.

32638 **FUTURE DIRECTIONS**

32639 None.

32640 **SEE ALSO**

32641 *pthread\_cond\_signal()*, *pthread\_cond\_broadcast()*, the Base Definitions volume of  
32642 IEEE Std 1003.1-2001, <pthread.h>

32643 **CHANGE HISTORY**

32644 First released in Issue 5. Included for alignment with the POSIX Threads Extension.

32645 **Issue 6**

32646 The *pthread\_cond\_timedwait()* and *pthread\_cond\_wait()* functions are marked as part of the  
32647 Threads option.

32648 The Open Group Corrigendum U021/9 is applied, correcting the prototype for the  
32649 *pthread\_cond\_wait()* function.

32650 The DESCRIPTION is updated for alignment with IEEE Std 1003.1j-2000 by adding semantics for  
32651 the Clock Selection option.

32652 The ERRORS section has an additional case for [EPERM] in response to IEEE PASC  
32653 Interpretation 1003.1c #28.

32654 The **restrict** keyword is added to the *pthread\_cond\_timedwait()* and *pthread\_cond\_wait()*  
32655 prototypes for alignment with the ISO/IEC 9899:1999 standard.

32656 **NAME**

32657 pthread\_condattr\_destroy, pthread\_condattr\_init — destroy and initialize the condition variable  
 32658 attributes object

32659 **SYNOPSIS**

```
32660 THR #include <pthread.h>
```

```
32661 int pthread_condattr_destroy(pthread_condattr_t *attr);
```

```
32662 int pthread_condattr_init(pthread_condattr_t *attr);
```

32663

32664 **DESCRIPTION**

32665 The *pthread\_condattr\_destroy()* function shall destroy a condition variable attributes object; the  
 32666 object becomes, in effect, uninitialized. An implementation may cause *pthread\_condattr\_destroy()*  
 32667 to set the object referenced by *attr* to an invalid value. A destroyed *attr* attributes object can be  
 32668 reinitialized using *pthread\_condattr\_init()*; the results of otherwise referencing the object after it  
 32669 has been destroyed are undefined.

32670 The *pthread\_condattr\_init()* function shall initialize a condition variable attributes object *attr* with  
 32671 the default value for all of the attributes defined by the implementation.

32672 Results are undefined if *pthread\_condattr\_init()* is called specifying an already initialized *attr*  
 32673 attributes object.

32674 After a condition variable attributes object has been used to initialize one or more condition  
 32675 variables, any function affecting the attributes object (including destruction) shall not affect any  
 32676 previously initialized condition variables.

32677 This volume of IEEE Std 1003.1-2001 requires two attributes, the *clock* attribute and the *process-*  
 32678 *shared* attribute.

32679 Additional attributes, their default values, and the names of the associated functions to get and  
 32680 set those attribute values are implementation-defined.

32681 **RETURN VALUE**

32682 If successful, the *pthread\_condattr\_destroy()* and *pthread\_condattr\_init()* functions shall return  
 32683 zero; otherwise, an error number shall be returned to indicate the error.

32684 **ERRORS**

32685 The *pthread\_condattr\_destroy()* function may fail if:

32686 [EINVAL] The value specified by *attr* is invalid.

32687 The *pthread\_condattr\_init()* function shall fail if:

32688 [ENOMEM] Insufficient memory exists to initialize the condition variable attributes object.

32689 These functions shall not return an error code of [EINTR].

32690 **EXAMPLES**

32691 None.

32692 **APPLICATION USAGE**

32693 None.

32694 **RATIONALE**

32695 See *pthread\_attr\_init()* and *pthread\_mutex\_init()*.

32696 A *process-shared* attribute has been defined for condition variables for the same reason it has been  
 32697 defined for mutexes.

## 32698 FUTURE DIRECTIONS

32699 None.

## 32703 CHANGE HISTORY

32704 First released in Issue 5. Included for alignment with the POSIX Threads Extension.

## 32705 Issue 6

32706 The *pthread\_condattr\_destroy()* and *pthread\_condattr\_init()* functions are marked as part of the  
32707 Threads option.

32708 **NAME**

32709 pthread\_condattr\_getclock, pthread\_condattr\_setclock — get and set the clock selection  
 32710 condition variable attribute (**ADVANCED REALTIME**)

32711 **SYNOPSIS**

32712 THR CS #include <pthread.h>

```
32713 int pthread_condattr_getclock(const pthread_condattr_t *restrict attr,
32714                             clockid_t *restrict clock_id);
32715 int pthread_condattr_setclock(pthread_condattr_t *attr,
32716                             clockid_t clock_id);
32717
```

32718 **DESCRIPTION**

32719 The *pthread\_condattr\_getclock()* function shall obtain the value of the *clock* attribute from the  
 32720 attributes object referenced by *attr*. The *pthread\_condattr\_setclock()* function shall set the *clock*  
 32721 attribute in an initialized attributes object referenced by *attr*. If *pthread\_condattr\_setclock()* is  
 32722 called with a *clock\_id* argument that refers to a CPU-time clock, the call shall fail.

32723 The *clock* attribute is the clock ID of the clock that shall be used to measure the timeout service of  
 32724 *pthread\_cond\_timedwait()*. The default value of the *clock* attribute shall refer to the system clock.

32725 **RETURN VALUE**

32726 If successful, the *pthread\_condattr\_getclock()* function shall return zero and store the value of the  
 32727 clock attribute of *attr* into the object referenced by the *clock\_id* argument. Otherwise, an error  
 32728 number shall be returned to indicate the error.

32729 If successful, the *pthread\_condattr\_setclock()* function shall return zero; otherwise, an error  
 32730 number shall be returned to indicate the error.

32731 **ERRORS**

32732 These functions may fail if:

32733 [EINVAL] The value specified by *attr* is invalid.

32734 The *pthread\_condattr\_setclock()* function may fail if:

32735 [EINVAL] The value specified by *clock\_id* does not refer to a known clock, or is a CPU-  
 32736 time clock.

32737 These functions shall not return an error code of [EINTR].

32738 **EXAMPLES**

32739 None.

32740 **APPLICATION USAGE**

32741 None.

32742 **RATIONALE**

32743 None.

32744 **FUTURE DIRECTIONS**

32745 None.

32746 **SEE ALSO**

32747 *pthread\_cond\_destroy()*, *pthread\_cond\_timedwait()*, *pthread\_condattr\_destroy()*,  
 32748 *pthread\_condattr\_getshared()* (on page 1041), *pthread\_condattr\_init()*,  
 32749 *pthread\_condattr\_setshared()* (on page 1045), *pthread\_create()*, *pthread\_mutex\_init()*, the Base  
 32750 Definitions volume of IEEE Std 1003.1-2001, <pthread.h>

32751 **CHANGE HISTORY**

32752 First released in Issue 6. Derived from IEEE Std 1003.1j-2000.

32753 **NAME**

32754 pthread\_condattr\_getpshared, pthread\_condattr\_setpshared — get and set the process-shared  
 32755 condition variable attributes

32756 **SYNOPSIS**

```
32757 THR TSH #include <pthread.h>
32758
32758 int pthread_condattr_getpshared(const pthread_condattr_t *restrict attr,
32759 int *restrict pshared);
32760 int pthread_condattr_setpshared(pthread_condattr_t *attr,
32761 int pshared);
32762
```

32763 **DESCRIPTION**

32764 The *pthread\_condattr\_getpshared()* function shall obtain the value of the *process-shared* attribute  
 32765 from the attributes object referenced by *attr*. The *pthread\_condattr\_setpshared()* function shall set  
 32766 the *process-shared* attribute in an initialized attributes object referenced by *attr*.

32767 The *process-shared* attribute is set to `PTHREAD_PROCESS_SHARED` to permit a condition  
 32768 variable to be operated upon by any thread that has access to the memory where the condition  
 32769 variable is allocated, even if the condition variable is allocated in memory that is shared by  
 32770 multiple processes. If the *process-shared* attribute is `PTHREAD_PROCESS_PRIVATE`, the  
 32771 condition variable shall only be operated upon by threads created within the same process as the  
 32772 thread that initialized the condition variable; if threads of differing processes attempt to operate  
 32773 on such a condition variable, the behavior is undefined. The default value of the attribute is  
 32774 `PTHREAD_PROCESS_PRIVATE`.

32775 **RETURN VALUE**

32776 If successful, the *pthread\_condattr\_setpshared()* function shall return zero; otherwise, an error  
 32777 number shall be returned to indicate the error.

32778 If successful, the *pthread\_condattr\_getpshared()* function shall return zero and store the value of  
 32779 the *process-shared* attribute of *attr* into the object referenced by the *pshared* parameter. Otherwise,  
 32780 an error number shall be returned to indicate the error.

32781 **ERRORS**

32782 The *pthread\_condattr\_getpshared()* and *pthread\_condattr\_setpshared()* functions may fail if:

32783 [EINVAL] The value specified by *attr* is invalid.

32784 The *pthread\_condattr\_setpshared()* function may fail if:

32785 [EINVAL] The new value specified for the attribute is outside the range of legal values  
 32786 for that attribute.

32787 These functions shall not return an error code of [EINTR].

32788 **EXAMPLES**

32789 None.

32790 **APPLICATION USAGE**

32791 None.

32792 **RATIONALE**

32793 None.

## 32794 FUTURE DIRECTIONS

32795 None.

32818 int pthread_condattr_setclock(pthread_condattr_t *attr,  
32819 clockid_t clock_id);
```

32820

32821 **DESCRIPTION**

32822 Refer to *pthread\_condattr\_getclock()*.

32823 **NAME**

32824 pthread\_condattr\_setpshared — set the process-shared condition variable attribute

32825 **SYNOPSIS**

32826 THR TSH #include &lt;pthread.h&gt;

32827 int pthread\_condattr\_setpshared(pthread\_condattr\_t \*attr,  
32828 int pshared);

32829

32830 **DESCRIPTION**32831 Refer to *pthread\_condattr\_getpshared()*.

## 32832 NAME

32833 pthread\_create — thread creation

## 32834 SYNOPSIS

32835 THR #include &lt;pthread.h&gt;

```
32836 int pthread_create(pthread_t *restrict thread,
32837     const pthread_attr_t *restrict attr,
32838     void *(*start_routine)(void*), void *restrict arg);
32839
```

## 32840 DESCRIPTION

32841 The *pthread\_create()* function shall create a new thread, with attributes specified by *attr*, within a  
 32842 process. If *attr* is NULL, the default attributes shall be used. If the attributes specified by *attr* are  
 32843 modified later, the thread's attributes shall not be affected. Upon successful completion,  
 32844 *pthread\_create()* shall store the ID of the created thread in the location referenced by *thread*.

32845 The thread is created executing *start\_routine* with *arg* as its sole argument. If the *start\_routine*  
 32846 returns, the effect shall be as if there was an implicit call to *pthread\_exit()* using the return value  
 32847 of *start\_routine* as the exit status. Note that the thread in which *main()* was originally invoked  
 32848 differs from this. When it returns from *main()*, the effect shall be as if there was an implicit call  
 32849 to *exit()* using the return value of *main()* as the exit status.

32850 The signal state of the new thread shall be initialized as follows:

- 32851 • The signal mask shall be inherited from the creating thread.
- 32852 • The set of signals pending for the new thread shall be empty.

32853 The floating-point environment shall be inherited from the creating thread.

32854 If *pthread\_create()* fails, no new thread is created and the contents of the location referenced by  
 32855 *thread* are undefined.

32856 TCT If `_POSIX_THREAD_CPUTIME` is defined, the new thread shall have a CPU-time clock  
 32857 accessible, and the initial value of this clock shall be set to zero.

## 32858 RETURN VALUE

32859 If successful, the *pthread\_create()* function shall return zero; otherwise, an error number shall be  
 32860 returned to indicate the error.

## 32861 ERRORS

32862 The *pthread\_create()* function shall fail if:

32863 [EAGAIN] The system lacked the necessary resources to create another thread, or the  
 32864 system-imposed limit on the total number of threads in a process  
 32865 {PTHREAD\_THREADS\_MAX} would be exceeded.

32866 [EINVAL] The value specified by *attr* is invalid.

32867 [EPERM] The caller does not have appropriate permission to set the required  
 32868 scheduling parameters or scheduling policy.

32869 The *pthread\_create()* function shall not return an error code of [EINTR].

32870 **EXAMPLES**

32871 None.

32872 **APPLICATION USAGE**

32873 None.

32874 **RATIONALE**

32875 A suggested alternative to *pthread\_create()* would be to define two separate operations: create  
 32876 and start. Some applications would find such behavior more natural. Ada, in particular,  
 32877 separates the “creation” of a task from its “activation”.

32878 Splitting the operation was rejected by the standard developers for many reasons:

- 32879 • The number of calls required to start a thread would increase from one to two and thus place  
 32880 an additional burden on applications that do not require the additional synchronization. The  
 32881 second call, however, could be avoided by the additional complication of a start-up state  
 32882 attribute.
- 32883 • An extra state would be introduced: “created but not started”. This would require the  
 32884 standard to specify the behavior of the thread operations when the target has not yet started  
 32885 executing.
- 32886 • For those applications that require such behavior, it is possible to simulate the two separate  
 32887 steps with the facilities that are currently provided. The *start\_routine()* can synchronize by  
 32888 waiting on a condition variable that is signaled by the start operation.

32889 An Ada implementor can choose to create the thread at either of two points in the Ada program:  
 32890 when the task object is created, or when the task is activated (generally at a “begin”). If the first  
 32891 approach is adopted, the *start\_routine()* needs to wait on a condition variable to receive the  
 32892 order to begin “activation”. The second approach requires no such condition variable or extra  
 32893 synchronization. In either approach, a separate Ada task control block would need to be created  
 32894 when the task object is created to hold rendezvous queues, and so on.

32895 An extension of the preceding model would be to allow the state of the thread to be modified  
 32896 between the create and start. This would allow the thread attributes object to be eliminated. This  
 32897 has been rejected because:

- 32898 • All state in the thread attributes object has to be able to be set for the thread. This would  
 32899 require the definition of functions to modify thread attributes. There would be no reduction  
 32900 in the number of function calls required to set up the thread. In fact, for an application that  
 32901 creates all threads using identical attributes, the number of function calls required to set up  
 32902 the threads would be dramatically increased. Use of a thread attributes object permits the  
 32903 application to make one set of attribute setting function calls. Otherwise, the set of attribute  
 32904 setting function calls needs to be made for each thread creation.
- 32905 • Depending on the implementation architecture, functions to set thread state would require  
 32906 kernel calls, or for other implementation reasons would not be able to be implemented as  
 32907 macros, thereby increasing the cost of thread creation.
- 32908 • The ability for applications to segregate threads by class would be lost.

32909 Another suggested alternative uses a model similar to that for process creation, such as “thread  
 32910 fork”. The fork semantics would provide more flexibility and the “create” function can be  
 32911 implemented simply by doing a thread fork followed immediately by a call to the desired “start  
 32912 routine” for the thread. This alternative has these problems:

- 32913 • For many implementations, the entire stack of the calling thread would need to be  
 32914 duplicated, since in many architectures there is no way to determine the size of the calling  
 32915 frame.

32916           • Efficiency is reduced since at least some part of the stack has to be copied, even though in  
32917           most cases the thread never needs the copied context, since it merely calls the desired start  
32918           routine.

32919 **FUTURE DIRECTIONS**

32920           None.

32921 **SEE ALSO**

32922           *fork()*, *pthread\_exit()*, *pthread\_join()*, the Base Definitions volume of IEEE Std 1003.1-2001,  
32923           <pthread.h>

32924 **CHANGE HISTORY**

32925           First released in Issue 5. Included for alignment with the POSIX Threads Extension.

32926 **Issue 6**

32927           The *pthread\_create()* function is marked as part of the Threads option.

32928           The following new requirements on POSIX implementations derive from alignment with the  
32929           Single UNIX Specification:

32930           • The [EPERM] mandatory error condition is added.

32931           The thread CPU-time clock semantics are added for alignment with IEEE Std 1003.1d-1999.

32932           The **restrict** keyword is added to the *pthread\_create()* prototype for alignment with the  
32933           ISO/IEC 9899:1999 standard.

32934           The DESCRIPTION is updated to make it explicit that the floating-point environment is  
32935           inherited from the creating thread.

32936 **NAME**

32937 pthread\_detach — detach a thread

32938 **SYNOPSIS**

32939 THR #include &lt;pthread.h&gt;

32940 int pthread\_detach(pthread\_t thread);

32941

32942 **DESCRIPTION**

32943 The *pthread\_detach()* function shall indicate to the implementation that storage for the thread  
 32944 *thread* can be reclaimed when that thread terminates. If *thread* has not terminated,  
 32945 *pthread\_detach()* shall not cause it to terminate. The effect of multiple *pthread\_detach()* calls on  
 32946 the same target thread is unspecified.

32947 **RETURN VALUE**

32948 If the call succeeds, *pthread\_detach()* shall return 0; otherwise, an error number shall be returned  
 32949 to indicate the error.

32950 **ERRORS**32951 The *pthread\_detach()* function shall fail if:

32952 [EINVAL] The implementation has detected that the value specified by *thread* does not  
 32953 refer to a joinable thread.

32954 [ESRCH] No thread could be found corresponding to that specified by the given thread  
 32955 ID.

32956 The *pthread\_detach()* function shall not return an error code of [EINTR].32957 **EXAMPLES**

32958 None.

32959 **APPLICATION USAGE**

32960 None.

32961 **RATIONALE**

32962 The *pthread\_join()* or *pthread\_detach()* functions should eventually be called for every thread that  
 32963 is created so that storage associated with the thread may be reclaimed.

32964 It has been suggested that a “detach” function is not necessary; the *detachstate* thread creation  
 32965 attribute is sufficient, since a thread need never be dynamically detached. However, need arises  
 32966 in at least two cases:

32967 1. In a cancellation handler for a *pthread\_join()* it is nearly essential to have a *pthread\_detach()*  
 32968 function in order to detach the thread on which *pthread\_join()* was waiting. Without it, it  
 32969 would be necessary to have the handler do another *pthread\_join()* to attempt to detach the  
 32970 thread, which would both delay the cancellation processing for an unbounded period and  
 32971 introduce a new call to *pthread\_join()*, which might itself need a cancellation handler. A  
 32972 dynamic detach is nearly essential in this case.

32973 2. In order to detach the “initial thread” (as may be desirable in processes that set up server  
 32974 threads).

32975 **FUTURE DIRECTIONS**

32976 None.

32977 **SEE ALSO**

32978 *pthread\_join()*, the Base Definitions volume of IEEE Std 1003.1-2001, <pthread.h>

32979 **CHANGE HISTORY**

32980 First released in Issue 5. Included for alignment with the POSIX Threads Extension.

32981 **Issue 6**

32982 The *pthread\_detach()* function is marked as part of the Threads option.

32983 **NAME**

32984 pthread\_equal — compare thread IDs

32985 **SYNOPSIS**

32986 THR #include &lt;pthread.h&gt;

32987 int pthread\_equal(pthread\_t t1, pthread\_t t2);

32988

32989 **DESCRIPTION**32990 This function shall compare the thread IDs *t1* and *t2*.32991 **RETURN VALUE**32992 The *pthread\_equal()* function shall return a non-zero value if *t1* and *t2* are equal; otherwise, zero  
32993 shall be returned.32994 If either *t1* or *t2* are not valid thread IDs, the behavior is undefined.32995 **ERRORS**

32996 No errors are defined.

32997 The *pthread\_equal()* function shall not return an error code of [EINTR].32998 **EXAMPLES**

32999 None.

33000 **APPLICATION USAGE**

33001 None.

33002 **RATIONALE**33003 Implementations may choose to define a thread ID as a structure. This allows additional  
33004 flexibility and robustness over using an **int**. For example, a thread ID could include a sequence  
33005 number that allows detection of “dangling IDs” (copies of a thread ID that has been detached).  
33006 Since the C language does not support comparison on structure types, the *pthread\_equal()*  
33007 function is provided to compare thread IDs.33008 **FUTURE DIRECTIONS**

33009 None.

33010 **SEE ALSO**33011 *pthread\_create()*, *pthread\_self()*, the Base Definitions volume of IEEE Std 1003.1-2001, <pthread.h>33012 **CHANGE HISTORY**

33013 First released in Issue 5. Included for alignment with the POSIX Threads Extension.

33014 **Issue 6**33015 The *pthread\_equal()* function is marked as part of the Threads option.

33016 **NAME**

33017 pthread\_exit — thread termination

33018 **SYNOPSIS**

33019 THR #include &lt;pthread.h&gt;

33020 void pthread\_exit(void \*value\_ptr);

33021

33022 **DESCRIPTION**

33023 The *pthread\_exit()* function shall terminate the calling thread and make the value *value\_ptr*  
33024 available to any successful join with the terminating thread. Any cancellation cleanup handlers  
33025 that have been pushed and not yet popped shall be popped in the reverse order that they were  
33026 pushed and then executed. After all cancellation cleanup handlers have been executed, if the  
33027 thread has any thread-specific data, appropriate destructor functions shall be called in an  
33028 unspecified order. Thread termination does not release any application visible process resources,  
33029 including, but not limited to, mutexes and file descriptors, nor does it perform any process-level  
33030 cleanup actions, including, but not limited to, calling any *atexit()* routines that may exist.

33031 An implicit call to *pthread\_exit()* is made when a thread other than the thread in which *main()*  
33032 was first invoked returns from the start routine that was used to create it. The function's return  
33033 value shall serve as the thread's exit status.

33034 The behavior of *pthread\_exit()* is undefined if called from a cancellation cleanup handler or  
33035 destructor function that was invoked as a result of either an implicit or explicit call to  
33036 *pthread\_exit()*.

33037 After a thread has terminated, the result of access to local (auto) variables of the thread is  
33038 undefined. Thus, references to local variables of the exiting thread should not be used for the  
33039 *pthread\_exit()* *value\_ptr* parameter value.

33040 The process shall exit with an exit status of 0 after the last thread has been terminated. The  
33041 behavior shall be as if the implementation called *exit()* with a zero argument at thread  
33042 termination time.

33043 **RETURN VALUE**33044 The *pthread\_exit()* function cannot return to its caller.33045 **ERRORS**

33046 No errors are defined.

33047 **EXAMPLES**

33048 None.

33049 **APPLICATION USAGE**

33050 None.

33051 **RATIONALE**

33052 The normal mechanism by which a thread terminates is to return from the routine that was  
33053 specified in the *pthread\_create()* call that started it. The *pthread\_exit()* function provides the  
33054 capability for a thread to terminate without requiring a return from the start routine of that  
33055 thread, thereby providing a function analogous to *exit()*.

33056 Regardless of the method of thread termination, any cancellation cleanup handlers that have  
33057 been pushed and not yet popped are executed, and the destructors for any existing thread-  
33058 specific data are executed. This volume of IEEE Std 1003.1-2001 requires that cancellation  
33059 cleanup handlers be popped and called in order. After all cancellation cleanup handlers have  
33060 been executed, thread-specific data destructors are called, in an unspecified order, for each item  
33061 of thread-specific data that exists in the thread. This ordering is necessary because cancellation

- 33062 cleanup handlers may rely on thread-specific data.
- 33063 As the meaning of the status is determined by the application (except when the thread has been  
33064 canceled, in which case it is PTHREAD\_CANCELED), the implementation has no idea what an  
33065 illegal status value is, which is why no address error checking is done.
- 33066 **FUTURE DIRECTIONS**
- 33067 None.
- 33068 **SEE ALSO**

- 33074 The *pthread\_exit()* function is marked as part of the Threads option.

33075 **NAME**

33076 pthread\_getconcurrency, pthread\_setconcurrency — get and set the level of concurrency

33077 **SYNOPSIS**

```
33078 XSI #include <pthread.h>
```

```
33079 int pthread_getconcurrency(void);
```

```
33080 int pthread_setconcurrency(int new_level);
```

```
33081
```

33082 **DESCRIPTION**

33083 Unbound threads in a process may or may not be required to be simultaneously active. By  
33084 default, the threads implementation ensures that a sufficient number of threads are active so that  
33085 the process can continue to make progress. While this conserves system resources, it may not  
33086 produce the most effective level of concurrency.

33087 The *pthread\_setconcurrency()* function allows an application to inform the threads  
33088 implementation of its desired concurrency level, *new\_level*. The actual level of concurrency  
33089 provided by the implementation as a result of this function call is unspecified.

33090 If *new\_level* is zero, it causes the implementation to maintain the concurrency level at its  
33091 discretion as if *pthread\_setconcurrency()* had never been called.

33092 The *pthread\_getconcurrency()* function shall return the value set by a previous call to the  
33093 *pthread\_setconcurrency()* function. If the *pthread\_setconcurrency()* function was not previously  
33094 called, this function shall return zero to indicate that the implementation is maintaining the  
33095 concurrency level.

33096 A call to *pthread\_setconcurrency()* shall inform the implementation of its desired concurrency  
33097 level. The implementation shall use this as a hint, not a requirement.

33098 If an implementation does not support multiplexing of user threads on top of several kernel-  
33099 scheduled entities, the *pthread\_setconcurrency()* and *pthread\_getconcurrency()* functions are  
33100 provided for source code compatibility but they shall have no effect when called. To maintain  
33101 the function semantics, the *new\_level* parameter is saved when *pthread\_setconcurrency()* is called  
33102 so that a subsequent call to *pthread\_getconcurrency()* shall return the same value.

33103 **RETURN VALUE**

33104 If successful, the *pthread\_setconcurrency()* function shall return zero; otherwise, an error number  
33105 shall be returned to indicate the error.

33106 The *pthread\_getconcurrency()* function shall always return the concurrency level set by a previous  
33107 call to *pthread\_setconcurrency()*. If the *pthread\_setconcurrency()* function has never been called,  
33108 *pthread\_getconcurrency()* shall return zero.

33109 **ERRORS**

33110 The *pthread\_setconcurrency()* function shall fail if:

33111 [EINVAL] The value specified by *new\_level* is negative.

33112 [EAGAIN] The value specific by *new\_level* would cause a system resource to be exceeded.

33113 These functions shall not return an error code of [EINTR].

33114 **EXAMPLES**

33115           None.

33116 **APPLICATION USAGE**

33117           Use of these functions changes the state of the underlying concurrency upon which the  
33118           application depends. Library developers are advised to not use the *pthread\_getconcurrency()* and  
33119           *pthread\_setconcurrency()* functions since their use may conflict with an applications use of these  
33120           functions.

33121 **RATIONALE**

33122           None.

33123 **FUTURE DIRECTIONS**

33124           None.

33125 **SEE ALSO**

33126           The Base Definitions volume of IEEE Std 1003.1-2001, &lt;pthread.h&gt;

33127 **CHANGE HISTORY**

33128           First released in Issue 5.

33129 **NAME**

33130 pthread\_getcpuclockid — access a thread CPU-time clock (**ADVANCED REALTIME**  
33131 **THREADS**)

33132 **SYNOPSIS**

```
33133 THR TCT #include <pthread.h>
```

```
33134 #include <time.h>
```

```
33135 int pthread_getcpuclockid(pthread_t thread_id, clockid_t *clock_id);
```

```
33136
```

33137 **DESCRIPTION**

33138 The *pthread\_getcpuclockid()* function shall return in *clock\_id* the clock ID of the CPU-time clock of  
33139 the thread specified by *thread\_id*, if the thread specified by *thread\_id* exists.

33140 **RETURN VALUE**

33141 Upon successful completion, *pthread\_getcpuclockid()* shall return zero; otherwise, an error  
33142 number shall be returned to indicate the error.

33143 **ERRORS**

33144 The *pthread\_getcpuclockid()* function may fail if:

33145 [ESRCH] The value specified by *thread\_id* does not refer to an existing thread.

33146 **EXAMPLES**

33147 None.

33148 **APPLICATION USAGE**

33149 The *pthread\_getcpuclockid()* function is part of the Thread CPU-Time Clocks option and need not  
33150 be provided on all implementations.

33151 **RATIONALE**

33152 None.

33153 **FUTURE DIRECTIONS**

33154 None.

33155 **SEE ALSO**

33156 *clock\_getcpuclockid()*, *clock\_getres()*, *timer\_create()*, the Base Definitions volume of  
33157 IEEE Std 1003.1-2001, <pthread.h>, <time.h>

33158 **CHANGE HISTORY**

33159 First released in Issue 6. Derived from IEEE Std 1003.1d-1999.

33160 In the SYNOPSIS, the inclusion of <sys/types.h> is no longer required.

## 33161 NAME

33162 pthread\_getschedparam, pthread\_setschedparam — dynamic thread scheduling parameters  
 33163 access (**REALTIME THREADS**)

## 33164 SYNOPSIS

```
33165 THR TPS #include <pthread.h>
33166
33166 int pthread_getschedparam(pthread_t thread, int *restrict policy,
33167 struct sched_param *restrict param);
33168 int pthread_setschedparam(pthread_t thread, int policy,
33169 const struct sched_param *param);
33170
```

## 33171 DESCRIPTION

33172 The *pthread\_getschedparam()* and *pthread\_setschedparam()* functions shall, respectively, get and set  
 33173 the scheduling policy and parameters of individual threads within a multi-threaded process to  
 33174 be retrieved and set. For SCHED\_FIFO and SCHED\_RR, the only required member of the  
 33175 **sched\_param** structure is the priority *sched\_priority*. For SCHED\_OTHER, the affected  
 33176 scheduling parameters are implementation-defined.

33177 The *pthread\_getschedparam()* function shall retrieve the scheduling policy and scheduling  
 33178 parameters for the thread whose thread ID is given by *thread* and shall store those values in  
 33179 *policy* and *param*, respectively. The priority value returned from *pthread\_getschedparam()* shall be  
 33180 the value specified by the most recent *pthread\_setschedparam()*, *pthread\_setschedprio()*, or  
 33181 *pthread\_create()* call affecting the target thread. It shall not reflect any temporary adjustments to  
 33182 its priority as a result of any priority inheritance or ceiling functions. The *pthread\_setschedparam()*  
 33183 function shall set the scheduling policy and associated scheduling parameters for the thread  
 33184 whose thread ID is given by *thread* to the policy and associated parameters provided in *policy*  
 33185 and *param*, respectively.

33186 The *policy* parameter may have the value SCHED\_OTHER, SCHED\_FIFO, or SCHED\_RR. The  
 33187 scheduling parameters for the SCHED\_OTHER policy are implementation-defined. The  
 33188 SCHED\_FIFO and SCHED\_RR policies shall have a single scheduling parameter, *priority*.

33189 TSP If **\_POSIX\_THREAD\_SPORADIC\_SERVER** is defined, then the *policy* argument may have  
 33190 the value SCHED\_SPORADIC, with the exception for the *pthread\_setschedparam()* function that if the  
 33191 scheduling policy was not SCHED\_SPORADIC at the time of the call, it is implementation-  
 33192 defined whether the function is supported; in other words, the implementation need not allow  
 33193 the application to dynamically change the scheduling policy to SCHED\_SPORADIC. The  
 33194 sporadic server scheduling policy has the associated parameters *sched\_ss\_low\_priority*,  
 33195 *sched\_ss\_repl\_period*, *sched\_ss\_init\_budget*, *sched\_priority*, and *sched\_ss\_max\_repl*. The specified  
 33196 *sched\_ss\_repl\_period* shall be greater than or equal to the specified *sched\_ss\_init\_budget* for the  
 33197 function to succeed; if it is not, then the function shall fail. The value of *sched\_ss\_max\_repl* shall  
 33198 be within the inclusive range [1,{SS\_REPL\_MAX}] for the function to succeed; if not, the function  
 33199 shall fail.

33200 If the *pthread\_setschedparam()* function fails, the scheduling parameters shall not be changed for  
 33201 the target thread.

## 33202 RETURN VALUE

33203 If successful, the *pthread\_getschedparam()* and *pthread\_setschedparam()* functions shall return zero;  
 33204 otherwise, an error number shall be returned to indicate the error.

33205 **ERRORS**

33206 The *pthread\_getschedparam()* function may fail if:

33207 [ESRCH] The value specified by *thread* does not refer to an existing thread.

33208 The *pthread\_setschedparam()* function may fail if:

33209 [EINVAL] The value specified by *policy* or one of the scheduling parameters associated  
33210 with the scheduling policy *policy* is invalid.

33211 [ENOTSUP] An attempt was made to set the policy or scheduling parameters to an  
33212 unsupported value.

33213 TSP [ENOTSUP] An attempt was made to dynamically change the scheduling policy to  
33214 SCHED\_SPORADIC, and the implementation does not support this change.

33215 [EPERM] The caller does not have the appropriate permission to set either the  
33216 scheduling parameters or the scheduling policy of the specified thread.

33217 [EPERM] The implementation does not allow the application to modify one of the  
33218 parameters to the value specified.

33219 [ESRCH] The value specified by *thread* does not refer to a existing thread.

33220 These functions shall not return an error code of [EINTR].

33221 **EXAMPLES**

33222 None.

33223 **APPLICATION USAGE**

33224 None.

33225 **RATIONALE**

33226 None.

33227 **FUTURE DIRECTIONS**

33228 None.

33229 **SEE ALSO**

33230 *pthread\_setschedprio()*, *sched\_getparam()*, *sched\_getscheduler()*, the Base Definitions volume of  
33231 IEEE Std 1003.1-2001, <pthread.h>, <sched.h>

33232 **CHANGE HISTORY**

33233 First released in Issue 5. Included for alignment with the POSIX Threads Extension.

33234 **Issue 6**

33235 The *pthread\_getschedparam()* and *pthread\_setschedparam()* functions are marked as part of the  
33236 Threads and Thread Execution Scheduling options.

33237 The [ENOSYS] error condition has been removed as stubs need not be provided if an  
33238 implementation does not support the Thread Execution Scheduling option.

33239 The Open Group Corrigendum U026/2 is applied, correcting the prototype for the  
33240 *pthread\_setschedparam()* function so that its second argument is of type **int**.

33241 The SCHED\_SPORADIC scheduling policy is added for alignment with IEEE Std 1003.1d-1999.

33242 The **restrict** keyword is added to the *pthread\_getschedparam()* prototype for alignment with the  
33243 ISO/IEC 9899:1999 standard.

33244 The Open Group Corrigendum U047/1 is applied.

33245  
33246

IEEE PASC Interpretation 1003.1 #96 is applied, noting that priority values can also be set by a call to the *pthread\_setschedprio()* function.

33247 **NAME**

33248 pthread\_getspecific, pthread\_setspecific — thread-specific data management

33249 **SYNOPSIS**

33250 THR #include &lt;pthread.h&gt;

33251 void \*pthread\_getspecific(pthread\_key\_t key);

33252 int pthread\_setspecific(pthread\_key\_t key, const void \*value);

33253

33254 **DESCRIPTION**33255 The *pthread\_getspecific()* function shall return the value currently bound to the specified *key* on  
33256 behalf of the calling thread.33257 The *pthread\_setspecific()* function shall associate a thread-specific *value* with a *key* obtained via a  
33258 previous call to *pthread\_key\_create()*. Different threads may bind different values to the same  
33259 key. These values are typically pointers to blocks of dynamically allocated memory that have  
33260 been reserved for use by the calling thread.33261 The effect of calling *pthread\_getspecific()* or *pthread\_setspecific()* with a *key* value not obtained  
33262 from *pthread\_key\_create()* or after *key* has been deleted with *pthread\_key\_delete()* is undefined.33263 Both *pthread\_getspecific()* and *pthread\_setspecific()* may be called from a thread-specific data  
33264 destructor function. A call to *pthread\_getspecific()* for the thread-specific data key being  
33265 destroyed shall return the value NULL, unless the value is changed (after the destructor starts)  
33266 by a call to *pthread\_setspecific()*. Calling *pthread\_setspecific()* from a thread-specific data  
33267 destructor routine may result either in lost storage (after at least  
33268 PTHREAD\_DESTRUCTOR\_ITERATIONS attempts at destruction) or in an infinite loop.

33269 Both functions may be implemented as macros.

33270 **RETURN VALUE**33271 The *pthread\_getspecific()* function shall return the thread-specific data value associated with the  
33272 given *key*. If no thread-specific data value is associated with *key*, then the value NULL shall be  
33273 returned.33274 If successful, the *pthread\_setspecific()* function shall return zero; otherwise, an error number shall  
33275 be returned to indicate the error.33276 **ERRORS**33277 No errors are returned from *pthread\_getspecific()*.33278 The *pthread\_setspecific()* function shall fail if:

33279 [ENOMEM] Insufficient memory exists to associate the value with the key.

33280 The *pthread\_setspecific()* function may fail if:

33281 [EINVAL] The key value is invalid.

33282 These functions shall not return an error code of [EINTR].

33283 **EXAMPLES**

33284 None.

33285 **APPLICATION USAGE**

33286 None.

33287 **RATIONALE**

33288 Performance and ease-of-use of *pthread\_getspecific()* are critical for functions that rely on  
33289 maintaining state in thread-specific data. Since no errors are required to be detected by it, and  
33290 since the only error that could be detected is the use of an invalid key, the function to  
33291 *pthread\_getspecific()* has been designed to favor speed and simplicity over error reporting.

33292 **FUTURE DIRECTIONS**

33293 None.

33294 **SEE ALSO**33295 *pthread\_key\_create()*, the Base Definitions volume of IEEE Std 1003.1-2001, <pthread.h>33296 **CHANGE HISTORY**

33297 First released in Issue 5. Included for alignment with the POSIX Threads Extension.

33298 **Issue 6**

33299 The *pthread\_getspecific()* and *pthread\_setspecific()* functions are marked as part of the Threads  
33300 option.

33301 IEEE PASC Interpretation 1003.1c #3 (Part 6) is applied, updating the DESCRIPTION.

## 33302 NAME

33303 pthread\_join — wait for thread termination

## 33304 SYNOPSIS

33305 THR #include &lt;pthread.h&gt;

33306 int pthread\_join(pthread\_t thread, void \*\*value\_ptr);

33307

## 33308 DESCRIPTION

33309 The *pthread\_join()* function shall suspend execution of the calling thread until the target *thread*  
 33310 terminates, unless the target *thread* has already terminated. On return from a successful  
 33311 *pthread\_join()* call with a non-NULL *value\_ptr* argument, the value passed to *pthread\_exit()* by  
 33312 the terminating thread shall be made available in the location referenced by *value\_ptr*. When a  
 33313 *pthread\_join()* returns successfully, the target thread has been terminated. The results of multiple  
 33314 simultaneous calls to *pthread\_join()* specifying the same target thread are undefined. If the  
 33315 thread calling *pthread\_join()* is canceled, then the target thread shall not be detached.

33316 It is unspecified whether a thread that has exited but remains unjoined counts against  
 33317 {PTHREAD\_THREADS\_MAX}.

## 33318 RETURN VALUE

33319 If successful, the *pthread\_join()* function shall return zero; otherwise, an error number shall be  
 33320 returned to indicate the error.

## 33321 ERRORS

33322 The *pthread\_join()* function shall fail if:

33323 [EINVAL] The implementation has detected that the value specified by *thread* does not  
 33324 refer to a joinable thread.

33325 [ESRCH] No thread could be found corresponding to that specified by the given thread  
 33326 ID.

33327 The *pthread\_join()* function may fail if:

33328 [EDEADLK] A deadlock was detected or the value of *thread* specifies the calling thread.

33329 The *pthread\_join()* function shall not return an error code of [EINTR].

## 33330 EXAMPLES

33331 An example of thread creation and deletion follows:

```

33332 typedef struct {
33333     int *ar;
33334     long n;
33335 } subarray;

33336 void *
33337 incer(void *arg)
33338 {
33339     long i;

33340     for (i = 0; i < ((subarray *)arg)->n; i++)
33341         ((subarray *)arg)->ar[i]++;
33342 }

33343 int main(void)
33344 {
33345     int         ar[1000000];

```

```

33346     pthread_t  th1, th2;
33347     subarray  sb1, sb2;

33348     sb1.ar = &ar[0];
33349     sb1.n  = 500000;
33350     (void) pthread_create(&th1, NULL, incer, &sb1);

33351     sb2.ar = &ar[500000];
33352     sb2.n  = 500000;
33353     (void) pthread_create(&th2, NULL, incer, &sb2);

33354     (void) pthread_join(th1, NULL);
33355     (void) pthread_join(th2, NULL);
33356     return 0;
33357 }

```

### 33358 APPLICATION USAGE

33359 None.

### 33360 RATIONALE

33361 The *pthread\_join()* function is a convenience that has proven useful in multi-threaded  
33362 applications. It is true that a programmer could simulate this function if it were not provided by  
33363 passing extra state as part of the argument to the *start\_routine()*. The terminating thread would  
33364 set a flag to indicate termination and broadcast a condition that is part of that state; a joining  
33365 thread would wait on that condition variable. While such a technique would allow a thread to  
33366 wait on more complex conditions (for example, waiting for multiple threads to terminate),  
33367 waiting on individual thread termination is considered widely useful. Also, including the  
33368 *pthread\_join()* function in no way precludes a programmer from coding such complex waits.  
33369 Thus, while not a primitive, including *pthread\_join()* in this volume of IEEE Std 1003.1-2001 was  
33370 considered valuable.

33371 The *pthread\_join()* function provides a simple mechanism allowing an application to wait for a  
33372 thread to terminate. After the thread terminates, the application may then choose to clean up  
33373 resources that were used by the thread. For instance, after *pthread\_join()* returns, any  
33374 application-provided stack storage could be reclaimed.

33375 The *pthread\_join()* or *pthread\_detach()* function should eventually be called for every thread that  
33376 is created with the *detachstate* attribute set to *PTHREAD\_CREATE\_JOINABLE* so that storage  
33377 associated with the thread may be reclaimed.

33378 The interaction between *pthread\_join()* and cancelation is well-defined for the following reasons:

- 33379 • The *pthread\_join()* function, like all other non-async-cancel-safe functions, can only be called  
33380 with deferred cancelability type.
- 33381 • Cancelation cannot occur in the disabled cancelability state.

33382 Thus, only the default cancelability state need be considered. As specified, either the  
33383 *pthread\_join()* call is canceled, or it succeeds, but not both. The difference is obvious to the  
33384 application, since either a cancelation handler is run or *pthread\_join()* returns. There are no race  
33385 conditions since *pthread\_join()* was called in the deferred cancelability state.

### 33386 FUTURE DIRECTIONS

33387 None.

33388 **SEE ALSO**

33389 *pthread\_create()*, *wait()*, the Base Definitions volume of IEEE Std 1003.1-2001, <pthread.h>

33390 **CHANGE HISTORY**

33391 First released in Issue 5. Included for alignment with the POSIX Threads Extension.

33392 **Issue 6**

33393 The *pthread\_join()* function is marked as part of the Threads option.

33394 **NAME**

33395 pthread\_key\_create — thread-specific data key creation

33396 **SYNOPSIS**

33397 THR #include &lt;pthread.h&gt;

33398 int pthread\_key\_create(pthread\_key\_t \*key, void (\*destructor)(void\*));

33399

33400 **DESCRIPTION**

33401 The *pthread\_key\_create()* function shall create a thread-specific data key visible to all threads in  
 33402 the process. Key values provided by *pthread\_key\_create()* are opaque objects used to locate  
 33403 thread-specific data. Although the same key value may be used by different threads, the values  
 33404 bound to the key by *pthread\_setspecific()* are maintained on a per-thread basis and persist for the  
 33405 life of the calling thread.

33406 Upon key creation, the value NULL shall be associated with the new key in all active threads.  
 33407 Upon thread creation, the value NULL shall be associated with all defined keys in the new  
 33408 thread.

33409 An optional destructor function may be associated with each key value. At thread exit, if a key  
 33410 value has a non-NULL destructor pointer, and the thread has a non-NULL value associated with  
 33411 that key, the value of the key is set to NULL, and then the function pointed to is called with the  
 33412 previously associated value as its sole argument. The order of destructor calls is unspecified if  
 33413 more than one destructor exists for a thread when it exits.

33414 If, after all the destructors have been called for all non-NULL values with associated destructors,  
 33415 there are still some non-NULL values with associated destructors, then the process is repeated.  
 33416 If, after at least {PTHREAD\_DESTRUCTOR\_ITERATIONS} iterations of destructor calls for  
 33417 outstanding non-NULL values, there are still some non-NULL values with associated  
 33418 destructors, implementations may stop calling destructors, or they may continue calling  
 33419 destructors until no non-NULL values with associated destructors exist, even though this might  
 33420 result in an infinite loop.

33421 **RETURN VALUE**

33422 If successful, the *pthread\_key\_create()* function shall store the newly created key value at *\*key* and  
 33423 shall return zero. Otherwise, an error number shall be returned to indicate the error.

33424 **ERRORS**33425 The *pthread\_key\_create()* function shall fail if:

33426 [EAGAIN] The system lacked the necessary resources to create another thread-specific  
 33427 data key, or the system-imposed limit on the total number of keys per process  
 33428 {PTHREAD\_KEYS\_MAX} has been exceeded.

33429 [ENOMEM] Insufficient memory exists to create the key.

33430 The *pthread\_key\_create()* function shall not return an error code of [EINTR].

33431 **EXAMPLES**

33432 The following example demonstrates a function that initializes a thread-specific data key when  
 33433 it is first called, and associates a thread-specific object with each calling thread, initializing this  
 33434 object when necessary.

```

33435     static pthread_key_t key;
33436     static pthread_once_t key_once = PTHREAD_ONCE_INIT;

33437     static void
33438     make_key()
33439     {
33440         (void) pthread_key_create(&key, NULL);
33441     }

33442     func()
33443     {
33444         void *ptr;

33445         (void) pthread_once(&key_once, make_key);
33446         if ((ptr = pthread_getspecific(key)) == NULL) {
33447             ptr = malloc(OBJECT_SIZE);
33448             ...
33449             (void) pthread_setspecific(key, ptr);
33450         }
33451         ...
33452     }

```

33453 Note that the key has to be initialized before *pthread\_getspecific()* or *pthread\_setspecific()* can be  
 33454 used. The *pthread\_key\_create()* call could either be explicitly made in a module initialization  
 33455 routine, or it can be done implicitly by the first call to a module as in this example. Any attempt  
 33456 to use the key before it is initialized is a programming error, making the code below incorrect.

```

33457     static pthread_key_t key;

33458     func()
33459     {
33460         void *ptr;

33461         /* KEY NOT INITIALIZED!!! THIS WON'T WORK!!! */
33462         if ((ptr = pthread_getspecific(key)) == NULL &&
33463             pthread_setspecific(key, NULL) != 0) {
33464             pthread_key_create(&key, NULL);
33465             ...
33466         }
33467     }

```

33468 **APPLICATION USAGE**

33469 None.

## 33470 RATIONALE

33471 **Destructor Functions**

33472 Normally, the value bound to a key on behalf of a particular thread is a pointer to storage  
 33473 allocated dynamically on behalf of the calling thread. The destructor functions specified with  
 33474 *pthread\_key\_create()* are intended to be used to free this storage when the thread exits. Thread  
 33475 cancelation cleanup handlers cannot be used for this purpose because thread-specific data may  
 33476 persist outside the lexical scope in which the cancelation cleanup handlers operate.

33477 If the value associated with a key needs to be updated during the lifetime of the thread, it may  
 33478 be necessary to release the storage associated with the old value before the new value is bound.  
 33479 Although the *pthread\_setspecific()* function could do this automatically, this feature is not needed  
 33480 often enough to justify the added complexity. Instead, the programmer is responsible for freeing  
 33481 the stale storage:

```
33482 pthread_getspecific(key, &old);
33483 new = allocate();
33484 destructor(old);
33485 pthread_setspecific(key, new);
```

33486 **Note:** The above example could leak storage if run with asynchronous cancelation enabled. No such  
 33487 problems occur in the default cancelation state if no cancelation points occur between the get  
 33488 and set.

33489 There is no notion of a destructor-safe function. If an application does not call *pthread\_exit()*  
 33490 from a signal handler, or if it blocks any signal whose handler may call *pthread\_exit()* while  
 33491 calling async-unsafe functions, all functions may be safely called from destructors.

33492 **Non-Idempotent Data Key Creation**

33493 There were requests to make *pthread\_key\_create()* idempotent with respect to a given *key* address  
 33494 parameter. This would allow applications to call *pthread\_key\_create()* multiple times for a given  
 33495 *key* address and be guaranteed that only one key would be created. Doing so would require the  
 33496 key value to be previously initialized (possibly at compile time) to a known null value and  
 33497 would require that implicit mutual-exclusion be performed based on the address and contents of  
 33498 the *key* parameter in order to guarantee that exactly one key would be created.

33499 Unfortunately, the implicit mutual-exclusion would not be limited to only *pthread\_key\_create()*.  
 33500 On many implementations, implicit mutual-exclusion would also have to be performed by  
 33501 *pthread\_getspecific()* and *pthread\_setspecific()* in order to guard against using incompletely stored  
 33502 or not-yet-visible key values. This could significantly increase the cost of important operations,  
 33503 particularly *pthread\_getspecific()*.

33504 Thus, this proposal was rejected. The *pthread\_key\_create()* function performs no implicit  
 33505 synchronization. It is the responsibility of the programmer to ensure that it is called exactly once  
 33506 per key before use of the key. Several straightforward mechanisms can already be used to  
 33507 accomplish this, including calling explicit module initialization functions, using mutexes, and  
 33508 using *pthread\_once()*. This places no significant burden on the programmer, introduces no  
 33509 possibly confusing *ad hoc* implicit synchronization mechanism, and potentially allows  
 33510 commonly used thread-specific data operations to be more efficient.

33511 **FUTURE DIRECTIONS**

33512 None.

33513 **SEE ALSO**

33514 *pthread\_getspecific()*, *pthread\_key\_delete()*, the Base Definitions volume of IEEE Std 1003.1-2001,  
33515 <pthread.h>

33516 **CHANGE HISTORY**

33517 First released in Issue 5. Included for alignment with the POSIX Threads Extension.

33518 **Issue 6**

33519 The *pthread\_key\_create()* function is marked as part of the Threads option.

33520 IEEE PASC Interpretation 1003.1c #8 is applied, updating the DESCRIPTION.

33521 **NAME**

33522 pthread\_key\_delete — thread-specific data key deletion

33523 **SYNOPSIS**

33524 THR #include &lt;pthread.h&gt;

33525 int pthread\_key\_delete(pthread\_key\_t key);

33526

33527 **DESCRIPTION**

33528 The *pthread\_key\_delete()* function shall delete a thread-specific data key previously returned by  
 33529 *pthread\_key\_create()*. The thread-specific data values associated with *key* need not be NULL at  
 33530 the time *pthread\_key\_delete()* is called. It is the responsibility of the application to free any  
 33531 application storage or perform any cleanup actions for data structures related to the deleted key  
 33532 or associated thread-specific data in any threads; this cleanup can be done either before or after  
 33533 *pthread\_key\_delete()* is called. Any attempt to use *key* following the call to *pthread\_key\_delete()*  
 33534 results in undefined behavior.

33535 The *pthread\_key\_delete()* function shall be callable from within destructor functions. No  
 33536 destructor functions shall be invoked by *pthread\_key\_delete()*. Any destructor function that may  
 33537 have been associated with *key* shall no longer be called upon thread exit.

33538 **RETURN VALUE**

33539 If successful, the *pthread\_key\_delete()* function shall return zero; otherwise, an error number shall  
 33540 be returned to indicate the error.

33541 **ERRORS**33542 The *pthread\_key\_delete()* function may fail if:33543 [EINVAL] The *key* value is invalid.33544 The *pthread\_key\_delete()* function shall not return an error code of [EINTR].33545 **EXAMPLES**

33546 None.

33547 **APPLICATION USAGE**

33548 None.

33549 **RATIONALE**

33550 A thread-specific data key deletion function has been included in order to allow the resources  
 33551 associated with an unused thread-specific data key to be freed. Unused thread-specific data keys  
 33552 can arise, among other scenarios, when a dynamically loaded module that allocated a key is  
 33553 unloaded.

33554 Conforming applications are responsible for performing any cleanup actions needed for data  
 33555 structures associated with the key to be deleted, including data referenced by thread-specific  
 33556 data values. No such cleanup is done by *pthread\_key\_delete()*. In particular, destructor functions  
 33557 are not called. There are several reasons for this division of responsibility:

- 33558 1. The associated destructor functions used to free thread-specific data at thread exit time are  
 33559 only guaranteed to work correctly when called in the thread that allocated the thread-  
 33560 specific data. (Destructors themselves may utilize thread-specific data.) Thus, they cannot  
 33561 be used to free thread-specific data in other threads at key deletion time. Attempting to  
 33562 have them called by other threads at key deletion time would require other threads to be  
 33563 asynchronously interrupted. But since interrupted threads could be in an arbitrary state,  
 33564 including holding locks necessary for the destructor to run, this approach would fail. In  
 33565 general, there is no safe mechanism whereby an implementation could free thread-specific  
 33566 data at key deletion time.

33567           2. Even if there were a means of safely freeing thread-specific data associated with keys to be  
33568 deleted, doing so would require that implementations be able to enumerate the threads  
33569 with non-NULL data and potentially keep them from creating more thread-specific data  
33570 while the key deletion is occurring. This special case could cause extra synchronization in  
33571 the normal case, which would otherwise be unnecessary.

33572           For an application to know that it is safe to delete a key, it has to know that all the threads that  
33573 might potentially ever use the key do not attempt to use it again. For example, it could know this  
33574 if all the client threads have called a cleanup procedure declaring that they are through with the  
33575 module that is being shut down, perhaps by setting a reference count to zero.

## 33576 **FUTURE DIRECTIONS**

33577           None.

## 33578 **SEE ALSO**

33579           *pthread\_key\_create()*, the Base Definitions volume of IEEE Std 1003.1-2001, <**pthread.h**>

## 33580 **CHANGE HISTORY**

33581           First released in Issue 5. Included for alignment with the POSIX Threads Extension.

## 33582 **Issue 6**

33583           The *pthread\_key\_delete()* function is marked as part of the Threads option.

33584 **NAME**

33585 pthread\_kill — send a signal to a thread

33586 **SYNOPSIS**

33587 THR #include &lt;signal.h&gt;

33588 int pthread\_kill(pthread\_t thread, int sig);

33589

33590 **DESCRIPTION**33591 The *pthread\_kill()* function shall request that a signal be delivered to the specified thread.33592 As in *kill()*, if *sig* is zero, error checking shall be performed but no signal shall actually be sent.33593 **RETURN VALUE**

33594 Upon successful completion, the function shall return a value of zero. Otherwise, the function

33595 shall return an error number. If the *pthread\_kill()* function fails, no signal shall be sent.33596 **ERRORS**33597 The *pthread\_kill()* function shall fail if:33598 [ESRCH] No thread could be found corresponding to that specified by the given thread  
33599 ID.33600 [EINVAL] The value of the *sig* argument is an invalid or unsupported signal number.33601 The *pthread\_kill()* function shall not return an error code of [EINTR].33602 **EXAMPLES**

33603 None.

33604 **APPLICATION USAGE**33605 The *pthread\_kill()* function provides a mechanism for asynchronously directing a signal at a  
33606 thread in the calling process. This could be used, for example, by one thread to affect broadcast  
33607 delivery of a signal to a set of threads.33608 Note that *pthread\_kill()* only causes the signal to be handled in the context of the given thread;  
33609 the signal action (termination or stopping) affects the process as a whole.33610 **RATIONALE**

33611 None.

33612 **FUTURE DIRECTIONS**

33613 None.

33614 **SEE ALSO**33615 *kill()*, *pthread\_self()*, *raise()*, the Base Definitions volume of IEEE Std 1003.1-2001, <signal.h>33616 **CHANGE HISTORY**

33617 First released in Issue 5. Included for alignment with the POSIX Threads Extension.

33618 **Issue 6**33619 The *pthread\_kill()* function is marked as part of the Threads option.

33620 The APPLICATION USAGE section is added.

## 33621 NAME

33622 pthread\_mutex\_destroy, pthread\_mutex\_init — destroy and initialize a mutex

## 33623 SYNOPSIS

33624 THR #include &lt;pthread.h&gt;

```

33625 int pthread_mutex_destroy(pthread_mutex_t *mutex);
33626 int pthread_mutex_init(pthread_mutex_t *restrict mutex,
33627     const pthread_mutexattr_t *restrict attr);
33628 pthread_mutex_t mutex = PTHREAD_MUTEX_INITIALIZER;
33629

```

## 33630 DESCRIPTION

33631 The *pthread\_mutex\_destroy()* function shall destroy the mutex object referenced by *mutex*; the  
 33632 mutex object becomes, in effect, uninitialized. An implementation may cause  
 33633 *pthread\_mutex\_destroy()* to set the object referenced by *mutex* to an invalid value. A destroyed  
 33634 mutex object can be reinitialized using *pthread\_mutex\_init()*; the results of otherwise referencing  
 33635 the object after it has been destroyed are undefined.

33636 It shall be safe to destroy an initialized mutex that is unlocked. Attempting to destroy a locked  
 33637 mutex results in undefined behavior.

33638 The *pthread\_mutex\_init()* function shall initialize the mutex referenced by *mutex* with attributes  
 33639 specified by *attr*. If *attr* is NULL, the default mutex attributes are used; the effect shall be the  
 33640 same as passing the address of a default mutex attributes object. Upon successful initialization,  
 33641 the state of the mutex becomes initialized and unlocked.

33642 Only *mutex* itself may be used for performing synchronization. The result of referring to copies  
 33643 of *mutex* in calls to *pthread\_mutex\_lock()*, *pthread\_mutex\_trylock()*, *pthread\_mutex\_unlock()*, and  
 33644 *pthread\_mutex\_destroy()* is undefined.

33645 Attempting to initialize an already initialized mutex results in undefined behavior.

33646 In cases where default mutex attributes are appropriate, the macro  
 33647 PTHREAD\_MUTEX\_INITIALIZER can be used to initialize mutexes that are statically allocated.  
 33648 The effect shall be equivalent to dynamic initialization by a call to *pthread\_mutex\_init()* with  
 33649 parameter *attr* specified as NULL, except that no error checks are performed.

## 33650 RETURN VALUE

33651 If successful, the *pthread\_mutex\_destroy()* and *pthread\_mutex\_init()* functions shall return zero;  
 33652 otherwise, an error number shall be returned to indicate the error.

33653 The [EBUSY] and [EINVAL] error checks, if implemented, act as if they were performed  
 33654 immediately at the beginning of processing for the function and shall cause an error return prior  
 33655 to modifying the state of the mutex specified by *mutex*.

## 33656 ERRORS

33657 The *pthread\_mutex\_destroy()* function may fail if:

33658 [EBUSY] The implementation has detected an attempt to destroy the object referenced  
 33659 by *mutex* while it is locked or referenced (for example, while being used in a  
 33660 *pthread\_cond\_timedwait()* or *pthread\_cond\_wait()*) by another thread.

33661 [EINVAL] The value specified by *mutex* is invalid.

33662 The *pthread\_mutex\_init()* function shall fail if:

33663 [EAGAIN] The system lacked the necessary resources (other than memory) to initialize  
 33664 another mutex.

- 33665 [ENOMEM] Insufficient memory exists to initialize the mutex.
- 33666 [EPERM] The caller does not have the privilege to perform the operation.
- 33667 The *pthread\_mutex\_init()* function may fail if:
- 33668 [EBUSY] The implementation has detected an attempt to reinitialize the object  
33669 referenced by *mutex*, a previously initialized, but not yet destroyed, mutex.
- 33670 [EINVAL] The value specified by *attr* is invalid.
- 33671 These functions shall not return an error code of [EINTR].

33672 **EXAMPLES**

33673 None.

33674 **APPLICATION USAGE**

33675 None.

33676 **RATIONALE**33677 **Alternate Implementations Possible**

33678 This volume of IEEE Std 1003.1-2001 supports several alternative implementations of mutexes.  
33679 An implementation may store the lock directly in the object of type **pthread\_mutex\_t**.  
33680 Alternatively, an implementation may store the lock in the heap and merely store a pointer,  
33681 handle, or unique ID in the mutex object. Either implementation has advantages or may be  
33682 required on certain hardware configurations. So that portable code can be written that is  
33683 invariant to this choice, this volume of IEEE Std 1003.1-2001 does not define assignment or  
33684 equality for this type, and it uses the term “initialize” to reinforce the (more restrictive) notion  
33685 that the lock may actually reside in the mutex object itself.

33686 Note that this precludes an over-specification of the type of the mutex or condition variable and  
33687 motivates the opaqueness of the type.

33688 An implementation is permitted, but not required, to have *pthread\_mutex\_destroy()* store an  
33689 illegal value into the mutex. This may help detect erroneous programs that try to lock (or  
33690 otherwise reference) a mutex that has already been destroyed.

33691 **Tradeoff Between Error Checks and Performance Supported**

33692 Many of the error checks were made optional in order to let implementations trade off  
33693 performance *versus* degree of error checking according to the needs of their specific applications  
33694 and execution environment. As a general rule, errors or conditions caused by the system (such as  
33695 insufficient memory) always need to be reported, but errors due to an erroneously coded  
33696 application (such as failing to provide adequate synchronization to prevent a mutex from being  
33697 deleted while in use) are made optional.

33698 A wide range of implementations is thus made possible. For example, an implementation  
33699 intended for application debugging may implement all of the error checks, but an  
33700 implementation running a single, provably correct application under very tight performance  
33701 constraints in an embedded computer might implement minimal checks. An implementation  
33702 might even be provided in two versions, similar to the options that compilers provide: a full-  
33703 checking, but slower version; and a limited-checking, but faster version. To forbid this  
33704 optionality would be a disservice to users.

33705 By carefully limiting the use of “undefined behavior” only to things that an erroneous (badly  
33706 coded) application might do, and by defining that resource-not-available errors are mandatory,  
33707 this volume of IEEE Std 1003.1-2001 ensures that a fully-conforming application is portable

33708 across the full range of implementations, while not forcing all implementations to add overhead  
33709 to check for numerous things that a correct program never does.

### 33710 **Why No Limits are Defined**

33711 Defining symbols for the maximum number of mutexes and condition variables was considered  
33712 but rejected because the number of these objects may change dynamically. Furthermore, many  
33713 implementations place these objects into application memory; thus, there is no explicit  
33714 maximum.

### 33715 **Static Initializers for Mutexes and Condition Variables**

33716 Providing for static initialization of statically allocated synchronization objects allows modules  
33717 with private static synchronization variables to avoid runtime initialization tests and overhead.  
33718 Furthermore, it simplifies the coding of self-initializing modules. Such modules are common in  
33719 C libraries, where for various reasons the design calls for self-initialization instead of requiring  
33720 an explicit module initialization function to be called. An example use of static initialization  
33721 follows.

33722 Without static initialization, a self-initializing routine *foo()* might look as follows:

```
33723 static pthread_once_t foo_once = PTHREAD_ONCE_INIT;  
33724 static pthread_mutex_t foo_mutex;  
  
33725 void foo_init()  
33726 {  
33727     pthread_mutex_init(&foo_mutex, NULL);  
33728 }  
  
33729 void foo()  
33730 {  
33731     pthread_once(&foo_once, foo_init);  
33732     pthread_mutex_lock(&foo_mutex);  
33733     /* Do work. */  
33734     pthread_mutex_unlock(&foo_mutex);  
33735 }
```

33736 With static initialization, the same routine could be coded as follows:

```
33737 static pthread_mutex_t foo_mutex = PTHREAD_MUTEX_INITIALIZER;  
  
33738 void foo()  
33739 {  
33740     pthread_mutex_lock(&foo_mutex);  
33741     /* Do work. */  
33742     pthread_mutex_unlock(&foo_mutex);  
33743 }
```

33744 Note that the static initialization both eliminates the need for the initialization test inside  
33745 *pthread\_once()* and the fetch of *&foo\_mutex* to learn the address to be passed to  
33746 *pthread\_mutex\_lock()* or *pthread\_mutex\_unlock()*.

33747 Thus, the C code written to initialize static objects is simpler on all systems and is also faster on a  
33748 large class of systems; those where the (entire) synchronization object can be stored in  
33749 application memory.

33750 Yet the locking performance question is likely to be raised for machines that require mutexes to  
33751 be allocated out of special memory. Such machines actually have to have mutexes and possibly

33752 condition variables contain pointers to the actual hardware locks. For static initialization to work  
33753 on such machines, *pthread\_mutex\_lock()* also has to test whether or not the pointer to the actual  
33754 lock has been allocated. If it has not, *pthread\_mutex\_lock()* has to initialize it before use. The  
33755 reservation of such resources can be made when the program is loaded, and hence return codes  
33756 have not been added to mutex locking and condition variable waiting to indicate failure to  
33757 complete initialization.

33758 This runtime test in *pthread\_mutex\_lock()* would at first seem to be extra work; an extra test is  
33759 required to see whether the pointer has been initialized. On most machines this would actually  
33760 be implemented as a fetch of the pointer, testing the pointer against zero, and then using the  
33761 pointer if it has already been initialized. While the test might seem to add extra work, the extra  
33762 effort of testing a register is usually negligible since no extra memory references are actually  
33763 done. As more and more machines provide caches, the real expenses are memory references, not  
33764 instructions executed.

33765 Alternatively, depending on the machine architecture, there are often ways to eliminate *all*  
33766 overhead in the most important case: on the lock operations that occur *after* the lock has been  
33767 initialized. This can be done by shifting more overhead to the less frequent operation:  
33768 initialization. Since out-of-line mutex allocation also means that an address has to be  
33769 dereferenced to find the actual lock, one technique that is widely applicable is to have static  
33770 initialization store a bogus value for that address; in particular, an address that causes a machine  
33771 fault to occur. When such a fault occurs upon the first attempt to lock such a mutex, validity  
33772 checks can be done, and then the correct address for the actual lock can be filled in. Subsequent  
33773 lock operations incur no extra overhead since they do not “fault”. This is merely one technique  
33774 that can be used to support static initialization, while not adversely affecting the performance of  
33775 lock acquisition. No doubt there are other techniques that are highly machine-dependent.

33776 The locking overhead for machines doing out-of-line mutex allocation is thus similar for  
33777 modules being implicitly initialized, where it is improved for those doing mutex allocation  
33778 entirely inline. The inline case is thus made much faster, and the out-of-line case is not  
33779 significantly worse.

33780 Besides the issue of locking performance for such machines, a concern is raised that it is possible  
33781 that threads would serialize contending for initialization locks when attempting to finish  
33782 initializing statically allocated mutexes. (Such finishing would typically involve taking an  
33783 internal lock, allocating a structure, storing a pointer to the structure in the mutex, and releasing  
33784 the internal lock.) First, many implementations would reduce such serialization by hashing on  
33785 the mutex address. Second, such serialization can only occur a bounded number of times. In  
33786 particular, it can happen at most as many times as there are statically allocated synchronization  
33787 objects. Dynamically allocated objects would still be initialized via *pthread\_mutex\_init()* or  
33788 *pthread\_cond\_init()*.

33789 Finally, if none of the above optimization techniques for out-of-line allocation yields sufficient  
33790 performance for an application on some implementation, the application can avoid static  
33791 initialization altogether by explicitly initializing all synchronization objects with the  
33792 corresponding *pthread\_\*\_init()* functions, which are supported by all implementations. An  
33793 implementation can also document the tradeoffs and advise which initialization technique is  
33794 more efficient for that particular implementation.

33795 **Destroying Mutexes**

33796 A mutex can be destroyed immediately after it is unlocked. For example, consider the following  
33797 code:

```
33798 struct obj {
33799     pthread_mutex_t om;
33800     int refcnt;
33801     ...
33802 };

33803 obj_done(struct obj *op)
33804 {
33805     pthread_mutex_lock(&op->om);
33806     if (--op->refcnt == 0) {
33807         pthread_mutex_unlock(&op->om);
33808         (A) pthread_mutex_destroy(&op->om);
33809         (B) free(op);
33810     } else
33811         (C) pthread_mutex_unlock(&op->om);
33812 }
```

33813 In this case *obj* is reference counted and *obj\_done()* is called whenever a reference to the object is  
33814 dropped. Implementations are required to allow an object to be destroyed and freed and  
33815 potentially unmapped (for example, lines A and B) immediately after the object is unlocked (line  
33816 C).

33817 **FUTURE DIRECTIONS**

33818 None.

33819 **SEE ALSO**

33820 *pthread\_mutex\_getprioceiling()*, *pthread\_mutex\_lock()*, *pthread\_mutex\_timedlock()*,  
33821 *pthread\_mutexattr\_getpshared()*, the Base Definitions volume of IEEE Std 1003.1-2001,  
33822 <pthread.h>

33823 **CHANGE HISTORY**

33824 First released in Issue 5. Included for alignment with the POSIX Threads Extension.

33825 **Issue 6**

33826 The *pthread\_mutex\_destroy()* and *pthread\_mutex\_init()* functions are marked as part of the  
33827 Threads option.

33828 The *pthread\_mutex\_timedlock()* function is added to the SEE ALSO section for alignment with  
33829 IEEE Std 1003.1d-1999.

33830 IEEE PASC Interpretation 1003.1c #34 is applied, updating the DESCRIPTION.

33831 The **restrict** keyword is added to the *pthread\_mutex\_init()* prototype for alignment with the  
33832 ISO/IEC 9899:1999 standard.

33833 **NAME**

33834 pthread\_mutex\_getprioceiling, pthread\_mutex\_setprioceiling — get and set the priority ceiling  
 33835 of a mutex (**REALTIME THREADS**)

33836 **SYNOPSIS**

```
33837 THR TPP #include <pthread.h>
33838 int pthread_mutex_getprioceiling(const pthread_mutex_t *restrict mutex,
33839 int *restrict prioceiling);
33840 int pthread_mutex_setprioceiling(pthread_mutex_t *restrict mutex,
33841 int prioceiling, int *restrict old_ceiling);
33842
```

33843 **DESCRIPTION**

33844 The *pthread\_mutex\_getprioceiling()* function shall return the current priority ceiling of the mutex.

33845 The *pthread\_mutex\_setprioceiling()* function shall either lock the mutex if it is unlocked, or block  
 33846 until it can successfully lock the mutex, then it shall change the mutex's priority ceiling and  
 33847 release the mutex. When the change is successful, the previous value of the priority ceiling shall  
 33848 be returned in *old\_ceiling*. The process of locking the mutex need not adhere to the priority  
 33849 protect protocol.

33850 If the *pthread\_mutex\_setprioceiling()* function fails, the mutex priority ceiling shall not be  
 33851 changed.

33852 **RETURN VALUE**

33853 If successful, the *pthread\_mutex\_getprioceiling()* and *pthread\_mutex\_setprioceiling()* functions shall  
 33854 return zero; otherwise, an error number shall be returned to indicate the error.

33855 **ERRORS**

33856 The *pthread\_mutex\_getprioceiling()* and *pthread\_mutex\_setprioceiling()* functions may fail if:

- 33857 [EINVAL] The priority requested by *prioceiling* is out of range.
- 33858 [EINVAL] The value specified by *mutex* does not refer to a currently existing mutex.
- 33859 [EPERM] The caller does not have the privilege to perform the operation.

33860 These functions shall not return an error code of [EINTR].

33861 **EXAMPLES**

33862 None.

33863 **APPLICATION USAGE**

33864 None.

33865 **RATIONALE**

33866 None.

33867 **FUTURE DIRECTIONS**

33868 None.

33869 **SEE ALSO**

33870 *pthread\_mutex\_destroy()*, *pthread\_mutex\_lock()*, *pthread\_mutex\_timedlock()*, the Base Definitions  
 33871 volume of IEEE Std 1003.1-2001, <pthread.h>

33872 **CHANGE HISTORY**

- 33873 First released in Issue 5. Included for alignment with the POSIX Threads Extension.
- 33874 Marked as part of the Realtime Threads Feature Group.

33875 **Issue 6**

33876 The *pthread\_mutex\_getprioceiling()* and *pthread\_mutex\_setprioceiling()* functions are marked as  
33877 part of the Threads and Thread Priority Protection options.

33878 The [ENOSYS] error condition has been removed as stubs need not be provided if an  
33879 implementation does not support the Thread Priority Protection option.

33880 The [ENOSYS] error denoting non-support of the priority ceiling protocol for mutexes has been  
33881 removed. This is because if the implementation provides the functions (regardless of whether  
33882 `_POSIX_PTHREAD_PRIO_PROTECT` is defined), they must function as in the DESCRIPTION  
33883 and therefore the priority ceiling protocol for mutexes is supported.

33884 The *pthread\_mutex\_timedlock()* function is added to the SEE ALSO section for alignment with  
33885 IEEE Std 1003.1d-1999.

33886 The **restrict** keyword is added to the *pthread\_mutex\_getprioceiling()* and  
33887 *pthread\_mutex\_setprioceiling()* prototypes for alignment with the ISO/IEC 9899:1999 standard.

33888 **NAME**

33889 pthread\_mutex\_init — initialize a mutex

33890 **SYNOPSIS**

33891 THR #include &lt;pthread.h&gt;

33892 int pthread\_mutex\_init(pthread\_mutex\_t \*restrict mutex,

33893 const pthread\_mutexattr\_t \*restrict attr);

33894 pthread\_mutex\_t mutex = PTHREAD\_MUTEX\_INITIALIZER;

33895

33896 **DESCRIPTION**33897 Refer to *pthread\_mutex\_destroy()*.

## 33898 NAME

33899 pthread\_mutex\_lock, pthread\_mutex\_trylock, pthread\_mutex\_unlock — lock and unlock a  
33900 mutex

## 33901 SYNOPSIS

```
33902 THR #include <pthread.h>
```

```
33903 int pthread_mutex_lock(pthread_mutex_t *mutex);
33904 int pthread_mutex_trylock(pthread_mutex_t *mutex);
33905 int pthread_mutex_unlock(pthread_mutex_t *mutex);
33906
```

## 33907 DESCRIPTION

33908 The mutex object referenced by *mutex* shall be locked by calling *pthread\_mutex\_lock()*. If the  
33909 mutex is already locked, the calling thread shall block until the mutex becomes available. This  
33910 operation shall return with the mutex object referenced by *mutex* in the locked state with the  
33911 calling thread as its owner.

33912 XSI If the mutex type is PTHREAD\_MUTEX\_NORMAL, deadlock detection shall not be provided.  
33913 Attempting to relock the mutex causes deadlock. If a thread attempts to unlock a mutex that it  
33914 has not locked or a mutex which is unlocked, undefined behavior results.

33915 If the mutex type is PTHREAD\_MUTEX\_ERRORCHECK, then error checking shall be provided.  
33916 If a thread attempts to relock a mutex that it has already locked, an error shall be returned. If a  
33917 thread attempts to unlock a mutex that it has not locked or a mutex which is unlocked, an error  
33918 shall be returned.

33919 If the mutex type is PTHREAD\_MUTEX\_RECURSIVE, then the mutex shall maintain the  
33920 concept of a lock count. When a thread successfully acquires a mutex for the first time, the lock  
33921 count shall be set to one. Every time a thread relocks this mutex, the lock count shall be  
33922 incremented by one. Each time the thread unlocks the mutex, the lock count shall be  
33923 decremented by one. When the lock count reaches zero, the mutex shall become available for  
33924 other threads to acquire. If a thread attempts to unlock a mutex that it has not locked or a mutex  
33925 which is unlocked, an error shall be returned.

33926 If the mutex type is PTHREAD\_MUTEX\_DEFAULT, attempting to recursively lock the mutex  
33927 results in undefined behavior. Attempting to unlock the mutex if it was not locked by the calling  
33928 thread results in undefined behavior. Attempting to unlock the mutex if it is not locked results in  
33929 undefined behavior.

33930 The *pthread\_mutex\_trylock()* function shall be equivalent to *pthread\_mutex\_lock()*, except that if  
33931 the mutex object referenced by *mutex* is currently locked (by any thread, including the current  
33932 thread), the call shall return immediately. If the mutex type is PTHREAD\_MUTEX\_RECURSIVE  
33933 and the mutex is currently owned by the calling thread, the mutex lock count shall be  
33934 incremented by one and the *pthread\_mutex\_trylock()* function shall immediately return success.

33935 XSI The *pthread\_mutex\_unlock()* function shall release the mutex object referenced by *mutex*. The  
33936 manner in which a mutex is released is dependent upon the mutex's type attribute. If there are  
33937 threads blocked on the mutex object referenced by *mutex* when *pthread\_mutex\_unlock()* is called,  
33938 resulting in the mutex becoming available, the scheduling policy shall determine which thread  
33939 shall acquire the mutex.

33940 XSI (In the case of PTHREAD\_MUTEX\_RECURSIVE mutexes, the mutex shall become available  
33941 when the count reaches zero and the calling thread no longer has any locks on this mutex.)

33942 If a signal is delivered to a thread waiting for a mutex, upon return from the signal handler the  
33943 thread shall resume waiting for the mutex as if it was not interrupted.

33944 **RETURN VALUE**

33945 If successful, the *pthread\_mutex\_lock()* and *pthread\_mutex\_unlock()* functions shall return zero;  
 33946 otherwise, an error number shall be returned to indicate the error.

33947 The *pthread\_mutex\_trylock()* function shall return zero if a lock on the mutex object referenced by  
 33948 *mutex* is acquired. Otherwise, an error number is returned to indicate the error.

33949 **ERRORS**

33950 The *pthread\_mutex\_lock()* and *pthread\_mutex\_trylock()* functions shall fail if:

33951 [EINVAL] The *mutex* was created with the protocol attribute having the value  
 33952 PTHREAD\_PRIO\_PROTECT and the calling thread's priority is higher than  
 33953 the mutex's current priority ceiling.

33954 The *pthread\_mutex\_trylock()* function shall fail if:

33955 [EBUSY] The *mutex* could not be acquired because it was already locked.

33956 The *pthread\_mutex\_lock()*, *pthread\_mutex\_trylock()*, and *pthread\_mutex\_unlock()* functions may  
 33957 fail if:

33958 [EINVAL] The value specified by *mutex* does not refer to an initialized mutex object.

33959 XSI [EAGAIN] The mutex could not be acquired because the maximum number of recursive  
 33960 locks for *mutex* has been exceeded.

33961 The *pthread\_mutex\_lock()* function may fail if:

33962 [EDEADLK] The current thread already owns the mutex.

33963 The *pthread\_mutex\_unlock()* function may fail if:

33964 [EPERM] The current thread does not own the mutex.

33965 These functions shall not return an error code of [EINTR].

33966 **EXAMPLES**

33967 None.

33968 **APPLICATION USAGE**

33969 None.

33970 **RATIONALE**

33971 Mutex objects are intended to serve as a low-level primitive from which other thread  
 33972 synchronization functions can be built. As such, the implementation of mutexes should be as  
 33973 efficient as possible, and this has ramifications on the features available at the interface.

33974 The mutex functions and the particular default settings of the mutex attributes have been  
 33975 motivated by the desire to not preclude fast, inlined implementations of mutex locking and  
 33976 unlocking.

33977 For example, deadlocking on a double-lock is explicitly allowed behavior in order to avoid  
 33978 requiring more overhead in the basic mechanism than is absolutely necessary. (More "friendly"  
 33979 mutexes that detect deadlock or that allow multiple locking by the same thread are easily  
 33980 constructed by the user via the other mechanisms provided. For example, *pthread\_self()* can be  
 33981 used to record mutex ownership.) Implementations might also choose to provide such extended  
 33982 features as options via special mutex attributes.

33983 Since most attributes only need to be checked when a thread is going to be blocked, the use of  
 33984 attributes does not slow the (common) mutex-locking case.

33985 Likewise, while being able to extract the thread ID of the owner of a mutex might be desirable, it  
33986 would require storing the current thread ID when each mutex is locked, and this could incur  
33987 unacceptable levels of overhead. Similar arguments apply to a *mutex\_tryunlock* operation.

33988 **FUTURE DIRECTIONS**

33989 None.

33990 **SEE ALSO**

33991 *pthread\_mutex\_destroy()*, *pthread\_mutex\_timedlock()*, the Base Definitions volume of  
33992 IEEE Std 1003.1-2001, <pthread.h>

33993 **CHANGE HISTORY**

33994 First released in Issue 5. Included for alignment with the POSIX Threads Extension.

33995 **Issue 6**

33996 The *pthread\_mutex\_lock()*, *pthread\_mutex\_trylock()*, and *pthread\_mutex\_unlock()* functions are  
33997 marked as part of the Threads option.

33998 The following new requirements on POSIX implementations derive from alignment with the  
33999 Single UNIX Specification:

- 34000 • The behavior when attempting to relock a mutex is defined.

34001 The *pthread\_mutex\_timedlock()* function is added to the SEE ALSO section for alignment with  
34002 IEEE Std 1003.1d-1999.

34003 **NAME**

34004 pthread\_mutex\_setprioceiling — change the priority ceiling of a mutex (**REALTIME**  
34005 **THREADS**)

34006 **SYNOPSIS**

34007 THR TPP #include <pthread.h>

```
34008 int pthread_mutex_setprioceiling(pthread_mutex_t *restrict mutex,  
34009 int prioceiling, int *restrict old_ceiling);
```

34010

34011 **DESCRIPTION**

34012 Refer to *pthread\_mutex\_getprioceiling()*.

## 34013 NAME

34014 pthread\_mutex\_timedlock — lock a mutex (ADVANCED REALTIME)

## 34015 SYNOPSIS

34016 THR TMO #include &lt;pthread.h&gt;

34017 #include &lt;time.h&gt;

34018 int pthread\_mutex\_timedlock(pthread\_mutex\_t \*restrict mutex,

34019 const struct timespec \*restrict abs\_timeout);

34020

## 34021 DESCRIPTION

34022 The *pthread\_mutex\_timedlock()* function shall lock the mutex object referenced by *mutex*. If the  
 34023 mutex is already locked, the calling thread shall block until the mutex becomes available as in  
 34024 the *pthread\_mutex\_lock()* function. If the mutex cannot be locked without waiting for another  
 34025 thread to unlock the mutex, this wait shall be terminated when the specified timeout expires.

34026 The timeout shall expire when the absolute time specified by *abs\_timeout* passes, as measured by  
 34027 the clock on which timeouts are based (that is, when the value of that clock equals or exceeds  
 34028 *abs\_timeout*), or if the absolute time specified by *abs\_timeout* has already been passed at the time  
 34029 of the call.

34030 TMR If the Timers option is supported, the timeout shall be based on the CLOCK\_REALTIME clock; if  
 34031 the Timers option is not supported, the timeout shall be based on the system clock as returned  
 34032 by the *time()* function.

34033 The resolution of the timeout shall be the resolution of the clock on which it is based. The  
 34034 **timespec** data type is defined in the <time.h> header.

34035 Under no circumstance shall the function fail with a timeout if the mutex can be locked  
 34036 immediately. The validity of the *abs\_timeout* parameter need not be checked if the mutex can be  
 34037 locked immediately.

34038 As a consequence of the priority inheritance rules (for mutexes initialized with the  
 34039 PRIORITY\_INHERIT protocol), if a timed mutex wait is terminated because its timeout expires, the  
 34040 priority of the owner of the mutex shall be adjusted as necessary to reflect the fact that this  
 34041 thread is no longer among the threads waiting for the mutex.

## 34042 RETURN VALUE

34043 If successful, the *pthread\_mutex\_timedlock()* function shall return zero; otherwise, an error  
 34044 number shall be returned to indicate the error.

## 34045 ERRORS

34046 The *pthread\_mutex\_timedlock()* function shall fail if:

34047 [EINVAL] The mutex was created with the protocol attribute having the value  
 34048 PTHREAD\_PRIO\_PROTECT and the calling thread's priority is higher than  
 34049 the mutex' current priority ceiling.

34050 [EINVAL] The process or thread would have blocked, and the *abs\_timeout* parameter  
 34051 specified a nanoseconds field value less than zero or greater than or equal to  
 34052 1 000 million.

34053 [ETIMEDOUT] The mutex could not be locked before the specified timeout expired.

34054 The *pthread\_mutex\_timedlock()* function may fail if:

34055 [EINVAL] The value specified by *mutex* does not refer to an initialized mutex object.

34056 XSI [EAGAIN] The mutex could not be acquired because the maximum number of recursive  
34057 locks for *mutex* has been exceeded.

34058 [EDEADLK] The current thread already owns the mutex.

34059 This function shall not return an error code of [EINTR].

#### 34060 EXAMPLES

34061 None.

#### 34062 APPLICATION USAGE

34063 The *pthread\_mutex\_timedlock()* function is part of the Threads and Timeouts options and need  
34064 not be provided on all implementations.

#### 34065 RATIONALE

34066 None.

#### 34067 FUTURE DIRECTIONS

34068 None.

#### 34069 SEE ALSO

34070 *pthread\_mutex\_destroy()*, *pthread\_mutex\_lock()*, *pthread\_mutex\_trylock()*, *time()*, the Base  
34071 Definitions volume of IEEE Std 1003.1-2001, <pthread.h>, <time.h>

#### 34072 CHANGE HISTORY

34073 First released in Issue 6. Derived from IEEE Std 1003.1d-1999.

34074 **NAME**

34075 pthread\_mutex\_trylock, pthread\_mutex\_unlock — lock and unlock a mutex

34076 **SYNOPSIS**

34077 THR #include <pthread.h>

34078 int pthread\_mutex\_trylock(pthread\_mutex\_t \*mutex);

34079 int pthread\_mutex\_unlock(pthread\_mutex\_t \*mutex);

34080

34081 **DESCRIPTION**

34082 Refer to *pthread\_mutex\_lock()*.

34083 **NAME**

34084 pthread\_mutexattr\_destroy, pthread\_mutexattr\_init — destroy and initialize the mutex  
 34085 attributes object

34086 **SYNOPSIS**

```
34087 THR #include <pthread.h>
```

```
34088 int pthread_mutexattr_destroy(pthread_mutexattr_t *attr);
```

```
34089 int pthread_mutexattr_init(pthread_mutexattr_t *attr);
```

34090

34091 **DESCRIPTION**

34092 The *pthread\_mutexattr\_destroy()* function shall destroy a mutex attributes object; the object  
 34093 becomes, in effect, uninitialized. An implementation may cause *pthread\_mutexattr\_destroy()* to  
 34094 set the object referenced by *attr* to an invalid value. A destroyed *attr* attributes object can be  
 34095 reinitialized using *pthread\_mutexattr\_init()*; the results of otherwise referencing the object after it  
 34096 has been destroyed are undefined.

34097 The *pthread\_mutexattr\_init()* function shall initialize a mutex attributes object *attr* with the  
 34098 default value for all of the attributes defined by the implementation.

34099 Results are undefined if *pthread\_mutexattr\_init()* is called specifying an already initialized *attr*  
 34100 attributes object.

34101 After a mutex attributes object has been used to initialize one or more mutexes, any function  
 34102 affecting the attributes object (including destruction) shall not affect any previously initialized  
 34103 mutexes.

34104 **RETURN VALUE**

34105 Upon successful completion, *pthread\_mutexattr\_destroy()* and *pthread\_mutexattr\_init()* shall  
 34106 return zero; otherwise, an error number shall be returned to indicate the error.

34107 **ERRORS**

34108 The *pthread\_mutexattr\_destroy()* function may fail if:

34109 [EINVAL] The value specified by *attr* is invalid.

34110 The *pthread\_mutexattr\_init()* function shall fail if:

34111 [ENOMEM] Insufficient memory exists to initialize the mutex attributes object.

34112 These functions shall not return an error code of [EINTR].

34113 **EXAMPLES**

34114 None.

34115 **APPLICATION USAGE**

34116 None.

34117 **RATIONALE**

34118 See *pthread\_attr\_init()* for a general explanation of attributes. Attributes objects allow  
 34119 implementations to experiment with useful extensions and permit extension of this volume of  
 34120 IEEE Std 1003.1-2001 without changing the existing functions. Thus, they provide for future  
 34121 extensibility of this volume of IEEE Std 1003.1-2001 and reduce the temptation to standardize  
 34122 prematurely on semantics that are not yet widely implemented or understood.

34123 Examples of possible additional mutex attributes that have been discussed are *spin\_only*,  
 34124 *limited\_spin*, *no\_spin*, *recursive*, and *metered*. (To explain what the latter attributes might mean:  
 34125 recursive mutexes would allow for multiple re-locking by the current owner; metered mutexes  
 34126 would transparently keep records of queue length, wait time, and so on.) Since there is not yet

34127 wide agreement on the usefulness of these resulting from shared implementation and usage  
 34128 experience, they are not yet specified in this volume of IEEE Std 1003.1-2001. Mutex attributes  
 34129 objects, however, make it possible to test out these concepts for possible standardization at a  
 34130 later time.

### 34131 **Mutex Attributes and Performance**

34132 Care has been taken to ensure that the default values of the mutex attributes have been defined  
 34133 such that mutexes initialized with the defaults have simple enough semantics so that the locking  
 34134 and unlocking can be done with the equivalent of a test-and-set instruction (plus possibly a few  
 34135 other basic instructions).

34136 There is at least one implementation method that can be used to reduce the cost of testing at  
 34137 lock-time if a mutex has non-default attributes. One such method that an implementation can  
 34138 employ (and this can be made fully transparent to fully conforming POSIX applications) is to  
 34139 secretly pre-lock any mutexes that are initialized to non-default attributes. Any later attempt to  
 34140 lock such a mutex causes the implementation to branch to the “slow path” as if the mutex were  
 34141 unavailable; then, on the slow path, the implementation can do the “real work” to lock a non-  
 34142 default mutex. The underlying unlock operation is more complicated since the implementation  
 34143 never really wants to release the pre-lock on this kind of mutex. This illustrates that, depending  
 34144 on the hardware, there may be certain optimizations that can be used so that whatever mutex  
 34145 attributes are considered “most frequently used” can be processed most efficiently.

### 34146 **Process Shared Memory and Synchronization**

34147 The existence of memory mapping functions in this volume of IEEE Std 1003.1-2001 leads to the  
 34148 possibility that an application may allocate the synchronization objects from this section in  
 34149 memory that is accessed by multiple processes (and therefore, by threads of multiple processes).

34150 In order to permit such usage, while at the same time keeping the usual case (that is, usage  
 34151 within a single process) efficient, a *process-shared* option has been defined.

34152 If an implementation supports the `_POSIX_THREAD_PROCESS_SHARED` option, then the  
 34153 *process-shared* attribute can be used to indicate that mutexes or condition variables may be  
 34154 accessed by threads of multiple processes.

34155 The default setting of `PTHREAD_PROCESS_PRIVATE` has been chosen for the *process-shared*  
 34156 attribute so that the most efficient forms of these synchronization objects are created by default.

34157 Synchronization variables that are initialized with the `PTHREAD_PROCESS_PRIVATE` *process-*  
 34158 *shared* attribute may only be operated on by threads in the process that initialized them.  
 34159 Synchronization variables that are initialized with the `PTHREAD_PROCESS_SHARED` *process-*  
 34160 *shared* attribute may be operated on by any thread in any process that has access to it. In  
 34161 particular, these processes may exist beyond the lifetime of the initializing process. For example,  
 34162 the following code implements a simple counting semaphore in a mapped file that may be used  
 34163 by many processes.

```
34164 /* sem.h */
34165 struct semaphore {
34166     pthread_mutex_t lock;
34167     pthread_cond_t nonzero;
34168     unsigned count;
34169 };
34170 typedef struct semaphore semaphore_t;
34171 semaphore_t *semaphore_create(char *semaphore_name);
34172 semaphore_t *semaphore_open(char *semaphore_name);
```

```
34173 void semaphore_post(semaphore_t *semap);
34174 void semaphore_wait(semaphore_t *semap);
34175 void semaphore_close(semaphore_t *semap);

34176 /* sem.c */
34177 #include <sys/types.h>
34178 #include <sys/stat.h>
34179 #include <sys/mman.h>
34180 #include <fcntl.h>
34181 #include <pthread.h>
34182 #include "sem.h"

34183 semaphore_t *
34184 semaphore_create(char *semaphore_name)
34185 {
34186     int fd;
34187     semaphore_t *semap;
34188     pthread_mutexattr_t psharedm;
34189     pthread_condattr_t psharedc;

34190     fd = open(semaphore_name, O_RDWR | O_CREAT | O_EXCL, 0666);
34191     if (fd < 0)
34192         return (NULL);
34193     (void) ftruncate(fd, sizeof(semaphore_t));
34194     (void) pthread_mutexattr_init(&psharedm);
34195     (void) pthread_mutexattr_setpshared(&psharedm,
34196         PTHREAD_PROCESS_SHARED);
34197     (void) pthread_condattr_init(&psharedc);
34198     (void) pthread_condattr_setpshared(&psharedc,
34199         PTHREAD_PROCESS_SHARED);
34200     semap = (semaphore_t *) mmap(NULL, sizeof(semaphore_t),
34201         PROT_READ | PROT_WRITE, MAP_SHARED,
34202         fd, 0);
34203     close (fd);
34204     (void) pthread_mutex_init(&semap->lock, &psharedm);
34205     (void) pthread_cond_init(&semap->nonzero, &psharedc);
34206     semap->count = 0;
34207     return (semap);
34208 }

34209 semaphore_t *
34210 semaphore_open(char *semaphore_name)
34211 {
34212     int fd;
34213     semaphore_t *semap;

34214     fd = open(semaphore_name, O_RDWR, 0666);
34215     if (fd < 0)
34216         return (NULL);
34217     semap = (semaphore_t *) mmap(NULL, sizeof(semaphore_t),
34218         PROT_READ | PROT_WRITE, MAP_SHARED,
34219         fd, 0);
34220     close (fd);
34221     return (semap);
34222 }
```

```

34223 void
34224 semaphore_post(semaphore_t *semap)
34225 {
34226     pthread_mutex_lock(&semap->lock);
34227     if (semap->count == 0)
34228         pthread_cond_signal(&semap->nonzero);
34229     semap->count++;
34230     pthread_mutex_unlock(&semap->lock);
34231 }

34232 void
34233 semaphore_wait(semaphore_t *semap)
34234 {
34235     pthread_mutex_lock(&semap->lock);
34236     while (semap->count == 0)
34237         pthread_cond_wait(&semap->nonzero, &semap->lock);
34238     semap->count--;
34239     pthread_mutex_unlock(&semap->lock);
34240 }

34241 void
34242 semaphore_close(semaphore_t *semap)
34243 {
34244     munmap((void *) semap, sizeof(semaphore_t));
34245 }

```

34246 The following code is for three separate processes that create, post, and wait on a semaphore in  
34247 the file **/tmp/semaphore**. Once the file is created, the post and wait programs increment and  
34248 decrement the counting semaphore (waiting and waking as required) even though they did not  
34249 initialize the semaphore.

```

34250 /* create.c */
34251 #include "pthread.h"
34252 #include "sem.h"

34253 int
34254 main()
34255 {
34256     semaphore_t *semap;

34257     semap = semaphore_create("/tmp/semaphore");
34258     if (semap == NULL)
34259         exit(1);
34260     semaphore_close(semap);
34261     return (0);
34262 }

34263 /* post */
34264 #include "pthread.h"
34265 #include "sem.h"

34266 int
34267 main()
34268 {
34269     semaphore_t *semap;

```

```
34270     semaphore = semaphore_open("/tmp/semaphore");
34271     if (semap == NULL)
34272         exit(1);
34273     semaphore_post(semap);
34274     semaphore_close(semap);
34275     return (0);
34276 }
34277 /* wait */
34278 #include "pthread.h"
34279 #include "sem.h"
34280
34281 int
34282 main()
34283 {
34284     semaphore_t *semap;
34285
34286     semap = semaphore_open("/tmp/semaphore");
34287     if (semap == NULL)
34288         exit(1);
34289     semaphore_wait(semap);
34290     semaphore_close(semap);
34291     return (0);
34292 }
```

#### 34291 FUTURE DIRECTIONS

34292 None.

34294 *pthread\_cond\_destroy()*, *pthread\_create()*, *pthread\_mutex\_destroy()*, *pthread\_mutexattr\_destroy()*, the  
34295 Base Definitions volume of IEEE Std 1003.1-2001, <pthread.h>

#### 34296 CHANGE HISTORY

34297 First released in Issue 5. Included for alignment with the POSIX Threads Extension.

#### 34298 Issue 6

34299 The *pthread\_mutexattr\_destroy()* and *pthread\_mutexattr\_init()* functions are marked as part of the  
34300 Threads option.

34301 IEEE PASC Interpretation 1003.1c #27 is applied, updating the ERRORS section.

## 34302 NAME

34303 pthread\_mutexattr\_getprioceiling, pthread\_mutexattr\_setprioceiling — get and set the  
 34304 prioceiling attribute of the mutex attributes object (**REALTIME THREADS**)

## 34305 SYNOPSIS

34306 THR TPP #include <pthread.h>

```
34307 int pthread_mutexattr_getprioceiling(const pthread_mutexattr_t *
34308     restrict attr, int *restrict prioceiling);
34309 int pthread_mutexattr_setprioceiling(pthread_mutexattr_t *attr,
34310     int prioceiling);
```

34311

## 34312 DESCRIPTION

34313 The *pthread\_mutexattr\_getprioceiling()* and *pthread\_mutexattr\_setprioceiling()* functions,  
 34314 respectively, shall get and set the priority ceiling attribute of a mutex attributes object pointed to  
 34315 by *attr* which was previously created by the function *pthread\_mutexattr\_init()*.

34316 The *prioceiling* attribute contains the priority ceiling of initialized mutexes. The values of  
 34317 *prioceiling* are within the maximum range of priorities defined by SCHED\_FIFO.

34318 The *prioceiling* attribute defines the priority ceiling of initialized mutexes, which is the minimum  
 34319 priority level at which the critical section guarded by the mutex is executed. In order to avoid  
 34320 priority inversion, the priority ceiling of the mutex shall be set to a priority higher than or equal  
 34321 to the highest priority of all the threads that may lock that mutex. The values of *prioceiling* are  
 34322 within the maximum range of priorities defined under the SCHED\_FIFO scheduling policy.

## 34323 RETURN VALUE

34324 Upon successful completion, the *pthread\_mutexattr\_getprioceiling()* and  
 34325 *pthread\_mutexattr\_setprioceiling()* functions shall return zero; otherwise, an error number shall be  
 34326 returned to indicate the error.

## 34327 ERRORS

34328 The *pthread\_mutexattr\_getprioceiling()* and *pthread\_mutexattr\_setprioceiling()* functions may fail if:

34329 [EINVAL] The value specified by *attr* or *prioceiling* is invalid.

34330 [EPERM] The caller does not have the privilege to perform the operation.

34331 These functions shall not return an error code of [EINTR].

## 34332 EXAMPLES

34333 None.

## 34334 APPLICATION USAGE

34335 None.

## 34336 RATIONALE

34337 None.

## 34338 FUTURE DIRECTIONS

34339 None.

## 34340 SEE ALSO

34341 *pthread\_cond\_destroy()*, *pthread\_create()*, *pthread\_mutex\_destroy()*, the Base Definitions volume of  
 34342 IEEE Std 1003.1-2001, <pthread.h>

34343 **CHANGE HISTORY**

34344 First released in Issue 5. Included for alignment with the POSIX Threads Extension.

34345 Marked as part of the Realtime Threads Feature Group.

34346 **Issue 6**

34347 The `pthread_mutexattr_getprioceiling()` and `pthread_mutexattr_setprioceiling()` functions are  
34348 marked as part of the Threads and Thread Priority Protection options.

34349 The [ENOSYS] error condition has been removed as stubs need not be provided if an  
34350 implementation does not support the Thread Priority Protection option.

34351 The [ENOTSUP] error condition has been removed since these functions do not have a *protocol*  
34352 argument.

34353 The **restrict** keyword is added to the `pthread_mutexattr_getprioceiling()` prototype for alignment  
34354 with the ISO/IEC 9899:1999 standard.

## 34355 NAME

34356 pthread\_mutexattr\_getprotocol, pthread\_mutexattr\_setprotocol — get and set the protocol  
34357 attribute of the mutex attributes object (**REALTIME THREADS**)

## 34358 SYNOPSIS

```
34359 THR #include <pthread.h>
34360 TPP|TPI int pthread_mutexattr_getprotocol(const pthread_mutexattr_t *
34361         restrict attr, int *restrict protocol);
34362 int pthread_mutexattr_setprotocol(pthread_mutexattr_t *attr,
34363         int protocol);
34364
```

## 34365 DESCRIPTION

34366 The *pthread\_mutexattr\_getprotocol()* and *pthread\_mutexattr\_setprotocol()* functions, respectively,  
34367 shall get and set the protocol attribute of a mutex attributes object pointed to by *attr* which was  
34368 previously created by the function *pthread\_mutexattr\_init()*.

34369 The *protocol* attribute defines the protocol to be followed in utilizing mutexes. The value of  
34370 *protocol* may be one of:

```
34371 PTHREAD_PRIO_NONE
34372 TPI PTHREAD_PRIO_INHERIT
34373 TPP PTHREAD_PRIO_PROTECT
34374
```

34375 which are defined in the **<pthread.h>** header.

34376 When a thread owns a mutex with the *PTHREAD\_PRIO\_NONE* *protocol* attribute, its priority  
34377 and scheduling shall not be affected by its mutex ownership.

34378 TPI When a thread is blocking higher priority threads because of owning one or more mutexes with  
34379 the *PTHREAD\_PRIO\_INHERIT* *protocol* attribute, it shall execute at the higher of its priority or  
34380 the priority of the highest priority thread waiting on any of the mutexes owned by this thread  
34381 and initialized with this protocol.

34382 TPP When a thread owns one or more mutexes initialized with the *PTHREAD\_PRIO\_PROTECT*  
34383 protocol, it shall execute at the higher of its priority or the highest of the priority ceilings of all  
34384 the mutexes owned by this thread and initialized with this attribute, regardless of whether other  
34385 threads are blocked on any of these mutexes or not.

34386 While a thread is holding a mutex which has been initialized with the  
34387 *PTHREAD\_PRIO\_INHERIT* or *PTHREAD\_PRIO\_PROTECT* protocol attributes, it shall not be  
34388 subject to being moved to the tail of the scheduling queue at its priority in the event that its  
34389 original priority is changed, such as by a call to *sched\_setparam()*. Likewise, when a thread  
34390 unlocks a mutex that has been initialized with the *PTHREAD\_PRIO\_INHERIT* or  
34391 *PTHREAD\_PRIO\_PROTECT* protocol attributes, it shall not be subject to being moved to the tail  
34392 of the scheduling queue at its priority in the event that its original priority is changed.

34393 If a thread simultaneously owns several mutexes initialized with different protocols, it shall  
34394 execute at the highest of the priorities that it would have obtained by each of these protocols.

34395 TPI When a thread makes a call to *pthread\_mutex\_lock()*, the mutex was initialized with the protocol  
34396 attribute having the value *PTHREAD\_PRIO\_INHERIT*, when the calling thread is blocked  
34397 because the mutex is owned by another thread, that owner thread shall inherit the priority level  
34398 of the calling thread as long as it continues to own the mutex. The implementation shall update  
34399 its execution priority to the maximum of its assigned priority and all its inherited priorities.  
34400 Furthermore, if this owner thread itself becomes blocked on another mutex, the same priority

34401 inheritance effect shall be propagated to this other owner thread, in a recursive manner.

#### 34402 RETURN VALUE

34403 Upon successful completion, the *pthread\_mutexattr\_getprotocol()* and  
34404 *pthread\_mutexattr\_setprotocol()* functions shall return zero; otherwise, an error number shall be  
34405 returned to indicate the error.

#### 34406 ERRORS

34407 The *pthread\_mutexattr\_setprotocol()* function shall fail if:

34408 [ENOTSUP] The value specified by *protocol* is an unsupported value.

34409 The *pthread\_mutexattr\_getprotocol()* and *pthread\_mutexattr\_setprotocol()* functions may fail if:

34410 [EINVAL] The value specified by *attr* or *protocol* is invalid.

34411 [EPERM] The caller does not have the privilege to perform the operation.

34412 These functions shall not return an error code of [EINTR].

#### 34413 EXAMPLES

34414 None.

#### 34415 APPLICATION USAGE

34416 None.

#### 34417 RATIONALE

34418 None.

#### 34419 FUTURE DIRECTIONS

34420 None.

#### 34421 SEE ALSO

34422 *pthread\_cond\_destroy()*, *pthread\_create()*, *pthread\_mutex\_destroy()*, the Base Definitions volume of  
34423 IEEE Std 1003.1-2001, <pthread.h>

#### 34424 CHANGE HISTORY

34425 First released in Issue 5. Included for alignment with the POSIX Threads Extension.

34426 Marked as part of the Realtime Threads Feature Group.

#### 34427 Issue 6

34428 The *pthread\_mutexattr\_getprotocol()* and *pthread\_mutexattr\_setprotocol()* functions are marked as  
34429 part of the Threads option and either the Thread Priority Protection or Thread Priority  
34430 Inheritance options.

34431 The [ENOSYS] error condition has been removed as stubs need not be provided if an  
34432 implementation does not support the Thread Priority Protection or Thread Priority Inheritance  
34433 options.

34434 The **restrict** keyword is added to the *pthread\_mutexattr\_getprotocol()* prototype for alignment  
34435 with the ISO/IEC 9899:1999 standard.

## 34436 NAME

34437 pthread\_mutexattr\_getpshared, pthread\_mutexattr\_setpshared — get and set the process-  
 34438 shared attribute

## 34439 SYNOPSIS

34440 THR TSH #include <pthread.h>

```
34441 int pthread_mutexattr_getpshared(const pthread_mutexattr_t *
34442     restrict attr, int *restrict pshared);
34443 int pthread_mutexattr_setpshared(pthread_mutexattr_t *attr,
34444     int pshared);
34445
```

## 34446 DESCRIPTION

34447 The *pthread\_mutexattr\_getpshared()* function shall obtain the value of the *process-shared* attribute  
 34448 from the attributes object referenced by *attr*. The *pthread\_mutexattr\_setpshared()* function shall  
 34449 set the *process-shared* attribute in an initialized attributes object referenced by *attr*.

34450 The *process-shared* attribute is set to PTHREAD\_PROCESS\_SHARED to permit a mutex to be  
 34451 operated upon by any thread that has access to the memory where the mutex is allocated, even if  
 34452 the mutex is allocated in memory that is shared by multiple processes. If the *process-shared*  
 34453 attribute is PTHREAD\_PROCESS\_PRIVATE, the mutex shall only be operated upon by threads  
 34454 created within the same process as the thread that initialized the mutex; if threads of differing  
 34455 processes attempt to operate on such a mutex, the behavior is undefined. The default value of  
 34456 the attribute shall be PTHREAD\_PROCESS\_PRIVATE.

## 34457 RETURN VALUE

34458 Upon successful completion, *pthread\_mutexattr\_setpshared()* shall return zero; otherwise, an error  
 34459 number shall be returned to indicate the error.

34460 Upon successful completion, *pthread\_mutexattr\_getpshared()* shall return zero and store the value  
 34461 of the *process-shared* attribute of *attr* into the object referenced by the *pshared* parameter.  
 34462 Otherwise, an error number shall be returned to indicate the error.

## 34463 ERRORS

34464 The *pthread\_mutexattr\_getpshared()* and *pthread\_mutexattr\_setpshared()* functions may fail if:

34465 [EINVAL] The value specified by *attr* is invalid.

34466 The *pthread\_mutexattr\_setpshared()* function may fail if:

34467 [EINVAL] The new value specified for the attribute is outside the range of legal values  
 34468 for that attribute.

34469 These functions shall not return an error code of [EINTR].

## 34470 EXAMPLES

34471 None.

## 34472 APPLICATION USAGE

34473 None.

## 34474 RATIONALE

34475 None.

## 34476 FUTURE DIRECTIONS

34477 None.

34478 **SEE ALSO**

34479 *pthread\_cond\_destroy()*, *pthread\_create()*, *pthread\_mutex\_destroy()*, *pthread\_mutexattr\_destroy()*, the  
34480 Base Definitions volume of IEEE Std 1003.1-2001, <pthread.h>

34481 **CHANGE HISTORY**

34482 First released in Issue 5. Included for alignment with the POSIX Threads Extension.

34483 **Issue 6**

34484 The *pthread\_mutexattr\_getpshared()* and *pthread\_mutexattr\_setpshared()* functions are marked as  
34485 part of the Threads and Thread Process-Shared Synchronization options.

34486 The **restrict** keyword is added to the *pthread\_mutexattr\_getpshared()* prototype for alignment  
34487 with the ISO/IEC 9899:1999 standard.

## 34488 NAME

34489 pthread\_mutexattr\_gettype, pthread\_mutexattr\_settype — get and set the mutex type attribute

## 34490 SYNOPSIS

```
34491 XSI #include <pthread.h>
```

```
34492 int pthread_mutexattr_gettype(const pthread_mutexattr_t *restrict attr,  
34493 int *restrict type);
```

```
34494 int pthread_mutexattr_settype(pthread_mutexattr_t *attr, int type);
```

34495

## 34496 DESCRIPTION

34497 The *pthread\_mutexattr\_gettype()* and *pthread\_mutexattr\_settype()* functions, respectively, shall get  
34498 and set the mutex *type* attribute. This attribute is set in the *type* parameter to these functions. The  
34499 default value of the *type* attribute is PTHREAD\_MUTEX\_DEFAULT.

34500 The type of mutex is contained in the *type* attribute of the mutex attributes. Valid mutex types  
34501 include:

## 34502 PTHREAD\_MUTEX\_NORMAL

34503 This type of mutex does not detect deadlock. A thread attempting to relock this mutex  
34504 without first unlocking it shall deadlock. Attempting to unlock a mutex locked by a  
34505 different thread results in undefined behavior. Attempting to unlock an unlocked mutex  
34506 results in undefined behavior.

## 34507 PTHREAD\_MUTEX\_ERRORCHECK

34508 This type of mutex provides error checking. A thread attempting to relock this mutex  
34509 without first unlocking it shall return with an error. A thread attempting to unlock a mutex  
34510 which another thread has locked shall return with an error. A thread attempting to unlock  
34511 an unlocked mutex shall return with an error.

## 34512 PTHREAD\_MUTEX\_RECURSIVE

34513 A thread attempting to relock this mutex without first unlocking it shall succeed in locking  
34514 the mutex. The relocking deadlock which can occur with mutexes of type  
34515 PTHREAD\_MUTEX\_NORMAL cannot occur with this type of mutex. Multiple locks of this  
34516 mutex shall require the same number of unlocks to release the mutex before another thread  
34517 can acquire the mutex. A thread attempting to unlock a mutex which another thread has  
34518 locked shall return with an error. A thread attempting to unlock an unlocked mutex shall  
34519 return with an error.

## 34520 PTHREAD\_MUTEX\_DEFAULT

34521 Attempting to recursively lock a mutex of this type results in undefined behavior.  
34522 Attempting to unlock a mutex of this type which was not locked by the calling thread  
34523 results in undefined behavior. Attempting to unlock a mutex of this type which is not  
34524 locked results in undefined behavior. An implementation may map this mutex to one of the  
34525 other mutex types.

## 34526 RETURN VALUE

34527 Upon successful completion, the *pthread\_mutexattr\_gettype()* function shall return zero and store  
34528 the value of the *type* attribute of *attr* into the object referenced by the *type* parameter. Otherwise,  
34529 an error shall be returned to indicate the error.

34530 If successful, the *pthread\_mutexattr\_settype()* function shall return zero; otherwise, an error  
34531 number shall be returned to indicate the error.

34532 **ERRORS**

34533 The *pthread\_mutexattr\_settype()* function shall fail if:

34534 [EINVAL] The value *type* is invalid.

34535 The *pthread\_mutexattr\_gettype()* and *pthread\_mutexattr\_settype()* functions may fail if:

34536 [EINVAL] The value specified by *attr* is invalid.

34537 These functions shall not return an error code of [EINTR].

34538 **EXAMPLES**

34539 None.

34540 **APPLICATION USAGE**

34541 It is advised that an application should not use a PTHREAD\_MUTEX\_RECURSIVE mutex with  
34542 condition variables because the implicit unlock performed for a *pthread\_cond\_timedwait()* or  
34543 *pthread\_cond\_wait()* may not actually release the mutex (if it had been locked multiple times). If  
34544 this happens, no other thread can satisfy the condition of the predicate.

34545 **RATIONALE**

34546 None.

34547 **FUTURE DIRECTIONS**

34548 None.

34549 **SEE ALSO**

34550 *pthread\_cond\_timedwait()*, the Base Definitions volume of IEEE Std 1003.1-2001, <pthread.h>

34551 **CHANGE HISTORY**

34552 First released in Issue 5.

34553 **Issue 6**

34554 The Open Group Corrigendum U033/3 is applied. The SYNOPSIS for  
34555 *pthread\_mutexattr\_gettype()* is updated so that the first argument is of type **const**  
34556 **pthread\_mutexattr\_t\***.

34557 The **restrict** keyword is added to the *pthread\_mutexattr\_gettype()* prototype for alignment with  
34558 the ISO/IEC 9899:1999 standard.

34559 **NAME**

34560 pthread\_mutexattr\_init — initialize the mutex attributes object

34561 **SYNOPSIS**

34562 THR #include <pthread.h>

34563 int pthread\_mutexattr\_init(pthread\_mutexattr\_t \*attr);

34564

34565 **DESCRIPTION**

34566 Refer to *pthread\_mutexattr\_destroy()*.

34567 **NAME**

34568 pthread\_mutexattr\_setprioceiling — set the prioceiling attribute of the mutex attributes object  
34569 (**REALTIME THREADS**)

34570 **SYNOPSIS**

```
34571 THR TPP #include <pthread.h>
```

```
34572 int pthread_mutexattr_setprioceiling(pthread_mutexattr_t *attr,  
34573 int prioceiling);
```

34574

34575 **DESCRIPTION**

34576 Refer to *pthread\_mutexattr\_getprioceiling()*.

34577 **NAME**

34578 pthread\_mutexattr\_setprotocol — set the protocol attribute of the mutex attributes object  
34579 (**REALTIME THREADS**)

34580 **SYNOPSIS**

34581 THR #include <pthread.h>

34582 TPP|TPI int pthread\_mutexattr\_setprotocol(pthread\_mutexattr\_t \*attr,  
34583 int protocol);

34584

34585 **DESCRIPTION**

34586 Refer to *pthread\_mutexattr\_getprotocol()*.

34587 **NAME**

34588 pthread\_mutexattr\_setpshared — set the process-shared attribute

34589 **SYNOPSIS**

34590 THR TSH #include &lt;pthread.h&gt;

34591 int pthread\_mutexattr\_setpshared(pthread\_mutexattr\_t \*attr,  
34592 int pshared);

34593

34594 **DESCRIPTION**34595 Refer to *pthread\_mutexattr\_getpshared()*.

34596 **NAME**

34597 pthread\_mutexattr\_settype — set the mutex type attribute

34598 **SYNOPSIS**

34599 XSI `#include <pthread.h>`

34600 `int pthread_mutexattr_settype(pthread_mutexattr_t *attr, int type);`

34601

34602 **DESCRIPTION**

34603 Refer to *pthread\_mutexattr\_gettype()*.

34604 **NAME**

34605 pthread\_once — dynamic package initialization

34606 **SYNOPSIS**

34607 THR #include &lt;pthread.h&gt;

```
34608 int pthread_once(pthread_once_t *once_control,
34609                 void (*init_routine)(void));
34610 pthread_once_t once_control = PTHREAD_ONCE_INIT;
34611
```

34612 **DESCRIPTION**

34613 The first call to *pthread\_once()* by any thread in a process, with a given *once\_control*, shall call the  
 34614 *init\_routine* with no arguments. Subsequent calls of *pthread\_once()* with the same *once\_control*  
 34615 shall not call the *init\_routine*. On return from *pthread\_once()*, *init\_routine* shall have completed.  
 34616 The *once\_control* parameter shall determine whether the associated initialization routine has  
 34617 been called.

34618 The *pthread\_once()* function is not a cancellation point. However, if *init\_routine* is a cancellation  
 34619 point and is canceled, the effect on *once\_control* shall be as if *pthread\_once()* was never called.

34620 The constant PTHREAD\_ONCE\_INIT is defined in the <pthread.h> header.

34621 The behavior of *pthread\_once()* is undefined if *once\_control* has automatic storage duration or is  
 34622 not initialized by PTHREAD\_ONCE\_INIT.

34623 **RETURN VALUE**

34624 Upon successful completion, *pthread\_once()* shall return zero; otherwise, an error number shall  
 34625 be returned to indicate the error.

34626 **ERRORS**

34627 The *pthread\_once()* function may fail if:

34628 [EINVAL] If either *once\_control* or *init\_routine* is invalid.

34629 The *pthread\_once()* function shall not return an error code of [EINTR].

34630 **EXAMPLES**

34631 None.

34632 **APPLICATION USAGE**

34633 None.

34634 **RATIONALE**

34635 Some C libraries are designed for dynamic initialization. That is, the global initialization for the  
 34636 library is performed when the first procedure in the library is called. In a single-threaded  
 34637 program, this is normally implemented using a static variable whose value is checked on entry  
 34638 to a routine, as follows:

```
34639 static int random_is_initialized = 0;
34640 extern int initialize_random();

34641 int random_function()
34642 {
34643     if (random_is_initialized == 0) {
34644         initialize_random();
34645         random_is_initialized = 1;
34646     }
34647     ... /* Operations performed after initialization. */
34648 }
```

34649 To keep the same structure in a multi-threaded program, a new primitive is needed. Otherwise,  
34650 library initialization has to be accomplished by an explicit call to a library-exported initialization  
34651 function prior to any use of the library.

34652 For dynamic library initialization in a multi-threaded process, a simple initialization flag is not  
34653 sufficient; the flag needs to be protected against modification by multiple threads  
34654 simultaneously calling into the library. Protecting the flag requires the use of a mutex; however,  
34655 mutexes have to be initialized before they are used. Ensuring that the mutex is only initialized  
34656 once requires a recursive solution to this problem.

34657 The use of *pthread\_once()* not only supplies an implementation-guaranteed means of dynamic  
34658 initialization, it provides an aid to the reliable construction of multi-threaded and realtime  
34659 systems. The preceding example then becomes:

```
34660 #include <pthread.h>
34661 static pthread_once_t random_is_initialized = PTHREAD_ONCE_INIT;
34662 extern int initialize_random();

34663 int random_function()
34664 {
34665     (void) pthread_once(&random_is_initialized, initialize_random);
34666     ... /* Operations performed after initialization. */
34667 }
```

34668 Note that a **pthread\_once\_t** cannot be an array because some compilers do not accept the  
34669 construct **&<array\_name>**.

#### 34670 FUTURE DIRECTIONS

34671 None.

#### 34672 SEE ALSO

34673 The Base Definitions volume of IEEE Std 1003.1-2001, **<pthread.h>**

#### 34674 CHANGE HISTORY

34675 First released in Issue 5. Included for alignment with the POSIX Threads Extension.

#### 34676 Issue 6

34677 The *pthread\_once()* function is marked as part of the Threads option.

34678 The [EINVAL] error is added as a may fail case for if either argument is invalid.

34679 **NAME**

34680 pthread\_rwlock\_destroy, pthread\_rwlock\_init — destroy and initialize a read-write lock object

34681 **SYNOPSIS**

34682 THR #include &lt;pthread.h&gt;

```
34683 int pthread_rwlock_destroy(pthread_rwlock_t *rwlock);
34684 int pthread_rwlock_init(pthread_rwlock_t *restrict rwlock,
34685 const pthread_rwlockattr_t *restrict attr);
34686
```

34687 **DESCRIPTION**

34688 The *pthread\_rwlock\_destroy()* function shall destroy the read-write lock object referenced by  
 34689 *rwlock* and release any resources used by the lock. The effect of subsequent use of the lock is  
 34690 undefined until the lock is reinitialized by another call to *pthread\_rwlock\_init()*. An  
 34691 implementation may cause *pthread\_rwlock\_destroy()* to set the object referenced by *rwlock* to an  
 34692 invalid value. Results are undefined if *pthread\_rwlock\_destroy()* is called when any thread holds  
 34693 *rwlock*. Attempting to destroy an uninitialized read-write lock results in undefined behavior.

34694 The *pthread\_rwlock\_init()* function shall allocate any resources required to use the read-write  
 34695 lock referenced by *rwlock* and initializes the lock to an unlocked state with attributes referenced  
 34696 by *attr*. If *attr* is NULL, the default read-write lock attributes shall be used; the effect is the same  
 34697 as passing the address of a default read-write lock attributes object. Once initialized, the lock can  
 34698 be used any number of times without being reinitialized. Results are undefined if  
 34699 *pthread\_rwlock\_init()* is called specifying an already initialized read-write lock. Results are  
 34700 undefined if a read-write lock is used without first being initialized.

34701 If the *pthread\_rwlock\_init()* function fails, *rwlock* shall not be initialized and the contents of *rwlock*  
 34702 are undefined.

34703 Only the object referenced by *rwlock* may be used for performing synchronization. The result of  
 34704 referring to copies of that object in calls to *pthread\_rwlock\_destroy()*, *pthread\_rwlock\_rdlock()*,  
 34705 *pthread\_rwlock\_timedrdlock()*, *pthread\_rwlock\_timedwrlock()*, *pthread\_rwlock\_tryrdlock()*,  
 34706 *pthread\_rwlock\_trywrlock()*, *pthread\_rwlock\_unlock()*, or *pthread\_rwlock\_wrlock()* is undefined.

34707 **RETURN VALUE**

34708 If successful, the *pthread\_rwlock\_destroy()* and *pthread\_rwlock\_init()* functions shall return zero;  
 34709 otherwise, an error number shall be returned to indicate the error.

34710 The [EBUSY] and [EINVAL] error checks, if implemented, act as if they were performed  
 34711 immediately at the beginning of processing for the function and caused an error return prior to  
 34712 modifying the state of the read-write lock specified by *rwlock*.

34713 **ERRORS**34714 The *pthread\_rwlock\_destroy()* function may fail if:

34715 [EBUSY] The implementation has detected an attempt to destroy the object referenced  
 34716 by *rwlock* while it is locked.

34717 [EINVAL] The value specified by *rwlock* is invalid.

34718 The *pthread\_rwlock\_init()* function shall fail if:

34719 [EAGAIN] The system lacked the necessary resources (other than memory) to initialize  
 34720 another read-write lock.

34721 [ENOMEM] Insufficient memory exists to initialize the read-write lock.

34722 [EPERM] The caller does not have the privilege to perform the operation.

- 34723 The *pthread\_rwlock\_init()* function may fail if:
- 34724 [EBUSY] The implementation has detected an attempt to reinitialize the object  
34725 referenced by *rwlock*, a previously initialized but not yet destroyed read-write  
34726 lock.
- 34727 [EINVAL] The value specified by *attr* is invalid.
- 34728 These functions shall not return an error code of [EINTR].
- 34729 **EXAMPLES**
- 34730 None.
- 34731 **APPLICATION USAGE**
- 34732 None.
- 34733 **RATIONALE**
- 34734 None.
- 34735 **FUTURE DIRECTIONS**
- 34736 None.
- 34737 **SEE ALSO**
- 34738 *pthread\_rwlock\_rdlock()*, *pthread\_rwlock\_timedrdlock()*, *pthread\_rwlock\_timedwrlock()*,  
34739 *pthread\_rwlock\_tryrdlock()*, *pthread\_rwlock\_trywrlock()*, *pthread\_rwlock\_unlock()*,  
34740 *pthread\_rwlock\_wrlock()*, the Base Definitions volume of IEEE Std 1003.1-2001, <**pthread.h**>
- 34741 **CHANGE HISTORY**
- 34742 First released in Issue 5.
- 34743 **Issue 6**
- 34744 The following changes are made for alignment with IEEE Std 1003.1j-2000:
- 34745 • The margin code in the SYNOPSIS is changed to THR to indicate that the functionality is  
34746 now part of the Threads option (previously it was part of the Read-Write Locks option in  
34747 IEEE Std 1003.1j-2000 and also part of the XSI extension). The initializer macro is also deleted  
34748 from the SYNOPSIS.
  - 34749 • The DESCRIPTION is updated as follows:
    - 34750 — It explicitly notes allocation of resources upon initialization of a read-write lock object.
    - 34751 — A paragraph is added specifying that copies of read-write lock objects may not be used.
  - 34752 • An [EINVAL] error is added to the ERRORS section for *pthread\_rwlock\_init()*, indicating that  
34753 the *rwlock* value is invalid.
  - 34754 • The SEE ALSO section is updated.
- 34755 The **restrict** keyword is added to the *pthread\_rwlock\_init()* prototype for alignment with the  
34756 ISO/IEC 9899:1999 standard.

34757 **NAME**

34758 pthread\_rwlock\_rdlock, pthread\_rwlock\_tryrdlock — lock a read-write lock object for reading

34759 **SYNOPSIS**

34760 THR #include &lt;pthread.h&gt;

34761 int pthread\_rwlock\_rdlock(pthread\_rwlock\_t \*rwlock);

34762 int pthread\_rwlock\_tryrdlock(pthread\_rwlock\_t \*rwlock);

34763

34764 **DESCRIPTION**

34765 The *pthread\_rwlock\_rdlock()* function shall apply a read lock to the read-write lock referenced by  
 34766 *rwlock*. The calling thread acquires the read lock if a writer does not hold the lock and there are  
 34767 no writers blocked on the lock.

34768 TPS If the Thread Execution Scheduling option is supported, and the threads involved in the lock are  
 34769 executing with the scheduling policies SCHED\_FIFO or SCHED\_RR, the calling thread shall not  
 34770 acquire the lock if a writer holds the lock or if writers of higher or equal priority are blocked on  
 34771 the lock; otherwise, the calling thread shall acquire the lock.

34772 TPS TSP If the Threads Execution Scheduling option is supported, and the threads involved in the lock  
 34773 are executing with the SCHED\_SPORADIC scheduling policy, the calling thread shall not  
 34774 acquire the lock if a writer holds the lock or if writers of higher or equal priority are blocked on  
 34775 the lock; otherwise, the calling thread shall acquire the lock.

34776 If the Thread Execution Scheduling option is not supported, it is implementation-defined  
 34777 whether the calling thread acquires the lock when a writer does not hold the lock and there are  
 34778 writers blocked on the lock. If a writer holds the lock, the calling thread shall not acquire the  
 34779 read lock. If the read lock is not acquired, the calling thread shall block until it can acquire the  
 34780 lock. The calling thread may deadlock if at the time the call is made it holds a write lock.

34781 A thread may hold multiple concurrent read locks on *rwlock* (that is, successfully call the  
 34782 *pthread\_rwlock\_rdlock()* function *n* times). If so, the application shall ensure that the thread  
 34783 performs matching unlocks (that is, it calls the *pthread\_rwlock\_unlock()* function *n* times).

34784 The maximum number of simultaneous read locks that an implementation guarantees can be  
 34785 applied to a read-write lock shall be implementation-defined. The *pthread\_rwlock\_rdlock()*  
 34786 function may fail if this maximum would be exceeded.

34787 The *pthread\_rwlock\_tryrdlock()* function shall apply a read lock as in the *pthread\_rwlock\_rdlock()*  
 34788 function, with the exception that the function shall fail if the equivalent *pthread\_rwlock\_rdlock()*  
 34789 call would have blocked the calling thread. In no case shall the *pthread\_rwlock\_tryrdlock()*  
 34790 function ever block; it always either acquires the lock or fails and returns immediately.

34791 Results are undefined if any of these functions are called with an uninitialized read-write lock.

34792 If a signal is delivered to a thread waiting for a read-write lock for reading, upon return from the  
 34793 signal handler the thread resumes waiting for the read-write lock for reading as if it was not  
 34794 interrupted.

34795 **RETURN VALUE**

34796 If successful, the *pthread\_rwlock\_rdlock()* function shall return zero; otherwise, an error number  
 34797 shall be returned to indicate the error.

34798 The *pthread\_rwlock\_tryrdlock()* function shall return zero if the lock for reading on the read-write  
 34799 lock object referenced by *rwlock* is acquired. Otherwise, an error number shall be returned to  
 34800 indicate the error.

34801 **ERRORS**

34802 The *pthread\_rwlock\_tryrdlock()* function shall fail if:

34803 [EBUSY] The read-write lock could not be acquired for reading because a writer holds  
34804 the lock or a writer with the appropriate priority was blocked on it.

34805 The *pthread\_rwlock\_rdlock()* and *pthread\_rwlock\_tryrdlock()* functions may fail if:

34806 [EINVAL] The value specified by *rwlock* does not refer to an initialized read-write lock  
34807 object.

34808 [EAGAIN] The read lock could not be acquired because the maximum number of read  
34809 locks for *rwlock* has been exceeded.

34810 The *pthread\_rwlock\_rdlock()* function may fail if:

34811 [EDEADLK] The current thread already owns the read-write lock for writing.

34812 These functions shall not return an error code of [EINTR].

34813 **EXAMPLES**

34814 None.

34815 **APPLICATION USAGE**

34816 Applications using these functions may be subject to priority inversion, as discussed in the Base  
34817 Definitions volume of IEEE Std 1003.1-2001, Section 3.285, Priority Inversion.

34818 **RATIONALE**

34819 None.

34820 **FUTURE DIRECTIONS**

34821 None.

34822 **SEE ALSO**

34823 *pthread\_rwlock\_destroy()*, *pthread\_rwlock\_timedrdlock()*, *pthread\_rwlock\_timedwrlock()*,  
34824 *pthread\_rwlock\_trywrlock()*, *pthread\_rwlock\_unlock()*, *pthread\_rwlock\_wrlock()*, the Base Definitions  
34825 volume of IEEE Std 1003.1-2001, <pthread.h>

34826 **CHANGE HISTORY**

34827 First released in Issue 5.

34828 **Issue 6**

34829 The following changes are made for alignment with IEEE Std 1003.1j-2000:

34830 • The margin code in the SYNOPSIS is changed to THR to indicate that the functionality is  
34831 now part of the Threads option (previously it was part of the Read-Write Locks option in  
34832 IEEE Std 1003.1j-2000 and also part of the XSI extension).

34833 • The DESCRIPTION is updated as follows:

34834 — Conditions under which writers have precedence over readers are specified.

34835 — Failure of *pthread\_rwlock\_tryrdlock()* is clarified.

34836 — A paragraph on the maximum number of read locks is added.

34837 • In the ERRORS sections, [EBUSY] is modified to take into account write priority, and  
34838 [EDEADLK] is deleted as a *pthread\_rwlock\_tryrdlock()* error.

34839 • The SEE ALSO section is updated.

34840 **NAME**

34841 pthread\_rwlock\_timedrdlock — lock a read-write lock for reading

34842 **SYNOPSIS**

34843 THR TMO #include &lt;pthread.h&gt;

34844 #include &lt;time.h&gt;

34845 int pthread\_rwlock\_timedrdlock(pthread\_rwlock\_t \*restrict *rwlock*,34846 const struct timespec \*restrict *abs\_timeout*);

34847

34848 **DESCRIPTION**

34849 The *pthread\_rwlock\_timedrdlock()* function shall apply a read lock to the read-write lock  
 34850 referenced by *rwlock* as in the *pthread\_rwlock\_rdlock()* function. However, if the lock cannot be  
 34851 acquired without waiting for other threads to unlock the lock, this wait shall be terminated  
 34852 when the specified timeout expires. The timeout shall expire when the absolute time specified  
 34853 by *abs\_timeout* passes, as measured by the clock on which timeouts are based (that is, when the  
 34854 value of that clock equals or exceeds *abs\_timeout*), or if the absolute time specified by *abs\_timeout*  
 34855 has already been passed at the time of the call.

34856 TMR If the Timers option is supported, the timeout shall be based on the `CLOCK_REALTIME` clock. If  
 34857 the Timers option is not supported, the timeout shall be based on the system clock as returned  
 34858 by the *time()* function. The resolution of the timeout shall be the resolution of the clock on which  
 34859 it is based. The **timespec** data type is defined in the `<time.h>` header. Under no circumstances  
 34860 shall the function fail with a timeout if the lock can be acquired immediately. The validity of the  
 34861 *abs\_timeout* parameter need not be checked if the lock can be immediately acquired.

34862 If a signal that causes a signal handler to be executed is delivered to a thread blocked on a read-  
 34863 write lock via a call to *pthread\_rwlock\_timedrdlock()*, upon return from the signal handler the  
 34864 thread shall resume waiting for the lock as if it was not interrupted.

34865 The calling thread may deadlock if at the time the call is made it holds a write lock on *rwlock*.  
 34866 The results are undefined if this function is called with an uninitialized read-write lock.

34867 **RETURN VALUE**

34868 The *pthread\_rwlock\_timedrdlock()* function shall return zero if the lock for reading on the read-  
 34869 write lock object referenced by *rwlock* is acquired. Otherwise, an error number shall be returned  
 34870 to indicate the error.

34871 **ERRORS**34872 The *pthread\_rwlock\_timedrdlock()* function shall fail if:

34873 [ETIMEDOUT] The lock could not be acquired before the specified timeout expired.

34874 The *pthread\_rwlock\_timedrdlock()* function may fail if:34875 [EAGAIN] The read lock could not be acquired because the maximum number of read  
34876 locks for lock would be exceeded.34877 [EDEADLK] The calling thread already holds a write lock on *rwlock*.34878 [EINVAL] The value specified by *rwlock* does not refer to an initialized read-write lock  
34879 object, or the *abs\_timeout* nanosecond value is less than zero or greater than or  
34880 equal to 1 000 million.

34881 This function shall not return an error code of [EINTR].

## 34882 EXAMPLES

34883 None.

## 34884 APPLICATION USAGE

34885 Applications using this function may be subject to priority inversion, as discussed in the Base  
34886 Definitions volume of IEEE Std 1003.1-2001, Section 3.285, Priority Inversion.

34887 The *pthread\_rwlock\_timedrdlock()* function is part of the Threads and Timeouts options and need  
34888 not be provided on all implementations.

## 34889 RATIONALE

## 34898 CHANGE HISTORY

34899 First released in Issue 6. Derived from IEEE Std 1003.1j-2000.

34900 **NAME**

34901 pthread\_rwlock\_timedwrlock — lock a read-write lock for writing

34902 **SYNOPSIS**

34903 THR TMO #include &lt;pthread.h&gt;

34904 #include &lt;time.h&gt;

34905 int pthread\_rwlock\_timedwrlock(pthread\_rwlock\_t \*restrict *rwlock*,34906 const struct timespec \*restrict *abs\_timeout*);

34907

34908 **DESCRIPTION**

34909 The *pthread\_rwlock\_timedwrlock()* function shall apply a write lock to the read-write lock  
 34910 referenced by *rwlock* as in the *pthread\_rwlock\_wrlock()* function. However, if the lock cannot be  
 34911 acquired without waiting for other threads to unlock the lock, this wait shall be terminated  
 34912 when the specified timeout expires. The timeout shall expire when the absolute time specified  
 34913 by *abs\_timeout* passes, as measured by the clock on which timeouts are based (that is, when the  
 34914 value of that clock equals or exceeds *abs\_timeout*), or if the absolute time specified by *abs\_timeout*  
 34915 has already been passed at the time of the call.

34916 TMR If the Timers option is supported, the timeout shall be based on the `CLOCK_REALTIME` clock. If  
 34917 the Timers option is not supported, the timeout shall be based on the system clock as returned  
 34918 by the *time()* function. The resolution of the timeout shall be the resolution of the clock on which  
 34919 it is based. The `timespec` data type is defined in the `<time.h>` header. Under no circumstances  
 34920 shall the function fail with a timeout if the lock can be acquired immediately. The validity of the  
 34921 *abs\_timeout* parameter need not be checked if the lock can be immediately acquired.

34922 If a signal that causes a signal handler to be executed is delivered to a thread blocked on a read-  
 34923 write lock via a call to *pthread\_rwlock\_timedwrlock()*, upon return from the signal handler the  
 34924 thread shall resume waiting for the lock as if it was not interrupted.

34925 The calling thread may deadlock if at the time the call is made it holds the read-write lock. The  
 34926 results are undefined if this function is called with an uninitialized read-write lock.

34927 **RETURN VALUE**

34928 The *pthread\_rwlock\_timedwrlock()* function shall return zero if the lock for writing on the read-  
 34929 write lock object referenced by *rwlock* is acquired. Otherwise, an error number shall be returned  
 34930 to indicate the error.

34931 **ERRORS**34932 The *pthread\_rwlock\_timedwrlock()* function shall fail if:

34933 [ETIMEDOUT] The lock could not be acquired before the specified timeout expired.

34934 The *pthread\_rwlock\_timedwrlock()* function may fail if:34935 [EDEADLK] The calling thread already holds the *rwlock*.

34936 [EINVAL] The value specified by *rwlock* does not refer to an initialized read-write lock  
 34937 object, or the *abs\_timeout* nanosecond value is less than zero or greater than or  
 34938 equal to 1 000 million.

34939 This function shall not return an error code of [EINTR].

## 34940 EXAMPLES

34941 None.

## 34942 APPLICATION USAGE

34943 Applications using this function may be subject to priority inversion, as discussed in the Base  
34944 Definitions volume of IEEE Std 1003.1-2001, Section 3.285, Priority Inversion.

34945 The *pthread\_rwlock\_timedwrlock()* function is part of the Threads and Timeouts options and need  
34946 not be provided on all implementations.

## 34956 CHANGE HISTORY

34957 First released in Issue 6. Derived from IEEE Std 1003.1j-2000.

34958 **NAME**

34959 pthread\_rwlock\_tryrdlock — lock a read-write lock object for reading

34960 **SYNOPSIS**

34961 THR #include <pthread.h>

34962 int pthread\_rwlock\_tryrdlock(pthread\_rwlock\_t \*rwlock);

34963

34964 **DESCRIPTION**

34965 Refer to *pthread\_rwlock\_rdlock()*.

34966 **NAME**

34967 pthread\_rwlock\_trywrlock, pthread\_rwlock\_wrlock — lock a read-write lock object for writing

34968 **SYNOPSIS**

34969 THR #include <pthread.h>

34970 int pthread\_rwlock\_trywrlock(pthread\_rwlock\_t \*rwlock);

34971 int pthread\_rwlock\_wrlock(pthread\_rwlock\_t \*rwlock);

34972

34973 **DESCRIPTION**

34974 The *pthread\_rwlock\_trywrlock()* function shall apply a write lock like the *pthread\_rwlock\_wrlock()*  
 34975 function, with the exception that the function shall fail if any thread currently holds *rwlock* (for  
 34976 reading or writing).

34977 The *pthread\_rwlock\_wrlock()* function shall apply a write lock to the read-write lock referenced  
 34978 by *rwlock*. The calling thread acquires the write lock if no other thread (reader or writer) holds  
 34979 the read-write lock *rwlock*. Otherwise, the thread shall block until it can acquire the lock. The  
 34980 calling thread may deadlock if at the time the call is made it holds the read-write lock (whether a  
 34981 read or write lock).

34982 Implementations may favor writers over readers to avoid writer starvation.

34983 Results are undefined if any of these functions are called with an uninitialized read-write lock.

34984 If a signal is delivered to a thread waiting for a read-write lock for writing, upon return from the  
 34985 signal handler the thread resumes waiting for the read-write lock for writing as if it was not  
 34986 interrupted.

34987 **RETURN VALUE**

34988 The *pthread\_rwlock\_trywrlock()* function shall return zero if the lock for writing on the read-write  
 34989 lock object referenced by *rwlock* is acquired. Otherwise, an error number shall be returned to  
 34990 indicate the error.

34991 If successful, the *pthread\_rwlock\_wrlock()* function shall return zero; otherwise, an error number  
 34992 shall be returned to indicate the error.

34993 **ERRORS**

34994 The *pthread\_rwlock\_trywrlock()* function shall fail if:

34995 [EBUSY] The read-write lock could not be acquired for writing because it was already  
 34996 locked for reading or writing.

34997 The *pthread\_rwlock\_trywrlock()* and *pthread\_rwlock\_wrlock()* functions may fail if:

34998 [EINVAL] The value specified by *rwlock* does not refer to an initialized read-write lock  
 34999 object.

35000 The *pthread\_rwlock\_wrlock()* function may fail if:

35001 [EDEADLK] The current thread already owns the read-write lock for writing or reading.

35002 These functions shall not return an error code of [EINTR].

35003 **EXAMPLES**

35004 None.

35005 **APPLICATION USAGE**

35006 Applications using these functions may be subject to priority inversion, as discussed in the Base  
35007 Definitions volume of IEEE Std 1003.1-2001, Section 3.285, Priority Inversion.

35008 **RATIONALE**

35009 None.

35010 **FUTURE DIRECTIONS**

35011 None.

35012 **SEE ALSO**

35013 *pthread\_rwlock\_destroy()*, *pthread\_rwlock\_rdlock()*, *pthread\_rwlock\_timedrdlock()*,  
35014 *pthread\_rwlock\_timedwrlock()*, *pthread\_rwlock\_tryrdlock()*, *pthread\_rwlock\_unlock()*, the Base  
35015 Definitions volume of IEEE Std 1003.1-2001, <pthread.h>

35016 **CHANGE HISTORY**

35017 First released in Issue 5.

35018 **Issue 6**

35019 The following changes are made for alignment with IEEE Std 1003.1j-2000:

- 35020 • The margin code in the SYNOPSIS is changed to THR to indicate that the functionality is  
35021 now part of the Threads option (previously it was part of the Read-Write Locks option in  
35022 IEEE Std 1003.1j-2000 and also part of the XSI extension).
- 35023 • The [EDEADLK] error is deleted as a *pthread\_rwlock\_trywrlock()* error.
- 35024 • The SEE ALSO section is updated.

35025 **NAME**

35026 pthread\_rwlock\_unlock — unlock a read-write lock object

35027 **SYNOPSIS**

35028 THR #include &lt;pthread.h&gt;

35029 int pthread\_rwlock\_unlock(pthread\_rwlock\_t \*rwlock);

35030

35031 **DESCRIPTION**

35032 The *pthread\_rwlock\_unlock()* function shall release a lock held on the read-write lock object  
35033 referenced by *rwlock*. Results are undefined if the read-write lock *rwlock* is not held by the  
35034 calling thread.

35035 If this function is called to release a read lock from the read-write lock object and there are other  
35036 read locks currently held on this read-write lock object, the read-write lock object remains in the  
35037 read locked state. If this function releases the last read lock for this read-write lock object, the  
35038 read-write lock object shall be put in the unlocked state with no owners.

35039 If this function is called to release a write lock for this read-write lock object, the read-write lock  
35040 object shall be put in the unlocked state.

35041 If there are threads blocked on the lock when it becomes available, the scheduling policy shall  
35042 determine which thread(s) shall acquire the lock. If the Thread Execution Scheduling option is  
35043 supported, when threads executing with the scheduling policies SCHED\_FIFO, SCHED\_RR, or  
35044 SCHED\_SPORADIC are waiting on the lock, they shall acquire the lock in priority order when  
35045 the lock becomes available. For equal priority threads, write locks shall take precedence over  
35046 read locks. If the Thread Execution Scheduling option is not supported, it is implementation-  
35047 defined whether write locks take precedence over read locks.

35048 Results are undefined if any of these functions are called with an uninitialized read-write lock.

35049 **RETURN VALUE**

35050 If successful, the *pthread\_rwlock\_unlock()* function shall return zero; otherwise, an error number  
35051 shall be returned to indicate the error.

35052 **ERRORS**

35053 The *pthread\_rwlock\_unlock()* function may fail if:

35054 [EINVAL] The value specified by *rwlock* does not refer to an initialized read-write lock  
35055 object.

35056 [EPERM] The current thread does not hold a lock on the read-write lock.

35057 The *pthread\_rwlock\_unlock()* function shall not return an error code of [EINTR].

35058 **EXAMPLES**

35059 None.

35060 **APPLICATION USAGE**

35061 None.

35062 **RATIONALE**

35063 None.

35064 **FUTURE DIRECTIONS**

35065 None.

35066 **SEE ALSO**

35067 *pthread\_rwlock\_destroy()*, *pthread\_rwlock\_rdlock()*, *pthread\_rwlock\_timedrdlock()*,  
35068 *pthread\_rwlock\_timedwrlock()*, *pthread\_rwlock\_tryrdlock()*, *pthread\_rwlock\_trywrlock()*,  
35069 *pthread\_rwlock\_wrlock()*, the Base Definitions volume of IEEE Std 1003.1-2001, <pthread.h>

35070 **CHANGE HISTORY**

35071 First released in Issue 5.

35072 **Issue 6**

35073 The following changes are made for alignment with IEEE Std 1003.1j-2000:

- 35074 • The margin code in the SYNOPSIS is changed to THR to indicate that the functionality is  
35075 now part of the Threads option (previously it was part of the Read-Write Locks option in  
35076 IEEE Std 1003.1j-2000 and also part of the XSI extension).
- 35077 • The DESCRIPTION is updated as follows:
- 35078 — The conditions under which writers have precedence over readers are specified.
- 35079 — The concept of read-write lock owner is deleted.
- 35080 • The SEE ALSO section is updated.

35081 **NAME**

35082 pthread\_rwlock\_wrlock — lock a read-write lock object for writing

35083 **SYNOPSIS**

35084 THR #include <pthread.h>

35085 int pthread\_rwlock\_wrlock(pthread\_rwlock\_t \*rwlock);

35086

35087 **DESCRIPTION**

35088 Refer to *pthread\_rwlock\_trywrlock()*.

35089 **NAME**

35090 pthread\_rwlockattr\_destroy, pthread\_rwlockattr\_init — destroy and initialize the read-write  
 35091 lock attributes object

35092 **SYNOPSIS**

35093 THR #include <pthread.h>

35094 int pthread\_rwlockattr\_destroy(pthread\_rwlockattr\_t \*attr);

35095 int pthread\_rwlockattr\_init(pthread\_rwlockattr\_t \*attr);

35096

35097 **DESCRIPTION**

35098 The *pthread\_rwlockattr\_destroy()* function shall destroy a read-write lock attributes object. A  
 35099 destroyed *attr* attributes object can be reinitialized using *pthread\_rwlockattr\_init()*; the results of  
 35100 otherwise referencing the object after it has been destroyed are undefined. An implementation  
 35101 may cause *pthread\_rwlockattr\_destroy()* to set the object referenced by *attr* to an invalid value.

35102 The *pthread\_rwlockattr\_init()* function shall initialize a read-write lock attributes object *attr* with  
 35103 the default value for all of the attributes defined by the implementation.

35104 Results are undefined if *pthread\_rwlockattr\_init()* is called specifying an already initialized *attr*  
 35105 attributes object.

35106 After a read-write lock attributes object has been used to initialize one or more read-write locks,  
 35107 any function affecting the attributes object (including destruction) shall not affect any previously  
 35108 initialized read-write locks.

35109 **RETURN VALUE**

35110 If successful, the *pthread\_rwlockattr\_destroy()* and *pthread\_rwlockattr\_init()* functions shall return  
 35111 zero; otherwise, an error number shall be returned to indicate the error.

35112 **ERRORS**

35113 The *pthread\_rwlockattr\_destroy()* function may fail if:

35114 [EINVAL] The value specified by *attr* is invalid.

35115 The *pthread\_rwlockattr\_init()* function shall fail if:

35116 [ENOMEM] Insufficient memory exists to initialize the read-write lock attributes object.

35117 These functions shall not return an error code of [EINTR].

35118 **EXAMPLES**

35119 None.

35120 **APPLICATION USAGE**

35121 None.

35122 **RATIONALE**

35123 None.

35124 **FUTURE DIRECTIONS**

35125 None.

35126 **SEE ALSO**

35127 *pthread\_rwlock\_destroy()*, *pthread\_rwlockattr\_getpshared()*, *pthread\_rwlockattr\_setpshared()*, the  
 35128 Base Definitions volume of IEEE Std 1003.1-2001, <pthread.h>

35129 **CHANGE HISTORY**

35130 First released in Issue 5.

35131 **Issue 6**

35132 The following changes are made for alignment with IEEE Std 1003.1j-2000:

- 35133 • The margin code in the SYNOPSIS is changed to THR to indicate that the functionality is
- 35134 now part of the Threads option (previously it was part of the Read-Write Locks option in
- 35135 IEEE Std 1003.1j-2000 and also part of the XSI extension).
- 35136 • The SEE ALSO section is updated.

35137 **NAME**

35138 pthread\_rwlockattr\_getpshared, pthread\_rwlockattr\_setpshared — get and set the process-  
 35139 shared attribute of the read-write lock attributes object

35140 **SYNOPSIS**

```
35141 THR TSH #include <pthread.h>
35142
35142 int pthread_rwlockattr_getpshared(const pthread_rwlockattr_t *
35143 restrict attr, int *restrict pshared);
35144 int pthread_rwlockattr_setpshared(pthread_rwlockattr_t *attr,
35145 int pshared);
35146
```

35147 **DESCRIPTION**

35148 The *pthread\_rwlockattr\_getpshared()* function shall obtain the value of the *process-shared* attribute  
 35149 from the initialized attributes object referenced by *attr*. The *pthread\_rwlockattr\_setpshared()*  
 35150 function shall set the *process-shared* attribute in an initialized attributes object referenced by *attr*.

35151 The *process-shared* attribute shall be set to PTHREAD\_PROCESS\_SHARED to permit a read-  
 35152 write lock to be operated upon by any thread that has access to the memory where the read-  
 35153 write lock is allocated, even if the read-write lock is allocated in memory that is shared by  
 35154 multiple processes. If the *process-shared* attribute is PTHREAD\_PROCESS\_PRIVATE, the read-  
 35155 write lock shall only be operated upon by threads created within the same process as the thread  
 35156 that initialized the read-write lock; if threads of differing processes attempt to operate on such a  
 35157 read-write lock, the behavior is undefined. The default value of the *process-shared* attribute shall  
 35158 be PTHREAD\_PROCESS\_PRIVATE.

35159 Additional attributes, their default values, and the names of the associated functions to get and  
 35160 set those attribute values are implementation-defined.

35161 **RETURN VALUE**

35162 Upon successful completion, the *pthread\_rwlockattr\_getpshared()* function shall return zero and  
 35163 store the value of the *process-shared* attribute of *attr* into the object referenced by the *pshared*  
 35164 parameter. Otherwise, an error number shall be returned to indicate the error.

35165 If successful, the *pthread\_rwlockattr\_setpshared()* function shall return zero; otherwise, an error  
 35166 number shall be returned to indicate the error.

35167 **ERRORS**

35168 The *pthread\_rwlockattr\_getpshared()* and *pthread\_rwlockattr\_setpshared()* functions may fail if:

35169 [EINVAL] The value specified by *attr* is invalid.

35170 The *pthread\_rwlockattr\_setpshared()* function may fail if:

35171 [EINVAL] The new value specified for the attribute is outside the range of legal values  
 35172 for that attribute.

35173 These functions shall not return an error code of [EINTR].

35174 **EXAMPLES**

35175 None.

35176 **APPLICATION USAGE**

35177 None.

35178 **RATIONALE**

35179 None.

35180 **FUTURE DIRECTIONS**

35181 None.

35182 **SEE ALSO**

35183 *pthread\_rwlock\_destroy()*, *pthread\_rwlockattr\_destroy()*, *pthread\_rwlockattr\_init()*, the Base  
35184 Definitions volume of IEEE Std 1003.1-2001, <pthread.h>

35185 **CHANGE HISTORY**

35186 First released in Issue 5.

35187 **Issue 6**

35188 The following changes are made for alignment with IEEE Std 1003.1j-2000:

- 35189 • The margin code in the SYNOPSIS is changed to THR TSH to indicate that the functionality  
35190 is now part of the Threads option (previously it was part of the Read-Write Locks option in  
35191 IEEE Std 1003.1j-2000 and also part of the XSI extension).
- 35192 • The DESCRIPTION notes that additional attributes are implementation-defined.
- 35193 • The SEE ALSO section is updated.

35194 The **restrict** keyword is added to the *pthread\_rwlockattr\_getpshared()* prototype for alignment  
35195 with the ISO/IEC 9899:1999 standard.

35196 **NAME**

35197 pthread\_rwlockattr\_init — initialize the read-write lock attributes object

35198 **SYNOPSIS**

35199 xSI #include <pthread.h>

35200 int pthread\_rwlockattr\_init(pthread\_rwlockattr\_t \*attr);

35201

35202 **DESCRIPTION**

35203 Refer to *pthread\_rwlockattr\_destroy()*.

35204 **NAME**

35205 pthread\_rwlockattr\_setpshared — set the process-shared attribute of the read-write lock  
35206 attributes object

35207 **SYNOPSIS**

35208 XSI #include <pthread.h>

```
35209 int pthread_rwlockattr_setpshared(pthread_rwlockattr_t *attr,  
35210 int pshared);
```

35211

35212 **DESCRIPTION**

35213 Refer to *pthread\_rwlockattr\_getpshared()*.

35214 **NAME**

35215 pthread\_self — get the calling thread ID

35216 **SYNOPSIS**

35217 THR #include <pthread.h>

35218 pthread\_t pthread\_self(void);

35219

35220 **DESCRIPTION**

35221 The *pthread\_self()* function shall return the thread ID of the calling thread.

35222 **RETURN VALUE**

35223 Refer to the DESCRIPTION.

35224 **ERRORS**

35225 No errors are defined.

35226 The *pthread\_self()* function shall not return an error code of [EINTR].

35227 **EXAMPLES**

35228 None.

35229 **APPLICATION USAGE**

35230 None.

35231 **RATIONALE**

35232 The *pthread\_self()* function provides a capability similar to the *getpid()* function for processes  
35233 and the rationale is the same: the creation call does not provide the thread ID to the created  
35234 thread.

35235 **FUTURE DIRECTIONS**

35236 None.

35237 **SEE ALSO**

35238 *pthread\_create()*, *pthread\_equal()*, the Base Definitions volume of IEEE Std 1003.1-2001,  
35239 <pthread.h>

35240 **CHANGE HISTORY**

35241 First released in Issue 5. Included for alignment with the POSIX Threads Extension.

35242 **Issue 6**

35243 The *pthread\_self()* function is marked as part of the Threads option.

35244 **NAME**

35245 pthread\_setcancelstate, pthread\_setcanceltype, pthread\_testcancel — set cancelability state

35246 **SYNOPSIS**

35247 THR #include &lt;pthread.h&gt;

35248 int pthread\_setcancelstate(int *state*, int \**oldstate*);35249 int pthread\_setcanceltype(int *type*, int \**oldtype*);

35250 void pthread\_testcancel(void);

35251

35252 **DESCRIPTION**

35253 The *pthread\_setcancelstate()* function shall atomically both set the calling thread's cancelability  
 35254 state to the indicated *state* and return the previous cancelability state at the location referenced  
 35255 by *oldstate*. Legal values for *state* are PTHREAD\_CANCEL\_ENABLE and  
 35256 PTHREAD\_CANCEL\_DISABLE.

35257 The *pthread\_setcanceltype()* function shall atomically both set the calling thread's cancelability  
 35258 type to the indicated *type* and return the previous cancelability type at the location referenced by  
 35259 *oldtype*. Legal values for *type* are PTHREAD\_CANCEL\_DEFERRED and  
 35260 PTHREAD\_CANCEL\_ASYNCHRONOUS.

35261 The cancelability state and type of any newly created threads, including the thread in which  
 35262 *main()* was first invoked, shall be PTHREAD\_CANCEL\_ENABLE and  
 35263 PTHREAD\_CANCEL\_DEFERRED respectively.

35264 The *pthread\_testcancel()* function shall create a cancellation point in the calling thread. The  
 35265 *pthread\_testcancel()* function shall have no effect if cancelability is disabled.

35266 **RETURN VALUE**

35267 If successful, the *pthread\_setcancelstate()* and *pthread\_setcanceltype()* functions shall return zero;  
 35268 otherwise, an error number shall be returned to indicate the error.

35269 **ERRORS**35270 The *pthread\_setcancelstate()* function may fail if:

35271 [EINVAL] The specified state is not PTHREAD\_CANCEL\_ENABLE or  
 35272 PTHREAD\_CANCEL\_DISABLE.

35273 The *pthread\_setcanceltype()* function may fail if:

35274 [EINVAL] The specified type is not PTHREAD\_CANCEL\_DEFERRED or  
 35275 PTHREAD\_CANCEL\_ASYNCHRONOUS.

35276 These functions shall not return an error code of [EINTR].

35277 **EXAMPLES**

35278 None.

35279 **APPLICATION USAGE**

35280 None.

35281 **RATIONALE**

35282 The *pthread\_setcancelstate()* and *pthread\_setcanceltype()* functions control the points at which a  
 35283 thread may be asynchronously canceled. For cancellation control to be usable in modular fashion,  
 35284 some rules need to be followed.

35285 An object can be considered to be a generalization of a procedure. It is a set of procedures and  
 35286 global variables written as a unit and called by clients not known by the object. Objects may  
 35287 depend on other objects.

35288 First, cancelability should only be disabled on entry to an object, never explicitly enabled. On  
35289 exit from an object, the cancelability state should always be restored to its value on entry to the  
35290 object.

35291 This follows from a modularity argument: if the client of an object (or the client of an object that  
35292 uses that object) has disabled cancelability, it is because the client does not want to be concerned  
35293 about cleaning up if the thread is canceled while executing some sequence of actions. If an object  
35294 is called in such a state and it enables cancelability and a cancelation request is pending for that  
35295 thread, then the thread is canceled, contrary to the wish of the client that disabled.

35296 Second, the cancelability type may be explicitly set to either *deferred* or *asynchronous* upon entry  
35297 to an object. But as with the cancelability state, on exit from an object the cancelability type  
35298 should always be restored to its value on entry to the object.

35299 Finally, only functions that are cancel-safe may be called from a thread that is asynchronously  
35300 cancelable.

#### 35301 **FUTURE DIRECTIONS**

35302 None.

#### 35303 **SEE ALSO**

35304 *pthread\_cancel()*, the Base Definitions volume of IEEE Std 1003.1-2001, <pthread.h>

#### 35305 **CHANGE HISTORY**

35306 First released in Issue 5. Included for alignment with the POSIX Threads Extension.

#### 35307 **Issue 6**

35308 The *pthread\_setcancelstate()*, *pthread\_setcanceltype()*, and *pthread\_testcancel()* functions are marked  
35309 as part of the Threads option.

35310 **NAME**

35311 pthread\_setconcurrency — set the level of concurrency

35312 **SYNOPSIS**

35313 XSI `#include <pthread.h>`

35314 `int pthread_setconcurrency(int new_level);`

35315

35316 **DESCRIPTION**

35317 Refer to *pthread\_getconcurrency()*.

35318 **NAME**

35319 pthread\_setschedparam — dynamic thread scheduling parameters access (**REALTIME**  
35320 **THREADS**)

35321 **SYNOPSIS**

```
35322 THR TPS #include <pthread.h>
```

```
35323 int pthread_setschedparam(pthread_t thread, int policy,  
35324     const struct sched_param *param);
```

35325

35326 **DESCRIPTION**

35327 Refer to *pthread\_getschedparam()*.

35328 **NAME**

35329 pthread\_setschedprio — dynamic thread scheduling parameters access (**REALTIME**  
35330 **THREADS**)

35331 **SYNOPSIS**

```
35332 THR TPS #include <pthread.h>
```

```
35333 int pthread_setschedprio(pthread_t thread, int prio);
```

35334

35335 **DESCRIPTION**

35336 The *pthread\_setschedprio()* function shall set the scheduling priority for the thread whose thread  
35337 ID is given by *thread* to the value given by *prio*. See **Scheduling Policies** (on page 44) for a  
35338 description on how this function call affects the ordering of the thread in the thread list for its  
35339 new priority.

35340 If the *pthread\_setschedprio()* function fails, the scheduling priority of the target thread shall not be  
35341 changed.

35342 **RETURN VALUE**

35343 If successful, the *pthread\_setschedprio()* function shall return zero; otherwise, an error number  
35344 shall be returned to indicate the error.

35345 **ERRORS**

35346 The *pthread\_setschedprio()* function may fail if:

35347 [EINVAL] The value of *prio* is invalid for the scheduling policy of the specified thread.

35348 [ENOTSUP] An attempt was made to set the priority to an unsupported value.

35349 [EPERM] The caller does not have the appropriate permission to set the scheduling  
35350 policy of the specified thread.

35351 [EPERM] The implementation does not allow the application to modify the priority to  
35352 the value specified.

35353 [ESRCH] The value specified by *thread* does not refer to an existing thread.

35354 The *pthread\_setschedprio()* function shall not return an error code of [EINTR].

35355 **EXAMPLES**

35356 None.

35357 **APPLICATION USAGE**

35358 None.

35359 **RATIONALE**

35360 The *pthread\_setschedprio()* function provides a way for an application to temporarily raise its  
35361 priority and then lower it again, without having the undesired side effect of yielding to other  
35362 threads of the same priority. This is necessary if the application is to implement its own  
35363 strategies for bounding priority inversion, such as priority inheritance or priority ceilings. This  
35364 capability is especially important if the implementation does not support the Thread Priority  
35365 Protection or Thread Priority Inheritance options, but even if those options are supported it is  
35366 needed if the application is to bound priority inheritance for other resources, such as  
35367 semaphores.

35368 The standard developers considered that while it might be preferable conceptually to solve this  
35369 problem by modifying the specification of *pthread\_setschedparam()*, it was too late to make such a  
35370 change, as there may be implementations that would need to be changed. Therefore, this new  
35371 function was introduced.

35372 **FUTURE DIRECTIONS**

35373 None.

35374 **SEE ALSO**35375 **Scheduling Policies** (on page 44), *pthread\_getschedparam()*, the Base Definitions volume of  
35376 IEEE Std 1003.1-2001, <**pthread.h**>35377 **CHANGE HISTORY**

35378 First released in Issue 6. Included as a response to IEEE PASC Interpretation 1003.1 #96.

35379 **NAME**

35380 pthread\_setspecific — thread-specific data management

35381 **SYNOPSIS**

35382 THR #include <pthread.h>

35383 int pthread\_setspecific(pthread\_key\_t key, const void \*value);

35384

35385 **DESCRIPTION**

35386 Refer to *pthread\_getspecific()*.

35387 **NAME**

35388 pthread\_sigmask, sigprocmask — examine and change blocked signals

35389 **SYNOPSIS**

35390 #include &lt;signal.h&gt;

35391 THR int pthread\_sigmask(int how, const sigset\_t \*restrict set,  
35392 sigset\_t \*restrict oset);35393 CX int sigprocmask(int how, const sigset\_t \*restrict set,  
35394 sigset\_t \*restrict oset);

35395

35396 **DESCRIPTION**35397 THR The *pthread\_sigmask()* function shall examine or change (or both) the calling thread's signal  
35398 mask, regardless of the number of threads in the process. The function shall be equivalent to  
35399 *sigprocmask()*, without the restriction that the call be made in a single-threaded process.35400 In a single-threaded process, the *sigprocmask()* function shall examine or change (or both) the  
35401 signal mask of the calling thread.35402 If the argument *set* is not a null pointer, it points to a set of signals to be used to change the  
35403 currently blocked set.35404 The argument *how* indicates the way in which the set is changed, and the application shall  
35405 ensure it consists of one of the following values:35406 SIG\_BLOCK The resulting set shall be the union of the current set and the signal set  
35407 pointed to by *set*.35408 SIG\_SETMASK The resulting set shall be the signal set pointed to by *set*.35409 SIG\_UNBLOCK The resulting set shall be the intersection of the current set and the  
35410 complement of the signal set pointed to by *set*.35411 If the argument *oset* is not a null pointer, the previous mask shall be stored in the location  
35412 pointed to by *oset*. If *set* is a null pointer, the value of the argument *how* is not significant and the  
35413 process' signal mask shall be unchanged; thus the call can be used to enquire about currently  
35414 blocked signals.35415 If there are any pending unblocked signals after the call to *sigprocmask()*, at least one of those  
35416 signals shall be delivered before the call to *sigprocmask()* returns.35417 It is not possible to block those signals which cannot be ignored. This shall be enforced by the  
35418 system without causing an error to be indicated.35419 If any of the SIGFPE, SIGILL, SIGSEGV, or SIGBUS signals are generated while they are blocked,  
35420 the result is undefined, unless the signal was generated by the *kill()* function, the *sigqueue()*  
35421 function, or the *raise()* function.35422 If *sigprocmask()* fails, the thread's signal mask shall not be changed.35423 The use of the *sigprocmask()* function is unspecified in a multi-threaded process.35424 **RETURN VALUE**35425 THR Upon successful completion *pthread\_sigmask()* shall return 0; otherwise, it shall return the  
35426 corresponding error number.35427 Upon successful completion, *sigprocmask()* shall return 0; otherwise, -1 shall be returned, *errno*  
35428 shall be set to indicate the error, and the process' signal mask shall be unchanged.

35429 **ERRORS**

35430 THR The *pthread\_sigmask()* and *sigprocmask()* functions shall fail if:

35431 [EINVAL] The value of the *how* argument is not equal to one of the defined values.

35432 THR The *pthread\_sigmask()* function shall not return an error code of [EINTR].

35433 **EXAMPLES**

35434 None.

35435 **APPLICATION USAGE**

35436 None.

35437 **RATIONALE**

35438 When a process' signal mask is changed in a signal-catching function that is installed by  
35439 *sigaction()*, the restoration of the signal mask on return from the signal-catching function  
35440 overrides that change (see *sigaction()*). If the signal-catching function was installed with  
35441 *signal()*, it is unspecified whether this occurs.

35442 See *kill()* for a discussion of the requirement on delivery of signals.

35443 **FUTURE DIRECTIONS**

35444 None.

35445 **SEE ALSO**

35446 *sigaction()*, *sigaddset()*, *sigdelset()*, *sigemptyset()*, *sigfillset()*, *sigismember()*, *sigpending()*,  
35447 *sigqueue()*, *sigsuspend()*, the Base Definitions volume of IEEE Std 1003.1-2001, <**signal.h**>

35448 **CHANGE HISTORY**

35449 First released in Issue 3. Included for alignment with the POSIX.1-1988 standard.

35450 **Issue 5**

35451 The DESCRIPTION is updated for alignment with the POSIX Threads Extension.

35452 The *pthread\_sigmask()* function is added for alignment with the POSIX Threads Extension.

35453 **Issue 6**

35454 The *pthread\_sigmask()* function is marked as part of the Threads option.

35455 The SYNOPSIS for *sigprocmask()* is marked as a CX extension to note that the presence of this  
35456 function in the <**signal.h**> header is an extension to the ISO C standard.

35457 The following changes are made for alignment with the ISO POSIX-1: 1996 standard:

- 35458 • The DESCRIPTION is updated to explicitly state the functions which may generate the  
35459 signal.

35460 The DESCRIPTION is updated to avoid use of the term “must” for application requirements.

35461 The **restrict** keyword is added to the *pthread\_sigmask()* and *sigprocmask()* prototypes for  
35462 alignment with the ISO/IEC 9899: 1999 standard.

35463 **NAME**

35464 pthread\_spin\_destroy, pthread\_spin\_init — destroy or initialize a spin lock object (**ADVANCED**  
35465 **REALTIME THREADS**)

35466 **SYNOPSIS**

```
35467 THR SPI #include <pthread.h>
```

```
35468 int pthread_spin_destroy(pthread_spinlock_t *lock);
```

```
35469 int pthread_spin_init(pthread_spinlock_t *lock, int pshared);
```

35470

35471 **DESCRIPTION**

35472 The *pthread\_spin\_destroy()* function shall destroy the spin lock referenced by *lock* and release any  
35473 resources used by the lock. The effect of subsequent use of the lock is undefined until the lock is  
35474 reinitialized by another call to *pthread\_spin\_init()*. The results are undefined if  
35475 *pthread\_spin\_destroy()* is called when a thread holds the lock, or if this function is called with an  
35476 uninitialized thread spin lock.

35477 The *pthread\_spin\_init()* function shall allocate any resources required to use the spin lock  
35478 referenced by *lock* and initialize the lock to an unlocked state.

35479 TSH If the Thread Process-Shared Synchronization option is supported and the value of *pshared* is  
35480 PTHREAD\_PROCESS\_SHARED, the implementation shall permit the spin lock to be operated  
35481 upon by any thread that has access to the memory where the spin lock is allocated, even if it is  
35482 allocated in memory that is shared by multiple processes.

35483 If the Thread Process-Shared Synchronization option is supported and the value of *pshared* is  
35484 PTHREAD\_PROCESS\_PRIVATE, or if the option is not supported, the spin lock shall only be  
35485 operated upon by threads created within the same process as the thread that initialized the spin  
35486 lock. If threads of differing processes attempt to operate on such a spin lock, the behavior is  
35487 undefined.

35488 The results are undefined if *pthread\_spin\_init()* is called specifying an already initialized spin  
35489 lock. The results are undefined if a spin lock is used without first being initialized.

35490 If the *pthread\_spin\_init()* function fails, the lock is not initialized and the contents of *lock* are  
35491 undefined.

35492 Only the object referenced by *lock* may be used for performing synchronization.

35493 The result of referring to copies of that object in calls to *pthread\_spin\_destroy()*,  
35494 *pthread\_spin\_lock()*, *pthread\_spin\_trylock()*, or *pthread\_spin\_unlock()* is undefined.

35495 **RETURN VALUE**

35496 Upon successful completion, these functions shall return zero; otherwise, an error number shall  
35497 be returned to indicate the error.

35498 **ERRORS**

35499 These functions may fail if:

35500 [EBUSY] The implementation has detected an attempt to initialize or destroy a spin  
35501 lock while it is in use (for example, while being used in a *pthread\_spin\_lock()*  
35502 call) by another thread.

35503 [EINVAL] The value specified by *lock* is invalid.

35504 The *pthread\_spin\_init()* function shall fail if:

35505 [EAGAIN] The system lacks the necessary resources to initialize another spin lock.

35506 [ENOMEM] Insufficient memory exists to initialize the lock.

35507 These functions shall not return an error code of [EINTR].

## 35508 EXAMPLES

35509 None.

## 35510 APPLICATION USAGE

35511 The *pthread\_spin\_destroy()* and *pthread\_spin\_init()* functions are part of the Spin Locks option  
35512 and need not be provided on all implementations.

## 35513 RATIONALE

35514 None.

## 35515 FUTURE DIRECTIONS

35516 None.

## 35517 SEE ALSO

35518 *pthread\_spin\_lock()*, *pthread\_spin\_unlock()*, the Base Definitions volume of IEEE Std 1003.1-2001,  
35519 <pthread.h>

## 35520 CHANGE HISTORY

35521 First released in Issue 6. Derived from IEEE Std 1003.1j-2000.

35522 In the SYNOPSIS, the inclusion of <sys/types.h> is no longer required.

35523 **NAME**

35524 pthread\_spin\_lock, pthread\_spin\_trylock — lock a spin lock object (**ADVANCED REALTIME**  
35525 **THREADS**)

35526 **SYNOPSIS**

35527 THR SPI #include <pthread.h>

35528 int pthread\_spin\_lock(pthread\_spinlock\_t \*lock);

35529 int pthread\_spin\_trylock(pthread\_spinlock\_t \*lock);

35530

35531 **DESCRIPTION**

35532 The *pthread\_spin\_lock()* function shall lock the spin lock referenced by *lock*. The calling thread  
35533 shall acquire the lock if it is not held by another thread. Otherwise, the thread shall spin (that is,  
35534 shall not return from the *pthread\_spin\_lock()* call) until the lock becomes available. The results  
35535 are undefined if the calling thread holds the lock at the time the call is made. The  
35536 *pthread\_spin\_trylock()* function shall lock the spin lock referenced by *lock* if it is not held by any  
35537 thread. Otherwise, the function shall fail.

35538 The results are undefined if any of these functions is called with an uninitialized spin lock.

35539 **RETURN VALUE**

35540 Upon successful completion, these functions shall return zero; otherwise, an error number shall  
35541 be returned to indicate the error.

35542 **ERRORS**

35543 These functions may fail if:

35544 [EINVAL] The value specified by *lock* does not refer to an initialized spin lock object.

35545 The *pthread\_spin\_lock()* function may fail if:

35546 [EDEADLK] The calling thread already holds the lock.

35547 The *pthread\_spin\_trylock()* function shall fail if:

35548 [EBUSY] A thread currently holds the lock.

35549 These functions shall not return an error code of [EINTR].

35550 **EXAMPLES**

35551 None.

35552 **APPLICATION USAGE**

35553 Applications using this function may be subject to priority inversion, as discussed in the Base  
35554 Definitions volume of IEEE Std 1003.1-2001, Section 3.285, Priority Inversion.

35555 The *pthread\_spin\_lock()* and *pthread\_spin\_trylock()* functions are part of the Spin Locks option  
35556 and need not be provided on all implementations.

35557 **RATIONALE**

35558 None.

35559 **FUTURE DIRECTIONS**

35560 None.

35561 **SEE ALSO**

35562 *pthread\_spin\_destroy()*, *pthread\_spin\_unlock()*, the Base Definitions volume of  
35563 IEEE Std 1003.1-2001, <pthread.h>

35564 **CHANGE HISTORY**

35565           First released in Issue 6. Derived from IEEE Std 1003.1j-2000.

35566           In the SYNOPSIS, the inclusion of `<sys/types.h>` is no longer required.

35567 **NAME**

35568 pthread\_spin\_unlock — unlock a spin lock object (**ADVANCED REALTIME THREADS**)

35569 **SYNOPSIS**

35570 THR SPI #include <pthread.h>

35571 int pthread\_spin\_unlock(pthread\_spinlock\_t \*lock);

35572

35573 **DESCRIPTION**

35574 The *pthread\_spin\_unlock()* function shall release the spin lock referenced by *lock* which was  
35575 locked via the *pthread\_spin\_lock()* or *pthread\_spin\_trylock()* functions. The results are undefined if  
35576 the lock is not held by the calling thread. If there are threads spinning on the lock when  
35577 *pthread\_spin\_unlock()* is called, the lock becomes available and an unspecified spinning thread  
35578 shall acquire the lock.

35579 The results are undefined if this function is called with an uninitialized thread spin lock.

35580 **RETURN VALUE**

35581 Upon successful completion, the *pthread\_spin\_unlock()* function shall return zero; otherwise, an  
35582 error number shall be returned to indicate the error.

35583 **ERRORS**

35584 The *pthread\_spin\_unlock()* function may fail if:

35585 [EINVAL] An invalid argument was specified.

35586 [EPERM] The calling thread does not hold the lock.

35587 This function shall not return an error code of [EINTR].

35588 **EXAMPLES**

35589 None.

35590 **APPLICATION USAGE**

35591 The *pthread\_spin\_unlock()* function is part of the Spin Locks option and need not be provided on  
35592 all implementations.

35593 **RATIONALE**

35594 None.

35595 **FUTURE DIRECTIONS**

35596 None.

35597 **SEE ALSO**

35598 *pthread\_spin\_destroy()*, *pthread\_spin\_lock()*, the Base Definitions volume of IEEE Std 1003.1-2001,  
35599 <pthread.h>

35600 **CHANGE HISTORY**

35601 First released in Issue 6. Derived from IEEE Std 1003.1j-2000.

35602 In the SYNOPSIS, the inclusion of <sys/types.h> is no longer required.

35603 **NAME**

35604 pthread\_testcancel — set cancelability state

35605 **SYNOPSIS**

35606 THR #include <pthread.h>

35607 void pthread\_testcancel(void);

35608

35609 **DESCRIPTION**

35610 Refer to *pthread\_setcancelstate()*.

35611 **NAME**

35612 ptsname — get name of the slave pseudo-terminal device

35613 **SYNOPSIS**

35614 XSI #include &lt;stdlib.h&gt;

35615 char \*ptsname(int *fildev*);

35616

35617 **DESCRIPTION**

35618 The *ptsname()* function shall return the name of the slave pseudo-terminal device associated  
35619 with a master pseudo-terminal device. The *fildev* argument is a file descriptor that refers to the  
35620 master device. The *ptsname()* function shall return a pointer to a string containing the pathname  
35621 of the corresponding slave device.

35622 The *ptsname()* function need not be reentrant. A function that is not required to be reentrant is  
35623 not required to be thread-safe.

35624 **RETURN VALUE**

35625 Upon successful completion, *ptsname()* shall return a pointer to a string which is the name of the  
35626 pseudo-terminal slave device. Upon failure, *ptsname()* shall return a null pointer. This could  
35627 occur if *fildev* is an invalid file descriptor or if the slave device name does not exist in the file  
35628 system.

35629 **ERRORS**

35630 No errors are defined.

35631 **EXAMPLES**

35632 None.

35633 **APPLICATION USAGE**35634 The value returned may point to a static data area that is overwritten by each call to *ptsname()*.35635 **RATIONALE**

35636 None.

35637 **FUTURE DIRECTIONS**

35638 None.

35639 **SEE ALSO**

35640 *grantpt()*, *open()*, *ttyname()*, *unlockpt()*, the Base Definitions volume of IEEE Std 1003.1-2001,  
35641 <stdlib.h>

35642 **CHANGE HISTORY**

35643 First released in Issue 4, Version 2.

35644 **Issue 5**

35645 Moved from X/OPEN UNIX extension to BASE.

35646 A note indicating that this function need not be reentrant is added to the DESCRIPTION.

35647 **NAME**

35648       putc — put a byte on a stream

35649 **SYNOPSIS**

35650       #include &lt;stdio.h&gt;

35651       int putc(int *c*, FILE \**stream*);35652 **DESCRIPTION**

35653 **CX**       The functionality described on this reference page is aligned with the ISO C standard. Any  
35654       conflict between the requirements described here and the ISO C standard is unintentional. This  
35655       volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

35656       The *putc()* function shall be equivalent to *fputc()*, except that if it is implemented as a macro it  
35657       may evaluate *stream* more than once, so the argument should never be an expression with side  
35658       effects.

35659 **RETURN VALUE**35660       Refer to *fputc()*.35661 **ERRORS**35662       Refer to *fputc()*.35663 **EXAMPLES**

35664       None.

35665 **APPLICATION USAGE**

35666       Since it may be implemented as a macro, *putc()* may treat a *stream* argument with side effects  
35667       incorrectly. In particular, *putc(c,\*f++)* does not necessarily work correctly. Therefore, use of this  
35668       function is not recommended in such situations; *fputc()* should be used instead.

35669 **RATIONALE**

35670       None.

35671 **FUTURE DIRECTIONS**

35672       None.

35673 **SEE ALSO**35674       *fputc()*, the Base Definitions volume of IEEE Std 1003.1-2001, <stdio.h>35675 **CHANGE HISTORY**

35676       First released in Issue 1. Derived from Issue 1 of the SVID.

35677 **NAME**35678        `putc_unlocked` — stdio with explicit client locking35679 **SYNOPSIS**35680 TSF        `#include <stdio.h>`35681        `int putc_unlocked(int c, FILE *stream);`

35682

35683 **DESCRIPTION**35684        Refer to `getc_unlocked()`.

35685 **NAME**

35686            putchar — put a byte on a stdout stream

35687 **SYNOPSIS**

35688            #include <stdio.h>

35689            int putchar(int c);

35690 **DESCRIPTION**

35691 cx        The functionality described on this reference page is aligned with the ISO C standard. Any  
35692            conflict between the requirements described here and the ISO C standard is unintentional. This  
35693            volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

35694            The function call *putchar(c)* shall be equivalent to *putc(c,stdout)*.

35695 **RETURN VALUE**

35696            Refer to *fputc()*.

35697 **ERRORS**

35698            Refer to *fputc()*.

35699 **EXAMPLES**

35700            None.

35701 **APPLICATION USAGE**

35702            None.

35703 **RATIONALE**

35704            None.

35705 **FUTURE DIRECTIONS**

35706            None.

35707 **SEE ALSO**

35708            *putc()*, the Base Definitions volume of IEEE Std 1003.1-2001, <stdio.h>

35709 **CHANGE HISTORY**

35710            First released in Issue 1. Derived from Issue 1 of the SVID.

35711 **NAME**

35712 putchar\_unlocked — stdio with explicit client locking

35713 **SYNOPSIS**

35714 TSF #include &lt;stdio.h&gt;

35715 int putchar\_unlocked(int c);

35716

35717 **DESCRIPTION**35718 Refer to *getc\_unlocked()*.

35719 **NAME**

35720 putenv — change or add a value to an environment

35721 **SYNOPSIS**35722 XSI `#include <stdlib.h>`35723 `int putenv(char *string);`

35724

35725 **DESCRIPTION**

35726 The *putenv()* function shall use the *string* argument to set environment variable values. The  
 35727 *string* argument should point to a string of the form "*name=value*". The *putenv()* function shall  
 35728 make the value of the environment variable *name* equal to *value* by altering an existing variable  
 35729 or creating a new one. In either case, the string pointed to by *string* shall become part of the  
 35730 environment, so altering the string shall change the environment. The space used by *string* is no  
 35731 longer used once a new string-defining *name* is passed to *putenv()*.

35732 The *putenv()* function need not be reentrant. A function that is not required to be reentrant is not  
 35733 required to be thread-safe.

35734 **RETURN VALUE**

35735 Upon successful completion, *putenv()* shall return 0; otherwise, it shall return a non-zero value  
 35736 and set *errno* to indicate the error.

35737 **ERRORS**35738 The *putenv()* function may fail if:

35739 [ENOMEM] Insufficient memory was available.

35740 **EXAMPLES**35741 **Changing the Value of an Environment Variable**

35742 The following example changes the value of the *HOME* environment variable to the value  
 35743 */usr/home*.

```
35744 #include <stdlib.h>
35745 ...
35746 static char *var = "HOME=/usr/home";
35747 int ret;
35748 ret = putenv(var);
```

35749 **APPLICATION USAGE**

35750 The *putenv()* function manipulates the environment pointed to by *environ*, and can be used in  
 35751 conjunction with *getenv()*.

35752 This routine may use *malloc()* to enlarge the environment.

35753 A potential error is to call *putenv()* with an automatic variable as the argument, then return from  
 35754 the calling function while *string* is still part of the environment.

35755 The *setenv()* function is preferred over this function.

35756 **RATIONALE**

35757 The standard developers noted that *putenv()* is the only function available to add to the  
 35758 environment without permitting memory leaks.

35759 **FUTURE DIRECTIONS**

35760 None.

35761 **SEE ALSO**35762 *exec*, *getenv()*, *malloc()*, *setenv()*, the Base Definitions volume of IEEE Std 1003.1-2001, <stdlib.h>35763 **CHANGE HISTORY**

35764 First released in Issue 1. Derived from Issue 1 of the SVID.

35765 **Issue 5**35766 The type of the argument to this function is changed from **const char \*** to **char \***. This was  
35767 indicated as a FUTURE DIRECTION in previous issues.

35768 A note indicating that this function need not be reentrant is added to the DESCRIPTION.

## 35769 NAME

35770 putmsg, putpmsg — send a message on a STREAM (STREAMS)

## 35771 SYNOPSIS

35772 XSR #include &lt;stropts.h&gt;

```

35773 int putmsg(int fildes, const struct strbuf *ctlptr,
35774           const struct strbuf *dataptr, int flags);
35775 int putpmsg(int fildes, const struct strbuf *ctlptr,
35776            const struct strbuf *dataptr, int band, int flags);
35777

```

## 35778 DESCRIPTION

35779 The *putmsg()* function shall create a message from a process buffer(s) and send the message to a  
 35780 STREAMS file. The message may contain either a data part, a control part, or both. The data and  
 35781 control parts are distinguished by placement in separate buffers, as described below. The  
 35782 semantics of each part are defined by the STREAMS module that receives the message.

35783 The *putpmsg()* function is equivalent to *putmsg()*, except that the process can send messages in  
 35784 different priority bands. Except where noted, all requirements on *putmsg()* also pertain to  
 35785 *putpmsg()*.

35786 The *fildes* argument specifies a file descriptor referencing an open STREAM. The *ctlptr* and  
 35787 *dataptr* arguments each point to a **strbuf** structure.

35788 The *ctlptr* argument points to the structure describing the control part, if any, to be included in  
 35789 the message. The *buf* member in the **strbuf** structure points to the buffer where the control  
 35790 information resides, and the *len* member indicates the number of bytes to be sent. The *maxlen*  
 35791 member is not used by *putmsg()*. In a similar manner, the argument *dataptr* specifies the data, if  
 35792 any, to be included in the message. The *flags* argument indicates what type of message should be  
 35793 sent and is described further below.

35794 To send the data part of a message, the application shall ensure that *dataptr* is not a null pointer  
 35795 and the *len* member of *dataptr* is 0 or greater. To send the control part of a message, the  
 35796 application shall ensure that the corresponding values are set for *ctlptr*. No data (control) part  
 35797 shall be sent if either *dataptr(ctlptr)* is a null pointer or the *len* member of *dataptr(ctlptr)* is set to  
 35798 -1.

35799 For *putmsg()*, if a control part is specified and *flags* is set to RS\_HIPRI, a high priority message  
 35800 shall be sent. If no control part is specified, and *flags* is set to RS\_HIPRI, *putmsg()* shall fail and  
 35801 set *errno* to [EINVAL]. If *flags* is set to 0, a normal message (priority band equal to 0) shall be  
 35802 sent. If a control part and data part are not specified and *flags* is set to 0, no message shall be  
 35803 sent and 0 shall be returned.

35804 For *putpmsg()*, the flags are different. The *flags* argument is a bitmask with the following  
 35805 mutually-exclusive flags defined: MSG\_HIPRI and MSG\_BAND. If *flags* is set to 0, *putpmsg()*  
 35806 shall fail and set *errno* to [EINVAL]. If a control part is specified and *flags* is set to MSG\_HIPRI  
 35807 and *band* is set to 0, a high-priority message shall be sent. If *flags* is set to MSG\_HIPRI and either  
 35808 no control part is specified or *band* is set to a non-zero value, *putpmsg()* shall fail and set *errno* to  
 35809 [EINVAL]. If *flags* is set to MSG\_BAND, then a message shall be sent in the priority band  
 35810 specified by *band*. If a control part and data part are not specified and *flags* is set to MSG\_BAND,  
 35811 no message shall be sent and 0 shall be returned.

35812 The *putmsg()* function shall block if the STREAM write queue is full due to internal flow control  
 35813 conditions, with the following exceptions:

- 35814 • For high-priority messages, *putmsg()* shall not block on this condition and continues  
 35815 processing the message.

35816           • For other messages, *putmsg()* shall not block but shall fail when the write queue is full and  
35817           O\_NONBLOCK is set.

35818           The *putmsg()* function shall also block, unless prevented by lack of internal resources, while  
35819           waiting for the availability of message blocks in the STREAM, regardless of priority or whether  
35820           O\_NONBLOCK has been specified. No partial message shall be sent.

#### 35821 RETURN VALUE

35822           Upon successful completion, *putmsg()* and *putpmsg()* shall return 0; otherwise, they shall return  
35823           -1 and set *errno* to indicate the error.

#### 35824 ERRORS

35825           The *putmsg()* and *putpmsg()* functions shall fail if:

35826           [EAGAIN]           A non-priority message was specified, the O\_NONBLOCK flag is set, and the  
35827           STREAM write queue is full due to internal flow control conditions; or buffers  
35828           could not be allocated for the message that was to be created.

35829           [EBADF]           *fildev* is not a valid file descriptor open for writing.

35830           [EINTR]           A signal was caught during *putmsg()*.

35831           [EINVAL]           An undefined value is specified in *flags*, or *flags* is set to RS\_HIPRI or  
35832           MSG\_HIPRI and no control part is supplied, or the STREAM or multiplexer  
35833           referenced by *fildev* is linked (directly or indirectly) downstream from a  
35834           multiplexer, or *flags* is set to MSG\_HIPRI and *band* is non-zero (for *putpmsg()*  
35835           only).

35836           [ENOSR]           Buffers could not be allocated for the message that was to be created due to  
35837           insufficient STREAMS memory resources.

35838           [ENOSTR]           A STREAM is not associated with *fildev*.

35839           [ENXIO]           A hangup condition was generated downstream for the specified STREAM.

35840           [EPIPE] or [EIO]   The *fildev* argument refers to a STREAMS-based pipe and the other end of the  
35841           pipe is closed. A SIGPIPE signal is generated for the calling thread.

35842           [ERANGE]           The size of the data part of the message does not fall within the range  
35843           specified by the maximum and minimum packet sizes of the topmost  
35844           STREAM module. This value is also returned if the control part of the message  
35845           is larger than the maximum configured size of the control part of a message,  
35846           or if the data part of a message is larger than the maximum configured size of  
35847           the data part of a message.

35848           In addition, *putmsg()* and *putpmsg()* shall fail if the STREAM head had processed an  
35849           asynchronous error before the call. In this case, the value of *errno* does not reflect the result of  
35850           *putmsg()* or *putpmsg()*, but reflects the prior error.

35851 **EXAMPLES**35852 **Sending a High-Priority Message**

35853 The value of *fd* is assumed to refer to an open STREAMS file. This call to *putmsg()* does the  
35854 following:

- 35855 1. Creates a high-priority message with a control part and a data part, using the buffers  
35856 pointed to by *ctrlbuf* and *databuf*, respectively.
- 35857 2. Sends the message to the STREAMS file identified by *fd*.

```
35858 #include <stropts.h>
35859 #include <string.h>
35860 ...
35861 int fd;
35862 char *ctrlbuf = "This is the control part";
35863 char *databuf = "This is the data part";
35864 struct strbuf ctrl;
35865 struct strbuf data;
35866 int ret;

35867 ctrl.buf = ctrlbuf;
35868 ctrl.len = strlen(ctrlbuf);

35869 data.buf = databuf;
35870 data.len = strlen(databuf);

35871 ret = putmsg(fd, &ctrl, &data, MSG_HIPRI);
```

35872 **Using putpmsg()**

35873 This example has the same effect as the previous example. In this example, however, the  
35874 *putpmsg()* function creates and sends the message to the STREAMS file.

```
35875 #include <stropts.h>
35876 #include <string.h>
35877 ...
35878 int fd;
35879 char *ctrlbuf = "This is the control part";
35880 char *databuf = "This is the data part";
35881 struct strbuf ctrl;
35882 struct strbuf data;
35883 int ret;

35884 ctrl.buf = ctrlbuf;
35885 ctrl.len = strlen(ctrlbuf);

35886 data.buf = databuf;
35887 data.len = strlen(databuf);

35888 ret = putpmsg(fd, &ctrl, &data, 0, MSG_HIPRI);
```

35889 **APPLICATION USAGE**

35890 None.

35891 **RATIONALE**

35892 None.

35893 **FUTURE DIRECTIONS**

35894 None.

35895 **SEE ALSO**35896 Section 2.6 (on page 38), *getmsg()*, *poll()*, *read()*, *write()*, the Base Definitions volume of  
35897 IEEE Std 1003.1-2001, <**stropts.h**>35898 **CHANGE HISTORY**

35899 First released in Issue 4, Version 2.

35900 **Issue 5**

35901 Moved from X/OPEN UNIX extension to BASE.

35902 The following text is removed from the DESCRIPTION: “The STREAM head guarantees that the  
35903 control part of a message generated by *putmsg()* is at least 64 bytes in length”.35904 **Issue 6**

35905 This function is marked as part of the XSI STREAMS Option Group.

35906 The DESCRIPTION is updated to avoid use of the term “must” for application requirements.

35907 **NAME**

35908 puts — put a string on standard output

35909 **SYNOPSIS**

35910 #include &lt;stdio.h&gt;

35911 int puts(const char \*s);

35912 **DESCRIPTION**

35913 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
 35914 conflict between the requirements described here and the ISO C standard is unintentional. This  
 35915 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

35916 The *puts()* function shall write the string pointed to by *s*, followed by a <newline>, to the  
 35917 standard output stream *stdout*. The terminating null byte shall not be written.

35918 CX The *st\_ctime* and *st\_mtime* fields of the file shall be marked for update between the successful  
 35919 execution of *puts()* and the next successful completion of a call to *fflush()* or *fclose()* on the same  
 35920 stream or a call to *exit()* or *abort()*.

35921 **RETURN VALUE**

35922 Upon successful completion, *puts()* shall return a non-negative number. Otherwise, it shall  
 35923 CX return EOF, shall set an error indicator for the stream, and *errno* shall be set to indicate the error.

35924 **ERRORS**35925 Refer to *fputc()*.35926 **EXAMPLES**35927 **Printing to Standard Output**

35928 The following example gets the current time, converts it to a string using *localtime()* and  
 35929 *asctime()*, and prints it to standard output using *puts()*. It then prints the number of minutes to  
 35930 an event for which it is waiting.

```

35931 #include <time.h>
35932 #include <stdio.h>
35933 ...
35934 time_t now;
35935 int minutes_to_event;
35936 ...
35937 time(&now);
35938 printf("The time is ");
35939 puts(asctime(localtime(&now)));
35940 printf("There are %d minutes to the event.\n",
35941     minutes_to_event);
35942 ...

```

35943 **APPLICATION USAGE**35944 The *puts()* function appends a <newline>, while *fputs()* does not.35945 **RATIONALE**

35946 None.

35947 **FUTURE DIRECTIONS**

35948 None.

35949 **SEE ALSO**

35950 *fopen()*, *fputs()*, *putc()*, the Base Definitions volume of IEEE Std 1003.1-2001, <stdio.h>

35951 **CHANGE HISTORY**

35952 First released in Issue 1. Derived from Issue 1 of the SVID.

35953 **Issue 6**

35954 Extensions beyond the ISO C standard are marked.

35955 **NAME**

35956 pututxline — put an entry into the user accounting database

35957 **SYNOPSIS**

35958 XSI `#include <utmpx.h>`

35959 `struct utmpx *pututxline(const struct utmpx *utmpx);`

35960

35961 **DESCRIPTION**

35962 Refer to *endutxent()*.

35963 **NAME**

35964 putwc — put a wide character on a stream

35965 **SYNOPSIS**

35966 #include &lt;stdio.h&gt;

35967 #include &lt;wchar.h&gt;

35968 wint\_t putwc(wchar\_t *wc*, FILE \**stream*);35969 **DESCRIPTION**

35970 cx The functionality described on this reference page is aligned with the ISO C standard. Any  
35971 conflict between the requirements described here and the ISO C standard is unintentional. This  
35972 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

35973 The *putwc()* function shall be equivalent to *fputwc()*, except that if it is implemented as a macro  
35974 it may evaluate *stream* more than once, so the argument should never be an expression with side  
35975 effects.

35976 **RETURN VALUE**35977 Refer to *fputwc()*.35978 **ERRORS**35979 Refer to *fputwc()*.35980 **EXAMPLES**

35981 None.

35982 **APPLICATION USAGE**

35983 Since it may be implemented as a macro, *putwc()* may treat a *stream* argument with side effects  
35984 incorrectly. In particular, *putwc(wc,\*f++)* need not work correctly. Therefore, use of this function  
35985 is not recommended; *fputwc()* should be used instead.

35986 **RATIONALE**

35987 None.

35988 **FUTURE DIRECTIONS**

35989 None.

35990 **SEE ALSO**35991 *fputwc()*, the Base Definitions volume of IEEE Std 1003.1-2001, <stdio.h>, <wchar.h>35992 **CHANGE HISTORY**

35993 First released as a World-wide Portability Interface in Issue 4.

35994 **Issue 5**

35995 Aligned with ISO/IEC 9899:1990/Amendment 1:1995 (E). Specifically, the type of argument *wc*  
35996 is changed from **wint\_t** to **wchar\_t**.

35997 The Optional Header (OH) marking is removed from &lt;stdio.h&gt;.

35998 **NAME**

35999           putwchar — put a wide character on a stdout stream

36000 **SYNOPSIS**

36001           #include <wchar.h>

36002           wint\_t putwchar(wchar\_t wc);

36003 **DESCRIPTION**

36004 cx       The functionality described on this reference page is aligned with the ISO C standard. Any  
36005       conflict between the requirements described here and the ISO C standard is unintentional. This  
36006       volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

36007       The function call *putwchar(wc)* shall be equivalent to *putwc(wc,stdout)*.

36008 **RETURN VALUE**

36009       Refer to *fputwc()*.

36010 **ERRORS**

36011       Refer to *fputwc()*.

36012 **EXAMPLES**

36013       None.

36014 **APPLICATION USAGE**

36015       None.

36016 **RATIONALE**

36017       None.

36018 **FUTURE DIRECTIONS**

36019       None.

36020 **SEE ALSO**

36021       *fputwc()*, *putwc()*, the Base Definitions volume of IEEE Std 1003.1-2001, <wchar.h>

36022 **CHANGE HISTORY**

36023       First released in Issue 4.

36024 **Issue 5**

36025       Aligned with ISO/IEC 9899:1990/Amendment 1:1995 (E). Specifically, the type of argument *wc*  
36026       is changed from **wint\_t** to **wchar\_t**.

36027 **NAME**

36028            pwrite — write on a file

36029 **SYNOPSIS**

36030            #include &lt;unistd.h&gt;

36031 XSI        ssize\_t pwrite(int *fildev*, const void \**buf*, size\_t *nbyte*,  
36032               off\_t *offset*);

36033

36034 **DESCRIPTION**36035            Refer to *write()*.

36036 **NAME**

36037 qsort — sort a table of data

36038 **SYNOPSIS**

36039 #include &lt;stdlib.h&gt;

36040 void qsort(void \*base, size\_t nel, size\_t width,  
36041 int (\*compar)(const void \*, const void \*));36042 **DESCRIPTION**36043 **CX** The functionality described on this reference page is aligned with the ISO C standard. Any  
36044 conflict between the requirements described here and the ISO C standard is unintentional. This  
36045 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.36046 The *qsort()* function shall sort an array of *nel* objects, the initial element of which is pointed to by  
36047 *base*. The size of each object, in bytes, is specified by the *width* argument.36048 The contents of the array shall be sorted in ascending order according to a comparison function.  
36049 The *compar* argument is a pointer to the comparison function, which is called with two  
36050 arguments that point to the elements being compared. The application shall ensure that the  
36051 function returns an integer less than, equal to, or greater than 0, if the first argument is  
36052 considered respectively less than, equal to, or greater than the second. If two members compare  
36053 as equal, their order in the sorted array is unspecified.36054 **RETURN VALUE**36055 The *qsort()* function shall not return a value.36056 **ERRORS**

36057 No errors are defined.

36058 **EXAMPLES**

36059 None.

36060 **APPLICATION USAGE**36061 The comparison function need not compare every byte, so arbitrary data may be contained in  
36062 the elements in addition to the values being compared.36063 **RATIONALE**

36064 None.

36065 **FUTURE DIRECTIONS**

36066 None.

36067 **SEE ALSO**

36068 The Base Definitions volume of IEEE Std 1003.1-2001, &lt;stdlib.h&gt;

36069 **CHANGE HISTORY**

36070 First released in Issue 1. Derived from Issue 1 of the SVID.

36071 **Issue 6**

36072 The DESCRIPTION is updated to avoid use of the term “must” for application requirements.

36073 **NAME**

36074 raise — send a signal to the executing process

36075 **SYNOPSIS**

36076 #include &lt;signal.h&gt;

36077 int raise(int sig);

36078 **DESCRIPTION**

36079 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
 36080 conflict between the requirements described here and the ISO C standard is unintentional. This  
 36081 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

36082 CX The *raise()* function shall send the signal *sig* to the executing thread or process. If a signal  
 36083 handler is called, the *raise()* function shall not return until after the signal handler does.

36084 THR If the implementation supports the Threads option, the effect of the *raise()* function shall be  
 36085 equivalent to calling:

36086 pthread\_kill(pthread\_self(), sig);

36087

36088 CX Otherwise, the effect of the *raise()* function shall be equivalent to calling:

36089 kill(getpid(), sig);

36090

36091 **RETURN VALUE**

36092 CX Upon successful completion, 0 shall be returned. Otherwise, a non-zero value shall be returned  
 36093 and *errno* shall be set to indicate the error.

36094 **ERRORS**36095 The *raise()* function shall fail if:

36096 CX [EINVAL] The value of the *sig* argument is an invalid signal number.

36097 **EXAMPLES**

36098 None.

36099 **APPLICATION USAGE**

36100 None.

36101 **RATIONALE**

36102 The term “thread” is an extension to the ISO C standard.

36103 **FUTURE DIRECTIONS**

36104 None.

36105 **SEE ALSO**

36106 *kill()*, *sigaction()*, the Base Definitions volume of IEEE Std 1003.1-2001, <signal.h>,  
 36107 <sys/types.h>

36108 **CHANGE HISTORY**

36109 First released in Issue 4. Derived from the ANSI C standard.

36110 **Issue 5**

36111 The DESCRIPTION is updated for alignment with the POSIX Threads Extension.

36112 **Issue 6**

36113 Extensions beyond the ISO C standard are marked.

36114 The following new requirements on POSIX implementations derive from alignment with the  
36115 Single UNIX Specification:

- 36116 • In the RETURN VALUE section, the requirement to set *errno* on error is added.
- 36117 • The [EINVAL] error condition is added.

36118 **NAME**

36119 rand, rand\_r, srand — pseudo-random number generator

36120 **SYNOPSIS**

```
36121     #include <stdlib.h>
36122     int rand(void);
36123 TSF   int rand_r(unsigned *seed);
36124     void srand(unsigned seed);
```

36125 **DESCRIPTION**

36126 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
 36127 conflict between the requirements described here and the ISO C standard is unintentional. This  
 36128 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

36129 The *rand()* function shall compute a sequence of pseudo-random integers in the range  
 36130 XSI  $[0, \{\text{RAND\_MAX}\}]$  with a period of at least  $2^{32}$ .

36131 CX The *rand()* function need not be reentrant. A function that is not required to be reentrant is not  
 36132 required to be thread-safe.

36133 TSF The *rand\_r()* function shall compute a sequence of pseudo-random integers in the range  
 36134  $[0, \{\text{RAND\_MAX}\}]$ . (The value of the  $\{\text{RAND\_MAX}\}$  macro shall be at least 32 767.)

36135 If *rand\_r()* is called with the same initial value for the object pointed to by *seed* and that object is  
 36136 not modified between successive returns and calls to *rand\_r()*, the same sequence shall be  
 36137 generated.

36138 The *srand()* function uses the argument as a seed for a new sequence of pseudo-random  
 36139 numbers to be returned by subsequent calls to *rand()*. If *srand()* is then called with the same  
 36140 seed value, the sequence of pseudo-random numbers shall be repeated. If *rand()* is called before  
 36141 any calls to *srand()* are made, the same sequence shall be generated as when *srand()* is first  
 36142 called with a seed value of 1.

36143 The implementation shall behave as if no function defined in this volume of  
 36144 IEEE Std 1003.1-2001 calls *rand()* or *srand()*.

36145 **RETURN VALUE**

36146 The *rand()* function shall return the next pseudo-random number in the sequence.

36147 TSF The *rand\_r()* function shall return a pseudo-random integer.

36148 The *srand()* function shall not return a value.

36149 **ERRORS**

36150 No errors are defined.

36151 **EXAMPLES**36152 **Generating a Pseudo-Random Number Sequence**

36153 The following example demonstrates how to generate a sequence of pseudo-random numbers.

```
36154     #include <stdio.h>
36155     #include <stdlib.h>
36156     ...
36157         long count, i;
36158         char *keystri;
36159         int elementlen, len;
36160         char c;
```

```

36161     ...
36162     /* Initial random number generator. */
36163     srand(1);

36164     /* Create keys using only lowercase characters */
36165     len = 0;
36166     for (i=0; i<count; i++) {
36167         while (len < elementlen) {
36168             c = (char) (rand() % 128);
36169             if (islower(c))
36170                 keystr[len++] = c;
36171         }

36172         keystr[len] = '\0';
36173         printf("%s Element%0*ld\n", keystr, elementlen, i);
36174         len = 0;
36175     }

```

### 36176 **Generating the Same Sequence on Different Machines**

36177 The following code defines a pair of functions that could be incorporated into applications  
36178 wishing to ensure that the same sequence of numbers is generated across different machines.

```

36179     static unsigned long next = 1;
36180     int myrand(void) /* RAND_MAX assumed to be 32767. */
36181     {
36182         next = next * 1103515245 + 12345;
36183         return((unsigned)(next/65536) % 32768);
36184     }

36185     void mysrand(unsigned seed)
36186     {
36187         next = seed;
36188     }

```

### 36189 **APPLICATION USAGE**

36190 The *drand48()* function provides a much more elaborate random number generator.

36191 The limitations on the amount of state that can be carried between one function call and another  
36192 mean the *rand\_r()* function can never be implemented in a way which satisfies all of the  
36193 requirements on a pseudo-random number generator. Therefore this function should be avoided  
36194 whenever non-trivial requirements (including safety) have to be fulfilled.

### 36195 **RATIONALE**

36196 The ISO C standard *rand()* and *srand()* functions allow per-process pseudo-random streams  
36197 shared by all threads. Those two functions need not change, but there has to be mutual-  
36198 exclusion that prevents interference between two threads concurrently accessing the random  
36199 number generator.

36200 With regard to *rand()*, there are two different behaviors that may be wanted in a multi-threaded  
36201 program:

- 36202 1. A single per-process sequence of pseudo-random numbers that is shared by all threads  
36203 that call *rand()*
- 36204 2. A different sequence of pseudo-random numbers for each thread that calls *rand()*

- 36205 This is provided by the modified thread-safe function based on whether the seed value is global  
36206 to the entire process or local to each thread.
- 36207 This does not address the known deficiencies of the *rand()* function implementations, which  
36208 have been approached by maintaining more state. In effect, this specifies new thread-safe forms  
36209 of a deficient function.
- 36210 **FUTURE DIRECTIONS**
- 36211 None.
- 36212 **SEE ALSO**
- 36213 *drand48()*, the Base Definitions volume of IEEE Std 1003.1-2001, <stdlib.h>
- 36214 **CHANGE HISTORY**
- 36215 First released in Issue 1. Derived from Issue 1 of the SVID.
- 36216 **Issue 5**
- 36217 The *rand\_r()* function is included for alignment with the POSIX Threads Extension.
- 36218 A note indicating that the *rand()* function need not be reentrant is added to the DESCRIPTION.
- 36219 **Issue 6**
- 36220 Extensions beyond the ISO C standard are marked.
- 36221 The *rand\_r()* function is marked as part of the Thread-Safe Functions option.

36222 **NAME**

36223           random — generate pseudo-random number

36224 **SYNOPSIS**

36225 xSI       #include <stdlib.h>

36226           long random(void);

36227

36228 **DESCRIPTION**

36229           Refer to *initstate()*.

36230 **NAME**36231 `pread, read` — read from a file36232 **SYNOPSIS**36233 `#include <unistd.h>`36234 XSI `ssize_t pread(int fildev, void *buf, size_t nbyte, off_t offset);`36235 `ssize_t read(int fildev, void *buf, size_t nbyte);`36236 **DESCRIPTION**

36237 The `read()` function shall attempt to read *nbyte* bytes from the file associated with the open file  
 36238 descriptor, *fildev*, into the buffer pointed to by *buf*. The behavior of multiple concurrent reads on  
 36239 the same pipe, FIFO, or terminal device is unspecified.

36240 Before any action described below is taken, and if *nbyte* is zero, the `read()` function may detect  
 36241 and return errors as described below. In the absence of errors, or if error detection is not  
 36242 performed, the `read()` function shall return zero and have no other results.

36243 On files that support seeking (for example, a regular file), the `read()` shall start at a position in  
 36244 the file given by the file offset associated with *fildev*. The file offset shall be incremented by the  
 36245 number of bytes actually read.

36246 Files that do not support seeking—for example, terminals—always read from the current  
 36247 position. The value of a file offset associated with such a file is undefined.

36248 No data transfer shall occur past the current end-of-file. If the starting position is at or after the  
 36249 end-of-file, 0 shall be returned. If the file refers to a device special file, the result of subsequent  
 36250 `read()` requests is implementation-defined.

36251 If the value of *nbyte* is greater than {SSIZE\_MAX}, the result is implementation-defined.

36252 When attempting to read from an empty pipe or FIFO:

- 36253 • If no process has the pipe open for writing, `read()` shall return 0 to indicate end-of-file.
- 36254 • If some process has the pipe open for writing and O\_NONBLOCK is set, `read()` shall return  
 36255 `-1` and set `errno` to [EAGAIN].
- 36256 • If some process has the pipe open for writing and O\_NONBLOCK is clear, `read()` shall block  
 36257 the calling thread until some data is written or the pipe is closed by all processes that had the  
 36258 pipe open for writing.

36259 When attempting to read a file (other than a pipe or FIFO) that supports non-blocking reads and  
 36260 has no data currently available:

- 36261 • If O\_NONBLOCK is set, `read()` shall return `-1` and set `errno` to [EAGAIN].
- 36262 • If O\_NONBLOCK is clear, `read()` shall block the calling thread until some data becomes  
 36263 available.
- 36264 • The use of the O\_NONBLOCK flag has no effect if there is some data available.

36265 The `read()` function reads data previously written to a file. If any portion of a regular file prior to  
 36266 the end-of-file has not been written, `read()` shall return bytes with value 0. For example, `lseek()`  
 36267 allows the file offset to be set beyond the end of existing data in the file. If data is later written at  
 36268 this point, subsequent reads in the gap between the previous end of data and the newly written  
 36269 data shall return bytes with value 0 until data is written into the gap.

36270 Upon successful completion, where *nbyte* is greater than 0, `read()` shall mark for update the  
 36271 `st_atime` field of the file, and shall return the number of bytes read. This number shall never be  
 36272 greater than *nbyte*. The value returned may be less than *nbyte* if the number of bytes left in the

- 36273 file is less than *nbyte*, if the *read()* request was interrupted by a signal, or if the file is a pipe or  
 36274 FIFO or special file and has fewer than *nbyte* bytes immediately available for reading. For  
 36275 example, a *read()* from a file associated with a terminal may return one typed line of data.
- 36276 If a *read()* is interrupted by a signal before it reads any data, it shall return  $-1$  with *errno* set to  
 36277 [EINTR].
- 36278 If a *read()* is interrupted by a signal after it has successfully read some data, it shall return the  
 36279 number of bytes read.
- 36280 For regular files, no data transfer shall occur past the offset maximum established in the open  
 36281 file description associated with *fdes*.
- 36282 If *fdes* refers to a socket, *read()* shall be equivalent to *recv()* with no flags set.
- 36283 SIO If the O\_DSYNC and O\_RSYNC bits have been set, read I/O operations on the file descriptor  
 36284 shall complete as defined by synchronized I/O data integrity completion. If the O\_SYNC and  
 36285 O\_RSYNC bits have been set, read I/O operations on the file descriptor shall complete as  
 36286 defined by synchronized I/O file integrity completion.
- 36287 SHM If *fdes* refers to a shared memory object, the result of the *read()* function is unspecified.
- 36288 TYM If *fdes* refers to a typed memory object, the result of the *read()* function is unspecified.
- 36289 XSR A *read()* from a STREAMS file can read data in three different modes: *byte-stream* mode,  
 36290 *message-nondiscard* mode, and *message-discard* mode. The default shall be byte-stream mode. This  
 36291 can be changed using the I\_SRDOPT *ioctl()* request, and can be tested with I\_GRDOPT *ioctl()*.  
 36292 In byte-stream mode, *read()* shall retrieve data from the STREAM until as many bytes as were  
 36293 requested are transferred, or until there is no more data to be retrieved. Byte-stream mode  
 36294 ignores message boundaries.
- 36295 In STREAMS message-nondiscard mode, *read()* shall retrieve data until as many bytes as were  
 36296 requested are transferred, or until a message boundary is reached. If *read()* does not retrieve all  
 36297 the data in a message, the remaining data shall be left on the STREAM, and can be retrieved by  
 36298 the next *read()* call. Message-discard mode also retrieves data until as many bytes as were  
 36299 requested are transferred, or a message boundary is reached. However, unread data remaining  
 36300 in a message after the *read()* returns shall be discarded, and shall not be available for a  
 36301 subsequent *read()*, *getmsg()*, or *getpmsg()* call.
- 36302 How *read()* handles zero-byte STREAMS messages is determined by the current read mode  
 36303 setting. In byte-stream mode, *read()* shall accept data until it has read *nbyte* bytes, or until there  
 36304 is no more data to read, or until a zero-byte message block is encountered. The *read()* function  
 36305 shall then return the number of bytes read, and place the zero-byte message back on the  
 36306 STREAM to be retrieved by the next *read()*, *getmsg()*, or *getpmsg()*. In message-nondiscard mode  
 36307 or message-discard mode, a zero-byte message shall return 0 and the message shall be removed  
 36308 from the STREAM. When a zero-byte message is read as the first message on a STREAM, the  
 36309 message shall be removed from the STREAM and 0 shall be returned, regardless of the read  
 36310 mode.
- 36311 A *read()* from a STREAMS file shall return the data in the message at the front of the STREAM  
 36312 head read queue, regardless of the priority band of the message.
- 36313 By default, STREAMS are in control-normal mode, in which a *read()* from a STREAMS file can  
 36314 only process messages that contain a data part but do not contain a control part. The *read()* shall  
 36315 fail if a message containing a control part is encountered at the STREAM head. This default  
 36316 action can be changed by placing the STREAM in either control-data mode or control-discard  
 36317 mode with the I\_SRDOPT *ioctl()* command. In control-data mode, *read()* shall convert any  
 36318 control part to data and pass it to the application before passing any data part originally present

36319 in the same message. In control-discard mode, *read()* shall discard message control parts but  
36320 return to the process any data part in the message.

36321 In addition, *read()* shall fail if the STREAM head had processed an asynchronous error before the  
36322 call. In this case, the value of *errno* shall not reflect the result of *read()*, but reflect the prior error.  
36323 If a hangup occurs on the STREAM being read, *read()* shall continue to operate normally until  
36324 the STREAM head read queue is empty. Thereafter, it shall return 0.

36325 XSI The *pread()* function shall be equivalent to *read()*, except that it shall read from a given position  
36326 in the file without changing the file pointer. The first three arguments to *pread()* are the same as  
36327 *read()* with the addition of a fourth argument *offset* for the desired position inside the file. An  
36328 attempt to perform a *pread()* on a file that is incapable of seeking shall result in an error.

### 36329 RETURN VALUE

36330 XSI Upon successful completion, *read()* and *pread()* shall return a non-negative integer indicating the  
36331 number of bytes actually read. Otherwise, the functions shall return  $-1$  and set *errno* to indicate  
36332 the error.

### 36333 ERRORS

36334 XSI The *read()* and *pread()* functions shall fail if:

36335 [EAGAIN] The O\_NONBLOCK flag is set for the file descriptor and the process would be  
36336 delayed.

36337 [EBADF] The *fildev* argument is not a valid file descriptor open for reading.

36338 XSR [EBADMSG] The file is a STREAM file that is set to control-normal mode and the message  
36339 waiting to be read includes a control part.

36340 [EINTR] The read operation was terminated due to the receipt of a signal, and no data  
36341 was transferred.

36342 XSR [EINVAL] The STREAM or multiplexer referenced by *fildev* is linked (directly or  
36343 indirectly) downstream from a multiplexer.

36344 [EIO] The process is a member of a background process attempting to read from its  
36345 controlling terminal, the process is ignoring or blocking the SIGTTIN signal,  
36346 or the process group is orphaned. This error may also be generated for  
36347 implementation-defined reasons.

36348 XSI [EISDIR] The *fildev* argument refers to a directory and the implementation does not  
36349 allow the directory to be read using *read()* or *pread()*. The *readdir()* function  
36350 should be used instead.

36351 [EOVERFLOW] The file is a regular file, *nbyte* is greater than 0, the starting position is before  
36352 the end-of-file, and the starting position is greater than or equal to the offset  
36353 maximum established in the open file description associated with *fildev*.

36354 The *read()* function shall fail if:

36355 [EAGAIN] or [EWOULDBLOCK]

36356 The file descriptor is for a socket, is marked O\_NONBLOCK, and no data is  
36357 waiting to be received.

36358 [ECONNRESET] A read was attempted on a socket and the connection was forcibly closed by  
36359 its peer.

36360 [ENOTCONN] A read was attempted on a socket that is not connected.

36361 [ETIMEDOUT] A read was attempted on a socket and a transmission timeout occurred.

- 36362 XSI The `read()` and `pread()` functions may fail if:
- 36363 [EIO] A physical I/O error has occurred.
- 36364 [ENOBUFS] Insufficient resources were available in the system to perform the operation.
- 36365 [ENOMEM] Insufficient memory was available to fulfill the request.
- 36366 [ENXIO] A request was made of a nonexistent device, or the request was outside the  
36367 capabilities of the device.
- 36368 The `pread()` function shall fail, and the file pointer shall remain unchanged, if:
- 36369 XSI [EINVAL] The `offset` argument is invalid. The value is negative.
- 36370 XSI [EOVERFLOW] The file is a regular file and an attempt was made to read at or beyond the  
36371 offset maximum associated with the file.
- 36372 XSI [ENXIO] A request was outside the capabilities of the device.
- 36373 XSI [ESPIPE] `fildev` is associated with a pipe or FIFO.

36374 **EXAMPLES**36375 **Reading Data into a Buffer**

36376 The following example reads data from the file associated with the file descriptor `fd` into the  
36377 buffer pointed to by `buf`.

```
36378 #include <sys/types.h>
36379 #include <unistd.h>
36380 ...
36381 char buf[20];
36382 size_t nbytes;
36383 ssize_t bytes_read;
36384 int fd;
36385 ...
36386 nbytes = sizeof(buf);
36387 bytes_read = read(fd, buf, nbytes);
36388 ...
```

36389 **APPLICATION USAGE**

36390 None.

36391 **RATIONALE**

36392 This volume of IEEE Std 1003.1-2001 does not specify the value of the file offset after an error is  
36393 returned; there are too many cases. For programming errors, such as [EBADF], the concept is  
36394 meaningless since no file is involved. For errors that are detected immediately, such as  
36395 [EAGAIN], clearly the pointer should not change. After an interrupt or hardware error, however,  
36396 an updated value would be very useful and is the behavior of many implementations.

36397 Note that a `read()` of zero bytes does not modify `st_atime`. A `read()` that requests more than zero  
36398 bytes, but returns zero, shall modify `st_atime`.

36399 Implementations are allowed, but not required, to perform error checking for `read()` requests of  
36400 zero bytes.

36401 **Input and Output**

36402 The use of I/O with large byte counts has always presented problems. Ideas such as *lread()* and  
36403 *lwrite()* (using and returning **longs**) were considered at one time. The current solution is to use  
36404 abstract types on the ISO C standard function to *read()* and *write()*. The abstract types can be  
36405 declared so that existing functions work, but can also be declared so that larger types can be  
36406 represented in future implementations. It is presumed that whatever constraints limit the  
36407 maximum range of **size\_t** also limit portable I/O requests to the same range. This volume of  
36408 IEEE Std 1003.1-2001 also limits the range further by requiring that the byte count be limited so  
36409 that a signed return value remains meaningful. Since the return type is also a (signed) abstract  
36410 type, the byte count can be defined by the implementation to be larger than an **int** can hold.

36411 The standard developers considered adding atomicity requirements to a pipe or FIFO, but  
36412 recognized that due to the nature of pipes and FIFOs there could be no guarantee of atomicity of  
36413 reads of {PIPE\_BUF} or any other size that would be an aid to applications portability.

36414 This volume of IEEE Std 1003.1-2001 requires that no action be taken for *read()* or *write()* when  
36415 *nbyte* is zero. This is not intended to take precedence over detection of errors (such as invalid  
36416 buffer pointers or file descriptors). This is consistent with the rest of this volume of  
36417 IEEE Std 1003.1-2001, but the phrasing here could be misread to require detection of the zero  
36418 case before any other errors. A value of zero is to be considered a correct value, for which the  
36419 semantics are a no-op.

36420 I/O is intended to be atomic to ordinary files and pipes and FIFOs. Atomic means that all the  
36421 bytes from a single operation that started out together end up together, without interleaving  
36422 from other I/O operations. It is a known attribute of terminals that this is not honored, and  
36423 terminals are explicitly (and implicitly permanently) excepted, making the behavior unspecified.  
36424 The behavior for other device types is also left unspecified, but the wording is intended to imply  
36425 that future standards might choose to specify atomicity (or not).

36426 There were recommendations to add format parameters to *read()* and *write()* in order to handle  
36427 networked transfers among heterogeneous file system and base hardware types. Such a facility  
36428 may be required for support by the OSI presentation of layer services. However, it was  
36429 determined that this should correspond with similar C-language facilities, and that is beyond the  
36430 scope of this volume of IEEE Std 1003.1-2001. The concept was suggested to the developers of  
36431 the ISO C standard for their consideration as a possible area for future work.

36432 In 4.3 BSD, a *read()* or *write()* that is interrupted by a signal before transferring any data does not  
36433 by default return an [EINTR] error, but is restarted. In 4.2 BSD, 4.3 BSD, and the Eighth Edition,  
36434 there is an additional function, *select()*, whose purpose is to pause until specified activity (data  
36435 to read, space to write, and so on) is detected on specified file descriptors. It is common in  
36436 applications written for those systems for *select()* to be used before *read()* in situations (such as  
36437 keyboard input) where interruption of I/O due to a signal is desired.

36438 The issue of which files or file types are interruptible is considered an implementation design  
36439 issue. This is often affected primarily by hardware and reliability issues.

36440 There are no references to actions taken following an “unrecoverable error”. It is considered  
36441 beyond the scope of this volume of IEEE Std 1003.1-2001 to describe what happens in the case of  
36442 hardware errors.

36443 Previous versions of IEEE Std 1003.1-2001 allowed two very different behaviors with regard to  
36444 the handling of interrupts. In order to minimize the resulting confusion, it was decided that  
36445 IEEE Std 1003.1-2001 should support only one of these behaviors. Historical practice on AT&T-  
36446 derived systems was to have *read()* and *write()* return **-1** and set *errno* to [EINTR] when  
36447 interrupted after some, but not all, of the data requested had been transferred. However, the U.S.  
36448 Department of Commerce FIPS 151-1 and FIPS 151-2 require the historical BSD behavior, in

36449 which *read()* and *write()* return the number of bytes actually transferred before the interrupt. If  
 36450  $-1$  is returned when any data is transferred, it is difficult to recover from the error on a seekable  
 36451 device and impossible on a non-seekable device. Most new implementations support this  
 36452 behavior. The behavior required by IEEE Std 1003.1-2001 is to return the number of bytes  
 36453 transferred.

36454 IEEE Std 1003.1-2001 does not specify when an implementation that buffers *read()*s actually  
 36455 moves the data into the user-supplied buffer, so an implementation may chose to do this at the  
 36456 latest possible moment. Therefore, an interrupt arriving earlier may not cause *read()* to return a  
 36457 partial byte count, but rather to return  $-1$  and set *errno* to [EINTR].

36458 Consideration was also given to combining the two previous options, and setting *errno* to  
 36459 [EINTR] while returning a short count. However, not only is there no existing practice that  
 36460 implements this, it is also contradictory to the idea that when *errno* is set, the function  
 36461 responsible shall return  $-1$ .

#### 36462 FUTURE DIRECTIONS

36463 None.

#### 36464 SEE ALSO

36465 *fcntl()*, *ioctl()*, *lseek()*, *open()*, *pipe()*, *readv()*, the Base Definitions volume of  
 36466 IEEE Std 1003.1-2001, Chapter 11, General Terminal Interface, <stropts.h>, <sys/uio.h>,  
 36467 <unistd.h>

#### 36468 CHANGE HISTORY

36469 First released in Issue 1. Derived from Issue 1 of the SVID.

#### 36470 Issue 5

36471 The DESCRIPTION is updated for alignment with the POSIX Realtime Extension and the POSIX  
 36472 Threads Extension.

36473 Large File Summit extensions are added.

36474 The *pread()* function is added.

#### 36475 Issue 6

36476 The DESCRIPTION and ERRORS sections are updated so that references to STREAMS are  
 36477 marked as part of the XSI STREAMS Option Group.

36478 The following new requirements on POSIX implementations derive from alignment with the  
 36479 Single UNIX Specification:

36480 • The DESCRIPTION now states that if *read()* is interrupted by a signal after it has successfully  
 36481 read some data, it returns the number of bytes read. In Issue 3, it was optional whether *read()*  
 36482 returned the number of bytes read, or whether it returned  $-1$  with *errno* set to [EINTR]. This  
 36483 is a FIPS requirement.

36484 • In the DESCRIPTION, text is added to indicate that for regular files, no data transfer occurs  
 36485 past the offset maximum established in the open file description associated with *files*. This  
 36486 change is to support large files.

36487 • The [EOVERFLOW] mandatory error condition is added.

36488 • The [ENXIO] optional error condition is added.

36489 Text referring to sockets is added to the DESCRIPTION.

36490 The following changes were made to align with the IEEE P1003.1a draft standard:

36491 • The effect of reading zero bytes is clarified.

- 36492 The DESCRIPTION is updated for alignment with IEEE Std 1003.1j-2000 by specifying that  
36493 *read()* results are unspecified for typed memory objects.
- 36494 New RATIONALE is added to explain the atomicity requirements for input and output  
36495 operations.
- 36496 The following error conditions are added for operations on sockets: [EAGAIN],  
36497 [ECONNRESET], [ENOTCONN], and [ETIMEDOUT].
- 36498 The [EIO] error is changed to “may fail”.
- 36499 The following error conditions are added for operations on sockets: [ENOBUFFS] and  
36500 [ENOMEM].
- 36501 The *readv()* function is split out into a separate reference page.

## 36502 NAME

36503 readdir, readdir\_r — read a directory

## 36504 SYNOPSIS

36505 #include &lt;dirent.h&gt;

36506 struct dirent \*readdir(DIR \*dirp);

36507 TSF int readdir\_r(DIR \*restrict dirp, struct dirent \*restrict entry,

36508 struct dirent \*\*restrict result);

36509

## 36510 DESCRIPTION

36511 The type **DIR**, which is defined in the <**dirent.h**> header, represents a *directory stream*, which is  
 36512 an ordered sequence of all the directory entries in a particular directory. Directory entries  
 36513 represent files; files may be removed from a directory or added to a directory asynchronously to  
 36514 the operation of *readdir()*.

36515 The *readdir()* function shall return a pointer to a structure representing the directory entry at the  
 36516 current position in the directory stream specified by the argument *dirp*, and position the  
 36517 directory stream at the next entry. It shall return a null pointer upon reaching the end of the  
 36518 directory stream. The structure **dirent** defined in the <**dirent.h**> header describes a directory  
 36519 entry.

36520 The *readdir()* function shall not return directory entries containing empty names. If entries for  
 36521 dot or dot-dot exist, one entry shall be returned for dot and one entry shall be returned for dot-  
 36522 dot; otherwise, they shall not be returned.

36523 The pointer returned by *readdir()* points to data which may be overwritten by another call to  
 36524 *readdir()* on the same directory stream. This data is not overwritten by another call to *readdir()*  
 36525 on a different directory stream.

36526 If a file is removed from or added to the directory after the most recent call to *opendir()* or  
 36527 *rewinddir()*, whether a subsequent call to *readdir()* returns an entry for that file is unspecified.

36528 The *readdir()* function may buffer several directory entries per actual read operation; *readdir()*  
 36529 shall mark for update the *st\_atime* field of the directory each time the directory is actually read.

36530 After a call to *fork()*, either the parent or child (but not both) may continue processing the  
 36531 XSI directory stream using *readdir()*, *rewinddir()*, or *seekdir()*. If both the parent and child processes  
 36532 use these functions, the result is undefined.

36533 If the entry names a symbolic link, the value of the *d\_ino* member is unspecified.

36534 The *readdir()* function need not be reentrant. A function that is not required to be reentrant is not  
 36535 required to be thread-safe.

36536 TSF The *readdir\_r()* function shall initialize the **dirent** structure referenced by *entry* to represent the  
 36537 directory entry at the current position in the directory stream referred to by *dirp*, store a pointer  
 36538 to this structure at the location referenced by *result*, and position the directory stream at the next  
 36539 entry.

36540 The storage pointed to by *entry* shall be large enough for a **dirent** with an array of **char** *d\_name*  
 36541 members containing at least {NAME\_MAX}+1 elements.

36542 Upon successful return, the pointer returned at *\*result* shall have the same value as the argument  
 36543 *entry*. Upon reaching the end of the directory stream, this pointer shall have the value NULL.

36544 The *readdir\_r()* function shall not return directory entries containing empty names.

36545 If a file is removed from or added to the directory after the most recent call to *opendir()* or  
 36546 *rewinddir()*, whether a subsequent call to *readdir\_r()* returns an entry for that file is unspecified.

36547 The *readdir\_r()* function may buffer several directory entries per actual read operation; the  
 36548 *readdir\_r()* function shall mark for update the *st\_atime* field of the directory each time the  
 36549 directory is actually read.

36550 Applications wishing to check for error situations should set *errno* to 0 before calling *readdir()*. If  
 36551 *errno* is set to non-zero on return, an error occurred.

#### 36552 RETURN VALUE

36553 Upon successful completion, *readdir()* shall return a pointer to an object of type **struct dirent**.  
 36554 When an error is encountered, a null pointer shall be returned and *errno* shall be set to indicate  
 36555 the error. When the end of the directory is encountered, a null pointer shall be returned and *errno*  
 36556 is not changed.

36557 TSF If successful, the *readdir\_r()* function shall return zero; otherwise, an error number shall be  
 36558 returned to indicate the error.

#### 36559 ERRORS

36560 The *readdir()* function shall fail if:

36561 [EOverflow] One of the values in the structure to be returned cannot be represented  
 36562 correctly.

36563 The *readdir()* function may fail if:

36564 [EBADF] The *dirp* argument does not refer to an open directory stream.

36565 [ENOENT] The current position of the directory stream is invalid.

36566 The *readdir\_r()* function may fail if:

36567 [EBADF] The *dirp* argument does not refer to an open directory stream.

#### 36568 EXAMPLES

36569 The following sample code searches the current directory for the entry *name*.

```
36570 dirp = opendir(".");
36571 while (dirp) {
36572     errno = 0;
36573     if ((dp = readdir(dirp)) != NULL) {
36574         if (strcmp(dp->d_name, name) == 0) {
36575             closedir(dirp);
36576             return FOUND;
36577         }
36578     } else {
36579         if (errno == 0) {
36580             closedir(dirp);
36581             return NOT_FOUND;
36582         }
36583         closedir(dirp);
36584         return READ_ERROR;
36585     }
36586 }
36587 return OPEN_ERROR;
```

36588 **APPLICATION USAGE**

36589       The *readdir()* function should be used in conjunction with *opendir()*, *closedir()*, and *rewinddir()* to  
36590       examine the contents of the directory.

36591       The *readdir\_r()* function is thread-safe and shall return values in a user-supplied buffer instead  
36592       of possibly using a static data area that may be overwritten by each call.

36593 **RATIONALE**

36594       The returned value of *readdir()* merely *represents* a directory entry. No equivalence should be  
36595       inferred.

36596       Historical implementations of *readdir()* obtain multiple directory entries on a single read  
36597       operation, which permits subsequent *readdir()* operations to operate from the buffered  
36598       information. Any wording that required each successful *readdir()* operation to mark the  
36599       directory *st\_atime* field for update would disallow such historical performance-oriented  
36600       implementations.

36601       Since *readdir()* returns NULL when it detects an error and when the end of the directory is  
36602       encountered, an application that needs to tell the difference must set *errno* to zero before the call  
36603       and check it if NULL is returned. Since the function must not change *errno* in the second case  
36604       and must set it to a non-zero value in the first case, a zero *errno* after a call returning NULL  
36605       indicates end-of-directory; otherwise, an error.

36606       Routines to deal with this problem more directly were proposed:

```
36607       int derror (dirp)
36608       DIR *dirp;
```

```
36609       void clearerr (dirp)
36610       DIR *dirp;
```

36611       The first would indicate whether an error had occurred, and the second would clear the error  
36612       indication. The simpler method involving *errno* was adopted instead by requiring that *readdir()*  
36613       not change *errno* when end-of-directory is encountered.

36614       An error or signal indicating that a directory has changed while open was considered but  
36615       rejected.

36616       The thread-safe version of the directory reading function returns values in a user-supplied buffer  
36617       instead of possibly using a static data area that may be overwritten by each call. Either the  
36618       {NAME\_MAX} compile-time constant or the corresponding *pathconf()* option can be used to  
36619       determine the maximum sizes of returned pathnames.

36620 **FUTURE DIRECTIONS**

36621       None.

36622 **SEE ALSO**

36623       *closedir()*, *lstat()*, *opendir()*, *rewinddir()*, *symlink()*, the Base Definitions volume of  
36624       IEEE Std 1003.1-2001, <*dirent.h*>, <*sys/types.h*>

36625 **CHANGE HISTORY**

36626       First released in Issue 2.

36627 **Issue 5**

36628       Large File Summit extensions are added.

36629       The *readdir\_r()* function is included for alignment with the POSIX Threads Extension.

36630       A note indicating that the *readdir()* function need not be reentrant is added to the  
36631       DESCRIPTION.

36632 **Issue 6**

- 36633 The `readdir_r()` function is marked as part of the Thread-Safe Functions option.
- 36634 The Open Group Corrigendum U026/7 is applied, correcting the prototype for `readdir_r()`.
- 36635 The Open Group Corrigendum U026/8 is applied, clarifying the wording of the successful  
36636 return for the `readdir_r()` function.
- 36637 The following new requirements on POSIX implementations derive from alignment with the  
36638 Single UNIX Specification:
- 36639 • The requirement to include `<sys/types.h>` has been removed. Although `<sys/types.h>` was  
36640 required for conforming implementations of previous POSIX specifications, it was not  
36641 required for UNIX applications.
  - 36642 • A statement is added to the DESCRIPTION indicating the disposition of certain fields in  
36643 **struct dirent** when an entry refers to a symbolic link.
  - 36644 • The [EOVERFLOW] mandatory error condition is added. This change is to support large  
36645 files.
  - 36646 • The [ENOENT] optional error condition is added.
- 36647 The APPLICATION USAGE section is updated to include a note on the thread-safe function and  
36648 its avoidance of possibly using a static data area.
- 36649 The **restrict** keyword is added to the `readdir_r()` prototype for alignment with the  
36650 ISO/IEC 9899:1999 standard.

36651 **NAME**

36652 readlink — read the contents of a symbolic link

36653 **SYNOPSIS**

36654 #include &lt;unistd.h&gt;

36655 ssize\_t readlink(const char \*restrict path, char \*restrict buf,  
36656 size\_t bufsize);36657 **DESCRIPTION**36658 The *readlink()* function shall place the contents of the symbolic link referred to by *path* in the  
36659 buffer *buf* which has size *bufsize*. If the number of bytes in the symbolic link is less than *bufsize*,  
36660 the contents of the remainder of *buf* are unspecified. If the *buf* argument is not large enough to  
36661 contain the link content, the first *bufsize* bytes shall be placed in *buf*.36662 If the value of *bufsize* is greater than {SSIZE\_MAX}, the result is implementation-defined.36663 **RETURN VALUE**36664 Upon successful completion, *readlink()* shall return the count of bytes placed in the buffer.  
36665 Otherwise, it shall return a value of -1, leave the buffer unchanged, and set *errno* to indicate the  
36666 error.36667 **ERRORS**36668 The *readlink()* function shall fail if:36669 [EACCES] Search permission is denied for a component of the path prefix of *path*.36670 [EINVAL] The *path* argument names a file that is not a symbolic link.

36671 [EIO] An I/O error occurred while reading from the file system.

36672 [ELOOP] A loop exists in symbolic links encountered during resolution of the *path*  
36673 argument.

36674 [ENAMETOOLONG]

36675 The length of the *path* argument exceeds {PATH\_MAX} or a pathname  
36676 component is longer than {NAME\_MAX}.36677 [ENOENT] A component of *path* does not name an existing file or *path* is an empty string.

36678 [ENOTDIR] A component of the path prefix is not a directory.

36679 The *readlink()* function may fail if:

36680 [EACCES] Read permission is denied for the directory.

36681 [ELOOP] More than {SYMLOOP\_MAX} symbolic links were encountered during  
36682 resolution of the *path* argument.

36683 [ENAMETOOLONG]

36684 As a result of encountering a symbolic link in resolution of the *path* argument,  
36685 the length of the substituted pathname string exceeded {PATH\_MAX}.

36686 **EXAMPLES**36687 **Reading the Name of a Symbolic Link**

36688 The following example shows how to read the name of a symbolic link named `/modules/pass1`.

```
36689 #include <unistd.h>
36690 char buf[1024];
36691 ssize_t len;
36692 ...
36693 if ((len = readlink("/modules/pass1", buf, sizeof(buf)-1)) != -1)
36694     buf[len] = '\0';
```

36695 **APPLICATION USAGE**

36696 Conforming applications should not assume that the returned contents of the symbolic link are  
 36697 null-terminated.

36698 **RATIONALE**

36699 Since IEEE Std 1003.1-2001 does not require any association of file times with symbolic links,  
 36700 there is no requirement that file times be updated by `readlink()`. The type associated with `bufsiz`  
 36701 is a `size_t` in order to be consistent with both the ISO C standard and the definition of `read()`.  
 36702 The behavior specified for `readlink()` when `bufsiz` is zero represents historical practice. For this  
 36703 case, the standard developers considered a change whereby `readlink()` would return the number  
 36704 of non-null bytes contained in the symbolic link with the buffer `buf` remaining unchanged;  
 36705 however, since the `stat` structure member `st_size` value can be used to determine the size of  
 36706 buffer necessary to contain the contents of the symbolic link as returned by `readlink()`, this  
 36707 proposal was rejected, and the historical practice retained.

36708 **FUTURE DIRECTIONS**

36709 None.

36710 **SEE ALSO**

36711 `lstat()`, `stat()`, `symlink()`, the Base Definitions volume of IEEE Std 1003.1-2001, `<unistd.h>`

36712 **CHANGE HISTORY**

36713 First released in Issue 4, Version 2.

36714 **Issue 5**

36715 Moved from X/OPEN UNIX extension to BASE.

36716 **Issue 6**

36717 The return type is changed to `ssize_t`, to align with the IEEE P1003.1a draft standard.

36718 The following new requirements on POSIX implementations derive from alignment with the  
 36719 Single UNIX Specification:

- 36720 • This function is made mandatory.
- 36721 • In this function it is possible for the return value to exceed the range of the type `ssize_t` (since  
 36722 `size_t` has a larger range of positive values than `ssize_t`). A sentence restricting the size of  
 36723 the `size_t` object is added to the description to resolve this conflict.

36724 The following changes are made for alignment with the ISO POSIX-1: 1996 standard:

- 36725 • The FUTURE DIRECTIONS section is changed to None.

36726 The following changes were made to align with the IEEE P1003.1a draft standard:

- 36727 • The [ELOOP] optional error condition is added.

36728  
36729

The **restrict** keyword is added to the *readlink()* prototype for alignment with the ISO/IEC 9899:1999 standard.

36730 **NAME**

36731 readv — read a vector

36732 **SYNOPSIS**36733 XSI `#include <sys/uio.h>`36734 `ssize_t readv(int fildes, const struct iovec *iov, int iovcnt);`

36735

36736 **DESCRIPTION**

36737 The `readv()` function shall be equivalent to `read()`, except as described below. The `readv()`  
 36738 function shall place the input data into the `iovcnt` buffers specified by the members of the `iov`  
 36739 array: `iov[0]`, `iov[1]`, ..., `iov[iovcnt-1]`. The `iovcnt` argument is valid if greater than 0 and less than  
 36740 or equal to `{IOV_MAX}`.

36741 Each `iovec` entry specifies the base address and length of an area in memory where data should  
 36742 be placed. The `readv()` function shall always fill an area completely before proceeding to the  
 36743 next.

36744 Upon successful completion, `readv()` shall mark for update the `st_atime` field of the file.

36745 **RETURN VALUE**36746 Refer to `read()`.36747 **ERRORS**36748 Refer to `read()`.36749 In addition, the `readv()` function shall fail if:36750 [EINVAL] The sum of the `iov_len` values in the `iov` array overflowed an `ssize_t`.36751 The `readv()` function may fail if:36752 [EINVAL] The `iovcnt` argument was less than or equal to 0, or greater than `{IOV_MAX}`.36753 **EXAMPLES**36754 **Reading Data into an Array**

36755 The following example reads data from the file associated with the file descriptor `fd` into the  
 36756 buffers specified by members of the `iov` array.

```

36757 #include <sys/types.h>
36758 #include <sys/uio.h>
36759 #include <unistd.h>
36760 ...
36761 ssize_t bytes_read;
36762 int fd;
36763 char buf0[20];
36764 char buf1[30];
36765 char buf2[40];
36766 int iocnt;
36767 struct iovec iov[3];

36768 iov[0].iov_base = buf0;
36769 iov[0].iov_len = sizeof(buf0);
36770 iov[1].iov_base = buf1;
36771 iov[1].iov_len = sizeof(buf1);
36772 iov[2].iov_base = buf2;
36773 iov[2].iov_len = sizeof(buf2);

```

```
36774     ...
36775     iovcnt = sizeof(iov) / sizeof(struct iovec);
36776     bytes_read = readv(fd, iov, iovcnt);
36777     ...
```

36778 **APPLICATION USAGE**

36779 None.

36780 **RATIONALE**

36781 Refer to *read()*.

36782 **FUTURE DIRECTIONS**

36783 None.

36784 **SEE ALSO**

36785 *read()*, *writenv()*, the Base Definitions volume of IEEE Std 1003.1-2001, <sys/uio.h>

36786 **CHANGE HISTORY**

36787 First released in Issue 4, Version 2.

36788 **Issue 6**

36789 Split out from the *read()* reference page.

36790 **NAME**

36791            realloc — memory reallocator

36792 **SYNOPSIS**

36793            #include &lt;stdlib.h&gt;

36794            void \*realloc(void \*ptr, size\_t size);

36795 **DESCRIPTION**

36796 **CX**        The functionality described on this reference page is aligned with the ISO C standard. Any  
 36797 conflict between the requirements described here and the ISO C standard is unintentional. This  
 36798 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

36799        The *realloc()* function shall change the size of the memory object pointed to by *ptr* to the size  
 36800 specified by *size*. The contents of the object shall remain unchanged up to the lesser of the new  
 36801 and old sizes. If the new size of the memory object would require movement of the object, the  
 36802 space for the previous instantiation of the object is freed. If the new size is larger, the contents of  
 36803 the newly allocated portion of the object are unspecified. If *size* is 0 and *ptr* is not a null pointer,  
 36804 the object pointed to is freed. If the space cannot be allocated, the object shall remain unchanged.

36805        If *ptr* is a null pointer, *realloc()* shall be equivalent to *malloc()* for the specified size.

36806        If *ptr* does not match a pointer returned earlier by *calloc()*, *malloc()*, or *realloc()* or if the space has  
 36807 previously been deallocated by a call to *free()* or *realloc()*, the behavior is undefined.

36808        The order and contiguity of storage allocated by successive calls to *realloc()* is unspecified. The  
 36809 pointer returned if the allocation succeeds shall be suitably aligned so that it may be assigned to  
 36810 a pointer to any type of object and then used to access such an object in the space allocated (until  
 36811 the space is explicitly freed or reallocated). Each such allocation shall yield a pointer to an object  
 36812 disjoint from any other object. The pointer returned shall point to the start (lowest byte address)  
 36813 of the allocated space. If the space cannot be allocated, a null pointer shall be returned.

36814 **RETURN VALUE**

36815        Upon successful completion with a *size* not equal to 0, *realloc()* shall return a pointer to the  
 36816 (possibly moved) allocated space. If *size* is 0, either a null pointer or a unique pointer that can be  
 36817 successfully passed to *free()* shall be returned. If there is not enough available memory, *realloc()*  
 36818 **CX** shall return a null pointer and set *errno* to [ENOMEM].

36819 **ERRORS**36820        The *realloc()* function shall fail if:

36821 **CX**        [ENOMEM]        Insufficient memory is available.

36822 **EXAMPLES**

36823        None.

36824 **APPLICATION USAGE**

36825        None.

36826 **RATIONALE**

36827        None.

36828 **FUTURE DIRECTIONS**

36829        None.

36830 **SEE ALSO**36831        *calloc()*, *free()*, *malloc()*, the Base Definitions volume of IEEE Std 1003.1-2001, <stdlib.h>

36832 **CHANGE HISTORY**

36833 First released in Issue 1. Derived from Issue 1 of the SVID.

36834 **Issue 6**

36835 Extensions beyond the ISO C standard are marked.

36836 The following new requirements on POSIX implementations derive from alignment with the  
36837 Single UNIX Specification:

- 36838 • In the RETURN VALUE section, if there is not enough available memory, the setting of *errno*
- 36839 to [ENOMEM] is added.
- 36840 • The [ENOMEM] error condition is added.

36841 **NAME**

36842           realpath — resolve a pathname

36843 **SYNOPSIS**

36844 XSI       #include &lt;stdlib.h&gt;

36845           char \*realpath(const char \*restrict *file\_name*,  
36846                        char \*restrict *resolved\_name*);

36847

36848 **DESCRIPTION**

36849       The *realpath()* function shall derive, from the pathname pointed to by *file\_name*, an absolute  
 36850       pathname that names the same file, whose resolution does not involve '.', '..', or symbolic  
 36851       links. The generated pathname shall be stored as a null-terminated string, up to a maximum of  
 36852       {PATH\_MAX} bytes, in the buffer pointed to by *resolved\_name*.

36853 **RETURN VALUE**

36854       Upon successful completion, *realpath()* shall return a pointer to the resolved name. Otherwise,  
 36855       *realpath()* shall return a null pointer and set *errno* to indicate the error, and the contents of the  
 36856       buffer pointed to by *resolved\_name* are undefined.

36857 **ERRORS**36858       The *realpath()* function shall fail if:

- |       |                |                                                                                                                                  |
|-------|----------------|----------------------------------------------------------------------------------------------------------------------------------|
| 36859 | [EACCES]       | Read or search permission was denied for a component of <i>file_name</i> .                                                       |
| 36860 | [EINVAL]       | Either the <i>file_name</i> or <i>resolved_name</i> argument is a null pointer.                                                  |
| 36861 | [EIO]          | An error occurred while reading from the file system.                                                                            |
| 36862 | [ELOOP]        | A loop exists in symbolic links encountered during resolution of the <i>path</i><br>36863       argument.                        |
| 36864 | [ENAMETOOLONG] | The length of the <i>file_name</i> argument exceeds {PATH_MAX} or a pathname<br>36865       component is longer than {NAME_MAX}. |
| 36867 | [ENOENT]       | A component of <i>file_name</i> does not name an existing file or <i>file_name</i> points to<br>36868       an empty string.     |
| 36869 | [ENOTDIR]      | A component of the path prefix is not a directory.                                                                               |

36870       The *realpath()* function may fail if:

- |       |                |                                                                                                                        |
|-------|----------------|------------------------------------------------------------------------------------------------------------------------|
| 36871 | [ELOOP]        | More than {SYMLOOP_MAX} symbolic links were encountered during<br>36872       resolution of the <i>path</i> argument.  |
| 36873 | [ENAMETOOLONG] | Pathname resolution of a symbolic link produced an intermediate result<br>36874       whose length exceeds {PATH_MAX}. |
| 36875 | [ENOMEM]       | Insufficient storage space is available.                                                                               |

36877 **EXAMPLES**36878 **Generating an Absolute Pathname**

36879 The following example generates an absolute pathname for the file identified by the *symlinkpath*  
36880 argument. The generated pathname is stored in the *actualpath* array.

```
36881 #include <stdlib.h>
36882 ...
36883 char *symlinkpath = "/tmp/symlink/file";
36884 char actualpath [PATH_MAX+1];
36885 char *ptr;
36886 ptr = realpath(symlinkpath, actualpath);
```

36887 **APPLICATION USAGE**

36888 None.

36889 **RATIONALE**

36890 None.

36891 **FUTURE DIRECTIONS**

36892 None.

36893 **SEE ALSO**

36894 *getcwd()*, *sysconf()*, the Base Definitions volume of IEEE Std 1003.1-2001, <stdlib.h>

36895 **CHANGE HISTORY**

36896 First released in Issue 4, Version 2.

36897 **Issue 5**

36898 Moved from X/OPEN UNIX extension to BASE.

36899 **Issue 6**

36900 The **restrict** keyword is added to the *realpath()* prototype for alignment with the  
36901 ISO/IEC 9899:1999 standard.

36902 The wording of the mandatory [ELOOP] error condition is updated, and a second optional  
36903 [ELOOP] error condition is added.

36904 **NAME**

36905           recv — receive a message from a connected socket

36906 **SYNOPSIS**

36907           #include &lt;sys/socket.h&gt;

36908           ssize\_t recv(int *socket*, void \**buffer*, size\_t *length*, int *flags*);36909 **DESCRIPTION**

36910           The *recv()* function shall receive a message from a connection-mode or connectionless-mode  
 36911           socket. It is normally used with connected sockets because it does not permit the application to  
 36912           retrieve the source address of received data.

36913           The *recv()* function takes the following arguments:36914           *socket*           Specifies the socket file descriptor.36915           *buffer*           Points to a buffer where the message should be stored.36916           *length*           Specifies the length in bytes of the buffer pointed to by the *buffer* argument.

36917           *flags*           Specifies the type of message reception. Values of this argument are formed by  
 36918           logically OR'ing zero or more of the following values:

36919                   MSG\_PEEK       Peeks at an incoming message. The data is treated as unread and  
 36920                   the next *recv()* or similar function shall still return this data.

36921                   MSG\_OOB       Requests out-of-band data. The significance and semantics of  
 36922                   out-of-band data are protocol-specific.

36923                   MSG\_WAITALL On SOCK\_STREAM sockets this requests that the function block  
 36924                   until the full amount of data can be returned. The function may  
 36925                   return the smaller amount of data if the socket is a message-  
 36926                   based socket, if a signal is caught, if the connection is  
 36927                   terminated, if MSG\_PEEK was specified, or if an error is pending  
 36928                   for the socket.

36929           The *recv()* function shall return the length of the message written to the buffer pointed to by the  
 36930           *buffer* argument. For message-based sockets, such as SOCK\_DGRAM and SOCK\_SEQPACKET,  
 36931           the entire message shall be read in a single operation. If a message is too long to fit in the  
 36932           supplied buffer, and MSG\_PEEK is not set in the *flags* argument, the excess bytes shall be  
 36933           discarded. For stream-based sockets, such as SOCK\_STREAM, message boundaries shall be  
 36934           ignored. In this case, data shall be returned to the user as soon as it becomes available, and no  
 36935           data shall be discarded.

36936           If the MSG\_WAITALL flag is not set, data shall be returned only up to the end of the first  
 36937           message.

36938           If no messages are available at the socket and O\_NONBLOCK is not set on the socket's file  
 36939           descriptor, *recv()* shall block until a message arrives. If no messages are available at the socket  
 36940           and O\_NONBLOCK is set on the socket's file descriptor, *recv()* shall fail and set *errno* to  
 36941           [EAGAIN] or [EWOULDBLOCK].

36942 **RETURN VALUE**

36943           Upon successful completion, *recv()* shall return the length of the message in bytes. If no  
 36944           messages are available to be received and the peer has performed an orderly shutdown, *recv()*  
 36945           shall return 0. Otherwise, -1 shall be returned and *errno* set to indicate the error.

36946 **ERRORS**

- 36947 The *recv()* function shall fail if:
- 36948 [EAGAIN] or [EWOULDBLOCK]
- 36949 The socket's file descriptor is marked O\_NONBLOCK and no data is waiting  
36950 to be received; or MSG\_OOB is set and no out-of-band data is available and  
36951 either the socket's file descriptor is marked O\_NONBLOCK or the socket does  
36952 not support blocking to await out-of-band data.
- 36953 [EBADF] The *socket* argument is not a valid file descriptor.
- 36954 [ECONNRESET] A connection was forcibly closed by a peer.
- 36955 [EINTR] The *recv()* function was interrupted by a signal that was caught, before any  
36956 data was available.
- 36957 [EINVAL] The MSG\_OOB flag is set and no out-of-band data is available.
- 36958 [ENOTCONN] A receive is attempted on a connection-mode socket that is not connected.
- 36959 [ENOTSOCK] The *socket* argument does not refer to a socket.
- 36960 [EOPNOTSUPP] The specified flags are not supported for this socket type or protocol.
- 36961 [ETIMEDOUT] The connection timed out during connection establishment, or due to a  
36962 transmission timeout on active connection.

36963 The *recv()* function may fail if:

- 36964 [EIO] An I/O error occurred while reading from or writing to the file system.
- 36965 [ENOBUFS] Insufficient resources were available in the system to perform the operation.
- 36966 [ENOMEM] Insufficient memory was available to fulfill the request.

36967 **EXAMPLES**

36968 None.

36969 **APPLICATION USAGE**

36970 The *recv()* function is equivalent to *recvfrom()* with a zero *address\_len* argument, and to *read()* if  
36971 no flags are used.

36972 The *select()* and *poll()* functions can be used to determine when data is available to be received.

36973 **RATIONALE**

36974 None.

36975 **FUTURE DIRECTIONS**

36976 None.

36977 **SEE ALSO**

36980 **CHANGE HISTORY**

36981 First released in Issue 6. Derived from the XNS, Issue 5.2 specification.

36982 **NAME**

36983       recvfrom — receive a message from a socket

36984 **SYNOPSIS**

36985       #include &lt;sys/socket.h&gt;

```
36986       ssize_t recvfrom(int socket, void *restrict buffer, size_t length,
36987                       int flags, struct sockaddr *restrict address,
36988                       socklen_t *restrict address_len);
```

36989 **DESCRIPTION**

36990       The *recvfrom()* function shall receive a message from a connection-mode or connectionless-mode  
 36991       socket. It is normally used with connectionless-mode sockets because it permits the application  
 36992       to retrieve the source address of received data.

36993       The *recvfrom()* function takes the following arguments:

|       |                    |                                                                                                                                                                                                                                                                                                                                                                                                                 |
|-------|--------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 36994 | <i>socket</i>      | Specifies the socket file descriptor.                                                                                                                                                                                                                                                                                                                                                                           |
| 36995 | <i>buffer</i>      | Points to the buffer where the message should be stored.                                                                                                                                                                                                                                                                                                                                                        |
| 36996 | <i>length</i>      | Specifies the length in bytes of the buffer pointed to by the <i>buffer</i> argument.                                                                                                                                                                                                                                                                                                                           |
| 36997 | <i>flags</i>       | Specifies the type of message reception. Values of this argument are formed<br>36998       by logically OR'ing zero or more of the following values:                                                                                                                                                                                                                                                            |
| 36999 | MSG_PEEK           | Peeks at an incoming message. The data is treated as unread<br>37000       and the next <i>recvfrom()</i> or similar function shall still return<br>37001       this data.                                                                                                                                                                                                                                      |
| 37002 | MSG_OOB            | Requests out-of-band data. The significance and semantics<br>37003       of out-of-band data are protocol-specific.                                                                                                                                                                                                                                                                                             |
| 37004 | MSG_WAITALL        | On SOCK_STREAM sockets this requests that the function<br>37005       block until the full amount of data can be returned. The<br>37006       function may return the smaller amount of data if the socket<br>37007       is a message-based socket, if a signal is caught, if the<br>37008       connection is terminated, if MSG_PEEK was specified, or if<br>37009       an error is pending for the socket. |
| 37010 | <i>address</i>     | A null pointer, or points to a <b>sockaddr</b> structure in which the sending address<br>37011       is to be stored. The length and format of the address depend on the address<br>37012       family of the socket.                                                                                                                                                                                           |
| 37013 | <i>address_len</i> | Specifies the length of the <b>sockaddr</b> structure pointed to by the <i>address</i><br>37014       argument.                                                                                                                                                                                                                                                                                                 |

37015       The *recvfrom()* function shall return the length of the message written to the buffer pointed to by  
 37016 RS       the *buffer* argument. For message-based sockets, such as SOCK\_RAW, SOCK\_DGRAM, and  
 37017       SOCK\_SEQPACKET, the entire message shall be read in a single operation. If a message is too  
 37018       long to fit in the supplied buffer, and MSG\_PEEK is not set in the *flags* argument, the excess  
 37019       bytes shall be discarded. For stream-based sockets, such as SOCK\_STREAM, message  
 37020       boundaries shall be ignored. In this case, data shall be returned to the user as soon as it becomes  
 37021       available, and no data shall be discarded.

37022       If the MSG\_WAITALL flag is not set, data shall be returned only up to the end of the first  
 37023       message.

37024       Not all protocols provide the source address for messages. If the *address* argument is not a null  
 37025       pointer and the protocol provides the source address of messages, the source address of the

37026 received message shall be stored in the **sockaddr** structure pointed to by the *address* argument,  
 37027 and the length of this address shall be stored in the object pointed to by the *address\_len*  
 37028 argument.

37029 If the actual length of the address is greater than the length of the supplied **sockaddr** structure,  
 37030 the stored address shall be truncated.

37031 If the *address* argument is not a null pointer and the protocol does not provide the source address  
 37032 of messages, the value stored in the object pointed to by *address* is unspecified.

37033 If no messages are available at the socket and O\_NONBLOCK is not set on the socket's file  
 37034 descriptor, *recvfrom()* shall block until a message arrives. If no messages are available at the  
 37035 socket and O\_NONBLOCK is set on the socket's file descriptor, *recvfrom()* shall fail and set *errno*  
 37036 to [EAGAIN] or [EWOULDBLOCK].

#### 37037 RETURN VALUE

37038 Upon successful completion, *recvfrom()* shall return the length of the message in bytes. If no  
 37039 messages are available to be received and the peer has performed an orderly shutdown,  
 37040 *recvfrom()* shall return 0. Otherwise, the function shall return -1 and set *errno* to indicate the  
 37041 error.

#### 37042 ERRORS

37043 The *recvfrom()* function shall fail if:

37044 [EAGAIN] or [EWOULDBLOCK]

37045 The socket's file descriptor is marked O\_NONBLOCK and no data is waiting  
 37046 to be received; or MSG\_OOB is set and no out-of-band data is available and  
 37047 either the socket's file descriptor is marked O\_NONBLOCK or the socket does  
 37048 not support blocking to await out-of-band data.

37049 [EBADF] The *socket* argument is not a valid file descriptor.

37050 [ECONNRESET] A connection was forcibly closed by a peer.

37051 [EINTR] A signal interrupted *recvfrom()* before any data was available.

37052 [EINVAL] The MSG\_OOB flag is set and no out-of-band data is available.

37053 [ENOTCONN] A receive is attempted on a connection-mode socket that is not connected.

37054 [ENOTSOCK] The *socket* argument does not refer to a socket.

37055 [EOPNOTSUPP] The specified flags are not supported for this socket type.

37056 [ETIMEDOUT] The connection timed out during connection establishment, or due to a  
 37057 transmission timeout on active connection.

37058 The *recvfrom()* function may fail if:

37059 [EIO] An I/O error occurred while reading from or writing to the file system.

37060 [ENOBUFS] Insufficient resources were available in the system to perform the operation.

37061 [ENOMEM] Insufficient memory was available to fulfill the request.

37062 **EXAMPLES**

37063           None.

37064 **APPLICATION USAGE**37065           The *select()* and *poll()* functions can be used to determine when data is available to be received.37066 **RATIONALE**

37067           None.

37068 **FUTURE DIRECTIONS**

37069           None.

37070 **SEE ALSO**37071           *poll()*, *read()*, *recv()*, *recvmsg()*, *select()*, *send()*, *sendmsg()*, *sendto()*, *shutdown()*, *socket()*, *write()*,

37072           the Base Definitions volume of IEEE Std 1003.1-2001, &lt;sys/socket.h&gt;

37073 **CHANGE HISTORY**

37074           First released in Issue 6. Derived from the XNS, Issue 5.2 specification.

37075 **NAME**

37076       recvmsg — receive a message from a socket

37077 **SYNOPSIS**

37078       #include &lt;sys/socket.h&gt;

37079       ssize\_t recvmsg(int *socket*, struct msghdr \**message*, int *flags*);37080 **DESCRIPTION**

37081       The *recvmsg()* function shall receive a message from a connection-mode or connectionless-mode  
 37082       socket. It is normally used with connectionless-mode sockets because it permits the application  
 37083       to retrieve the source address of received data.

37084       The *recvmsg()* function takes the following arguments:

|       |                |                                                                                                                                                                                                                                                                                                                                      |
|-------|----------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 37085 | <i>socket</i>  | Specifies the socket file descriptor.                                                                                                                                                                                                                                                                                                |
| 37086 | <i>message</i> | Points to a <b>msghdr</b> structure, containing both the buffer to store the source address and the buffers for the incoming message. The length and format of the address depend on the address family of the socket. The <i>msg_flags</i> member is ignored on input, but may contain meaningful values on output.                 |
| 37087 |                |                                                                                                                                                                                                                                                                                                                                      |
| 37088 |                |                                                                                                                                                                                                                                                                                                                                      |
| 37089 |                |                                                                                                                                                                                                                                                                                                                                      |
| 37090 | <i>flags</i>   | Specifies the type of message reception. Values of this argument are formed by logically OR'ing zero or more of the following values:                                                                                                                                                                                                |
| 37091 |                |                                                                                                                                                                                                                                                                                                                                      |
| 37092 | MSG_OOB        | Requests out-of-band data. The significance and semantics of out-of-band data are protocol-specific.                                                                                                                                                                                                                                 |
| 37093 |                |                                                                                                                                                                                                                                                                                                                                      |
| 37094 | MSG_PEEK       | Peeks at the incoming message.                                                                                                                                                                                                                                                                                                       |
| 37095 | MSG_WAITALL    | On SOCK_STREAM sockets this requests that the function block until the full amount of data can be returned. The function may return the smaller amount of data if the socket is a message-based socket, if a signal is caught, if the connection is terminated, if MSG_PEEK was specified, or if an error is pending for the socket. |
| 37096 |                |                                                                                                                                                                                                                                                                                                                                      |
| 37097 |                |                                                                                                                                                                                                                                                                                                                                      |
| 37098 |                |                                                                                                                                                                                                                                                                                                                                      |
| 37099 |                |                                                                                                                                                                                                                                                                                                                                      |
| 37100 |                |                                                                                                                                                                                                                                                                                                                                      |

37101       The *recvmsg()* function shall receive messages from unconnected or connected sockets and shall  
 37102       return the length of the message.

37103       The *recvmsg()* function shall return the total length of the message. For message-based sockets,  
 37104       such as SOCK\_DGRAM and SOCK\_SEQPACKET, the entire message shall be read in a single  
 37105       operation. If a message is too long to fit in the supplied buffers, and MSG\_PEEK is not set in the  
 37106       *flags* argument, the excess bytes shall be discarded, and MSG\_TRUNC shall be set in the  
 37107       *msg\_flags* member of the **msghdr** structure. For stream-based sockets, such as SOCK\_STREAM,  
 37108       message boundaries shall be ignored. In this case, data shall be returned to the user as soon as it  
 37109       becomes available, and no data shall be discarded.

37110       If the MSG\_WAITALL flag is not set, data shall be returned only up to the end of the first  
 37111       message.

37112       If no messages are available at the socket and O\_NONBLOCK is not set on the socket's file  
 37113       descriptor, *recvmsg()* shall block until a message arrives. If no messages are available at the  
 37114       socket and O\_NONBLOCK is set on the socket's file descriptor, the *recvmsg()* function shall fail  
 37115       and set *errno* to [EAGAIN] or [EWOULDBLOCK].

37116       In the **msghdr** structure, the *msg\_name* and *msg\_namelen* members specify the source address if  
 37117       the socket is unconnected. If the socket is connected, the *msg\_name* and *msg\_namelen* members  
 37118       shall be ignored. The *msg\_name* member may be a null pointer if no names are desired or  
 37119       required. The *msg\_iov* and *msg\_iovlen* fields are used to specify where the received data shall be

37120 stored. *msg\_iov* points to an array of **iovec** structures; *msg\_iovlen* shall be set to the dimension of  
 37121 this array. In each **iovec** structure, the *iov\_base* field specifies a storage area and the *iov\_len* field  
 37122 gives its size in bytes. Each storage area indicated by *msg\_iov* is filled with received data in turn  
 37123 until all of the received data is stored or all of the areas have been filled.

37124 Upon successful completion, the *msg\_flags* member of the message header shall be the bitwise-  
 37125 inclusive OR of all of the following flags that indicate conditions detected for the received  
 37126 message:

37127 MSG\_EOR End-of-record was received (if supported by the protocol).

37128 MSG\_OOB Out-of-band data was received.

37129 MSG\_TRUNC Normal data was truncated.

37130 MSG\_CTRUNC Control data was truncated.

### 37131 RETURN VALUE

37132 Upon successful completion, *recvmsg()* shall return the length of the message in bytes. If no  
 37133 messages are available to be received and the peer has performed an orderly shutdown,  
 37134 *recvmsg()* shall return 0. Otherwise,  $-1$  shall be returned and *errno* set to indicate the error.

### 37135 ERRORS

37136 The *recvmsg()* function shall fail if:

37137 [EAGAIN] or [EWOULDBLOCK]

37138 The socket's file descriptor is marked O\_NONBLOCK and no data is waiting  
 37139 to be received; or MSG\_OOB is set and no out-of-band data is available and  
 37140 either the socket's file descriptor is marked O\_NONBLOCK or the socket does  
 37141 not support blocking to await out-of-band data.

37142 [EBADF] The *socket* argument is not a valid open file descriptor.

37143 [ECONNRESET] A connection was forcibly closed by a peer.

37144 [EINTR] This function was interrupted by a signal before any data was available.

37145 [EINVAL] The sum of the *iov\_len* values overflows a **ssize\_t**, or the MSG\_OOB flag is set  
 37146 and no out-of-band data is available.

37147 [EMSGSIZE] The *msg\_iovlen* member of the **msghdr** structure pointed to by *message* is less  
 37148 than or equal to 0, or is greater than {IOV\_MAX}.

37149 [ENOTCONN] A receive is attempted on a connection-mode socket that is not connected.

37150 [ENOTSOCK] The *socket* argument does not refer to a socket.

37151 [EOPNOTSUPP] The specified flags are not supported for this socket type.

37152 [ETIMEDOUT] The connection timed out during connection establishment, or due to a  
 37153 transmission timeout on active connection.

37154 The *recvmsg()* function may fail if:

37155 [EIO] An I/O error occurred while reading from or writing to the file system.

37156 [ENOBUFS] Insufficient resources were available in the system to perform the operation.

37157 [ENOMEM] Insufficient memory was available to fulfill the request.

37158 **EXAMPLES**

37159 None.

37160 **APPLICATION USAGE**37161 The *select()* and *poll()* functions can be used to determine when data is available to be received.37162 **RATIONALE**

37163 None.

37164 **FUTURE DIRECTIONS**

37165 None.

37166 **SEE ALSO**37167 *poll()*, *recv()*, *recvfrom()*, *select()*, *send()*, *sendmsg()*, *sendto()*, *shutdown()*, *socket()*, the Base37168 Definitions volume of IEEE Std 1003.1-2001, <**sys/socket.h**>37169 **CHANGE HISTORY**

37170 First released in Issue 6. Derived from the XNS, Issue 5.2 specification.

37171 **NAME**

37172 regcomp, regerror, regex, regfree — regular expression matching

37173 **SYNOPSIS**

37174 #include &lt;regex.h&gt;

37175 int regcomp(regex\_t \*restrict preg, const char \*restrict pattern,  
37176 int cflags);37177 size\_t regerror(int errcode, const regex\_t \*restrict preg,  
37178 char \*restrict errbuf, size\_t errbuf\_size);37179 int regex(const regex\_t \*restrict preg, const char \*restrict string,  
37180 size\_t rmatch, regmatch\_t pmatch[restrict], int eflags);

37181 void regfree(regex\_t \*preg);

37182 **DESCRIPTION**37183 These functions interpret *basic* and *extended* regular expressions as described in the Base  
37184 Definitions volume of IEEE Std 1003.1-2001, Chapter 9, Regular Expressions.37185 The **regex\_t** structure is defined in <regex.h> and contains at least the following member:

37186

37187

37188

| Member Type | Member Name | Description                             |
|-------------|-------------|-----------------------------------------|
| size_t      | re_nsub     | Number of parenthesized subexpressions. |

37189 The **regmatch\_t** structure is defined in <regex.h> and contains at least the following members:

37190

37191

37192

37193

37194

| Member Type | Member Name | Description                                                                                |
|-------------|-------------|--------------------------------------------------------------------------------------------|
| regoff_t    | rm_so       | Byte offset from start of <i>string</i> to start of substring.                             |
| regoff_t    | rm_eo       | Byte offset from start of <i>string</i> of the first character after the end of substring. |

37195 The *regcomp()* function shall compile the regular expression contained in the string pointed to by  
37196 the *pattern* argument and place the results in the structure pointed to by *preg*. The *cflags*  
37197 argument is the bitwise-inclusive OR of zero or more of the following flags, which are defined in  
37198 the <regex.h> header:

37199 REG\_EXTENDED Use Extended Regular Expressions.

37200 REG\_ICASE Ignore case in match. (See the Base Definitions volume of  
37201 IEEE Std 1003.1-2001, Chapter 9, Regular Expressions.)37202 REG\_NOSUB Report only success/fail in *regex()*.

37203 REG\_NEWLINE Change the handling of &lt;newline&gt;s, as described in the text.

37204 The default regular expression type for *pattern* is a Basic Regular Expression. The application can  
37205 specify Extended Regular Expressions using the REG\_EXTENDED *cflags* flag.37206 If the REG\_NOSUB flag was not set in *cflags*, then *regcomp()* shall set *re\_nsub* to the number of  
37207 parenthesized subexpressions (delimited by "\(\)" in basic regular expressions or "( )" in  
37208 extended regular expressions) found in *pattern*.37209 The *regex()* function compares the null-terminated string specified by *string* with the compiled  
37210 regular expression *preg* initialized by a previous call to *regcomp()*. If it finds a match, *regex()*  
37211 shall return 0; otherwise, it shall return non-zero indicating either no match or an error. The  
37212 *eflags* argument is the bitwise-inclusive OR of zero or more of the following flags, which are  
37213 defined in the <regex.h> header:

37214 REG\_NOTBOL The first character of the string pointed to by *string* is not the beginning of the  
 37215 line. Therefore, the circumflex character ( '^ '), when taken as a special  
 37216 character, shall not match the beginning of *string*.

37217 REG\_NOTEOL The last character of the string pointed to by *string* is not the end of the line.  
 37218 Therefore, the dollar sign ( '\$ '), when taken as a special character, shall not  
 37219 match the end of *string*.

37220 If *nmatch* is 0 or REG\_NOSUB was set in the *cflags* argument to *regcomp()*, then *regexec()* shall  
 37221 ignore the *pmatch* argument. Otherwise, the application shall ensure that the *pmatch* argument  
 37222 points to an array with at least *nmatch* elements, and *regexec()* shall fill in the elements of that  
 37223 array with offsets of the substrings of *string* that correspond to the parenthesized subexpressions  
 37224 of *pattern*: *pmatch[i].rm\_so* shall be the byte offset of the beginning and *pmatch[i].rm\_eo* shall be  
 37225 one greater than the byte offset of the end of substring *i*. (Subexpression *i* begins at the *i*th  
 37226 matched open parenthesis, counting from 1.) Offsets in *pmatch[0]* identify the substring that  
 37227 corresponds to the entire regular expression. Unused elements of *pmatch* up to *pmatch[nmatch-1]*  
 37228 shall be filled with -1. If there are more than *nmatch* subexpressions in *pattern* (*pattern* itself  
 37229 counts as a subexpression), then *regexec()* shall still do the match, but shall record only the first  
 37230 *nmatch* substrings.

37231 When matching a basic or extended regular expression, any given parenthesized subexpression  
 37232 of *pattern* might participate in the match of several different substrings of *string*, or it might not  
 37233 match any substring even though the pattern as a whole did match. The following rules shall be  
 37234 used to determine which substrings to report in *pmatch* when matching regular expressions:

37235 1. If subexpression *i* in a regular expression is not contained within another subexpression,  
 37236 and it participated in the match several times, then the byte offsets in *pmatch[i]* shall  
 37237 delimit the last such match.

37238 2. If subexpression *i* is not contained within another subexpression, and it did not participate  
 37239 in an otherwise successful match, the byte offsets in *pmatch[i]* shall be -1. A subexpression  
 37240 does not participate in the match when:

37241 ' \* ' or "\{\}" appears immediately after the subexpression in a basic regular  
 37242 expression, or ' \* ', ' ? ', or "{ }" appears immediately after the subexpression in an  
 37243 extended regular expression, and the subexpression did not match (matched 0 times)

37244 or:

37245 ' | ' is used in an extended regular expression to select this subexpression or another,  
 37246 and the other subexpression matched.

37247 3. If subexpression *i* is contained within another subexpression *j*, and *i* is not contained  
 37248 within any other subexpression that is contained within *j*, and a match of subexpression *j*  
 37249 is reported in *pmatch[j]*, then the match or non-match of subexpression *i* reported in  
 37250 *pmatch[i]* shall be as described in 1. and 2. above, but within the substring reported in  
 37251 *pmatch[j]* rather than the whole string. The offsets in *pmatch[i]* are still relative to the start  
 37252 of *string*.

37253 4. If subexpression *i* is contained in subexpression *j*, and the byte offsets in *pmatch[j]* are -1,  
 37254 then the pointers in *pmatch[i]* shall also be -1.

37255 5. If subexpression *i* matched a zero-length string, then both byte offsets in *pmatch[i]* shall be  
 37256 the byte offset of the character or null terminator immediately following the zero-length  
 37257 string.

37258 If, when *regexec()* is called, the locale is different from when the regular expression was  
 37259 compiled, the result is undefined.

37260 If REG\_NEWLINE is not set in *cflags*, then a <newline> in *pattern* or *string* shall be treated as an  
 37261 ordinary character. If REG\_NEWLINE is set, then <newline> shall be treated as an ordinary  
 37262 character except as follows:

- 37263 1. A <newline> in *string* shall not be matched by a period outside a bracket expression or by  
 37264 any form of a non-matching list (see the Base Definitions volume of IEEE Std 1003.1-2001,  
 37265 Chapter 9, Regular Expressions).
- 37266 2. A circumflex ('^') in *pattern*, when used to specify expression anchoring (see the Base  
 37267 Definitions volume of IEEE Std 1003.1-2001, Section 9.3.8, BRE Expression Anchoring),  
 37268 shall match the zero-length string immediately after a <newline> in *string*, regardless of  
 37269 the setting of REG\_NOTBOL.
- 37270 3. A dollar sign ('\$') in *pattern*, when used to specify expression anchoring, shall match the  
 37271 zero-length string immediately before a <newline> in *string*, regardless of the setting of  
 37272 REG\_NOTEOL.

37273 The *regfree()* function frees any memory allocated by *regcomp()* associated with *preg*.

37274 The following constants are defined as error return values:

|       |              |                                                                                                                     |
|-------|--------------|---------------------------------------------------------------------------------------------------------------------|
| 37275 | REG_NOMATCH  | <i>regexexec()</i> failed to match.                                                                                 |
| 37276 | REG_BADPAT   | Invalid regular expression.                                                                                         |
| 37277 | REG_ECOLLATE | Invalid collating element referenced.                                                                               |
| 37278 | REG_ETYPE    | Invalid character class type referenced.                                                                            |
| 37279 | REG_EESCAPE  | Trailing '\\' in pattern.                                                                                           |
| 37280 | REG_ESUBREG  | Number in "\\digit" invalid or in error.                                                                            |
| 37281 | REG_EBRACK   | "[]" imbalance.                                                                                                     |
| 37282 | REG_EPAREN   | "\(\)" or "()" imbalance.                                                                                           |
| 37283 | REG_EBRACE   | "\{\}" imbalance.                                                                                                   |
| 37284 | REG_BADBR    | Content of "\\{" invalid: not a number, number too large, more than<br>37285 two numbers, first larger than second. |
| 37286 | REG_ERANGE   | Invalid endpoint in range expression.                                                                               |
| 37287 | REG_ESPACE   | Out of memory.                                                                                                      |
| 37288 | REG_BADRPT   | '?', '*', or '+' not preceded by valid regular expression.                                                          |

37289 The *regerror()* function provides a mapping from error codes returned by *regcomp()* and  
 37290 *regexexec()* to unspecified printable strings. It generates a string corresponding to the value of the  
 37291 *errcode* argument, which the application shall ensure is the last non-zero value returned by  
 37292 *regcomp()* or *regexexec()* with the given value of *preg*. If *errcode* is not such a value, the content of  
 37293 the generated string is unspecified.

37294 If *preg* is a null pointer, but *errcode* is a value returned by a previous call to *regexexec()* or *regcomp()*,  
 37295 the *regerror()* still generates an error string corresponding to the value of *errcode*, but it might not  
 37296 be as detailed under some implementations.

37297 If the *errbuf\_size* argument is not 0, *regerror()* shall place the generated string into the buffer of  
 37298 size *errbuf\_size* bytes pointed to by *errbuf*. If the string (including the terminating null) cannot fit  
 37299 in the buffer, *regerror()* shall truncate the string and null-terminate the result.

37300 If *errbuf\_size* is 0, *regerror()* shall ignore the *errbuf* argument, and return the size of the buffer  
 37301 needed to hold the generated string.

37302 If the *preg* argument to *regex()* or *regfree()* is not a compiled regular expression returned by  
 37303 *regcomp()*, the result is undefined. A *preg* is no longer treated as a compiled regular expression  
 37304 after it is given to *regfree()*.

#### 37305 RETURN VALUE

37306 Upon successful completion, the *regcomp()* function shall return 0. Otherwise, it shall return an  
 37307 integer value indicating an error as described in <**regex.h**>, and the content of *preg* is undefined.  
 37308 If a code is returned, the interpretation shall be as given in <**regex.h**>.

37309 If *regcomp()* detects an invalid RE, it may return REG\_BADPAT, or it may return one of the error  
 37310 codes that more precisely describes the error.

37311 Upon successful completion, the *regex()* function shall return 0. Otherwise, it shall return  
 37312 REG\_NOMATCH to indicate no match.

37313 Upon successful completion, the *regerror()* function shall return the number of bytes needed to  
 37314 hold the entire generated string, including the null termination. If the return value is greater than  
 37315 *errbuf\_size*, the string returned in the buffer pointed to by *errbuf* has been truncated.

37316 The *regfree()* function shall not return a value.

#### 37317 ERRORS

37318 No errors are defined.

#### 37319 EXAMPLES

```

37320 #include <regex.h>
37321 /*
37322  * Match string against the extended regular expression in
37323  * pattern, treating errors as no match.
37324  *
37325  * Return 1 for match, 0 for no match.
37326  */
37327 int
37328 match(const char *string, char *pattern)
37329 {
37330     int     status;
37331     regex_t re;
37332     if (regcomp(&re, pattern, REG_EXTENDED|REG_NOSUB) != 0) {
37333         return(0); /* Report error. */
37334     }
37335     status = regexexec(&re, string, (size_t) 0, NULL, 0);
37336     regfree(&re);
37337     if (status != 0) {
37338         return(0); /* Report error. */
37339     }
37340     return(1);
37341 }

```

37342 The following demonstrates how the REG\_NOTBOL flag could be used with *regex()* to find all  
 37343 substrings in a line that match a pattern supplied by a user. (For simplicity of the example, very  
 37344 little error checking is done.)

```

37345     (void) regcomp (&re, pattern, 0);
37346     /* This call to regexec() finds the first match on the line. */
37347     error = regexec (&re, &buffer[0], 1, &pm, 0);
37348     while (error == 0) { /* While matches found. */
37349         /* Substring found between pm.rm_so and pm.rm_eo. */
37350         /* This call to regexec() finds the next match. */
37351         error = regexec (&re, buffer + pm.rm_eo, 1, &pm, REG_NOTBOL);
37352     }

```

### 37353 APPLICATION USAGE

37354 An application could use:

```

37355     regerror(code, preg, (char *)NULL, (size_t)0)

```

37356 to find out how big a buffer is needed for the generated string, *malloc()* a buffer to hold the  
37357 string, and then call *regerror()* again to get the string. Alternatively, it could allocate a fixed,  
37358 static buffer that is big enough to hold most strings, and then use *malloc()* to allocate a larger  
37359 buffer if it finds that this is too small.

37360 To match a pattern as described in the Shell and Utilities volume of IEEE Std 1003.1-2001, Section  
37361 2.13, Pattern Matching Notation, use the *fnmatch()* function.

### 37362 RATIONALE

37363 The *regexec()* function must fill in all *nmatch* elements of *pmatch*, where *nmatch* and *pmatch* are  
37364 supplied by the application, even if some elements of *pmatch* do not correspond to  
37365 subexpressions in *pattern*. The application writer should note that there is probably no reason  
37366 for using a value of *nmatch* that is larger than *preg->re\_nsub+1*.

37367 The REG\_NEWLINE flag supports a use of RE matching that is needed in some applications like  
37368 text editors. In such applications, the user supplies an RE asking the application to find a line  
37369 that matches the given expression. An anchor in such an RE anchors at the beginning or end of  
37370 any line. Such an application can pass a sequence of <newline>-separated lines to *regexec()* as a  
37371 single long string and specify REG\_NEWLINE to *regcomp()* to get the desired behavior. The  
37372 application must ensure that there are no explicit <newline>s in *pattern* if it wants to ensure that  
37373 any match occurs entirely within a single line.

37374 The REG\_NEWLINE flag affects the behavior of *regexec()*, but it is in the *cflags* parameter to  
37375 *regcomp()* to allow flexibility of implementation. Some implementations will want to generate  
37376 the same compiled RE in *regcomp()* regardless of the setting of REG\_NEWLINE and have  
37377 *regexec()* handle anchors differently based on the setting of the flag. Other implementations will  
37378 generate different compiled REs based on the REG\_NEWLINE.

37379 The REG\_ICASE flag supports the operations taken by the *grep -i* option and the historical  
37380 implementations of *ex* and *vi*. Including this flag will make it easier for application code to be  
37381 written that does the same thing as these utilities.

37382 The substrings reported in *pmatch[]* are defined using offsets from the start of the string rather  
37383 than pointers. Since this is a new interface, there should be no impact on historical  
37384 implementations or applications, and offsets should be just as easy to use as pointers. The  
37385 change to offsets was made to facilitate future extensions in which the string to be searched is  
37386 presented to *regexec()* in blocks, allowing a string to be searched that is not all in memory at  
37387 once.

37388 The type **regoff\_t** is used for the elements of *pmatch[]* to ensure that the application can  
37389 represent either the largest possible array in memory (important for an application conforming  
37390 to the Shell and Utilities volume of IEEE Std 1003.1-2001) or the largest possible file (important  
37391 for an application using the extension where a file is searched in chunks).

37392 The standard developers rejected the inclusion of a *regsub()* function that would be used to do  
37393 substitutions for a matched RE. While such a routine would be useful to some applications, its  
37394 utility would be much more limited than the matching function described here. Both RE parsing  
37395 and substitution are possible to implement without support other than that required by the  
37396 ISO C standard, but matching is much more complex than substituting. The only difficult part of  
37397 substitution, given the information supplied by *regexexec()*, is finding the next character in a string  
37398 when there can be multi-byte characters. That is a much larger issue, and one that needs a more  
37399 general solution.

37400 The *errno* variable has not been used for error returns to avoid filling the *errno* name space for  
37401 this feature.

37402 The interface is defined so that the matched substrings *rm\_sp* and *rm\_ep* are in a separate  
37403 **regmatch\_t** structure instead of in **regex\_t**. This allows a single compiled RE to be used  
37404 simultaneously in several contexts; in *main()* and a signal handler, perhaps, or in multiple  
37405 threads of lightweight processes. (The *preg* argument to *regexexec()* is declared with type **const**, so  
37406 the implementation is not permitted to use the structure to store intermediate results.) It also  
37407 allows an application to request an arbitrary number of substrings from an RE. The number of  
37408 subexpressions in the RE is reported in *re\_nsub* in *preg*. With this change to *regexexec()*,  
37409 consideration was given to dropping the REG\_NOSUB flag since the user can now specify this  
37410 with a zero *nmatch* argument to *regexexec()*. However, keeping REG\_NOSUB allows an  
37411 implementation to use a different (perhaps more efficient) algorithm if it knows in *regcomp()*  
37412 that no subexpressions need be reported. The implementation is only required to fill in *pmatch* if  
37413 *nmatch* is not zero and if REG\_NOSUB is not specified. Note that the **size\_t** type, as defined in  
37414 the ISO C standard, is unsigned, so the description of *regexexec()* does not need to address  
37415 negative values of *nmatch*.

37416 REG\_NOTBOL was added to allow an application to do repeated searches for the same pattern  
37417 in a line. If the pattern contains a circumflex character that should match the beginning of a line,  
37418 then the pattern should only match when matched against the beginning of the line. Without  
37419 the REG\_NOTBOL flag, the application could rewrite the expression for subsequent matches,  
37420 but in the general case this would require parsing the expression. The need for REG\_NOTEOL is  
37421 not as clear; it was added for symmetry.

37422 The addition of the *regerror()* function addresses the historical need for conforming application  
37423 programs to have access to error information more than “Function failed to compile/match your  
37424 RE for unknown reasons”.

37425 This interface provides for two different methods of dealing with error conditions. The specific  
37426 error codes (REG\_EBRACE, for example), defined in **<regex.h>**, allow an application to recover  
37427 from an error if it is so able. Many applications, especially those that use patterns supplied by a  
37428 user, will not try to deal with specific error cases, but will just use *regerror()* to obtain a human-  
37429 readable error message to present to the user.

37430 The *regerror()* function uses a scheme similar to *confstr()* to deal with the problem of allocating  
37431 memory to hold the generated string. The scheme used by *strerror()* in the ISO C standard was  
37432 considered unacceptable since it creates difficulties for multi-threaded applications.

37433 The *preg* argument is provided to *regerror()* to allow an implementation to generate a more  
37434 descriptive message than would be possible with *errcode* alone. An implementation might, for  
37435 example, save the character offset of the offending character of the pattern in a field of *preg*, and  
37436 then include that in the generated message string. The implementation may also ignore *preg*.

37437 A REG\_FILENAME flag was considered, but omitted. This flag caused *regexexec()* to match  
37438 patterns as described in the Shell and Utilities volume of IEEE Std 1003.1-2001, Section 2.13,  
37439 Pattern Matching Notation instead of REs. This service is now provided by the *fnmatch()*

37440 function.

37441 Notice that there is a difference in philosophy between the ISO POSIX-2:1993 standard and  
37442 IEEE Std 1003.1-2001 in how to handle a “bad” regular expression. The ISO POSIX-2:1993  
37443 standard says that many bad constructs “produce undefined results”, or that “the interpretation  
37444 is undefined”. IEEE Std 1003.1-2001, however, says that the interpretation of such REs is  
37445 unspecified. The term “undefined” means that the action by the application is an error, of  
37446 similar severity to passing a bad pointer to a function.

37447 The *regcomp()* and *regexec()* functions are required to accept any null-terminated string as the  
37448 *pattern* argument. If the meaning of the string is “undefined”, the behavior of the function is  
37449 “unspecified”. IEEE Std 1003.1-2001 does not specify how the functions will interpret the  
37450 pattern; they might return error codes, or they might do pattern matching in some completely  
37451 unexpected way, but they should not do something like abort the process.

#### 37452 FUTURE DIRECTIONS

37453 None.

37457 Expressions, <**regex.h**>, <**sys/types.h**>

#### 37458 CHANGE HISTORY

37459 First released in Issue 4. Derived from the ISO POSIX-2 standard.

#### 37460 Issue 5

37461 Moved from POSIX2 C-language Binding to BASE.

#### 37462 Issue 6

37463 In the SYNOPSIS, the optional include of the <**sys/types.h**> header is removed.

37464 The following new requirements on POSIX implementations derive from alignment with the  
37465 Single UNIX Specification:

- 37466 • The requirement to include <**sys/types.h**> has been removed. Although <**sys/types.h**> was  
37467 required for conforming implementations of previous POSIX specifications, it was not  
37468 required for UNIX applications.

37469 The DESCRIPTION is updated to avoid use of the term “must” for application requirements.

37470 The REG\_ENOSYS constant is removed.

37471 The **restrict** keyword is added to the *regcomp()*, *regerror()*, and *regexec()* prototypes for  
37472 alignment with the ISO/IEC 9899:1999 standard.

37473 **NAME**

37474 remainder, remainderf, remainderl — remainder function

37475 **SYNOPSIS**

37476 #include &lt;math.h&gt;

37477 double remainder(double x, double y);

37478 float remainderf(float x, float y);

37479 long double remainderl(long double x, long double y);

37480 **DESCRIPTION**

37481 **CX** The functionality described on this reference page is aligned with the ISO C standard. Any  
 37482 conflict between the requirements described here and the ISO C standard is unintentional. This  
 37483 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

37484 These functions shall return the floating-point remainder  $r=x-ny$  when  $y$  is non-zero. The value  
 37485  $n$  is the integral value nearest the exact value  $x/y$ . When  $|n-x/y| = 1/2$ , the value  $n$  is chosen to  
 37486 be even.

37487 The behavior of *remainder()* shall be independent of the rounding mode.37488 **RETURN VALUE**37489 Upon successful completion, these functions shall return the floating-point remainder  $r=x-ny$   
37490 when  $y$  is non-zero.37491 **MX** If  $x$  or  $y$  is NaN, a NaN shall be returned.37492 If  $x$  is infinite or  $y$  is 0 and the other is non-NaN, a domain error shall occur, and either a NaN (if  
37493 supported), or an implementation-defined value shall be returned.37494 **ERRORS**

37495 These functions shall fail if:

|                 |                     |                                                                                                         |
|-----------------|---------------------|---------------------------------------------------------------------------------------------------------|
| 37496 <b>MX</b> | <b>Domain Error</b> | The $x$ argument is $\pm\text{Inf}$ , or the $y$ argument is $\pm 0$ and the other argument is non-NaN. |
|-----------------|---------------------|---------------------------------------------------------------------------------------------------------|

|       |       |       |       |                                                                                                                                                                                                                                                        |
|-------|-------|-------|-------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 37498 | 37499 | 37500 | 37501 | If the integer expression (math_errhandling & MATH_ERRNO) is non-zero, then <i>errno</i> shall be set to [EDOM]. If the integer expression (math_errhandling & MATH_ERREXCEPT) is non-zero, then the invalid floating-point exception shall be raised. |
|-------|-------|-------|-------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

37502 **EXAMPLES**

37503 None.

37504 **APPLICATION USAGE**37505 On error, the expressions (math\_errhandling & MATH\_ERRNO) and (math\_errhandling &  
37506 MATH\_ERREXCEPT) are independent of each other, but at least one of them must be non-zero.37507 **RATIONALE**

37508 None.

37509 **FUTURE DIRECTIONS**

37510 None.

37511 **SEE ALSO**37512 *abs()*, *div()*, *feclearexcept()*, *fetestexcept()*, *ldiv()*, the Base Definitions volume of  
37513 IEEE Std 1003.1-2001, Section 4.18, Treatment of Error Conditions for Mathematical Functions,  
37514 <math.h>

37515 **CHANGE HISTORY**

37516 First released in Issue 4, Version 2.

37517 **Issue 5**

37518 Moved from X/OPEN UNIX extension to BASE.

37519 **Issue 6**

37520 The *remainder()* function is no longer marked as an extension.

37521 The *remainderf()* and *remainderl()* functions are added for alignment with the ISO/IEC 9899:1999 standard.

37523 The DESCRIPTION, RETURN VALUE, ERRORS, and APPLICATION USAGE sections are revised to align with the ISO/IEC 9899:1999 standard.

37525 IEC 60559:1989 standard floating-point extensions over the ISO/IEC 9899:1999 standard are marked.

37526

37527 **NAME**

37528 remove — remove a file

37529 **SYNOPSIS**

37530 #include &lt;stdio.h&gt;

37531 int remove(const char \*path);

37532 **DESCRIPTION**

37533 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
37534 conflict between the requirements described here and the ISO C standard is unintentional. This  
37535 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

37536 The *remove()* function shall cause the file named by the pathname pointed to by *path* to be no  
37537 longer accessible by that name. A subsequent attempt to open that file using that name shall fail,  
37538 unless it is created anew.

37539 CX If *path* does not name a directory, *remove(path)* shall be equivalent to *unlink(path)*.

37540 If *path* names a directory, *remove(path)* shall be equivalent to *rmdir(path)*.

37541 **RETURN VALUE**37542 CX Refer to *rmdir()* or *unlink()*.37543 **ERRORS**37544 CX Refer to *rmdir()* or *unlink()*.37545 **EXAMPLES**37546 **Removing Access to a File**37547 The following example shows how to remove access to a file named `/home/cnd/old_mods`.

37548 #include &lt;stdio.h&gt;

37549 int status;

37550 ...

37551 status = remove("/home/cnd/old\_mods");

37552 **APPLICATION USAGE**

37553 None.

37554 **RATIONALE**

37555 None.

37556 **FUTURE DIRECTIONS**

37557 None.

37558 **SEE ALSO**37559 *rmdir()*, *unlink()*, the Base Definitions volume of IEEE Std 1003.1-2001, <stdio.h>37560 **CHANGE HISTORY**

37561 First released in Issue 3. Included for alignment with the POSIX.1-1988 standard and the ISO C  
37562 standard.

37563 **Issue 6**

37564 Extensions beyond the ISO C standard are marked.

37565 The following new requirements on POSIX implementations derive from alignment with the  
37566 Single UNIX Specification:

37567  
37568  
37569

- The DESCRIPTION, RETURN VALUE, and ERRORS sections are updated so that if *path* is not a directory, *remove()* is equivalent to *unlink()*, and if it is a directory, it is equivalent to *rmdir()*.

37570 **NAME**

37571 remque — remove an element from a queue

37572 **SYNOPSIS**

37573 xSI #include <search.h>

37574 void remque(void \**element*);

37575

37576 **DESCRIPTION**

37577 Refer to *insque()*.

37578 **NAME**

37579 remquo, remquof, remquol — remainder functions

37580 **SYNOPSIS**

37581 #include &lt;math.h&gt;

37582 double remquo(double x, double y, int \*quo);

37583 float remquof(float x, float y, int \*quo);

37584 long double remquol(long double x, long double y, int \*quo);

37585 **DESCRIPTION**

37586 **CX** The functionality described on this reference page is aligned with the ISO C standard. Any  
 37587 conflict between the requirements described here and the ISO C standard is unintentional. This  
 37588 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

37589 The *remquo()*, *remquof()*, and *remquol()* functions shall compute the same remainder as the  
 37590 *remainder()*, *remainderf()*, and *remainderl()* functions, respectively. In the object pointed to by  
 37591 *quo*, they store a value whose sign is the sign of  $x/y$  and whose magnitude is congruent modulo  
 37592  $2^n$  to the magnitude of the integral quotient of  $x/y$ , where  $n$  is an implementation-defined  
 37593 integer greater than or equal to 3.

37594 An application wishing to check for error situations should set *errno* to zero and call  
 37595 *feclearexcept*(FE\_ALL\_EXCEPT) before calling these functions. On return, if *errno* is non-zero or  
 37596 *fetestexcept*(FE\_INVALID | FE\_DIVBYZERO | FE\_OVERFLOW | FE\_UNDERFLOW) is non-  
 37597 zero, an error has occurred.

37598 **RETURN VALUE**37599 These functions shall return  $x \text{ REM } y$ .37600 **MX** If  $x$  or  $y$  is NaN, a NaN shall be returned.

37601 If  $x$  is  $\pm\text{Inf}$  or  $y$  is zero and the other argument is non-NaN, a domain error shall occur, and either  
 37602 a NaN (if supported), or an implementation-defined value shall be returned.

37603 **ERRORS**

37604 These functions shall fail if:

37605 **MX** Domain Error The  $x$  argument is  $\pm\text{Inf}$ , or the  $y$  argument is  $\pm 0$  and the other argument is  
 37606 non-NaN.

37607 If the integer expression (*math\_errhandling* & MATH\_ERRNO) is non-zero,  
 37608 then *errno* shall be set to [EDOM]. If the integer expression (*math\_errhandling*  
 37609 & MATH\_ERREXCEPT) is non-zero, then the invalid floating-point exception  
 37610 shall be raised.

37611 **EXAMPLES**

37612 None.

37613 **APPLICATION USAGE**

37614 On error, the expressions (*math\_errhandling* & MATH\_ERRNO) and (*math\_errhandling* &  
 37615 MATH\_ERREXCEPT) are independent of each other, but at least one of them must be non-zero.

37616 **RATIONALE**

37617 These functions are intended for implementing argument reductions which can exploit a few  
 37618 low-order bits of the quotient. Note that  $x$  may be so large in magnitude relative to  $y$  that an  
 37619 exact representation of the quotient is not practical.

37620 **FUTURE DIRECTIONS**

37621 None.

37622 **SEE ALSO**37623 *feclearexcept()*, *fetetestexcept()*, *remainder()*, the Base Definitions volume of IEEE Std 1003.1-2001,  
37624 Section 4.18, Treatment of Error Conditions for Mathematical Functions, <**math.h**>37625 **CHANGE HISTORY**

37626 First released in Issue 6. Derived from the ISO/IEC 9899:1999 standard.

37627 **NAME**

37628 rename — rename a file

37629 **SYNOPSIS**

37630 #include &lt;stdio.h&gt;

37631 int rename(const char \*old, const char \*new);

37632 **DESCRIPTION**

37633 cx The functionality described on this reference page is aligned with the ISO C standard. Any  
 37634 conflict between the requirements described here and the ISO C standard is unintentional. This  
 37635 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

37636 The *rename()* function shall change the name of a file. The *old* argument points to the pathname  
 37637 of the file to be renamed. The *new* argument points to the new pathname of the file.

37638 cx If either the *old* or *new* argument names a symbolic link, *rename()* shall operate on the symbolic  
 37639 link itself, and shall not resolve the last component of the argument. If the *old* argument and the  
 37640 *new* argument resolve to the same existing file, *rename()* shall return successfully and perform no  
 37641 other action.

37642 If the *old* argument points to the pathname of a file that is not a directory, the *new* argument shall  
 37643 not point to the pathname of a directory. If the link named by the *new* argument exists, it shall be  
 37644 removed and *old* renamed to *new*. In this case, a link named *new* shall remain visible to other  
 37645 processes throughout the renaming operation and refer either to the file referred to by *new* or *old*  
 37646 before the operation began. Write access permission is required for both the directory containing  
 37647 *old* and the directory containing *new*.

37648 If the *old* argument points to the pathname of a directory, the *new* argument shall not point to the  
 37649 pathname of a file that is not a directory. If the directory named by the *new* argument exists, it  
 37650 shall be removed and *old* renamed to *new*. In this case, a link named *new* shall exist throughout  
 37651 the renaming operation and shall refer either to the directory referred to by *new* or *old* before the  
 37652 operation began. If *new* names an existing directory, it shall be required to be an empty directory.

37653 If the *old* argument points to a pathname of a symbolic link, the symbolic link shall be renamed.  
 37654 If the *new* argument points to a pathname of a symbolic link, the symbolic link shall be removed.

37655 The *new* pathname shall not contain a path prefix that names *old*. Write access permission is  
 37656 required for the directory containing *old* and the directory containing *new*. If the *old* argument  
 37657 points to the pathname of a directory, write access permission may be required for the directory  
 37658 named by *old*, and, if it exists, the directory named by *new*.

37659 If the link named by the *new* argument exists and the file's link count becomes 0 when it is  
 37660 removed and no process has the file open, the space occupied by the file shall be freed and the  
 37661 file shall no longer be accessible. If one or more processes have the file open when the last link is  
 37662 removed, the link shall be removed before *rename()* returns, but the removal of the file contents  
 37663 shall be postponed until all references to the file are closed.

37664 Upon successful completion, *rename()* shall mark for update the *st\_ctime* and *st\_mtime* fields of  
 37665 the parent directory of each file.

37666 If the *rename()* function fails for any reason other than [EIO], any file named by *new* shall be  
 37667 unaffected.

37668 **RETURN VALUE**

37669 cx Upon successful completion, *rename()* shall return 0; otherwise, -1 shall be returned, *errno* shall  
 37670 be set to indicate the error, and neither the file named by *old* nor the file named by *new* shall be  
 37671 changed or created.

37672 **ERRORS**37673 The *rename()* function shall fail if:

37674 CX [EACCES] A component of either path prefix denies search permission; or one of the  
 37675 directories containing *old* or *new* denies write permissions; or, write  
 37676 permission is required and is denied for a directory pointed to by the *old* or  
 37677 *new* arguments.

37678 CX [EBUSY] The directory named by *old* or *new* is currently in use by the system or another  
 37679 process, and the implementation considers this an error.

37680 CX [EEXIST] or [ENOTEMPTY]  
 37681 The link named by *new* is a directory that is not an empty directory.

37682 CX [EINVAL] The *new* directory pathname contains a path prefix that names the *old*  
 37683 directory.

37684 CX [EIO] A physical I/O error has occurred.

37685 CX [EISDIR] The *new* argument points to a directory and the *old* argument points to a file  
 37686 that is not a directory.

37687 CX [ELOOP] A loop exists in symbolic links encountered during resolution of the *path*  
 37688 argument.

37689 CX [EMLINK] The file named by *old* is a directory, and the link count of the parent directory  
 37690 of *new* would exceed {LINK\_MAX}.

37691 CX [ENAMETOOLONG]  
 37692 The length of the *old* or *new* argument exceeds {PATH\_MAX} or a pathname  
 37693 component is longer than {NAME\_MAX}.

37694 CX [ENOENT] The link named by *old* does not name an existing file, or either *old* or *new*  
 37695 points to an empty string.

37696 CX [ENOSPC] The directory that would contain *new* cannot be extended.

37697 CX [ENOTDIR] A component of either path prefix is not a directory; or the *old* argument  
 37698 names a directory and *new* argument names a non-directory file.

37699 XSI [EPERM] or [EACCES]  
 37700 The S\_ISVTX flag is set on the directory containing the file referred to by *old*  
 37701 and the caller is not the file owner, nor is the caller the directory owner, nor  
 37702 does the caller have appropriate privileges; or *new* refers to an existing file, the  
 37703 S\_ISVTX flag is set on the directory containing this file, and the caller is not  
 37704 the file owner, nor is the caller the directory owner, nor does the caller have  
 37705 appropriate privileges.

37706 CX [EROFS] The requested operation requires writing in a directory on a read-only file  
 37707 system.

37708 CX [EXDEV] The links named by *new* and *old* are on different file systems and the  
 37709 implementation does not support links between file systems.

37710 The *rename()* function may fail if:

37711 XSI [EBUSY] The file named by the *old* or *new* arguments is a named STREAM.

37712 CX [ELOOP] More than {SYMLOOP\_MAX} symbolic links were encountered during  
 37713 resolution of the *path* argument.

37714 CX [ENAMETOOLONG]  
 37715 As a result of encountering a symbolic link in resolution of the *path* argument,  
 37716 the length of the substituted pathname string exceeded {PATH\_MAX}.

37717 CX [ETXTBSY] The file to be renamed is a pure procedure (shared text) file that is being  
 37718 executed.

### 37719 EXAMPLES

#### 37720 Renaming a File

37721 The following example shows how to rename a file named `/home/cnd/mod1` to  
 37722 `/home/cnd/mod2`.

```
37723 #include <stdio.h>
37724 int status;
37725 ...
37726 status = rename("/home/cnd/mod1", "/home/cnd/mod2");
```

#### 37727 APPLICATION USAGE

37728 Some implementations mark for update the *st\_ctime* field of renamed files and some do not.  
 37729 Applications which make use of the *st\_ctime* field may behave differently with respect to  
 37730 renamed files unless they are designed to allow for either behavior.

#### 37731 RATIONALE

37732 This *rename()* function is equivalent for regular files to that defined by the ISO C standard. Its  
 37733 inclusion here expands that definition to include actions on directories and specifies behavior  
 37734 when the *new* parameter names a file that already exists. That specification requires that the  
 37735 action of the function be atomic.

37736 One of the reasons for introducing this function was to have a means of renaming directories  
 37737 while permitting implementations to prohibit the use of *link()* and *unlink()* with directories,  
 37738 thus constraining links to directories to those made by *mkdir()*.

37739 The specification that if *old* and *new* refer to the same file is intended to guarantee that:

```
37740 rename("x", "x");
```

37741 does not remove the file.

37742 Renaming dot or dot-dot is prohibited in order to prevent cyclical file system paths.

37743 See also the descriptions of [ENOTEMPTY] and [ENAMETOOLONG] in *rmdir()* and [EBUSY] in  
 37744 *unlink()*. For a discussion of [EXDEV], see *link()*.

#### 37745 FUTURE DIRECTIONS

37746 None.

#### 37747 SEE ALSO

37748 *link()*, *rmdir()*, *symlink()*, *unlink()*, the Base Definitions volume of IEEE Std 1003.1-2001,  
 37749 `<stdio.h>`

#### 37750 CHANGE HISTORY

37751 First released in Issue 3. Included for alignment with the POSIX.1-1988 standard.

#### 37752 Issue 5

37753 The [EBUSY] error is added to the “may fail” part of the ERRORS section.

37754 **Issue 6**

- 37755 Extensions beyond the ISO C standard are marked.
- 37756 The following new requirements on POSIX implementations derive from alignment with the  
37757 Single UNIX Specification:
- 37758 • The [EIO] mandatory error condition is added.
  - 37759 • The [ELOOP] mandatory error condition is added.
  - 37760 • A second [ENAMETOOLONG] is added as an optional error condition.
  - 37761 • The [ETXTBSY] optional error condition is added.
- 37762 The following changes were made to align with the IEEE P1003.1a draft standard:
- 37763 • Details are added regarding the treatment of symbolic links.
  - 37764 • The [ELOOP] optional error condition is added.
- 37765 The DESCRIPTION is updated to avoid use of the term “must” for application requirements.

37766 **NAME**

37767       rewind — reset the file position indicator in a stream

37768 **SYNOPSIS**

37769       #include <stdio.h>

37770       void rewind(FILE \*stream);

37771 **DESCRIPTION**

37772 **CX**       The functionality described on this reference page is aligned with the ISO C standard. Any  
37773 conflict between the requirements described here and the ISO C standard is unintentional. This  
37774 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

37775       The call:

37776       rewind(stream)

37777       shall be equivalent to:

37778       (void) fseek(stream, 0L, SEEK\_SET)

37779       except that *rewind()* shall also clear the error indicator.

37780 **CX**       Since *rewind()* does not return a value, an application wishing to detect errors should clear *errno*,  
37781 then call *rewind()*, and if *errno* is non-zero, assume an error has occurred.

37782 **RETURN VALUE**

37783       The *rewind()* function shall not return a value.

37784 **ERRORS**

37785 **CX**       Refer to *fseek()* with the exception of [EINVAL] which does not apply.

37786 **EXAMPLES**

37787       None.

37788 **APPLICATION USAGE**

37789       None.

37790 **RATIONALE**

37791       None.

37792 **FUTURE DIRECTIONS**

37793       None.

37794 **SEE ALSO**

37795       *fseek()*, the Base Definitions volume of IEEE Std 1003.1-2001, <stdio.h>

37796 **CHANGE HISTORY**

37797       First released in Issue 1. Derived from Issue 1 of the SVID.

37798 **Issue 6**

37799       Extensions beyond the ISO C standard are marked.

37800 **NAME**

37801       rewinddir — reset the position of a directory stream to the beginning of a directory

37802 **SYNOPSIS**

37803       #include <dirent.h>

37804       void rewinddir(DIR \*dirp);

37805 **DESCRIPTION**

37806       The *rewinddir()* function shall reset the position of the directory stream to which *dirp* refers to  
37807       the beginning of the directory. It shall also cause the directory stream to refer to the current state  
37808       of the corresponding directory, as a call to *opendir()* would have done. If *dirp* does not refer to a  
37809       directory stream, the effect is undefined.

37810       After a call to the *fork()* function, either the parent or child (but not both) may continue  
37811 XSI       processing the directory stream using *readdir()*, *rewinddir()*, or *seekdir()*. If both the parent and  
37812       child processes use these functions, the result is undefined.

37813 **RETURN VALUE**

37814       The *rewinddir()* function shall not return a value.

37815 **ERRORS**

37816       No errors are defined.

37817 **EXAMPLES**

37818       None.

37819 **APPLICATION USAGE**

37820       The *rewinddir()* function should be used in conjunction with *opendir()*, *readdir()*, and *closedir()* to  
37821       examine the contents of the directory. This method is recommended for portability.

37822 **RATIONALE**

37823       None.

37824 **FUTURE DIRECTIONS**

37825       None.

37826 **SEE ALSO**

37827       *closedir()*, *opendir()*, *readdir()*, the Base Definitions volume of IEEE Std 1003.1-2001, <dirent.h>  
37828       <sys/types.h>

37829 **CHANGE HISTORY**

37830       First released in Issue 2.

37831 **Issue 6**

37832       In the SYNOPSIS, the optional include of the <sys/types.h> header is removed.

37833       The following new requirements on POSIX implementations derive from alignment with the  
37834       Single UNIX Specification:

- 37835       • The requirement to include <sys/types.h> has been removed. Although <sys/types.h> was  
37836       required for conforming implementations of previous POSIX specifications, it was not  
37837       required for UNIX applications.

37838 **NAME**37839 rindex — character string operations (**LEGACY**)37840 **SYNOPSIS**37841 XSI 

```
#include <strings.h>
```

37842 

```
char *rindex(const char *s, int c);
```

37843

37844 **DESCRIPTION**37845 The *rindex()* function shall be equivalent to *strchr()*.37846 **RETURN VALUE**37847 Refer to *strchr()*.37848 **ERRORS**37849 Refer to *strchr()*.37850 **EXAMPLES**

37851 None.

37852 **APPLICATION USAGE**37853 The *strchr()* function is preferred over this function.37854 For maximum portability, it is recommended to replace the function call to *rindex()* as follows:37855 

```
#define rindex(a,b) strchr((a),(b))
```

37856 **RATIONALE**

37857 None.

37858 **FUTURE DIRECTIONS**

37859 This function may be withdrawn in a future version.

37860 **SEE ALSO**37861 *strchr()*, the Base Definitions volume of IEEE Std 1003.1-2001, <**strings.h**>37862 **CHANGE HISTORY**

37863 First released in Issue 4, Version 2.

37864 **Issue 5**

37865 Moved from X/OPEN UNIX extension to BASE.

37866 **Issue 6**

37867 This function is marked LEGACY.

37868 **NAME**

37869 rint, rintf, rintl — round-to-nearest integral value

37870 **SYNOPSIS**

37871 #include &lt;math.h&gt;

37872 double rint(double x);

37873 float rintf(float x);

37874 long double rintl(long double x);

37875 **DESCRIPTION**

37876 **CX** The functionality described on this reference page is aligned with the ISO C standard. Any  
 37877 conflict between the requirements described here and the ISO C standard is unintentional. This  
 37878 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

37879 These functions shall return the integral value (represented as a **double**) nearest *x* in the  
 37880 direction of the current rounding mode. The current rounding mode is implementation-defined.

37881 If the current rounding mode rounds toward negative infinity, then *rint()* shall be equivalent to  
 37882 *floor()*. If the current rounding mode rounds toward positive infinity, then *rint()* shall be  
 37883 equivalent to *ceil()*.

37884 These functions differ from the *nearbyint()*, *nearbyintf()*, and *nearbyintl()* functions only in that  
 37885 they may raise the inexact floating-point exception if the result differs in value from the  
 37886 argument.

37887 An application wishing to check for error situations should set *errno* to zero and call  
 37888 *feclearexcept*(FE\_ALL\_EXCEPT) before calling these functions. On return, if *errno* is non-zero or  
 37889 *fetestexcept*(FE\_INVALID | FE\_DIVBYZERO | FE\_OVERFLOW | FE\_UNDERFLOW) is non-  
 37890 zero, an error has occurred.

37891 **RETURN VALUE**

37892 Upon successful completion, these functions shall return the integer (represented as a double  
 37893 precision number) nearest *x* in the direction of the current rounding mode.

37894 **MX** If *x* is NaN, a NaN shall be returned.

37895 If *x* is  $\pm 0$  or  $\pm \text{Inf}$ , *x* shall be returned.

37896 **XSI** If the correct value would cause overflow, a range error shall occur and *rint()*, *rintf()*, and *rintl()*  
 37897 shall return the value of the macro  $\pm\text{HUGE\_VAL}$ ,  $\pm\text{HUGE\_VALF}$ , and  $\pm\text{HUGE\_VALL}$  (with the  
 37898 same sign as *x*), respectively.

37899 **ERRORS**

37900 These functions shall fail if:

37901 **XSI** **Range Error** The result would cause an overflow.

37902 If the integer expression (math\_errhandling & MATH\_ERRNO) is non-zero,  
 37903 then *errno* shall be set to [ERANGE]. If the integer expression  
 37904 (math\_errhandling & MATH\_ERREXCEPT) is non-zero, then the overflow  
 37905 floating-point exception shall be raised.

37906 **EXAMPLES**

37907 None.

37908 **APPLICATION USAGE**

37909 On error, the expressions (`math_errhandling & MATH_ERRNO`) and (`math_errhandling &`  
37910 `MATH_ERREXCEPT`) are independent of each other, but at least one of them must be non-zero.

37911 **RATIONALE**

37912 None.

37913 **FUTURE DIRECTIONS**

37914 None.

37919 **CHANGE HISTORY**

37920 First released in Issue 4, Version 2.

37921 **Issue 5**

37922 Moved from X/OPEN UNIX extension to BASE.

37923 **Issue 6**

37924 The following changes are made for alignment with the ISO/IEC 9899:1999 standard:

- 37925 • The *rintf()* and *rintl()* functions are added.
- 37926 • The *rint()* function is no longer marked as an extension.
- 37927 • The DESCRIPTION, RETURN VALUE, ERRORS, and APPLICATION USAGE sections are  
37928 revised to align with the ISO/IEC 9899:1999 standard.
- 37929 IEC 60559:1989 standard floating-point extensions over the ISO/IEC 9899:1999 standard are  
37930 marked.

37931 **NAME**

37932 rmdir — remove a directory

37933 **SYNOPSIS**

37934 #include &lt;unistd.h&gt;

37935 int rmdir(const char \*path);

37936 **DESCRIPTION**37937 The *rmdir()* function shall remove a directory whose name is given by *path*. The directory shall  
37938 be removed only if it is an empty directory.37939 If the directory is the root directory or the current working directory of any process, it is  
37940 unspecified whether the function succeeds, or whether it shall fail and set *errno* to [EBUSY].37941 If *path* names a symbolic link, then *rmdir()* shall fail and set *errno* to [ENOTDIR].37942 If the *path* argument refers to a path whose final component is either dot or dot-dot, *rmdir()* shall  
37943 fail.37944 If the directory's link count becomes 0 and no process has the directory open, the space occupied  
37945 by the directory shall be freed and the directory shall no longer be accessible. If one or more  
37946 processes have the directory open when the last link is removed, the dot and dot-dot entries, if  
37947 present, shall be removed before *rmdir()* returns and no new entries may be created in the  
37948 directory, but the directory shall not be removed until all references to the directory are closed.37949 If the directory is not an empty directory, *rmdir()* shall fail and set *errno* to [EEXIST] or  
37950 [ENOTEMPTY].37951 Upon successful completion, the *rmdir()* function shall mark for update the *st\_ctime* and  
37952 *st\_mtime* fields of the parent directory.37953 **RETURN VALUE**37954 Upon successful completion, the function *rmdir()* shall return 0. Otherwise, -1 shall be returned,  
37955 and *errno* set to indicate the error. If -1 is returned, the named directory shall not be changed.37956 **ERRORS**37957 The *rmdir()* function shall fail if:37958 [EACCES] Search permission is denied on a component of the path prefix, or write  
37959 permission is denied on the parent directory of the directory to be removed.37960 [EBUSY] The directory to be removed is currently in use by the system or some process  
37961 and the implementation considers this to be an error.37962 [EEXIST] or [ENOTEMPTY]  
37963 The *path* argument names a directory that is not an empty directory, or there  
37964 are hard links to the directory other than dot or a single entry in dot-dot.37965 [EINVAL] The *path* argument contains a last component that is dot.

37966 [EIO] A physical I/O error has occurred.

37967 [ELOOP] A loop exists in symbolic links encountered during resolution of the *path*  
37968 argument.37969 [ENAMETOOLONG]  
37970 The length of the *path* argument exceeds {PATH\_MAX} or a pathname  
37971 component is longer than {NAME\_MAX}.37972 [ENOENT] A component of *path* does not name an existing file, or the *path* argument  
37973 names a nonexistent directory or points to an empty string.

- 37974 [ENOTDIR] A component of *path* is not a directory.
- 37975 XSI [EPERM] or [EACCES]  
 37976 The S\_ISVTX flag is set on the parent directory of the directory to be removed  
 37977 and the caller is not the owner of the directory to be removed, nor is the caller  
 37978 the owner of the parent directory, nor does the caller have the appropriate  
 37979 privileges.
- 37980 [EROFS] The directory entry to be removed resides on a read-only file system.
- 37981 The *rmdir()* function may fail if:
- 37982 [ELOOP] More than {SYMLOOP\_MAX} symbolic links were encountered during  
 37983 resolution of the *path* argument.
- 37984 [ENAMETOOLONG]  
 37985 As a result of encountering a symbolic link in resolution of the *path* argument,  
 37986 the length of the substituted pathname string exceeded {PATH\_MAX}.

37987 **EXAMPLES**37988 **Removing a Directory**

37989 The following example shows how to remove a directory named `/home/cnd/mod1`.

```
37990 #include <unistd.h>
37991 int status;
37992 ...
37993 status = rmdir("/home/cnd/mod1");
```

37994 **APPLICATION USAGE**

37995 None.

37996 **RATIONALE**

37997 The *rmdir()* and *rename()* functions originated in 4.2 BSD, and they used [ENOTEMPTY] for the  
 37998 condition when the directory to be removed does not exist or *new* already exists. When the 1984  
 37999 /usr/group standard was published, it contained [EEXIST] instead. When these functions were  
 38000 adopted into System V, the 1984 /usr/group standard was used as a reference. Therefore, several  
 38001 existing applications and implementations support/use both forms, and no agreement could be  
 38002 reached on either value. All implementations are required to supply both [EEXIST] and  
 38003 [ENOTEMPTY] in `<errno.h>` with distinct values, so that applications can use both values in C-  
 38004 language **case** statements.

38005 The meaning of deleting *pathname/dot* is unclear, because the name of the file (directory) in the  
 38006 parent directory to be removed is not clear, particularly in the presence of multiple links to a  
 38007 directory.

38008 The POSIX.1-1990 standard was silent with regard to the behavior of *rmdir()* when there are  
 38009 multiple hard links to the directory being removed. The requirement to set *errno* to [EEXIST] or  
 38010 [ENOTEMPTY] clarifies the behavior in this case.

38011 If the process' current working directory is being removed, that should be an allowed error.

38012 Virtually all existing implementations detect [ENOTEMPTY] or the case of dot-dot. The text in  
 38013 Section 2.3 (on page 21) about returning any one of the possible errors permits that behavior to  
 38014 continue. The [ELOOP] error may be returned if more than {SYMLOOP\_MAX} symbolic links  
 38015 are encountered during resolution of the *path* argument.

38016 **FUTURE DIRECTIONS**

38017 None.

38018 **SEE ALSO**

38019 Section 2.3 (on page 21), *mkdir()*, *remove()*, *unlink()*, the Base Definitions volume of  
38020 IEEE Std 1003.1-2001, <**unistd.h**>

38021 **CHANGE HISTORY**

38022 First released in Issue 3. Included for alignment with the POSIX.1-1988 standard.

38023 **Issue 6**

38024 The following new requirements on POSIX implementations derive from alignment with the  
38025 Single UNIX Specification:

- 38026 • The DESCRIPTION is updated to indicate the results of naming a symbolic link in *path*.
- 38027 • The [EIO] mandatory error condition is added.
- 38028 • The [ELOOP] mandatory error condition is added.
- 38029 • A second [ENAMETOOLONG] is added as an optional error condition.

38030 The following changes were made to align with the IEEE P1003.1a draft standard:

- 38031 • The [ELOOP] optional error condition is added.

38032 **NAME**

38033 round, roundf, roundl — round to the nearest integer value in a floating-point format

38034 **SYNOPSIS**

38035 #include &lt;math.h&gt;

38036 double round(double x);

38037 float roundf(float x);

38038 long double roundl(long double x);

38039 **DESCRIPTION**

38040 **CX** The functionality described on this reference page is aligned with the ISO C standard. Any  
 38041 conflict between the requirements described here and the ISO C standard is unintentional. This  
 38042 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

38043 These functions shall round their argument to the nearest integer value in floating-point format,  
 38044 rounding halfway cases away from zero, regardless of the current rounding direction.

38045 An application wishing to check for error situations should set *errno* to zero and call  
 38046 *feclearexcept*(FE\_ALL\_EXCEPT) before calling these functions. On return, if *errno* is non-zero or  
 38047 *fetestexcept*(FE\_INVALID | FE\_DIVBYZERO | FE\_OVERFLOW | FE\_UNDERFLOW) is non-  
 38048 zero, an error has occurred.

38049 **RETURN VALUE**

38050 Upon successful completion, these functions shall return the rounded integer value.

38051 **MX** If *x* is NaN, a NaN shall be returned.38052 If *x* is  $\pm 0$  or  $\pm \text{Inf}$ , *x* shall be returned.

38053 **XSI** If the correct value would cause overflow, a range error shall occur and *round()*, *roundf()*, and  
 38054 *roundl()* shall return the value of the macro  $\pm \text{HUGE\_VAL}$ ,  $\pm \text{HUGE\_VALF}$ , and  $\pm \text{HUGE\_VALL}$   
 38055 (with the same sign as *x*), respectively.

38056 **ERRORS**

38057 These functions may fail if:

38058 **XSI** **Range Error** The result overflows.

38059 If the integer expression (math\_errhandling & MATH\_ERRNO) is non-zero,  
 38060 then *errno* shall be set to [ERANGE]. If the integer expression  
 38061 (math\_errhandling & MATH\_ERREXCEPT) is non-zero, then the overflow  
 38062 floating-point exception shall be raised.

38063 **EXAMPLES**

38064 None.

38065 **APPLICATION USAGE**

38066 On error, the expressions (math\_errhandling & MATH\_ERRNO) and (math\_errhandling &  
 38067 MATH\_ERREXCEPT) are independent of each other, but at least one of them must be non-zero.

38068 **RATIONALE**

38069 None.

38070 **FUTURE DIRECTIONS**

38071 None.

38072 **SEE ALSO**

38073            *feclearexcept()*, *fetestexcept()*, the Base Definitions volume of IEEE Std 1003.1-2001, Section 4.18,  
38074            Treatment of Error Conditions for Mathematical Functions, <**math.h**>

38075 **CHANGE HISTORY**

38076            First released in Issue 6. Derived from the ISO/IEC 9899:1999 standard.

38077 **NAME**38078        *scalb* — load exponent of a radix-independent floating-point number38079 **SYNOPSIS**

38080 OB XSI    #include &lt;math.h&gt;

38081        double scalb(double *x*, double *n*);

38082

38083 **DESCRIPTION**

38084        The *scalb()* function shall compute  $x \cdot r^n$ , where *r* is the radix of the machine's floating-point arithmetic. When *r* is 2, *scalb()* shall be equivalent to *ldexp()*. The value of *r* is FLT\_RADIX which is defined in <float.h>.

38087        An application wishing to check for error situations should set *errno* to zero and call *feclearexcept*(FE\_ALL\_EXCEPT) before calling these functions. On return, if *errno* is non-zero or *fetestexcept*(FE\_INVALID | FE\_DIVBYZERO | FE\_OVERFLOW | FE\_UNDERFLOW) is non-zero, an error has occurred.

38091 **RETURN VALUE**38092        Upon successful completion, the *scalb()* function shall return  $x \cdot r^n$ .38093        If *x* or *n* is NaN, a NaN shall be returned.38094        If *n* is zero, *x* shall be returned.38095        If *x* is  $\pm\text{Inf}$  and *n* is not  $-\text{Inf}$ , *x* shall be returned.38096        If *x* is  $\pm 0$  and *n* is not  $+\text{Inf}$ , *x* shall be returned.

38097        If *x* is  $\pm 0$  and *n* is  $+\text{Inf}$ , a domain error shall occur, and either a NaN (if supported), or an implementation-defined value shall be returned.

38099        If *x* is  $\pm\text{Inf}$  and *n* is  $-\text{Inf}$ , a domain error shall occur, and either a NaN (if supported), or an implementation-defined value shall be returned.

38101        If the result would cause an overflow, a range error shall occur and  $\pm\text{HUGE\_VAL}$  (according to the sign of *x*) shall be returned.

38103        If the correct value would cause underflow, and is representable, a range error may occur and the correct value shall be returned.

38105        If the correct value would cause underflow, and is not representable, a range error may occur, and 0.0 shall be returned.

38107 **ERRORS**38108        The *scalb()* function shall fail if:38109        Domain Error    If *x* is zero and *n* is  $+\text{Inf}$ , or *x* is  $\text{Inf}$  and *n* is  $-\text{Inf}$ .

38110                        If the integer expression (math\_errhandling & MATH\_ERRNO) is non-zero, then *errno* shall be set to [EDOM]. If the integer expression (math\_errhandling & MATH\_ERREXCEPT) is non-zero, then the invalid floating-point exception shall be raised.

38114        Range Error    The result would overflow.

38115                        If the integer expression (math\_errhandling & MATH\_ERRNO) is non-zero, then *errno* shall be set to [ERANGE]. If the integer expression (math\_errhandling & MATH\_ERREXCEPT) is non-zero, then the overflow floating-point exception shall be raised.

38119 The *scalb()* function may fail if:

38120 Range Error The result underflows.

38121 If the integer expression (`math_errhandling & MATH_ERRNO`) is non-zero,  
38122 then *errno* shall be set to [ERANGE]. If the integer expression  
38123 (`math_errhandling & MATH_ERREXCEPT`) is non-zero, then the underflow  
38124 floating-point exception shall be raised.

#### 38125 EXAMPLES

38126 None.

#### 38127 APPLICATION USAGE

38128 Applications should use either *scalbln()*, *scalblnf()*, or *scalblnl()* in preference to this function.

38129 IEEE Std 1003.1-2001 only defines the behavior for the *scalb()* function when the *n* argument is  
38130 an integer, a NaN, or Inf. The behavior of other values for the *n* argument is unspecified.

38131 On error, the expressions (`math_errhandling & MATH_ERRNO`) and (`math_errhandling &`  
38132 `MATH_ERREXCEPT`) are independent of each other, but at least one of them must be non-zero.

#### 38133 RATIONALE

38134 None.

#### 38135 FUTURE DIRECTIONS

38136 None.

#### 38137 SEE ALSO

38138 *feclearexcept()*, *fetestexcept()*, *ilogb()*, *ldexp()*, *logb()*, *scalbln()*, the Base Definitions volume of  
38139 IEEE Std 1003.1-2001, Section 4.18, Treatment of Error Conditions for Mathematical Functions,  
38140 `<float.h>`, `<math.h>`

#### 38141 CHANGE HISTORY

38142 First released in Issue 4, Version 2.

#### 38143 Issue 5

38144 Moved from X/OPEN UNIX extension to BASE.

38145 The DESCRIPTION is updated to indicate how an application should check for an error. This  
38146 text was previously published in the APPLICATION USAGE section.

#### 38147 Issue 6

38148 This function is marked obsolescent.

38149 Although this function is not part of the ISO/IEC 9899:1999 standard, the RETURN VALUE and  
38150 ERRORS sections are updated to align with the error handling in the ISO/IEC 9899:1999  
38151 standard.

38152 **NAME**

38153 scalbln, scalblnf, scalblnl, scalbn, scalbnf, scalbnl, — compute exponent using FLT\_RADIX

38154 **SYNOPSIS**

38155 #include &lt;math.h&gt;

38156 double scalbln(double x, long n);

38157 float scalblnf(float x, long n);

38158 long double scalblnl(long double x, long n);

38159 double scalbn(double x, int n);

38160 float scalbnf(float x, int n);

38161 long double scalbnl(long double x, int n);

38162 **DESCRIPTION**

38163 **CX** The functionality described on this reference page is aligned with the ISO C standard. Any  
 38164 conflict between the requirements described here and the ISO C standard is unintentional. This  
 38165 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

38166 These functions shall compute  $x * FLT\_RADIX^n$  efficiently, not normally by computing  
 38167  $FLT\_RADIX^n$  explicitly.

38168 An application wishing to check for error situations should set *errno* to zero and call  
 38169 *feclearexcept*(FE\_ALL\_EXCEPT) before calling these functions. On return, if *errno* is non-zero or  
 38170 *fetestexcept*(FE\_INVALID | FE\_DIVBYZERO | FE\_OVERFLOW | FE\_UNDERFLOW) is non-  
 38171 zero, an error has occurred.

38172 **RETURN VALUE**38173 Upon successful completion, these functions shall return  $x * FLT\_RADIX^n$ .

38174 If the result would cause overflow, a range error shall occur and these functions shall return  
 38175  $\pm HUGUE\_VAL$ ,  $\pm HUGUE\_VALF$ , and  $\pm HUGUE\_VALL$  (according to the sign of *x*) as appropriate for  
 38176 the return type of the function.

38177 If the correct value would cause underflow, and is not representable, a range error may occur,  
 38178 **MX** and either 0.0 (if supported), or an implementation-defined value shall be returned.

38179 **MX** If *x* is NaN, a NaN shall be returned.38180 If *x* is  $\pm 0$  or  $\pm Inf$ , *x* shall be returned.38181 If *n* is 0, *x* shall be returned.

38182 If the correct value would cause underflow, and is representable, a range error may occur and  
 38183 the correct value shall be returned.

38184 **ERRORS**

38185 These functions shall fail if:

38186 **Range Error** The result overflows.

38187 If the integer expression (math\_errhandling & MATH\_ERRNO) is non-zero,  
 38188 then *errno* shall be set to [ERANGE]. If the integer expression  
 38189 (math\_errhandling & MATH\_ERREXCEPT) is non-zero, then the overflow  
 38190 floating-point exception shall be raised.

38191 These functions may fail if:

38192 **Range Error** The result underflows.

38193 If the integer expression (math\_errhandling & MATH\_ERRNO) is non-zero,  
 38194 then *errno* shall be set to [ERANGE]. If the integer expression

38195 (math\_errhandling & MATH\_ERREXCEPT) is non-zero, then the underflow  
38196 floating-point exception shall be raised.

**38197 EXAMPLES**

38198 None.

**38199 APPLICATION USAGE**

38200 On error, the expressions (math\_errhandling & MATH\_ERRNO) and (math\_errhandling &  
38201 MATH\_ERREXCEPT) are independent of each other, but at least one of them must be non-zero.

**38202 RATIONALE**

38203 These functions are named so as to avoid conflicting with the historical definition of the *scalb()*  
38204 function from the Single UNIX Specification. The difference is that the *scalb()* function has a  
38205 second argument of **double** instead of **int**. The *scalb()* function is not part of the ISO C standard.  
38206 The three functions whose second type is **long** are provided because the factor required to scale  
38207 from the smallest positive floating-point value to the largest finite one, on many  
38208 implementations, is too large to represent in the minimum-width **int** format.

**38209 FUTURE DIRECTIONS**

38210 None.

**38211 SEE ALSO**

38212 *feclearexcept()*, *fetestexcept()*, *scalb()*, the Base Definitions volume of IEEE Std 1003.1-2001, Section  
38213 4.18, Treatment of Error Conditions for Mathematical Functions, <math.h>

**38214 CHANGE HISTORY**

38215 First released in Issue 6. Derived from the ISO/IEC 9899:1999 standard.

38216 **NAME**

38217       scanf — convert formatted input

38218 **SYNOPSIS**

38219       #include &lt;stdio.h&gt;

38220       int scanf(const char \*restrict *format*, ... );38221 **DESCRIPTION**38222       Refer to *fscanf()*.

38223 **NAME**

38224 sched\_get\_priority\_max, sched\_get\_priority\_min — get priority limits (**REALTIME**)

38225 **SYNOPSIS**

38226 PS #include <sched.h>

38227 int sched\_get\_priority\_max(int *policy*);

38228 int sched\_get\_priority\_min(int *policy*);

38229

38230 **DESCRIPTION**

38231 The *sched\_get\_priority\_max()* and *sched\_get\_priority\_min()* functions shall return the appropriate  
38232 maximum or minimum, respectively, for the scheduling policy specified by *policy*.

38233 The value of *policy* shall be one of the scheduling policy values defined in <sched.h>.

38234 **RETURN VALUE**

38235 If successful, the *sched\_get\_priority\_max()* and *sched\_get\_priority\_min()* functions shall return the  
38236 appropriate maximum or minimum values, respectively. If unsuccessful, they shall return a  
38237 value of -1 and set *errno* to indicate the error.

38238 **ERRORS**

38239 The *sched\_get\_priority\_max()* and *sched\_get\_priority\_min()* functions shall fail if:

38240 [EINVAL] The value of the *policy* parameter does not represent a defined scheduling  
38241 policy.

38242 **EXAMPLES**

38243 None.

38244 **APPLICATION USAGE**

38245 None.

38246 **RATIONALE**

38247 None.

38248 **FUTURE DIRECTIONS**

38249 None.

38250 **SEE ALSO**

38251 *sched\_getparam()*, *sched\_setparam()*, *sched\_getscheduler()*, *sched\_rr\_get\_interval()*,  
38252 *sched\_setscheduler()*, the Base Definitions volume of IEEE Std 1003.1-2001, <sched.h>

38253 **CHANGE HISTORY**

38254 First released in Issue 5. Included for alignment with the POSIX Realtime Extension.

38255 **Issue 6**

38256 These functions are marked as part of the Process Scheduling option.

38257 The [ENOSYS] error condition has been removed as stubs need not be provided if an  
38258 implementation does not support the Process Scheduling option.

38259 The [ESRCH] error condition has been removed since these functions do not take a *pid*  
38260 argument.

38261 **NAME**38262 sched\_getparam — get scheduling parameters (**REALTIME**)38263 **SYNOPSIS**

38264 PS #include &lt;sched.h&gt;

38265 int sched\_getparam(pid\_t pid, struct sched\_param \*param);

38266

38267 **DESCRIPTION**38268 The *sched\_getparam()* function shall return the scheduling parameters of a process specified by  
38269 *pid* in the **sched\_param** structure pointed to by *param*.38270 If a process specified by *pid* exists, and if the calling process has permission, the scheduling  
38271 parameters for the process whose process ID is equal to *pid* shall be returned.38272 If *pid* is zero, the scheduling parameters for the calling process shall be returned. The behavior of  
38273 the *sched\_getparam()* function is unspecified if the value of *pid* is negative.38274 **RETURN VALUE**38275 Upon successful completion, the *sched\_getparam()* function shall return zero. If the call to  
38276 *sched\_getparam()* is unsuccessful, the function shall return a value of -1 and set *errno* to indicate  
38277 the error.38278 **ERRORS**38279 The *sched\_getparam()* function shall fail if:38280 [EPERM] The requesting process does not have permission to obtain the scheduling  
38281 parameters of the specified process.38282 [ESRCH] No process can be found corresponding to that specified by *pid*.38283 **EXAMPLES**

38284 None.

38285 **APPLICATION USAGE**

38295 First released in Issue 5. Included for alignment with the POSIX Realtime Extension.

38296 **Issue 6**38297 The *sched\_getparam()* function is marked as part of the Process Scheduling option.38298 The [ENOSYS] error condition has been removed as stubs need not be provided if an  
38299 implementation does not support the Process Scheduling option.

38300 **NAME**

38301 sched\_getscheduler — get scheduling policy (**REALTIME**)

38302 **SYNOPSIS**

38303 PS #include <sched.h>

38304 int sched\_getscheduler(pid\_t pid);

38305

38306 **DESCRIPTION**

38307 The *sched\_getscheduler()* function shall return the scheduling policy of the process specified by  
 38308 *pid*. If the value of *pid* is negative, the behavior of the *sched\_getscheduler()* function is  
 38309 unspecified.

38310 The values that can be returned by *sched\_getscheduler()* are defined in the <**sched.h**> header.

38311 If a process specified by *pid* exists, and if the calling process has permission, the scheduling  
 38312 policy shall be returned for the process whose process ID is equal to *pid*.

38313 If *pid* is zero, the scheduling policy shall be returned for the calling process.

38314 **RETURN VALUE**

38315 Upon successful completion, the *sched\_getscheduler()* function shall return the scheduling policy  
 38316 of the specified process. If unsuccessful, the function shall return  $-1$  and set *errno* to indicate the  
 38317 error.

38318 **ERRORS**

38319 The *sched\_getscheduler()* function shall fail if:

38320 [EPERM] The requesting process does not have permission to determine the scheduling  
 38321 policy of the specified process.

38322 [ESRCH] No process can be found corresponding to that specified by *pid*.

38334 **CHANGE HISTORY**

38335 First released in Issue 5. Included for alignment with the POSIX Realtime Extension.

38336 **Issue 6**

38337 The *sched\_getscheduler()* function is marked as part of the Process Scheduling option.

38338 The [ENOSYS] error condition has been removed as stubs need not be provided if an  
 38339 implementation does not support the Process Scheduling option.

38340 **NAME**

38341 sched\_rr\_get\_interval — get execution time limits (**REALTIME**)

38342 **SYNOPSIS**

38343 PS #include <sched.h>

38344 int sched\_rr\_get\_interval(pid\_t pid, struct timespec \*interval);

38345

38346 **DESCRIPTION**

38347 The *sched\_rr\_get\_interval()* function shall update the **timespec** structure referenced by the  
38348 *interval* argument to contain the current execution time limit (that is, time quantum) for the  
38349 process specified by *pid*. If *pid* is zero, the current execution time limit for the calling process  
38350 shall be returned.

38351 **RETURN VALUE**

38352 If successful, the *sched\_rr\_get\_interval()* function shall return zero. Otherwise, it shall return a  
38353 value of  $-1$  and set *errno* to indicate the error.

38354 **ERRORS**

38355 The *sched\_rr\_get\_interval()* function shall fail if:

38356 [ESRCH] No process can be found corresponding to that specified by *pid*.

38368 **CHANGE HISTORY**

38369 First released in Issue 5. Included for alignment with the POSIX Realtime Extension.

38370 **Issue 6**

38371 The *sched\_rr\_get\_interval()* function is marked as part of the Process Scheduling option.

38372 The [ENOSYS] error condition has been removed as stubs need not be provided if an  
38373 implementation does not support the Process Scheduling option.

## 38374 NAME

38375 sched\_setparam — set scheduling parameters (**REALTIME**)

## 38376 SYNOPSIS

38377 PS #include &lt;sched.h&gt;

38378 int sched\_setparam(pid\_t pid, const struct sched\_param \*param);

38379

## 38380 DESCRIPTION

38381 The *sched\_setparam()* function shall set the scheduling parameters of the process specified by *pid*  
 38382 to the values specified by the **sched\_param** structure pointed to by *param*. The value of the  
 38383 *sched\_priority* member in the **sched\_param** structure shall be any integer within the inclusive  
 38384 priority range for the current scheduling policy of the process specified by *pid*. Higher  
 38385 numerical values for the priority represent higher priorities. If the value of *pid* is negative, the  
 38386 behavior of the *sched\_setparam()* function is unspecified.

38387 If a process specified by *pid* exists, and if the calling process has permission, the scheduling  
 38388 parameters shall be set for the process whose process ID is equal to *pid*.

38389 If *pid* is zero, the scheduling parameters shall be set for the calling process.

38390 The conditions under which one process has permission to change the scheduling parameters of  
 38391 another process are implementation-defined.

38392 Implementations may require the requesting process to have the appropriate privilege to set its  
 38393 own scheduling parameters or those of another process.

38394 The target process, whether it is running or not running, shall be moved to the tail of the thread  
 38395 list for its priority.

38396 If the priority of the process specified by the *pid* argument is set higher than that of the lowest  
 38397 priority running process and if the specified process is ready to run, the process specified by the  
 38398 *pid* argument shall preempt a lowest priority running process. Similarly, if the process calling  
 38399 *sched\_setparam()* sets its own priority lower than that of one or more other non-empty process  
 38400 lists, then the process that is the head of the highest priority list shall also preempt the calling  
 38401 process. Thus, in either case, the originating process might not receive notification of the  
 38402 completion of the requested priority change until the higher priority process has executed.

38403 ss If the scheduling policy of the target process is SCHED\_SPORADIC, the value specified by the  
 38404 *sched\_ss\_low\_priority* member of the *param* argument shall be any integer within the inclusive  
 38405 priority range for the sporadic server policy. The *sched\_ss\_repl\_period* and *sched\_ss\_init\_budget*  
 38406 members of the *param* argument shall represent the time parameters to be used by the sporadic  
 38407 server scheduling policy for the target process. The *sched\_ss\_max\_repl* member of the *param*  
 38408 argument shall represent the maximum number of replenishments that are allowed to be  
 38409 pending simultaneously for the process scheduled under this scheduling policy.

38410 The specified *sched\_ss\_repl\_period* shall be greater than or equal to the specified  
 38411 *sched\_ss\_init\_budget* for the function to succeed; if it is not, then the function shall fail.

38412 The value of *sched\_ss\_max\_repl* shall be within the inclusive range [1,{SS\_REPL\_MAX}] for the  
 38413 function to succeed; if not, the function shall fail.

38414 If the scheduling policy of the target process is either SCHED\_FIFO or SCHED\_RR, the  
 38415 *sched\_ss\_low\_priority*, *sched\_ss\_repl\_period*, and *sched\_ss\_init\_budget* members of the *param*  
 38416 argument shall have no effect on the scheduling behavior. If the scheduling policy of this process  
 38417 is not SCHED\_FIFO, SCHED\_RR, or SCHED\_SPORADIC, the effects of these members are  
 38418 implementation-defined; this case includes the SCHED\_OTHER policy.

38419 If the current scheduling policy for the process specified by *pid* is not SCHED\_FIFO,  
 38420 ss SCHED\_RR, or SCHED\_SPORADIC, the result is implementation-defined; this case includes the  
 38421 SCHED\_OTHER policy.

38422 The effect of this function on individual threads is dependent on the scheduling contention  
 38423 scope of the threads:

- 38424 • For threads with system scheduling contention scope, these functions shall have no effect on  
 38425 their scheduling.

- 38426 • For threads with process scheduling contention scope, the threads' scheduling parameters  
 38427 shall not be affected. However, the scheduling of these threads with respect to threads in  
 38428 other processes may be dependent on the scheduling parameters of their process, which are  
 38429 governed using these functions.

38430 If an implementation supports a two-level scheduling model in which library threads are  
 38431 multiplexed on top of several kernel-scheduled entities, then the underlying kernel-scheduled  
 38432 entities for the system contention scope threads shall not be affected by these functions.

38433 The underlying kernel-scheduled entities for the process contention scope threads shall have  
 38434 their scheduling parameters changed to the value specified in *param*. Kernel-scheduled entities  
 38435 for use by process contention scope threads that are created after this call completes shall inherit  
 38436 their scheduling policy and associated scheduling parameters from the process.

38437 This function is not atomic with respect to other threads in the process. Threads may continue to  
 38438 execute while this function call is in the process of changing the scheduling policy for the  
 38439 underlying kernel-scheduled entities used by the process contention scope threads.

#### 38440 RETURN VALUE

38441 If successful, the *sched\_setparam()* function shall return zero.

38442 If the call to *sched\_setparam()* is unsuccessful, the priority shall remain unchanged, and the  
 38443 function shall return a value of  $-1$  and set *errno* to indicate the error.

#### 38444 ERRORS

38445 The *sched\_setparam()* function shall fail if:

38446 [EINVAL] One or more of the requested scheduling parameters is outside the range  
 38447 defined for the scheduling policy of the specified *pid*.

38448 [EPERM] The requesting process does not have permission to set the scheduling  
 38449 parameters for the specified process, or does not have the appropriate  
 38450 privilege to invoke *sched\_setparam()*.

38451 [ESRCH] No process can be found corresponding to that specified by *pid*.

#### 38452 EXAMPLES

38453 None.

#### 38454 APPLICATION USAGE

38455 None.

#### 38456 RATIONALE

38457 None.

#### 38458 FUTURE DIRECTIONS

38459 None.

38461 *sched\_getparam()*, *sched\_getscheduler()*, *sched\_setscheduler()*, the Base Definitions volume of  
38462 IEEE Std 1003.1-2001, <sched.h>

38463 **CHANGE HISTORY**

38464 First released in Issue 5. Included for alignment with the POSIX Realtime Extension.

38465 **Issue 6**

38466 The *sched\_setparam()* function is marked as part of the Process Scheduling option.

38467 The [ENOSYS] error condition has been removed as stubs need not be provided if an  
38468 implementation does not support the Process Scheduling option.

38469 The following new requirements on POSIX implementations derive from alignment with the  
38470 Single UNIX Specification:

38471 • In the DESCRIPTION, the effect of this function on a thread's scheduling parameters is  
38472 added.

38473 • Sections describing two-level scheduling and atomicity of the function are added.

38474 The SCHED\_SPORADIC scheduling policy is added for alignment with IEEE Std 1003.1d-1999.

38475 IEEE PASC Interpretation 1003.1 #100 is applied.

## 38476 NAME

38477 sched\_setscheduler — set scheduling policy and parameters (**REALTIME**)

## 38478 SYNOPSIS

38479 PS 

```
#include <sched.h>
```

38480 

```
int sched_setscheduler(pid_t pid, int policy,
```

  
38481 

```
    const struct sched_param *param);
```

38482

## 38483 DESCRIPTION

38484 The *sched\_setscheduler()* function shall set the scheduling policy and scheduling parameters of  
 38485 the process specified by *pid* to *policy* and the parameters specified in the **sched\_param** structure  
 38486 pointed to by *param*, respectively. The value of the *sched\_priority* member in the **sched\_param**  
 38487 structure shall be any integer within the inclusive priority range for the scheduling policy  
 38488 specified by *policy*. If the value of *pid* is negative, the behavior of the *sched\_setscheduler()*  
 38489 function is unspecified.

38490 The possible values for the *policy* parameter are defined in the **<sched.h>** header.

38491 If a process specified by *pid* exists, and if the calling process has permission, the scheduling  
 38492 policy and scheduling parameters shall be set for the process whose process ID is equal to *pid*.

38493 If *pid* is zero, the scheduling policy and scheduling parameters shall be set for the calling  
 38494 process.

38495 The conditions under which one process has the appropriate privilege to change the scheduling  
 38496 parameters of another process are implementation-defined.

38497 Implementations may require that the requesting process have permission to set its own  
 38498 scheduling parameters or those of another process. Additionally, implementation-defined  
 38499 restrictions may apply as to the appropriate privileges required to set a process' own scheduling  
 38500 policy, or another process' scheduling policy, to a particular value.

38501 The *sched\_setscheduler()* function shall be considered successful if it succeeds in setting the  
 38502 scheduling policy and scheduling parameters of the process specified by *pid* to the values  
 38503 specified by *policy* and the structure pointed to by *param*, respectively.

38504 ss If the scheduling policy specified by *policy* is **SCHED\_SPORADIC**, the value specified by the  
 38505 *sched\_ss\_low\_priority* member of the *param* argument shall be any integer within the inclusive  
 38506 priority range for the sporadic server policy. The *sched\_ss\_repl\_period* and *sched\_ss\_init\_budget*  
 38507 members of the *param* argument shall represent the time parameters used by the sporadic server  
 38508 scheduling policy for the target process. The *sched\_ss\_max\_repl* member of the *param* argument  
 38509 shall represent the maximum number of replenishments that are allowed to be pending  
 38510 simultaneously for the process scheduled under this scheduling policy.

38511 The specified *sched\_ss\_repl\_period* shall be greater than or equal to the specified  
 38512 *sched\_ss\_init\_budget* for the function to succeed; if it is not, then the function shall fail.

38513 The value of *sched\_ss\_max\_repl* shall be within the inclusive range [1,{**SS\_REPL\_MAX**}] for the  
 38514 function to succeed; if not, the function shall fail.

38515 If the scheduling policy specified by *policy* is either **SCHED\_FIFO** or **SCHED\_RR**, the  
 38516 *sched\_ss\_low\_priority*, *sched\_ss\_repl\_period*, and *sched\_ss\_init\_budget* members of the *param*  
 38517 argument shall have no effect on the scheduling behavior.

38518 The effect of this function on individual threads is dependent on the scheduling contention  
 38519 scope of the threads:

38520           • For threads with system scheduling contention scope, these functions shall have no effect on  
38521 their scheduling.

38522           • For threads with process scheduling contention scope, the threads' scheduling policy and  
38523 associated parameters shall not be affected. However, the scheduling of these threads with  
38524 respect to threads in other processes may be dependent on the scheduling parameters of their  
38525 process, which are governed using these functions.

38526 If an implementation supports a two-level scheduling model in which library threads are  
38527 multiplexed on top of several kernel-scheduled entities, then the underlying kernel-scheduled  
38528 entities for the system contention scope threads shall not be affected by these functions.

38529 The underlying kernel-scheduled entities for the process contention scope threads shall have  
38530 their scheduling policy and associated scheduling parameters changed to the values specified in  
38531 *policy* and *param*, respectively. Kernel-scheduled entities for use by process contention scope  
38532 threads that are created after this call completes shall inherit their scheduling policy and  
38533 associated scheduling parameters from the process.

38534 This function is not atomic with respect to other threads in the process. Threads may continue to  
38535 execute while this function call is in the process of changing the scheduling policy and  
38536 associated scheduling parameters for the underlying kernel-scheduled entities used by the  
38537 process contention scope threads.

### 38538 RETURN VALUE

38539 Upon successful completion, the function shall return the former scheduling policy of the  
38540 specified process. If the *sched\_setscheduler()* function fails to complete successfully, the policy  
38541 and scheduling parameters shall remain unchanged, and the function shall return a value of -1  
38542 and set *errno* to indicate the error.

### 38543 ERRORS

38544 The *sched\_setscheduler()* function shall fail if:

38545 [EINVAL]       The value of the *policy* parameter is invalid, or one or more of the parameters  
38546 contained in *param* is outside the valid range for the specified scheduling  
38547 policy.

38548 [EPERM]        The requesting process does not have permission to set either or both of the  
38549 scheduling parameters or the scheduling policy of the specified process.

38550 [ESRCH]        No process can be found corresponding to that specified by *pid*.

### 38551 EXAMPLES

38552 None.

### 38553 APPLICATION USAGE

38554 None.

### 38555 RATIONALE

38556 None.

### 38557 FUTURE DIRECTIONS

38560 *sched\_getparam()*, *sched\_getscheduler()*, *sched\_setparam()*, the Base Definitions volume of  
38561 IEEE Std 1003.1-2001, <*sched.h*>

38562 **CHANGE HISTORY**

38563 First released in Issue 5. Included for alignment with the POSIX Realtime Extension.

38564 **Issue 6**

38565 The *sched\_setscheduler()* function is marked as part of the Process Scheduling option.

38566 The [ENOSYS] error condition has been removed as stubs need not be provided if an  
38567 implementation does not support the Process Scheduling option.

38568 The following new requirements on POSIX implementations derive from alignment with the  
38569 Single UNIX Specification:

38570 • In the DESCRIPTION, the effect of this function on a thread's scheduling parameters is  
38571 added.

38572 • Sections describing two-level scheduling and atomicity of the function are added.

38573 The SCHED\_SPORADIC scheduling policy is added for alignment with IEEE Std 1003.1d-1999.

38574 **NAME**

38575 sched\_yield — yield the processor

38576 **SYNOPSIS**

```
38577 PS|THR #include <sched.h>
```

```
38578 int sched_yield(void);
```

38579

38580 **DESCRIPTION**

38581 The *sched\_yield()* function shall force the running thread to relinquish the processor until it again  
38582 becomes the head of its thread list. It takes no arguments.

38583 **RETURN VALUE**

38584 The *sched\_yield()* function shall return 0 if it completes successfully; otherwise, it shall return a  
38585 value of -1 and set *errno* to indicate the error.

38586 **ERRORS**

38587 No errors are defined.

38588 **EXAMPLES**

38589 None.

38590 **APPLICATION USAGE**

38591 None.

38592 **RATIONALE**

38593 None.

38594 **FUTURE DIRECTIONS**

38595 None.

38596 **SEE ALSO**

38597 The Base Definitions volume of IEEE Std 1003.1-2001, <**sched.h**>

38598 **CHANGE HISTORY**

38599 First released in Issue 5. Included for alignment with the POSIX Realtime Extension and the  
38600 POSIX Threads Extension.

38601 **Issue 6**

38602 The *sched\_yield()* function is now marked as part of the Process Scheduling and Threads options.

38603 **NAME**

38604        seed48 — seed a uniformly distributed pseudo-random non-negative long integer generator

38605 **SYNOPSIS**

38606 xSI        #include &lt;stdlib.h&gt;

38607        unsigned short \*seed48(unsigned short seed16v[3]);

38608

38609 **DESCRIPTION**38610        Refer to *drand48()*.

38611 **NAME**

38612 seekdir — set the position of a directory stream

38613 **SYNOPSIS**

38614 XSI #include &lt;dirent.h&gt;

38615 void seekdir(DIR \*dirp, long loc);

38616

38617 **DESCRIPTION**

38618 The *seekdir()* function shall set the position of the next *readdir()* operation on the directory  
38619 stream specified by *dirp* to the position specified by *loc*. The value of *loc* should have been  
38620 returned from an earlier call to *telldir()*. The new position reverts to the one associated with the  
38621 directory stream when *telldir()* was performed.

38622 If the value of *loc* was not obtained from an earlier call to *telldir()*, or if a call to *rewinddir()*  
38623 occurred between the call to *telldir()* and the call to *seekdir()*, the results of subsequent calls to  
38624 *readdir()* are unspecified.

38625 **RETURN VALUE**38626 The *seekdir()* function shall not return a value.38627 **ERRORS**

38628 No errors are defined.

38629 **EXAMPLES**

38630 None.

38631 **APPLICATION USAGE**

38632 None.

38633 **RATIONALE**

38634 The original standard developers perceived that there were restrictions on the use of the  
38635 *seekdir()* and *telldir()* functions related to implementation details, and for that reason these  
38636 functions need not be supported on all POSIX-conforming systems. They are required on  
38637 implementations supporting the XSI extension.

38638 One of the perceived problems of implementation is that returning to a given point in a directory  
38639 is quite difficult to describe formally, in spite of its intuitive appeal, when systems that use B-  
38640 trees, hashing functions, or other similar mechanisms to order their directories are considered.  
38641 The definition of *seekdir()* and *telldir()* does not specify whether, when using these interfaces, a  
38642 given directory entry will be seen at all, or more than once.

38643 On systems not supporting these functions, their capability can sometimes be accomplished by  
38644 saving a filename found by *readdir()* and later using *rewinddir()* and a loop on *readdir()* to  
38645 relocate the position from which the filename was saved.

38646 **FUTURE DIRECTIONS**

38647 None.

38648 **SEE ALSO**

38649 *opendir()*, *readdir()*, *telldir()*, the Base Definitions volume of IEEE Std 1003.1-2001, <*dirent.h*>,  
38650 <*stdio.h*>, <*sys/types.h*>

38651 **CHANGE HISTORY**

38652 First released in Issue 2.

38653 **Issue 6**

38654

In the SYNOPSIS, the inclusion of `<sys/types.h>` is no longer required.

38655 **NAME**

38656           select — synchronous I/O multiplexing

38657 **SYNOPSIS**

38658           #include <sys/time.h>

```
38659           int select(int nfds, fd_set *restrict readfds,  
38660                      fd_set *restrict writefds, fd_set *restrict errorfds,  
38661                      struct timeval *restrict timeout);  
38662
```

38663 **DESCRIPTION**

38664           Refer to *pselect()*.

38665 **NAME**38666 sem\_close — close a named semaphore (**REALTIME**)38667 **SYNOPSIS**

38668 SEM #include &lt;semaphore.h&gt;

38669 int sem\_close(sem\_t \*sem);

38670

38671 **DESCRIPTION**

38672 The *sem\_close()* function shall indicate that the calling process is finished using the named  
 38673 semaphore indicated by *sem*. The effects of calling *sem\_close()* for an unnamed semaphore (one  
 38674 created by *sem\_init()*) are undefined. The *sem\_close()* function shall deallocate (that is, make  
 38675 available for reuse by a subsequent *sem\_open()* by this process) any system resources allocated  
 38676 by the system for use by this process for this semaphore. The effect of subsequent use of the  
 38677 semaphore indicated by *sem* by this process is undefined. If the semaphore has not been  
 38678 removed with a successful call to *sem\_unlink()*, then *sem\_close()* has no effect on the state of the  
 38679 semaphore. If the *sem\_unlink()* function has been successfully invoked for *name* after the most  
 38680 recent call to *sem\_open()* with *O\_CREAT* for this semaphore, then when all processes that have  
 38681 opened the semaphore close it, the semaphore is no longer accessible.

38682 **RETURN VALUE**

38683 Upon successful completion, a value of zero shall be returned. Otherwise, a value of -1 shall be  
 38684 returned and *errno* set to indicate the error.

38685 **ERRORS**38686 The *sem\_close()* function shall fail if:38687 [EINVAL] The *sem* argument is not a valid semaphore descriptor.38688 **EXAMPLES**

38689 None.

38690 **APPLICATION USAGE**

38691 The *sem\_close()* function is part of the Semaphores option and need not be available on all  
 38692 implementations.

38693 **RATIONALE**

38694 None.

38695 **FUTURE DIRECTIONS**

38696 None.

38697 **SEE ALSO**

 38699 IEEE Std 1003.1-2001, <**semaphore.h**>

38700 **CHANGE HISTORY**

38701 First released in Issue 5. Included for alignment with the POSIX Realtime Extension.

38702 **Issue 6**38703 The *sem\_close()* function is marked as part of the Semaphores option.

38704 The [ENOSYS] error condition has been removed as stubs need not be provided if an  
 38705 implementation does not support the Semaphores option.

38706 **NAME**

38707 sem\_destroy — destroy an unnamed semaphore (**REALTIME**)

38708 **SYNOPSIS**

```
38709 SEM #include <semaphore.h>
```

```
38710 int sem_destroy(sem_t *sem);
```

38711

38712 **DESCRIPTION**

38713 The *sem\_destroy()* function shall destroy the unnamed semaphore indicated by *sem*. Only a  
38714 semaphore that was created using *sem\_init()* may be destroyed using *sem\_destroy()*; the effect of  
38715 calling *sem\_destroy()* with a named semaphore is undefined. The effect of subsequent use of the  
38716 semaphore *sem* is undefined until *sem* is reinitialized by another call to *sem\_init()*.

38717 It is safe to destroy an initialized semaphore upon which no threads are currently blocked. The  
38718 effect of destroying a semaphore upon which other threads are currently blocked is undefined.

38719 **RETURN VALUE**

38720 Upon successful completion, a value of zero shall be returned. Otherwise, a value of -1 shall be  
38721 returned and *errno* set to indicate the error.

38722 **ERRORS**

38723 The *sem\_destroy()* function shall fail if:

38724 [EINVAL] The *sem* argument is not a valid semaphore.

38725 The *sem\_destroy()* function may fail if:

38726 [EBUSY] There are currently processes blocked on the semaphore.

38727 **EXAMPLES**

38728 None.

38729 **APPLICATION USAGE**

38730 The *sem\_destroy()* function is part of the Semaphores option and need not be available on all  
38731 implementations.

38732 **RATIONALE**

38733 None.

38734 **FUTURE DIRECTIONS**

38735 None.

38736 **SEE ALSO**

38737 *semctl()*, *semget()*, *semop()*, *sem\_init()*, *sem\_open()*, the Base Definitions volume of  
38738 IEEE Std 1003.1-2001, <**semaphore.h**>

38739 **CHANGE HISTORY**

38740 First released in Issue 5. Included for alignment with the POSIX Realtime Extension.

38741 **Issue 6**

38742 The *sem\_destroy()* function is marked as part of the Semaphores option.

38743 The [ENOSYS] error condition has been removed as stubs need not be provided if an  
38744 implementation does not support the Semaphores option.

38745 **NAME**38746 `sem_getvalue` — get the value of a semaphore (**REALTIME**)38747 **SYNOPSIS**38748 SEM `#include <semaphore.h>`38749 `int sem_getvalue(sem_t *restrict sem, int *restrict sval);`

38750

38751 **DESCRIPTION**

38752 The `sem_getvalue()` function shall update the location referenced by the `sval` argument to have  
 38753 the value of the semaphore referenced by `sem` without affecting the state of the semaphore. The  
 38754 updated value represents an actual semaphore value that occurred at some unspecified time  
 38755 during the call, but it need not be the actual value of the semaphore when it is returned to the  
 38756 calling process.

38757 If `sem` is locked, then the value returned by `sem_getvalue()` is either zero or a negative number  
 38758 whose absolute value represents the number of processes waiting for the semaphore at some  
 38759 unspecified time during the call.

38760 **RETURN VALUE**

38761 Upon successful completion, the `sem_getvalue()` function shall return a value of zero. Otherwise,  
 38762 it shall return a value of `-1` and set `errno` to indicate the error.

38763 **ERRORS**38764 The `sem_getvalue()` function shall fail if:38765 [EINVAL] The `sem` argument does not refer to a valid semaphore.38766 **EXAMPLES**

38767 None.

38768 **APPLICATION USAGE**

38769 The `sem_getvalue()` function is part of the Semaphores option and need not be available on all  
 38770 implementations.

38771 **RATIONALE**

38772 None.

38773 **FUTURE DIRECTIONS**

38774 None.

38775 **SEE ALSO**

38776 `semctl()`, `semget()`, `semop()`, `sem_post()`, `sem_timedwait()`, `sem_trywait()`, `sem_wait()`, the Base  
 38777 Definitions volume of IEEE Std 1003.1-2001, <**semaphore.h**>

38778 **CHANGE HISTORY**

38779 First released in Issue 5. Included for alignment with the POSIX Realtime Extension.

38780 **Issue 6**38781 The `sem_getvalue()` function is marked as part of the Semaphores option.

38782 The [ENOSYS] error condition has been removed as stubs need not be provided if an  
 38783 implementation does not support the Semaphores option.

38784 The `sem_timedwait()` function is added to the SEE ALSO section for alignment with  
 38785 IEEE Std 1003.1d-1999.

38786 The **restrict** keyword is added to the `sem_getvalue()` prototype for alignment with the  
 38787 ISO/IEC 9899:1999 standard.

38788 **NAME**38789 sem\_init — initialize an unnamed semaphore (**REALTIME**)38790 **SYNOPSIS**

38791 SEM #include &lt;semaphore.h&gt;

38792 int sem\_init(sem\_t \*sem, int pshared, unsigned value);

38793

38794 **DESCRIPTION**

38795 The *sem\_init()* function shall initialize the unnamed semaphore referred to by *sem*. The value of  
 38796 the initialized semaphore shall be *value*. Following a successful call to *sem\_init()*, the semaphore  
 38797 may be used in subsequent calls to *sem\_wait()*, *sem\_trywait()*, *sem\_post()*, and *sem\_destroy()*.  
 38798 This semaphore shall remain usable until the semaphore is destroyed.

38799 If the *pshared* argument has a non-zero value, then the semaphore is shared between processes;  
 38800 in this case, any process that can access the semaphore *sem* can use *sem* for performing  
 38801 *sem\_wait()*, *sem\_trywait()*, *sem\_post()*, and *sem\_destroy()* operations.

38802 Only *sem* itself may be used for performing synchronization. The result of referring to copies of  
 38803 *sem* in calls to *sem\_wait()*, *sem\_trywait()*, *sem\_post()*, and *sem\_destroy()* is undefined.

38804 If the *pshared* argument is zero, then the semaphore is shared between threads of the process; any  
 38805 thread in this process can use *sem* for performing *sem\_wait()*, *sem\_trywait()*, *sem\_post()*, and  
 38806 *sem\_destroy()* operations. The use of the semaphore by threads other than those created in the  
 38807 same process is undefined.

38808 Attempting to initialize an already initialized semaphore results in undefined behavior.

38809 **RETURN VALUE**

38810 Upon successful completion, the *sem\_init()* function shall initialize the semaphore in *sem*.  
 38811 Otherwise, it shall return  $-1$  and set *errno* to indicate the error.

38812 **ERRORS**38813 The *sem\_init()* function shall fail if:38814 [EINVAL] The *value* argument exceeds {SEM\_VALUE\_MAX}.

38815 [ENOSPC] A resource required to initialize the semaphore has been exhausted, or the  
 38816 limit on semaphores ({SEM\_NSEMS\_MAX}) has been reached.

38817 [EPERM] The process lacks the appropriate privileges to initialize the semaphore.

38818 **EXAMPLES**

38819 None.

38820 **APPLICATION USAGE**

38821 The *sem\_init()* function is part of the Semaphores option and need not be available on all  
 38822 implementations.

38823 **RATIONALE**

38824 Although this volume of IEEE Std 1003.1-2001 fails to specify a successful return value, it is  
 38825 likely that a later version may require the implementation to return a value of zero if the call to  
 38826 *sem\_init()* is successful.

38827 **FUTURE DIRECTIONS**

38828 None.

38829 **SEE ALSO**

38830 *sem\_destroy()*, *sem\_post()*, *sem\_timedwait()*, *sem\_trywait()*, *sem\_wait()*, the Base Definitions  
38831 volume of IEEE Std 1003.1-2001, <**semaphore.h**>

38832 **CHANGE HISTORY**

38833 First released in Issue 5. Included for alignment with the POSIX Realtime Extension.

38834 **Issue 6**

38835 The *sem\_init()* function is marked as part of the Semaphores option.

38836 The [ENOSYS] error condition has been removed as stubs need not be provided if an  
38837 implementation does not support the Semaphores option.

38838 The *sem\_timedwait()* function is added to the SEE ALSO section for alignment with  
38839 IEEE Std 1003.1d-1999.

## 38840 NAME

38841 sem\_open — initialize and open a named semaphore (**REALTIME**)

## 38842 SYNOPSIS

38843 SEM #include &lt;semaphore.h&gt;

38844 sem\_t \*sem\_open(const char \*name, int oflag, ...);

38845

## 38846 DESCRIPTION

38847 The *sem\_open()* function shall establish a connection between a named semaphore and a process.  
 38848 Following a call to *sem\_open()* with semaphore name *name*, the process may reference the  
 38849 semaphore associated with *name* using the address returned from the call. This semaphore may  
 38850 be used in subsequent calls to *sem\_wait()*, *sem\_trywait()*, *sem\_post()*, and *sem\_close()*. The  
 38851 semaphore remains usable by this process until the semaphore is closed by a successful call to  
 38852 *sem\_close()*, *\_exit()*, or one of the *exec* functions.

38853 The *oflag* argument controls whether the semaphore is created or merely accessed by the call to  
 38854 *sem\_open()*. The following flag bits may be set in *oflag*:

38855 **O\_CREAT** This flag is used to create a semaphore if it does not already exist. If **O\_CREAT**  
 38856 is set and the semaphore already exists, then **O\_CREAT** has no effect, except as noted  
 38857 under **O\_EXCL**. Otherwise, *sem\_open()* creates a named semaphore. The **O\_CREAT**  
 38858 flag requires a third and a fourth argument: *mode*, which is of type **mode\_t**, and  
 38859 *value*, which is of type **unsigned**. The semaphore is created with an initial value of  
 38860 *value*. Valid initial values for semaphores are less than or equal to  
 38861 {SEM\_VALUE\_MAX}.

38862 The user ID of the semaphore is set to the effective user ID of the process; the  
 38863 group ID of the semaphore is set to a system default group ID or to the effective  
 38864 group ID of the process. The permission bits of the semaphore are set to the value  
 38865 of the *mode* argument except those set in the file mode creation mask of the  
 38866 process. When bits in *mode* other than the file permission bits are specified, the  
 38867 effect is unspecified.

38868 After the semaphore named *name* has been created by *sem\_open()* with the  
 38869 **O\_CREAT** flag, other processes can connect to the semaphore by calling  
 38870 *sem\_open()* with the same value of *name*.

38871 **O\_EXCL** If **O\_EXCL** and **O\_CREAT** are set, *sem\_open()* fails if the semaphore *name* exists.  
 38872 The check for the existence of the semaphore and the creation of the semaphore if  
 38873 it does not exist are atomic with respect to other processes executing *sem\_open()*  
 38874 with **O\_EXCL** and **O\_CREAT** set. If **O\_EXCL** is set and **O\_CREAT** is not set, the  
 38875 effect is undefined.

38876 If flags other than **O\_CREAT** and **O\_EXCL** are specified in the *oflag* parameter, the  
 38877 effect is unspecified.

38878 The *name* argument points to a string naming a semaphore object. It is unspecified whether the  
 38879 name appears in the file system and is visible to functions that take pathnames as arguments.  
 38880 The *name* argument conforms to the construction rules for a pathname. If *name* begins with the  
 38881 slash character, then processes calling *sem\_open()* with the same value of *name* shall refer to the  
 38882 same semaphore object, as long as that name has not been removed. If *name* does not begin with  
 38883 the slash character, the effect is implementation-defined. The interpretation of slash characters  
 38884 other than the leading slash character in *name* is implementation-defined.

38885 If a process makes multiple successful calls to *sem\_open()* with the same value for *name*, the  
 38886 same semaphore address shall be returned for each such successful call, provided that there

38887 have been no calls to *sem\_unlink()* for this semaphore.

38888 References to copies of the semaphore produce undefined results.

#### 38889 RETURN VALUE

38890 Upon successful completion, the *sem\_open()* function shall return the address of the semaphore.

38891 Otherwise, it shall return a value of SEM\_FAILED and set *errno* to indicate the error. The symbol

38892 SEM\_FAILED is defined in the `<semaphore.h>` header. No successful return from *sem\_open()*

38893 shall return the value SEM\_FAILED.

#### 38894 ERRORS

38895 If any of the following conditions occur, the *sem\_open()* function shall return SEM\_FAILED and

38896 set *errno* to the corresponding value:

38897 [EACCES] The named semaphore exists and the permissions specified by *oflag* are  
38898 denied, or the named semaphore does not exist and permission to create the  
38899 named semaphore is denied.

38900 [EEXIST] O\_CREAT and O\_EXCL are set and the named semaphore already exists.

38901 [EINTR] The *sem\_open()* operation was interrupted by a signal.

38902 [EINVAL] The *sem\_open()* operation is not supported for the given name, or O\_CREAT

38903 was specified in *oflag* and *value* was greater than {SEM\_VALUE\_MAX}.

38904 [EMFILE] Too many semaphore descriptors or file descriptors are currently in use by  
38905 this process.

38906 [ENAMETOOLONG]

38907 The length of the *name* argument exceeds {PATH\_MAX} or a pathname  
38908 component is longer than {NAME\_MAX}.

38909 [ENFILE] Too many semaphores are currently open in the system.

38910 [ENOENT] O\_CREAT is not set and the named semaphore does not exist.

38911 [ENOSPC] There is insufficient space for the creation of the new named semaphore.

#### 38912 EXAMPLES

38913 None.

#### 38914 APPLICATION USAGE

38915 The *sem\_open()* function is part of the Semaphores option and need not be available on all  
38916 implementations.

#### 38917 RATIONALE

38918 Early drafts required an error return value of `-1` with the type `sem_t *` for the *sem\_open()*

38919 function, which is not guaranteed to be portable across implementations. The revised text

38920 provides the symbolic error code SEM\_FAILED to eliminate the type conflict.

#### 38921 FUTURE DIRECTIONS

38922 None.

#### 38923 SEE ALSO

38924 *semctl()*, *semget()*, *semop()*, *sem\_close()*, *sem\_post()*, *sem\_timedwait()*, *sem\_trywait()*, *sem\_unlink()*,

38925 *sem\_wait()*, the Base Definitions volume of IEEE Std 1003.1-2001, `<semaphore.h>`

#### 38926 CHANGE HISTORY

38927 First released in Issue 5. Included for alignment with the POSIX Realtime Extension.

38928 **Issue 6**

38929 The *sem\_open()* function is marked as part of the Semaphores option.

38930 The [ENOSYS] error condition has been removed as stubs need not be provided if an  
38931 implementation does not support the Semaphores option.

38932 The *sem\_timedwait()* function is added to the SEE ALSO section for alignment with  
38933 IEEE Std 1003.1d-1999.

38934 **NAME**38935 sem\_post — unlock a semaphore (**REALTIME**)38936 **SYNOPSIS**

38937 SEM #include &lt;semaphore.h&gt;

38938 int sem\_post(sem\_t \*sem);

38939

38940 **DESCRIPTION**38941 The *sem\_post()* function shall unlock the semaphore referenced by *sem* by performing a  
38942 semaphore unlock operation on that semaphore.38943 If the semaphore value resulting from this operation is positive, then no threads were blocked  
38944 waiting for the semaphore to become unlocked; the semaphore value is simply incremented.38945 If the value of the semaphore resulting from this operation is zero, then one of the threads  
38946 blocked waiting for the semaphore shall be allowed to return successfully from its call to  
38947 *sem\_wait()*. If the Process Scheduling option is supported, the thread to be unblocked shall be  
38948 chosen in a manner appropriate to the scheduling policies and parameters in effect for the  
38949 blocked threads. In the case of the schedulers SCHED\_FIFO and SCHED\_RR, the highest  
38950 priority waiting thread shall be unblocked, and if there is more than one highest priority thread  
38951 blocked waiting for the semaphore, then the highest priority thread that has been waiting the  
38952 longest shall be unblocked. If the Process Scheduling option is not defined, the choice of a thread  
38953 to unblock is unspecified.38954 SS If the Process Sporadic Server option is supported, and the scheduling policy is  
38955 SCHED\_SPORADIC, the semantics are as per SCHED\_FIFO above.38956 The *sem\_post()* function shall be reentrant with respect to signals and may be invoked from a  
38957 signal-catching function.38958 **RETURN VALUE**38959 If successful, the *sem\_post()* function shall return zero; otherwise, the function shall return  $-1$   
38960 and set *errno* to indicate the error.38961 **ERRORS**38962 The *sem\_post()* function shall fail if:38963 [EINVAL] The *sem* argument does not refer to a valid semaphore.38964 **EXAMPLES**

38965 None.

38966 **APPLICATION USAGE**38967 The *sem\_post()* function is part of the Semaphores option and need not be available on all  
38968 implementations.38969 **RATIONALE**

38970 None.

38971 **FUTURE DIRECTIONS**

38972 None.

38973 **SEE ALSO**38974 *semctl()*, *semget()*, *semop()*, *sem\_timedwait()*, *sem\_trywait()*, *sem\_wait()*, the Base Definitions  
38975 volume of IEEE Std 1003.1-2001, <semaphore.h>

38976 **CHANGE HISTORY**

38977 First released in Issue 5. Included for alignment with the POSIX Realtime Extension.

38978 **Issue 6**

38979 The *sem\_post()* function is marked as part of the Semaphores option.

38980 The [ENOSYS] error condition has been removed as stubs need not be provided if an  
38981 implementation does not support the Semaphores option.

38982 The *sem\_timedwait()* function is added to the SEE ALSO section for alignment with  
38983 IEEE Std 1003.1d-1999.

38984 SCHED\_SPORADIC is added to the list of scheduling policies for which the thread that is to be  
38985 unblocked is specified for alignment with IEEE Std 1003.1d-1999.

38986 **NAME**38987 sem\_timedwait — lock a semaphore (**ADVANCED REALTIME**)38988 **SYNOPSIS**

38989 SEM TMO #include &lt;semaphore.h&gt;

38990 #include &lt;time.h&gt;

38991 int sem\_timedwait(sem\_t \*restrict sem,

38992 const struct timespec \*restrict abs\_timeout);

38993

38994 **DESCRIPTION**

38995 The *sem\_timedwait()* function shall lock the semaphore referenced by *sem* as in the *sem\_wait()*  
 38996 function. However, if the semaphore cannot be locked without waiting for another process or  
 38997 thread to unlock the semaphore by performing a *sem\_post()* function, this wait shall be  
 38998 terminated when the specified timeout expires.

38999 The timeout shall expire when the absolute time specified by *abs\_timeout* passes, as measured by  
 39000 the clock on which timeouts are based (that is, when the value of that clock equals or exceeds  
 39001 *abs\_timeout*), or if the absolute time specified by *abs\_timeout* has already been passed at the time  
 39002 of the call.

39003 TMR If the Timers option is supported, the timeout shall be based on the **CLOCK\_REALTIME** clock. If  
 39004 the Timers option is not supported, the timeout shall be based on the system clock as returned  
 39005 by the *time()* function. The resolution of the timeout shall be the resolution of the clock on which  
 39006 it is based. The **timespec** data type is defined as a structure in the **<time.h>** header.

39007 Under no circumstance shall the function fail with a timeout if the semaphore can be locked  
 39008 immediately. The validity of the *abs\_timeout* need not be checked if the semaphore can be locked  
 39009 immediately.

39010 **RETURN VALUE**

39011 The *sem\_timedwait()* function shall return zero if the calling process successfully performed the  
 39012 semaphore lock operation on the semaphore designated by *sem*. If the call was unsuccessful, the  
 39013 state of the semaphore shall be unchanged, and the function shall return a value of  $-1$  and set  
 39014 *errno* to indicate the error.

39015 **ERRORS**39016 The *sem\_timedwait()* function shall fail if:39017 [EINVAL] The *sem* argument does not refer to a valid semaphore.

39018 [EINVAL] The process or thread would have blocked, and the *abs\_timeout* parameter  
 39019 specified a nanoseconds field value less than zero or greater than or equal to  
 39020 1 000 million.

39021 [ETIMEDOUT] The semaphore could not be locked before the specified timeout expired.

39022 The *sem\_timedwait()* function may fail if:

39023 [EDEADLK] A deadlock condition was detected.

39024 [EINTR] A signal interrupted this function.

39025 **EXAMPLES**

39026 None.

39027 **APPLICATION USAGE**39028 Applications using these functions may be subject to priority inversion, as discussed in the Base  
39029 Definitions volume of IEEE Std 1003.1-2001, Section 3.285, Priority Inversion.39030 The *sem\_timedwait()* function is part of the Semaphores and Timeouts options and need not be  
39031 provided on all implementations.39032 **RATIONALE**

39033 None.

39034 **FUTURE DIRECTIONS**

39035 None.

39036 **SEE ALSO**39037 *sem\_post()*, *sem\_trywait()*, *sem\_wait()*, *semctl()*, *semget()*, *semop()*, *time()*, the Base Definitions  
39038 volume of IEEE Std 1003.1-2001, <**semaphore.h**>, <**time.h**>39039 **CHANGE HISTORY**

39040 First released in Issue 6. Derived from IEEE Std 1003.1d-1999.

39041 **NAME**39042 sem\_trywait, sem\_wait — lock a semaphore (**REALTIME**)39043 **SYNOPSIS**

39044 SEM #include &lt;semaphore.h&gt;

39045 int sem\_trywait(sem\_t \*sem);

39046 int sem\_wait(sem\_t \*sem);

39047

39048 **DESCRIPTION**

39049 The *sem\_trywait()* function shall lock the semaphore referenced by *sem* only if the semaphore is  
 39050 currently not locked; that is, if the semaphore value is currently positive. Otherwise, it shall not  
 39051 lock the semaphore.

39052 The *sem\_wait()* function shall lock the semaphore referenced by *sem* by performing a semaphore  
 39053 lock operation on that semaphore. If the semaphore value is currently zero, then the calling  
 39054 thread shall not return from the call to *sem\_wait()* until it either locks the semaphore or the call is  
 39055 interrupted by a signal.

39056 Upon successful return, the state of the semaphore shall be locked and shall remain locked until  
 39057 the *sem\_post()* function is executed and returns successfully.

39058 The *sem\_wait()* function is interruptible by the delivery of a signal.

39059 **RETURN VALUE**

39060 The *sem\_trywait()* and *sem\_wait()* functions shall return zero if the calling process successfully  
 39061 performed the semaphore lock operation on the semaphore designated by *sem*. If the call was  
 39062 unsuccessful, the state of the semaphore shall be unchanged, and the function shall return a  
 39063 value of  $-1$  and set *errno* to indicate the error.

39064 **ERRORS**

39065 The *sem\_trywait()* and *sem\_wait()* functions shall fail if:

39066 [EAGAIN] The semaphore was already locked, so it cannot be immediately locked by the  
 39067 *sem\_trywait()* operation (*sem\_trywait()* only).

39068 [EINVAL] The *sem* argument does not refer to a valid semaphore.

39069 The *sem\_trywait()* and *sem\_wait()* functions may fail if:

39070 [EDEADLK] A deadlock condition was detected.

39071 [EINTR] A signal interrupted this function.

39072 **EXAMPLES**

39073 None.

39074 **APPLICATION USAGE**

39075 Applications using these functions may be subject to priority inversion, as discussed in the Base  
 39076 Definitions volume of IEEE Std 1003.1-2001, Section 3.285, Priority Inversion.

39077 The *sem\_trywait()* and *sem\_wait()* functions are part of the Semaphores option and need not be  
 39078 provided on all implementations.

39079 **RATIONALE**

39080 None.

39081 **FUTURE DIRECTIONS**

39082       None.

39083 **SEE ALSO**

39084       *semctl()*, *semget()*, *semop()*, *sem\_post()*, *sem\_timedwait()*, the Base Definitions volume of  
39085       IEEE Std 1003.1-2001, <**semaphore.h**>

39086 **CHANGE HISTORY**

39087       First released in Issue 5. Included for alignment with the POSIX Realtime Extension.

39088 **Issue 6**

39089       The *sem\_trywait()* and *sem\_wait()* functions are marked as part of the Semaphores option.

39090       The [ENOSYS] error condition has been removed as stubs need not be provided if an  
39091       implementation does not support the Semaphores option.

39092       The *sem\_timedwait()* function is added to the SEE ALSO section for alignment with  
39093       IEEE Std 1003.1d-1999.

39094 **NAME**39095 sem\_unlink — remove a named semaphore (**REALTIME**)39096 **SYNOPSIS**

39097 SEM #include &lt;semaphore.h&gt;

39098 int sem\_unlink(const char \*name);

39099

39100 **DESCRIPTION**

39101 The *sem\_unlink()* function shall remove the semaphore named by the string *name*. If the  
39102 semaphore named by *name* is currently referenced by other processes, then *sem\_unlink()* shall  
39103 have no effect on the state of the semaphore. If one or more processes have the semaphore open  
39104 when *sem\_unlink()* is called, destruction of the semaphore is postponed until all references to the  
39105 semaphore have been destroyed by calls to *sem\_close()*, *\_exit()*, or *exec*. Calls to *sem\_open()* to  
39106 recreate or reconnect to the semaphore refer to a new semaphore after *sem\_unlink()* is called. The  
39107 *sem\_unlink()* call shall not block until all references have been destroyed; it shall return  
39108 immediately.

39109 **RETURN VALUE**

39110 Upon successful completion, the *sem\_unlink()* function shall return a value of 0. Otherwise, the  
39111 semaphore shall not be changed and the function shall return a value of -1 and set *errno* to  
39112 indicate the error.

39113 **ERRORS**39114 The *sem\_unlink()* function shall fail if:

39115 [EACCES] Permission is denied to unlink the named semaphore.

39116 [ENAMETOOLONG]

39117 The length of the *name* argument exceeds {PATH\_MAX} or a pathname  
39118 component is longer than {NAME\_MAX}.

39119 [ENOENT] The named semaphore does not exist.

39120 **EXAMPLES**

39121 None.

39122 **APPLICATION USAGE**

39123 The *sem\_unlink()* function is part of the Semaphores option and need not be available on all  
39124 implementations.

39125 **RATIONALE**

39126 None.

39127 **FUTURE DIRECTIONS**

39128 None.

39136  
39137

The [ENOSYS] error condition has been removed as stubs need not be provided if an implementation does not support the Semaphores option.

39138 **NAME**39139 sem\_wait — lock a semaphore (**REALTIME**)39140 **SYNOPSIS**

39141 SEM #include &lt;semaphore.h&gt;

39142 int sem\_wait(sem\_t \*sem);

39143

39144 **DESCRIPTION**39145 Refer to *sem\_trywait()*.

## 39146 NAME

39147 semctl — XSI semaphore control operations

## 39148 SYNOPSIS

39149 XSI 

```
#include <sys/sem.h>
```

39150 

```
int semctl(int semid, int semnum, int cmd, ...);
```

39151

## 39152 DESCRIPTION

39153 The *semctl()* function operates on XSI semaphores (see the Base Definitions volume of  
 39154 IEEE Std 1003.1-2001, Section 4.15, Semaphore). It is unspecified whether this function  
 39155 interoperates with the realtime interprocess communication facilities defined in Section 2.8 (on  
 39156 page 41).

39157 The *semctl()* function provides a variety of semaphore control operations as specified by *cmd*.  
 39158 The fourth argument is optional and depends upon the operation requested. If required, it is of  
 39159 type **union semun**, which the application shall explicitly declare:

```
39160 union semun {
39161     int val;
39162     struct semid_ds *buf;
39163     unsigned short *array;
39164 } arg;
```

39165 The following semaphore control operations as specified by *cmd* are executed with respect to the  
 39166 semaphore specified by *semid* and *semnum*. The level of permission required for each operation  
 39167 is shown with each command; see Section 2.7 (on page 39). The symbolic names for the values  
 39168 of *cmd* are defined in the `<sys/sem.h>` header:

39169 GETVAL Return the value of *semval*; see `<sys/sem.h>`. Requires read permission.

39170 SETVAL Set the value of *semval* to *arg.val*, where *arg* is the value of the fourth argument  
 39171 to *semctl()*. When this command is successfully executed, the *semadj* value  
 39172 corresponding to the specified semaphore in all processes is cleared. Requires  
 39173 alter permission; see Section 2.7 (on page 39).

39174 GETPID Return the value of *sempid*. Requires read permission.

39175 GETNCNT Return the value of *semmcnt*. Requires read permission.

39176 GETZCNT Return the value of *semzcnt*. Requires read permission.

39177 The following values of *cmd* operate on each *semval* in the set of semaphores:

39178 GETALL Return the value of *semval* for each semaphore in the semaphore set and place  
 39179 into the array pointed to by *arg.array*, where *arg* is the fourth argument to  
 39180 *semctl()*. Requires read permission.

39181 SETALL Set the value of *semval* for each semaphore in the semaphore set according to  
 39182 the array pointed to by *arg.array*, where *arg* is the fourth argument to *semctl()*.  
 39183 When this command is successfully executed, the *semadj* values corresponding  
 39184 to each specified semaphore in all processes are cleared. Requires alter  
 39185 permission.

39186 The following values of *cmd* are also available:

39187 IPC\_STAT Place the current value of each member of the **semid\_ds** data structure  
 39188 associated with *semid* into the structure pointed to by *arg.buf*, where *arg* is the  
 39189 fourth argument to *semctl()*. The contents of this structure are defined in

|       |                     |                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|-------|---------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 39190 |                     | <sys/sem.h>. Requires read permission.                                                                                                                                                                                                                                                                                                                                                                                                            |
| 39191 | IPC_SET             | Set the value of the following members of the <b>semid_ds</b> data structure associated with <i>semid</i> to the corresponding value found in the structure pointed to by <i>arg.buf</i> , where <i>arg</i> is the fourth argument to <i>semctl()</i> :                                                                                                                                                                                           |
| 39192 |                     |                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| 39193 |                     |                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| 39194 |                     | <i>sem_perm.uid</i>                                                                                                                                                                                                                                                                                                                                                                                                                               |
| 39195 |                     | <i>sem_perm.gid</i>                                                                                                                                                                                                                                                                                                                                                                                                                               |
| 39196 |                     | <i>sem_perm.mode</i>                                                                                                                                                                                                                                                                                                                                                                                                                              |
| 39197 |                     | The mode bits specified in Section 2.7.1 (on page 40) are copied into the corresponding bits of the <i>sem_perm.mode</i> associated with <i>semid</i> . The stored values of any other bits are unspecified.                                                                                                                                                                                                                                      |
| 39198 |                     |                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| 39199 |                     |                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| 39200 |                     | This command can only be executed by a process that has an effective user ID equal to either that of a process with appropriate privileges or to the value of <i>sem_perm.cuid</i> or <i>sem_perm.uid</i> in the <b>semid_ds</b> data structure associated with <i>semid</i> .                                                                                                                                                                    |

| 39228 |                     |                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| 39229 | [ERANGE]            | The argument <i>cmd</i> is equal to SETVAL or SETALL and the value to which <i>semval</i> is to be set is greater than the system-imposed maximum.                                                                                                                                                                                                                                                                                                |
| 39230 |                     |                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

39231 **EXAMPLES**

39232 None.

39233 **APPLICATION USAGE**

39234 The fourth parameter in the SYNOPSIS section is now specified as ". . ." in order to avoid a  
39235 clash with the ISO C standard when referring to the union *semun* (as defined in Issue 3) and for  
39236 backwards-compatibility.

39237 The POSIX Realtime Extension defines alternative interfaces for interprocess communication.  
39238 Application developers who need to use IPC should design their applications so that modules  
39239 using the IPC routines described in Section 2.7 (on page 39) can be easily modified to use the  
39240 alternative interfaces.

39241 **RATIONALE**

39242 None.

39243 **FUTURE DIRECTIONS**

39244 None.

39249 **CHANGE HISTORY**

39250 First released in Issue 2. Derived from Issue 2 of the SVID.

39251 **Issue 5**

39252 The note about use of POSIX Realtime Extension IPC routines has been moved from FUTURE  
39253 DIRECTIONS to the APPLICATION USAGE section.

39254 **NAME**39255 `semget` — get set of XSI semaphores39256 **SYNOPSIS**39257 XSI 

```
#include <sys/sem.h>
```

39258 

```
int semget(key_t key, int nsems, int semflg);
```

39259

39260 **DESCRIPTION**

39261 The `semget()` function operates on XSI semaphores (see the Base Definitions volume of  
 39262 IEEE Std 1003.1-2001, Section 4.15, Semaphore). It is unspecified whether this function  
 39263 interoperates with the realtime interprocess communication facilities defined in Section 2.8 (on  
 39264 page 41).

39265 The `semget()` function shall return the semaphore identifier associated with *key*.

39266 A semaphore identifier with its associated `semid_ds` data structure and its associated set of  
 39267 *nsems* semaphores (see `<sys/sem.h>`) is created for *key* if one of the following is true:

- 39268 • The argument *key* is equal to `IPC_PRIVATE`.
- 39269 • The argument *key* does not already have a semaphore identifier associated with it and (*semflg*  
 39270 `&IPC_CREAT`) is non-zero.

39271 Upon creation, the `semid_ds` data structure associated with the new semaphore identifier is  
 39272 initialized as follows:

- 39273 • In the operation permissions structure *sem\_perm.cuid*, *sem\_perm.uid*, *sem\_perm.cgid*, and  
 39274 *sem\_perm.gid* shall be set equal to the effective user ID and effective group ID, respectively, of  
 39275 the calling process.
- 39276 • The low-order 9 bits of *sem\_perm.mode* shall be set equal to the low-order 9 bits of *semflg*.
- 39277 • The variable *sem\_nsems* shall be set equal to the value of *nsems*.
- 39278 • The variable *sem\_otime* shall be set equal to 0 and *sem\_ctime* shall be set equal to the current  
 39279 time.
- 39280 • The data structure associated with each semaphore in the set shall not be initialized. The  
 39281 `semctl()` function with the command `SETVAL` or `SETALL` can be used to initialize each  
 39282 semaphore.

39283 **RETURN VALUE**

39284 Upon successful completion, `semget()` shall return a non-negative integer, namely a semaphore  
 39285 identifier; otherwise, it shall return `-1` and set *errno* to indicate the error.

39286 **ERRORS**

39287 The `semget()` function shall fail if:

- |                                  |          |                                                                                                                                                                                                                                                                                               |
|----------------------------------|----------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 39288<br>39289<br>39290          | [EACCES] | A semaphore identifier exists for <i>key</i> , but operation permission as specified by the low-order 9 bits of <i>semflg</i> would not be granted; see Section 2.7 (on page 39).                                                                                                             |
| 39291<br>39292                   | [EEXIST] | A semaphore identifier exists for the argument <i>key</i> but <code>((semflg &amp;IPC_CREAT) &amp;&amp;(semflg &amp;IPC_EXCL))</code> is non-zero.                                                                                                                                            |
| 39293<br>39294<br>39295<br>39296 | [EINVAL] | The value of <i>nsems</i> is either less than or equal to 0 or greater than the system-imposed limit, or a semaphore identifier exists for the argument <i>key</i> , but the number of semaphores in the set associated with it is less than <i>nsems</i> and <i>nsems</i> is not equal to 0. |

- 39297 [ENOENT] A semaphore identifier does not exist for the argument *key* and (*semflg*  
39298 &IPC\_CREAT) is equal to 0.
- 39299 [ENOSPC] A semaphore identifier is to be created but the system-imposed limit on the  
39300 maximum number of allowed semaphores system-wide would be exceeded.

39301 **EXAMPLES**39302 **Creating a Semaphore Identifier**

39303 The following example gets a unique semaphore key using the *ftok()* function, then gets a  
39304 semaphore ID associated with that key using the *semget()* function (the first call also tests to  
39305 make sure the semaphore exists). If the semaphore does not exist, the program creates it, as  
39306 shown by the second call to *semget()*. In creating the semaphore for the queuing process, the  
39307 program attempts to create one semaphore with read/write permission for all. It also uses the  
39308 IPC\_EXCL flag, which forces *semget()* to fail if the semaphore already exists.

39309 After creating the semaphore, the program uses a call to *semop()* to initialize it to the values in  
39310 the *sbuf* array. The number of processes that can execute concurrently without queuing is  
39311 initially set to 2. The final call to *semget()* creates a semaphore identifier that can be used later in  
39312 the program.

```

39313 #include <sys/types.h>
39314 #include <stdio.h>
39315 #include <sys/ipc.h>
39316 #include <sys/sem.h>
39317 #include <sys/stat.h>
39318 #include <errno.h>
39319 #include <unistd.h>
39320 #include <stdlib.h>
39321 #include <pwd.h>
39322 #include <fcntl.h>
39323 #include <limits.h>
39324 ...
39325 key_t semkey;
39326 int semid, pfd, fv;
39327 struct sembuf sbuf;
39328 char *lgn;
39329 char filename[PATH_MAX+1];
39330 struct stat outstat;
39331 struct passwd *pw;
39332 ...
39333 /* Get unique key for semaphore. */
39334 if ((semkey = ftok("/tmp", 'a')) == (key_t) -1) {
39335     perror("IPC error: ftok"); exit(1);
39336 }
39337
39338 /* Get semaphore ID associated with this key. */
39339 if ((semid = semget(semkey, 0, 0)) == -1) {
39340     /* Semaphore does not exist - Create. */
39341     if ((semid = semget(semkey, 1, IPC_CREAT | IPC_EXCL | S_IRUSR |
39342         S_IWUSR | S_IRGRP | S_IWGRP | S_IROTH | S_IWOTH)) != -1)
39343     {
39344         /* Initialize the semaphore. */
39345         sbuf.sem_num = 0;

```

```
39345         sbuf.sem_op = 2; /* This is the number of runs
39346                        without queuing. */
39347         sbuf.sem_flg = 0;
39348         if (semop(semid, &sbuf, 1) == -1) {
39349             perror("IPC error: semop"); exit(1);
39350         }
39351     }
39352     else if (errno == EEXIST) {
39353         if ((semid = semget(semkey, 0, 0)) == -1) {
39354             perror("IPC error 1: semget"); exit(1);
39355         }
39356     }
39357     else {
39358         perror("IPC error 2: semget"); exit(1);
39359     }
39360 }
39361 ...
```

#### 39362 APPLICATION USAGE

39363 The POSIX Realtime Extension defines alternative interfaces for interprocess communication.  
39364 Application developers who need to use IPC should design their applications so that modules  
39365 using the IPC routines described in Section 2.7 (on page 39) can be easily modified to use the  
39366 alternative interfaces.

39379 DIRECTIONS to a new APPLICATION USAGE section.

## 39380 NAME

39381 semop — XSI semaphore operations

## 39382 SYNOPSIS

39383 XSI #include &lt;sys/sem.h&gt;

39384 int semop(int *semid*, struct sembuf \**sops*, size\_t *nsops*);

39385

## 39386 DESCRIPTION

39387 The *semop()* function operates on XSI semaphores (see the Base Definitions volume of  
 39388 IEEE Std 1003.1-2001, Section 4.15, Semaphore). It is unspecified whether this function  
 39389 interoperates with the realtime interprocess communication facilities defined in Section 2.8 (on  
 39390 page 41).

39391 The *semop()* function shall perform atomically a user-defined array of semaphore operations on  
 39392 the set of semaphores associated with the semaphore identifier specified by the argument *semid*.

39393 The argument *sops* is a pointer to a user-defined array of semaphore operation structures. The  
 39394 implementation shall not modify elements of this array unless the application uses  
 39395 implementation-defined extensions.

39396 The argument *nsops* is the number of such structures in the array.

39397 Each structure, **sembuf**, includes the following members:

39398

39399

39400

39401

39402

| Member Type | Member Name    | Description          |
|-------------|----------------|----------------------|
| short       | <i>sem_num</i> | Semaphore number.    |
| short       | <i>sem_op</i>  | Semaphore operation. |
| short       | <i>sem_flg</i> | Operation flags.     |

39403 Each semaphore operation specified by *sem\_op* is performed on the corresponding semaphore  
 39404 specified by *semid* and *sem\_num*.

39405 The variable *sem\_op* specifies one of three semaphore operations:

39406 1. If *sem\_op* is a negative integer and the calling process has alter permission, one of the  
 39407 following shall occur:

39408 • If *semval* (see <sys/sem.h>) is greater than or equal to the absolute value of *sem\_op*, the  
 39409 absolute value of *sem\_op* is subtracted from *semval*. Also, if (*sem\_flg* &SEM\_UNDO) is  
 39410 non-zero, the absolute value of *sem\_op* shall be added to the calling process' *semadj*  
 39411 value for the specified semaphore.

39412 • If *semval* is less than the absolute value of *sem\_op* and (*sem\_flg* &IPC\_NOWAIT) is non-  
 39413 zero, *semop()* shall return immediately.

39414 • If *semval* is less than the absolute value of *sem\_op* and (*sem\_flg* &IPC\_NOWAIT) is 0,  
 39415 *semop()* shall increment the *semncnt* associated with the specified semaphore and  
 39416 suspend execution of the calling thread until one of the following conditions occurs:

39417 — The value of *semval* becomes greater than or equal to the absolute value of *sem\_op*.  
 39418 When this occurs, the value of *semncnt* associated with the specified semaphore  
 39419 shall be decremented, the absolute value of *sem\_op* shall be subtracted from *semval*  
 39420 and, if (*sem\_flg* &SEM\_UNDO) is non-zero, the absolute value of *sem\_op* shall be  
 39421 added to the calling process' *semadj* value for the specified semaphore.

39422 — The *semid* for which the calling thread is awaiting action is removed from the  
 39423 system. When this occurs, *errno* shall be set equal to [EIDRM] and *-1* shall be

- 39424 returned.
- 39425 — The calling thread receives a signal that is to be caught. When this occurs, the value of *semncnt* associated with the specified semaphore shall be decremented, and the  
39426 calling thread shall resume execution in the manner prescribed in *sigaction()*.  
39427
- 39428 2. If *sem\_op* is a positive integer and the calling process has alter permission, the value of  
39429 *sem\_op* shall be added to *semval* and, if (*sem\_flg* &SEM\_UNDO) is non-zero, the value of  
39430 *sem\_op* shall be subtracted from the calling process' *semadj* value for the specified  
39431 semaphore.
- 39432 3. If *sem\_op* is 0 and the calling process has read permission, one of the following shall occur:  
39433
- If *semval* is 0, *semop()* shall return immediately.
  - If *semval* is non-zero and (*sem\_flg* &IPC\_NOWAIT) is non-zero, *semop()* shall return  
39434 immediately.  
39435
  - If *semval* is non-zero and (*sem\_flg* &IPC\_NOWAIT) is 0, *semop()* shall increment the  
39436 *semzcnt* associated with the specified semaphore and suspend execution of the calling  
39437 thread until one of the following occurs:  
39438
    - The value of *semval* becomes 0, at which time the value of *semzcnt* associated with  
39439 the specified semaphore shall be decremented.  
39440
    - The *semid* for which the calling thread is awaiting action is removed from the  
39441 system. When this occurs, *errno* shall be set equal to [EIDRM] and -1 shall be  
39442 returned.  
39443
    - The calling thread receives a signal that is to be caught. When this occurs, the value  
39444 of *semzcnt* associated with the specified semaphore shall be decremented, and the  
39445 calling thread shall resume execution in the manner prescribed in *sigaction()*.  
39446
- 39447 Upon successful completion, the value of *sempid* for each semaphore specified in the array  
39448 pointed to by *sops* shall be set equal to the process ID of the calling process.

39449 **RETURN VALUE**

39450 Upon successful completion, *semop()* shall return 0; otherwise, it shall return -1 and set *errno* to  
39451 indicate the error.

39452 **ERRORS**

39453 The *semop()* function shall fail if:

- |       |          |                                                                                                                                                                                                                  |
|-------|----------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 39454 | [E2BIG]  | The value of <i>nsops</i> is greater than the system-imposed maximum.                                                                                                                                            |
| 39455 | [EACCES] | Operation permission is denied to the calling process; see Section 2.7 (on page<br>39456 39).                                                                                                                    |
| 39457 | [EAGAIN] | The operation would result in suspension of the calling process but ( <i>sem_flg</i><br>39458 &IPC_NOWAIT) is non-zero.                                                                                          |
| 39459 | [EFBIG]  | The value of <i>sem_num</i> is less than 0 or greater than or equal to the number of<br>39460 semaphores in the set associated with <i>semid</i> .                                                               |
| 39461 | [EIDRM]  | The semaphore identifier <i>semid</i> is removed from the system.                                                                                                                                                |
| 39462 | [EINTR]  | The <i>semop()</i> function was interrupted by a signal.                                                                                                                                                         |
| 39463 | [EINVAL] | The value of <i>semid</i> is not a valid semaphore identifier, or the number of<br>39464 individual semaphores for which the calling process requests a SEM_UNDO<br>39465 would exceed the system-imposed limit. |

39466 [ENOSPC] The limit on the number of individual processes requesting a SEM\_UNDO  
 39467 would be exceeded.

39468 [ERANGE] An operation would cause a *semval* to overflow the system-imposed limit, or  
 39469 an operation would cause a *semadj* value to overflow the system-imposed  
 39470 limit.

### 39471 EXAMPLES

#### 39472 Setting Values in Semaphores

39473 The following example sets the values of the two semaphores associated with the *semid*  
 39474 identifier to the values contained in the *sb* array.

```
39475 #include <sys/sem.h>
39476 ...
39477 int semid;
39478 struct sembuf sb[2];
39479 int nsops = 2;
39480 int result;

39481 /* Adjust value of semaphore in the semaphore array semid. */
39482 sb[0].sem_num = 0;
39483 sb[0].sem_op = -1;
39484 sb[0].sem_flg = SEM_UNDO | IPC_NOWAIT;
39485 sb[1].sem_num = 1;
39486 sb[1].sem_op = 1;
39487 sb[1].sem_flg = 0;

39488 result = semop(semid, sb, nsops);
```

#### 39489 Creating a Semaphore Identifier

39490 The following example gets a unique semaphore key using the *ftok()* function, then gets a  
 39491 semaphore ID associated with that key using the *semget()* function (the first call also tests to  
 39492 make sure the semaphore exists). If the semaphore does not exist, the program creates it, as  
 39493 shown by the second call to *semget()*. In creating the semaphore for the queuing process, the  
 39494 program attempts to create one semaphore with read/write permission for all. It also uses the  
 39495 IPC\_EXCL flag, which forces *semget()* to fail if the semaphore already exists.

39496 After creating the semaphore, the program uses a call to *semop()* to initialize it to the values in  
 39497 the *sbuf* array. The number of processes that can execute concurrently without queuing is  
 39498 initially set to 2. The final call to *semget()* creates a semaphore identifier that can be used later in  
 39499 the program.

39500 The final call to *semop()* acquires the semaphore and waits until it is free; the SEM\_UNDO  
 39501 option releases the semaphore when the process exits, waiting until there are less than two  
 39502 processes running concurrently.

```
39503 #include <sys/types.h>
39504 #include <stdio.h>
39505 #include <sys/ipc.h>
39506 #include <sys/sem.h>
39507 #include <sys/stat.h>
39508 #include <errno.h>
39509 #include <unistd.h>
39510 #include <stdlib.h>
```

```

39511     #include <pwd.h>
39512     #include <fcntl.h>
39513     #include <limits.h>
39514     ...
39515     key_t semkey;
39516     int semid, pfd, fv;
39517     struct sembuf sbuf;
39518     char *lgn;
39519     char filename[PATH_MAX+1];
39520     struct stat outstat;
39521     struct passwd *pw;
39522     ...
39523     /* Get unique key for semaphore. */
39524     if ((semkey = ftok("/tmp", 'a')) == (key_t) -1) {
39525         perror("IPC error: ftok"); exit(1);
39526     }
39527     /* Get semaphore ID associated with this key. */
39528     if ((semid = semget(semkey, 0, 0)) == -1) {
39529         /* Semaphore does not exist - Create. */
39530         if ((semid = semget(semkey, 1, IPC_CREAT | IPC_EXCL | S_IRUSR |
39531             S_IWUSR | S_IRGRP | S_IWGRP | S_IROTH | S_IWOTH)) != -1)
39532         {
39533             /* Initialize the semaphore. */
39534             sbuf.sem_num = 0;
39535             sbuf.sem_op = 2; /* This is the number of runs without queuing. */
39536             sbuf.sem_flg = 0;
39537             if (semop(semid, &sbuf, 1) == -1) {
39538                 perror("IPC error: semop"); exit(1);
39539             }
39540         }
39541         else if (errno == EEXIST) {
39542             if ((semid = semget(semkey, 0, 0)) == -1) {
39543                 perror("IPC error 1: semget"); exit(1);
39544             }
39545         }
39546         else {
39547             perror("IPC error 2: semget"); exit(1);
39548         }
39549     }
39550     ...
39551     sbuf.sem_num = 0;
39552     sbuf.sem_op = -1;
39553     sbuf.sem_flg = SEM_UNDO;
39554     if (semop(semid, &sbuf, 1) == -1) {
39555         perror("IPC Error: semop"); exit(1);
39556     }

```

### 39557 APPLICATION USAGE

39558 The POSIX Realtime Extension defines alternative interfaces for interprocess communication.  
39559 Application developers who need to use IPC should design their applications so that modules  
39560 using the IPC routines described in Section 2.7 (on page 39) can be easily modified to use the  
39561 alternative interfaces.

39576 **NAME**39577        *send* — send a message on a socket39578 **SYNOPSIS**

39579        #include &lt;sys/socket.h&gt;

39580        ssize\_t send(int *socket*, const void \**buffer*, size\_t *length*, int *flags*);39581 **DESCRIPTION**39582        The *send()* function shall initiate transmission of a message from the specified socket to its peer.39583        The *send()* function shall send a message only when the socket is connected (including when the peer of a connectionless socket has been set via *connect()*).

39584

39585        The *send()* function takes the following arguments:39586        *socket*                Specifies the socket file descriptor.39587        *buffer*               Points to the buffer containing the message to send.39588        *length*               Specifies the length of the message in bytes.39589        *flags*                Specifies the type of message transmission. Values of this argument are formed by logically OR'ing zero or more of the following flags:

39590

39591                MSG\_EOR        Terminates a record (if supported by the protocol).

39592                MSG\_OOB        Sends out-of-band data on sockets that support out-of-band communications. The significance and semantics of out-of-band data are protocol-specific.

39593

39594

39595        The length of the message to be sent is specified by the *length* argument. If the message is too long to pass through the underlying protocol, *send()* shall fail and no data shall be transmitted.

39596

39597        Successful completion of a call to *send()* does not guarantee delivery of the message. A return value of  $-1$  indicates only locally-detected errors.

39598

39599        If space is not available at the sending socket to hold the message to be transmitted, and the socket file descriptor does not have O\_NONBLOCK set, *send()* shall block until space is available. If space is not available at the sending socket to hold the message to be transmitted, and the socket file descriptor does have O\_NONBLOCK set, *send()* shall fail. The *select()* and *poll()* functions can be used to determine when it is possible to send more data.

39600

39601

39602

39603

39604        The socket in use may require the process to have appropriate privileges to use the *send()* function.

39605

39606 **RETURN VALUE**39607        Upon successful completion, *send()* shall return the number of bytes sent. Otherwise,  $-1$  shall be returned and *errno* set to indicate the error.

39608

39609 **ERRORS**39610        The *send()* function shall fail if:

39611        [EAGAIN] or [EWOULDBLOCK]

39612                The socket's file descriptor is marked O\_NONBLOCK and the requested operation would block.

39613

39614        [EBADF]            The *socket* argument is not a valid file descriptor.

39615        [ECONNRESET]        A connection was forcibly closed by a peer.

39616        [EDESTADDRREQ]

39617                The socket is not connection-mode and no peer address is set.

- 39618 [EINTR] A signal interrupted *send()* before any data was transmitted.
- 39619 [EMSGSIZE] The message is too large to be sent all at once, as the socket requires.
- 39620 [ENOTCONN] The socket is not connected or otherwise has not had the peer pre-specified.
- 39621 [ENOTSOCK] The *socket* argument does not refer to a socket.
- 39622 [EOPNOTSUPP] The *socket* argument is associated with a socket that does not support one or  
39623 more of the values set in *flags*.
- 39624 [EPIPE] The socket is shut down for writing, or the socket is connection-mode and is  
39625 no longer connected. In the latter case, and if the socket is of type  
39626 SOCK\_STREAM, the SIGPIPE signal is generated to the calling thread.
- 39627 The *send()* function may fail if:
- 39628 [EACCES] The calling process does not have the appropriate privileges.
- 39629 [EIO] An I/O error occurred while reading from or writing to the file system.
- 39630 [ENETDOWN] The local network interface used to reach the destination is down.
- 39631 [ENETUNREACH]  
39632 No route to the network is present.
- 39633 [ENOBUFS] Insufficient resources were available in the system to perform the operation.
- 39634 **EXAMPLES**
- 39635 None.
- 39636 **APPLICATION USAGE**
- 39637 The *send()* function is equivalent to *sendto()* with a null pointer *dest\_len* argument, and to *write()*  
39638 if no flags are used.
- 39639 **RATIONALE**
- 39640 None.
- 39641 **FUTURE DIRECTIONS**
- 39642 None.

- 39647 **CHANGE HISTORY**
- 39648 First released in Issue 6. Derived from the XNS, Issue 5.2 specification.

39649 **NAME**

39650 sendmsg — send a message on a socket using a message structure

39651 **SYNOPSIS**

39652 #include &lt;sys/socket.h&gt;

39653 ssize\_t sendmsg(int *socket*, const struct msghdr \**message*, int *flags*);39654 **DESCRIPTION**

39655 The *sendmsg()* function shall send a message through a connection-mode or connectionless-  
 39656 mode socket. If the socket is connectionless-mode, the message shall be sent to the address  
 39657 specified by **msghdr**. If the socket is connection-mode, the destination address in **msghdr** shall  
 39658 be ignored.

39659 The *sendmsg()* function takes the following arguments:

|       |                |                                                                                                                                                                                                                                                 |
|-------|----------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 39660 | <i>socket</i>  | Specifies the socket file descriptor.                                                                                                                                                                                                           |
| 39661 | <i>message</i> | Points to a <b>msghdr</b> structure, containing both the destination address and the buffers for the outgoing message. The length and format of the address depend on the address family of the socket. The <i>msg_flags</i> member is ignored. |
| 39662 |                |                                                                                                                                                                                                                                                 |
| 39663 |                |                                                                                                                                                                                                                                                 |
| 39664 | <i>flags</i>   | Specifies the type of message transmission. The application may specify 0 or the following flag:                                                                                                                                                |
| 39665 |                |                                                                                                                                                                                                                                                 |
| 39666 | MSG_EOR        | Terminates a record (if supported by the protocol).                                                                                                                                                                                             |
| 39667 | MSG_OOB        | Sends out-of-band data on sockets that support out-of-band data. The significance and semantics of out-of-band data are protocol-specific.                                                                                                      |
| 39668 |                |                                                                                                                                                                                                                                                 |
| 39669 |                |                                                                                                                                                                                                                                                 |

39670 The *msg\_iov* and *msg\_iovlen* fields of *message* specify zero or more buffers containing the data to  
 39671 be sent. *msg\_iov* points to an array of **iovec** structures; *msg\_iovlen* shall be set to the dimension of  
 39672 this array. In each **iovec** structure, the *iov\_base* field specifies a storage area and the *iov\_len* field  
 39673 gives its size in bytes. Some of these sizes can be zero. The data from each storage area indicated  
 39674 by *msg\_iov* is sent in turn.

39675 Successful completion of a call to *sendmsg()* does not guarantee delivery of the message. A  
 39676 return value of  $-1$  indicates only locally-detected errors.

39677 If space is not available at the sending socket to hold the message to be transmitted and the  
 39678 socket file descriptor does not have **O\_NONBLOCK** set, the *sendmsg()* function shall block until  
 39679 space is available. If space is not available at the sending socket to hold the message to be  
 39680 transmitted and the socket file descriptor does have **O\_NONBLOCK** set, the *sendmsg()* function  
 39681 shall fail.

39682 If the socket protocol supports broadcast and the specified address is a broadcast address for the  
 39683 socket protocol, *sendmsg()* shall fail if the **SO\_BROADCAST** option is not set for the socket.

39684 The socket in use may require the process to have appropriate privileges to use the *sendmsg()*  
 39685 function.

39686 **RETURN VALUE**

39687 Upon successful completion, *sendmsg()* shall return the number of bytes sent. Otherwise,  $-1$   
 39688 shall be returned and *errno* set to indicate the error.

39689 **ERRORS**39690 The *sendmsg()* function shall fail if:

39691 [EAGAIN] or [EWOULDBLOCK]

39692 The socket's file descriptor is marked **O\_NONBLOCK** and the requested

|       |                |                                                                                                                                                                                                                                |
|-------|----------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 39693 |                | operation would block.                                                                                                                                                                                                         |
| 39694 | [EAFNOSUPPORT] |                                                                                                                                                                                                                                |
| 39695 |                | Addresses in the specified address family cannot be used with this socket.                                                                                                                                                     |
| 39696 | [EBADF]        | The <i>socket</i> argument is not a valid file descriptor.                                                                                                                                                                     |
| 39697 | [ECONNRESET]   | A connection was forcibly closed by a peer.                                                                                                                                                                                    |
| 39698 | [EINTR]        | A signal interrupted <i>sendmsg()</i> before any data was transmitted.                                                                                                                                                         |
| 39699 | [EINVAL]       | The sum of the <i>iov_len</i> values overflows an <i>ssize_t</i> .                                                                                                                                                             |
| 39700 | [EMSGSIZE]     | The message is too large to be sent all at once (as the socket requires), or the <i>msg_iovlen</i> member of the <i>msghdr</i> structure pointed to by <i>message</i> is less than or equal to 0 or is greater than {IOV_MAX}. |
| 39701 |                |                                                                                                                                                                                                                                |
| 39702 |                |                                                                                                                                                                                                                                |
| 39703 | [ENOTCONN]     | The socket is connection-mode but is not connected.                                                                                                                                                                            |
| 39704 | [ENOTSOCK]     | The <i>socket</i> argument does not refer to a socket.                                                                                                                                                                         |
| 39705 | [EOPNOTSUPP]   | The <i>socket</i> argument is associated with a socket that does not support one or more of the values set in <i>flags</i> .                                                                                                   |
| 39706 |                |                                                                                                                                                                                                                                |
| 39707 | [EPIPE]        | The socket is shut down for writing, or the socket is connection-mode and is no longer connected. In the latter case, and if the socket is of type SOCK_STREAM, the SIGPIPE signal is generated to the calling thread.         |
| 39708 |                |                                                                                                                                                                                                                                |
| 39709 |                |                                                                                                                                                                                                                                |
| 39710 |                | If the address family of the socket is AF_UNIX, then <i>sendmsg()</i> shall fail if:                                                                                                                                           |
| 39711 | [EIO]          | An I/O error occurred while reading from or writing to the file system.                                                                                                                                                        |
| 39712 | [ELOOP]        | A loop exists in symbolic links encountered during resolution of the pathname in the socket address.                                                                                                                           |
| 39713 |                |                                                                                                                                                                                                                                |
| 39714 | [ENAMETOOLONG] |                                                                                                                                                                                                                                |
| 39715 |                | A component of a pathname exceeded {NAME_MAX} characters, or an entire pathname exceeded {PATH_MAX} characters.                                                                                                                |
| 39716 |                |                                                                                                                                                                                                                                |
| 39717 | [ENOENT]       | A component of the pathname does not name an existing file or the path name is an empty string.                                                                                                                                |
| 39718 |                |                                                                                                                                                                                                                                |
| 39719 | [ENOTDIR]      | A component of the path prefix of the pathname in the socket address is not a directory.                                                                                                                                       |
| 39720 |                |                                                                                                                                                                                                                                |
| 39721 |                | The <i>sendmsg()</i> function may fail if:                                                                                                                                                                                     |
| 39722 | [EACCES]       | Search permission is denied for a component of the path prefix; or write access to the named socket is denied.                                                                                                                 |
| 39723 |                |                                                                                                                                                                                                                                |
| 39724 | [EDESTADDRREQ] |                                                                                                                                                                                                                                |
| 39725 |                | The socket is not connection-mode and does not have its peer address set, and no destination address was specified.                                                                                                            |
| 39726 |                |                                                                                                                                                                                                                                |
| 39727 | [EHOSTUNREACH] |                                                                                                                                                                                                                                |
| 39728 |                | The destination host cannot be reached (probably because the host is down or a remote router cannot reach it).                                                                                                                 |
| 39729 |                |                                                                                                                                                                                                                                |
| 39730 | [EIO]          | An I/O error occurred while reading from or writing to the file system.                                                                                                                                                        |
| 39731 | [EISCONN]      | A destination address was specified and the socket is already connected.                                                                                                                                                       |
| 39732 | [ENETDOWN]     | The local network interface used to reach the destination is down.                                                                                                                                                             |

- 39733 [ENETUNREACH]  
39734 No route to the network is present.
- 39735 [ENOBUFS] Insufficient resources were available in the system to perform the operation.
- 39736 [ENOMEM] Insufficient memory was available to fulfill the request.
- 39737 If the address family of the socket is AF\_UNIX, then *sendmsg()* may fail if:
- 39738 [ELOOP] More than {SYMLOOP\_MAX} symbolic links were encountered during  
39739 resolution of the pathname in the socket address.
- 39740 [ENAMETOOLONG]  
39741 Pathname resolution of a symbolic link produced an intermediate result  
39742 whose length exceeds {PATH\_MAX}.
- 39743 **EXAMPLES**  
39744 Done.
- 39745 **APPLICATION USAGE**  
39746 The *select()* and *poll()* functions can be used to determine when it is possible to send more data.
- 39747 **RATIONALE**  
39748 None.
- 39749 **FUTURE DIRECTIONS**  
39750 None.
- 39751 **SEE ALSO**  
39752 *getsockopt()*, *poll()*, *recv()*, *recvfrom()*, *recvmsg()*, *select()*, *send()*, *sendto()*, *setsockopt()*,  
39753 *shutdown()*, *socket()*, the Base Definitions volume of IEEE Std 1003.1-2001, <sys/socket.h>
- 39754 **CHANGE HISTORY**  
39755 First released in Issue 6. Derived from the XNS, Issue 5.2 specification.
- 39756 The wording of the mandatory [ELOOP] error condition is updated, and a second optional  
39757 [ELOOP] error condition is added.

## 39758 NAME

39759 sendto — send a message on a socket

## 39760 SYNOPSIS

39761 #include &lt;sys/socket.h&gt;

39762 ssize\_t sendto(int socket, const void \*message, size\_t length,

39763 int flags, const struct sockaddr \*dest\_addr,

39764 socklen\_t dest\_len);

## 39765 DESCRIPTION

39766 The *sendto()* function shall send a message through a connection-mode or connectionless-mode  
 39767 socket. If the socket is connectionless-mode, the message shall be sent to the address specified by  
 39768 *dest\_addr*. If the socket is connection-mode, *dest\_addr* shall be ignored.

39769 The *sendto()* function takes the following arguments:

|       |                  |                                                                                                                                                                     |
|-------|------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 39770 | <i>socket</i>    | Specifies the socket file descriptor.                                                                                                                               |
| 39771 | <i>message</i>   | Points to a buffer containing the message to be sent.                                                                                                               |
| 39772 | <i>length</i>    | Specifies the size of the message in bytes.                                                                                                                         |
| 39773 | <i>flags</i>     | Specifies the type of message transmission. Values of this argument are<br>39774 formed by logically OR'ing zero or more of the following flags:                    |
| 39775 | MSG_EOR          | Terminates a record (if supported by the protocol).                                                                                                                 |
| 39776 | MSG_OOB          | Sends out-of-band data on sockets that support out-of-band<br>39777 data. The significance and semantics of out-of-band data are<br>39778 protocol-specific.        |
| 39779 | <i>dest_addr</i> | Points to a <b>sockaddr</b> structure containing the destination address. The length<br>39780 and format of the address depend on the address family of the socket. |
| 39781 | <i>dest_len</i>  | Specifies the length of the <b>sockaddr</b> structure pointed to by the <i>dest_addr</i><br>39782 argument.                                                         |

39783 If the socket protocol supports broadcast and the specified address is a broadcast address for the  
 39784 socket protocol, *sendto()* shall fail if the SO\_BROADCAST option is not set for the socket.

39785 The *dest\_addr* argument specifies the address of the target. The *length* argument specifies the  
 39786 length of the message.

39787 Successful completion of a call to *sendto()* does not guarantee delivery of the message. A return  
 39788 value of  $-1$  indicates only locally-detected errors.

39789 If space is not available at the sending socket to hold the message to be transmitted and the  
 39790 socket file descriptor does not have O\_NONBLOCK set, *sendto()* shall block until space is  
 39791 available. If space is not available at the sending socket to hold the message to be transmitted  
 39792 and the socket file descriptor does have O\_NONBLOCK set, *sendto()* shall fail.

39793 The socket in use may require the process to have appropriate privileges to use the *sendto()*  
 39794 function.

## 39795 RETURN VALUE

39796 Upon successful completion, *sendto()* shall return the number of bytes sent. Otherwise,  $-1$  shall  
 39797 be returned and *errno* set to indicate the error.

39798 **ERRORS**

- 39799 The *sendto()* function shall fail if:
- 39800 [EAFNOSUPPORT]  
39801 Addresses in the specified address family cannot be used with this socket.
- 39802 [EAGAIN] or [EWOULDBLOCK]  
39803 The socket's file descriptor is marked O\_NONBLOCK and the requested  
39804 operation would block.
- 39805 [EBADF] The *socket* argument is not a valid file descriptor.
- 39806 [ECONNRESET] A connection was forcibly closed by a peer.
- 39807 [EINTR] A signal interrupted *sendto()* before any data was transmitted.
- 39808 [EMSGSIZE] The message is too large to be sent all at once, as the socket requires.
- 39809 [ENOTCONN] The socket is connection-mode but is not connected.
- 39810 [ENOTSOCK] The *socket* argument does not refer to a socket.
- 39811 [EOPNOTSUPP] The *socket* argument is associated with a socket that does not support one or  
39812 more of the values set in *flags*.
- 39813 [EPIPE] The socket is shut down for writing, or the socket is connection-mode and is  
39814 no longer connected. In the latter case, and if the socket is of type  
39815 SOCK\_STREAM, the SIGPIPE signal is generated to the calling thread.
- 39816 If the address family of the socket is AF\_UNIX, then *sendto()* shall fail if:
- 39817 [EIO] An I/O error occurred while reading from or writing to the file system.
- 39818 [ELOOP] A loop exists in symbolic links encountered during resolution of the pathname  
39819 in the socket address.
- 39820 [ENAMETOOLONG]  
39821 A component of a pathname exceeded {NAME\_MAX} characters, or an entire  
39822 pathname exceeded {PATH\_MAX} characters.
- 39823 [ENOENT] A component of the pathname does not name an existing file or the pathname  
39824 is an empty string.
- 39825 [ENOTDIR] A component of the path prefix of the pathname in the socket address is not a  
39826 directory.
- 39827 The *sendto()* function may fail if:
- 39828 [EACCES] Search permission is denied for a component of the path prefix; or write  
39829 access to the named socket is denied.
- 39830 [EDESTADDRREQ]  
39831 The socket is not connection-mode and does not have its peer address set, and  
39832 no destination address was specified.
- 39833 [EHOSTUNREACH]  
39834 The destination host cannot be reached (probably because the host is down or  
39835 a remote router cannot reach it).
- 39836 [EINVAL] The *dest\_len* argument is not a valid length for the address family.
- 39837 [EIO] An I/O error occurred while reading from or writing to the file system.

- 39838 [EISCONN] A destination address was specified and the socket is already connected. This  
39839 error may or may not be returned for connection mode sockets.
- 39840 [ENETDOWN] The local network interface used to reach the destination is down.
- 39841 [ENETUNREACH]  
39842 No route to the network is present.
- 39843 [ENOBUFS] Insufficient resources were available in the system to perform the operation.
- 39844 [ENOMEM] Insufficient memory was available to fulfill the request.
- 39845 If the address family of the socket is AF\_UNIX, then *sendto()* may fail if:
- 39846 [ELOOP] More than {SYMLOOP\_MAX} symbolic links were encountered during  
39847 resolution of the pathname in the socket address.
- 39848 [ENAMETOOLONG]  
39849 Pathname resolution of a symbolic link produced an intermediate result  
39850 whose length exceeds {PATH\_MAX}.
- 39851 **EXAMPLES**  
39852 None.
- 39853 **APPLICATION USAGE**  
39854 The *select()* and *poll()* functions can be used to determine when it is possible to send more data.
- 39855 **RATIONALE**  
39856 None.
- 39857 **FUTURE DIRECTIONS**  
39858 None.
- 39859 **SEE ALSO**  
39860 *getsockopt()*, *poll()*, *recv()*, *recvfrom()*, *recvmsg()*, *select()*, *send()*, *sendmsg()*, *setsockopt()*,  
39861 *shutdown()*, *socket()*, the Base Definitions volume of IEEE Std 1003.1-2001, <sys/socket.h>
- 39862 **CHANGE HISTORY**  
39863 First released in Issue 6. Derived from the XNS, Issue 5.2 specification.
- 39864 The wording of the mandatory [ELOOP] error condition is updated, and a second optional  
39865 [ELOOP] error condition is added.

39866 **NAME**

39867 setbuf — assign buffering to a stream

39868 **SYNOPSIS**

39869 #include &lt;stdio.h&gt;

39870 void setbuf(FILE \*restrict stream, char \*restrict buf);

39871 **DESCRIPTION**

39872 cx The functionality described on this reference page is aligned with the ISO C standard. Any  
39873 conflict between the requirements described here and the ISO C standard is unintentional. This  
39874 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

39875 Except that it returns no value, the function call:

39876 setbuf(stream, buf)

39877 shall be equivalent to:

39878 setvbuf(stream, buf, \_IOFBF, BUFSIZ)

39879 if *buf* is not a null pointer, or to:

39880 setvbuf(stream, buf, \_IONBF, BUFSIZ)

39881 if *buf* is a null pointer.39882 **RETURN VALUE**39883 The *setbuf()* function shall not return a value.39884 **ERRORS**

39885 No errors are defined.

39886 **EXAMPLES**

39887 None.

39888 **APPLICATION USAGE**

39889 A common source of error is allocating buffer space as an “automatic” variable in a code block,  
39890 and then failing to close the stream in the same block.

39891 With *setbuf()*, allocating a buffer of BUFSIZ bytes does not necessarily imply that all of BUFSIZ  
39892 bytes are used for the buffer area.

39893 **RATIONALE**

39894 None.

39895 **FUTURE DIRECTIONS**

39896 None.

39897 **SEE ALSO**39898 *fopen()*, *setvbuf()*, the Base Definitions volume of IEEE Std 1003.1-2001, <stdio.h>39899 **CHANGE HISTORY**

39900 First released in Issue 1. Derived from Issue 1 of the SVID.

39901 **Issue 6**39902 The prototype for *setbuf()* is updated for alignment with the ISO/IEC 9899:1999 standard.

39903 **NAME**

39904           setcontext — set current user context

39905 **SYNOPSIS**

39906 xSI       #include <ucontext.h>

39907           int setcontext(const ucontext\_t \*ucp);

39908

39909 **DESCRIPTION**

39910           Refer to *getcontext()*.

39911 **NAME**

39912 setegid — set the effective group ID

39913 **SYNOPSIS**

39914 #include <unistd.h>

39915 int setegid(gid\_t gid);

39916 **DESCRIPTION**

39917 If *gid* is equal to the real group ID or the saved set-group-ID, or if the process has appropriate  
39918 privileges, *setegid()* shall set the effective group ID of the calling process to *gid*; the real group  
39919 ID, saved set-group-ID, and any supplementary group IDs shall remain unchanged.

39920 The *setegid()* function shall not affect the supplementary group list in any way.

39921 **RETURN VALUE**

39922 Upon successful completion, 0 shall be returned; otherwise, -1 shall be returned and *errno* set to  
39923 indicate the error.

39924 **ERRORS**

39925 The *setegid()* function shall fail if:

39926 [EINVAL] The value of the *gid* argument is invalid and is not supported by the  
39927 implementation.

39928 [EPERM] The process does not have appropriate privileges and *gid* does not match the  
39929 real group ID or the saved set-group-ID.

39930 **EXAMPLES**

39931 None.

39932 **APPLICATION USAGE**

39933 None.

39934 **RATIONALE**

39935 Refer to the RATIONALE section in *setuid()*.

39936 **FUTURE DIRECTIONS**

39937 None.

39938 **SEE ALSO**

39939 *exec*, *getegid()*, *geteuid()*, *getgid()*, *getuid()*, *seteuid()*, *setgid()*, *setregid()*, *setreuid()*, *setuid()*, the  
39940 Base Definitions volume of IEEE Std 1003.1-2001, <sys/types.h>, <unistd.h>

39941 **CHANGE HISTORY**

39942 First released in Issue 6. Derived from the IEEE P1003.1a draft standard.

39943 **NAME**

39944 setenv — add or change environment variable

39945 **SYNOPSIS**39946 cx 

```
#include <stdlib.h>
```

39947 

```
int setenv(const char *envname, const char *envval, int overwrite);
```

39948

39949 **DESCRIPTION**

39950 The *setenv()* function shall update or add a variable in the environment of the calling process.  
 39951 The *envname* argument points to a string containing the name of an environment variable to be  
 39952 added or altered. The environment variable shall be set to the value to which *envval* points. The  
 39953 function shall fail if *envname* points to a string which contains an '=' character. If the  
 39954 environment variable named by *envname* already exists and the value of *overwrite* is non-zero,  
 39955 the function shall return success and the environment shall be updated. If the environment  
 39956 variable named by *envname* already exists and the value of *overwrite* is zero, the function shall  
 39957 return success and the environment shall remain unchanged.

39958 If the application modifies *environ* or the pointers to which it points, the behavior of *setenv()* is  
 39959 undefined. The *setenv()* function shall update the list of pointers to which *environ* points.

39960 The strings described by *envname* and *envval* are copied by this function.

39961 The *setenv()* function need not be reentrant. A function that is not required to be reentrant is not  
 39962 required to be thread-safe.

39963 **RETURN VALUE**

39964 Upon successful completion, zero shall be returned. Otherwise, -1 shall be returned, *errno* set to  
 39965 indicate the error, and the environment shall be unchanged.

39966 **ERRORS**

39967 The *setenv()* function shall fail if:

39968 [EINVAL] The *name* argument is a null pointer, points to an empty string, or points to a  
 39969 string containing an '=' character.

39970 [ENOMEM] Insufficient memory was available to add a variable or its value to the  
 39971 environment.

39972 **EXAMPLES**

39973 None.

39974 **APPLICATION USAGE**

39975 None.

39976 **RATIONALE**

39977 Unanticipated results may occur if *setenv()* changes the external variable *environ*. In particular,  
 39978 if the optional *envp* argument to *main()* is present, it is not changed, and thus may point to an  
 39979 obsolete copy of the environment (as may any other copy of *environ*). However, other than the  
 39980 aforementioned restriction, the developers of IEEE Std 1003.1-2001 intended that the traditional  
 39981 method of walking through the environment by way of the *environ* pointer must be supported.

39982 It was decided that *setenv()* should be required by this revision because it addresses a piece of  
 39983 missing functionality, and does not impose a significant burden on the implementor.

39984 There was considerable debate as to whether the System V *putenv()* function or the BSD *setenv()*  
 39985 function should be required as a mandatory function. The *setenv()* function was chosen because  
 39986 it permitted the implementation of the *unsetenv()* function to delete environmental variables,  
 39987 without specifying an additional interface. The *putenv()* function is available as an XSI

39988 extension.

39989 The standard developers considered requiring that *setenv()* indicate an error when a call to it  
39990 would result in exceeding {ARG\_MAX}. The requirement was rejected since the condition might  
39991 be temporary, with the application eventually reducing the environment size. The ultimate  
39992 success or failure depends on the size at the time of a call to *exec*, which returns an indication of  
39993 this error condition.

39994 **FUTURE DIRECTIONS**

39995 None.

39996 **SEE ALSO**

39997 *getenv()*, *unsetenv()*, the Base Definitions volume of IEEE Std 1003.1-2001, `<stdlib.h>`,  
39998 `<sys/types.h>`, `<unistd.h>`

39999 **CHANGE HISTORY**

40000 First released in Issue 6. Derived from the IEEE P1003.1a draft standard.

40001 **NAME**

40002            seteuid — set effective user ID

40003 **SYNOPSIS**

40004            #include &lt;unistd.h&gt;

40005            int seteuid(uid\_t uid);

40006 **DESCRIPTION**

40007            If *uid* is equal to the real user ID or the saved set-user-ID, or if the process has appropriate privileges, *seteuid()* shall set the effective user ID of the calling process to *uid*; the real user ID and saved set-user-ID shall remain unchanged.

40010            The *seteuid()* function shall not affect the supplementary group list in any way.

40011 **RETURN VALUE**

40012            Upon successful completion, 0 shall be returned; otherwise, -1 shall be returned and *errno* set to indicate the error.

40014 **ERRORS**

40015            The *seteuid()* function shall fail if:

40016            [EINVAL]            The value of the *uid* argument is invalid and is not supported by the implementation.

40018            [EPERM]            The process does not have appropriate privileges and *uid* does not match the real group ID or the saved set-group-ID.

40020 **EXAMPLES**

40021            None.

40022 **APPLICATION USAGE**

40023            None.

40024 **RATIONALE**40025            Refer to the RATIONALE section in *setuid()*.40026 **FUTURE DIRECTIONS**

40027            None.

40028 **SEE ALSO**

40029            *exec*, *getegid()*, *geteuid()*, *getgid()*, *getuid()*, *setegid()*, *setgid()*, *setregid()*, *setreuid()*, *setuid()*, the Base Definitions volume of IEEE Std 1003.1-2001, <sys/types.h>, <unistd.h>

40031 **CHANGE HISTORY**

40032            First released in Issue 6. Derived from the IEEE P1003.1a draft standard.

40033 **NAME**

40034 setgid — set-group-ID

40035 **SYNOPSIS**

40036 #include &lt;unistd.h&gt;

40037 int setgid(gid\_t *gid*);40038 **DESCRIPTION**40039 If the process has appropriate privileges, *setgid()* shall set the real group ID, effective group ID,  
40040 and the saved set-group-ID of the calling process to *gid*.40041 If the process does not have appropriate privileges, but *gid* is equal to the real group ID or the  
40042 saved set-group-ID, *setgid()* shall set the effective group ID to *gid*; the real group ID and saved  
40043 set-group-ID shall remain unchanged.40044 The *setgid()* function shall not affect the supplementary group list in any way.

40045 Any supplementary group IDs of the calling process shall remain unchanged.

40046 **RETURN VALUE**40047 Upon successful completion, 0 is returned. Otherwise, -1 shall be returned and *errno* set to  
40048 indicate the error.40049 **ERRORS**40050 The *setgid()* function shall fail if:40051 [EINVAL] The value of the *gid* argument is invalid and is not supported by the  
40052 implementation.40053 [EPERM] The process does not have appropriate privileges and *gid* does not match the  
40054 real group ID or the saved set-group-ID.40055 **EXAMPLES**

40056 None.

40057 **APPLICATION USAGE**

40058 None.

40059 **RATIONALE**40060 Refer to the RATIONALE section in *setuid()*.40061 **FUTURE DIRECTIONS**

40062 None.

40063 **SEE ALSO**40064 *exec*, *getegid()*, *geteuid()*, *getgid()*, *getuid()*, *setegid()*, *seteuid()*, *setregid()*, *setreuid()*, *setuid()*, the  
40065 Base Definitions volume of IEEE Std 1003.1-2001, <sys/types.h>, <unistd.h>40066 **CHANGE HISTORY**

40067 First released in Issue 1. Derived from Issue 1 of the SVID.

40068 **Issue 6**

40069 In the SYNOPSIS, the optional include of the &lt;sys/types.h&gt; header is removed.

40070 The following new requirements on POSIX implementations derive from alignment with the  
40071 Single UNIX Specification:

- 40072 • The requirement to include <sys/types.h> has been removed. Although <sys/types.h> was
- 
- 40073 required for conforming implementations of previous POSIX specifications, it was not
- 
- 40074 required for UNIX applications.

40075 • Functionality associated with `_POSIX_SAVED_IDS` is now mandated. This is a FIPS  
40076 requirement.

40077 The following changes were made to align with the IEEE P1003.1a draft standard:

- 40078 • The effects of `setgid()` in processes without appropriate privileges are changed.
- 40079 • A requirement that the supplementary group list is not affected is added.

40080 **NAME**

40081           setgrent — reset the group database to the first entry

40082 **SYNOPSIS**

```
40083 xSI       #include <grp.h>
```

```
40084           void setgrent(void);
```

40085

40086 **DESCRIPTION**

40087           Refer to *endgrent()*.

40088 **NAME**

40089           sethostent — network host database functions

40090 **SYNOPSIS**

40091           #include <netdb.h>

40092           void sethostent(int *stayopen*);

40093 **DESCRIPTION**

40094           Refer to *endhostent()*.

40095 **NAME**

40096 setitimer — set the value of an interval timer

40097 **SYNOPSIS**

40098 xSI #include &lt;sys/time.h&gt;

40099 int setitimer(int *which*, const struct itimerval \*restrict *value*,  
40100 struct itimerval \*restrict *ovalue*);

40101

40102 **DESCRIPTION**40103 Refer to *getitimer()*.

40104 **NAME**

40105 setjmp — set jump point for a non-local goto

40106 **SYNOPSIS**

40107 #include <setjmp.h>

40108 int setjmp(jmp\_buf env);

40109 **DESCRIPTION**

40110 **CX** The functionality described on this reference page is aligned with the ISO C standard. Any  
40111 conflict between the requirements described here and the ISO C standard is unintentional. This  
40112 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

40113 A call to *setjmp()* shall save the calling environment in its *env* argument for later use by  
40114 *longjmp()*.

40115 It is unspecified whether *setjmp()* is a macro or a function. If a macro definition is suppressed in  
40116 order to access an actual function, or a program defines an external identifier with the name  
40117 *setjmp*, the behavior is undefined.

40118 An application shall ensure that an invocation of *setjmp()* appears in one of the following  
40119 contexts only:

- 40120 • The entire controlling expression of a selection or iteration statement
- 40121 • One operand of a relational or equality operator with the other operand an integral constant  
40122 expression, with the resulting expression being the entire controlling expression of a  
40123 selection or iteration statement
- 40124 • The operand of a unary '!' operator with the resulting expression being the entire  
40125 controlling expression of a selection or iteration
- 40126 • The entire expression of an expression statement (possibly cast to **void**)

40127 If the invocation appears in any other context, the behavior is undefined.

40128 **RETURN VALUE**

40129 If the return is from a direct invocation, *setjmp()* shall return 0. If the return is from a call to  
40130 *longjmp()*, *setjmp()* shall return a non-zero value.

40131 **ERRORS**

40132 No errors are defined.

40133 **EXAMPLES**

40134 None.

40135 **APPLICATION USAGE**

40136 In general, *sigsetjmp()* is more useful in dealing with errors and interrupts encountered in a low-  
40137 level subroutine of a program.

40138 **RATIONALE**

40139 None.

40140 **FUTURE DIRECTIONS**

40141 None.

40142 **SEE ALSO**

40143 *longjmp()*, *sigsetjmp()*, the Base Definitions volume of IEEE Std 1003.1-2001, <**setjmp.h**>

40144 **CHANGE HISTORY**

40145 First released in Issue 1. Derived from Issue 1 of the SVID.

40146 **Issue 6**

40147 The DESCRIPTION is updated to avoid use of the term “must” for application requirements.

40148 **NAME**40149 setkey — set encoding key (**CRYPT**)40150 **SYNOPSIS**

40151 XSI #include &lt;stdlib.h&gt;

40152 void setkey(const char \*key);

40153

40154 **DESCRIPTION**

40155 The *setkey()* function provides access to an implementation-defined encoding algorithm. The  
40156 argument of *setkey()* is an array of length 64 bytes containing only the bytes with numerical  
40157 value of 0 and 1. If this string is divided into groups of 8, the low-order bit in each group is  
40158 ignored; this gives a 56-bit key which is used by the algorithm. This is the key that shall be used  
40159 with the algorithm to encode a string *block* passed to *encrypt()*.

40160 The *setkey()* function shall not change the setting of *errno* if successful. An application wishing to  
40161 check for error situations should set *errno* to 0 before calling *setkey()*. If *errno* is non-zero on  
40162 return, an error has occurred.

40163 The *setkey()* function need not be reentrant. A function that is not required to be reentrant is not  
40164 required to be thread-safe.

40165 **RETURN VALUE**

40166 No values are returned.

40167 **ERRORS**40168 The *setkey()* function shall fail if:

40169 [ENOSYS] The functionality is not supported on this implementation.

40170 **EXAMPLES**

40171 None.

40172 **APPLICATION USAGE**

40173 Decoding need not be implemented in all environments. This is related to government  
40174 restrictions in some countries on encryption and decryption routines. Historical practice has  
40175 been to ship a different version of the encryption library without the decryption feature in the  
40176 routines supplied. Thus the exported version of *encrypt()* does encoding but not decoding.

40177 **RATIONALE**

40178 None.

40179 **FUTURE DIRECTIONS**

40180 None.

40181 **SEE ALSO**40182 *crypt()*, *encrypt()*, the Base Definitions volume of IEEE Std 1003.1-2001, <stdlib.h>40183 **CHANGE HISTORY**

40184 First released in Issue 1. Derived from Issue 1 of the SVID.

40185 **Issue 5**40186 The DESCRIPTION is updated to indicate that *errno* is not changed if the function is successful.

40187 **NAME**

40188            setlocale — set program locale

40189 **SYNOPSIS**

40190            #include &lt;locale.h&gt;

40191            char \*setlocale(int *category*, const char \**locale*);40192 **DESCRIPTION**

40193 **CX**        The functionality described on this reference page is aligned with the ISO C standard. Any  
 40194 conflict between the requirements described here and the ISO C standard is unintentional. This  
 40195 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

40196        The *setlocale()* function selects the appropriate piece of the program's locale, as specified by the  
 40197 *category* and *locale* arguments, and may be used to change or query the program's entire locale or  
 40198 portions thereof. The value *LC\_ALL* for *category* names the program's entire locale; other values  
 40199 for *category* name only a part of the program's locale:

40200        *LC\_COLLATE*    Affects the behavior of regular expressions and the collation functions.

40201        *LC\_CTYPE*     Affects the behavior of regular expressions, character classification, character  
 40202 conversion functions, and wide-character functions.

40203 **CX**        *LC\_MESSAGES* Affects what strings are expected by commands and utilities as affirmative or  
 40204 negative responses.

40205 **XSI**        It also affects what strings are given by commands and utilities as affirmative  
 40206 or negative responses, and the content of messages.

40207        *LC\_MONETARY* Affects the behavior of functions that handle monetary values.

40208        *LC\_NUMERIC*   Affects the behavior of functions that handle numeric values.

40209        *LC\_TIME*       Affects the behavior of the time conversion functions.

40210        The *locale* argument is a pointer to a character string containing the required setting of *category*.  
 40211 The contents of this string are implementation-defined. In addition, the following preset values  
 40212 of *locale* are defined for all settings of *category*:

40213 **CX**        "POSIX"       Specifies the minimal environment for C-language translation called the  
 40214 POSIX locale. If *setlocale()* is not invoked, the POSIX locale is the default at  
 40215 entry to *main()*.

40216        "C"             Equivalent to "POSIX".

40217 **CX**        ""            Specifies an implementation-defined native environment. This corresponds to  
 40218 the value of the associated environment variables, *LC\_\** and *LANG*; see the  
 40219 Base Definitions volume of IEEE Std 1003.1-2001, Chapter 7, Locale and the  
 40220 Base Definitions volume of IEEE Std 1003.1-2001, Chapter 8, Environment  
 40221 Variables.

40222        A null pointer   Used to direct *setlocale()* to query the current internationalized environment  
 40223 and return the name of the *locale()*.

40224 **THR**        The locale state is common to all threads within a process.

40225 **RETURN VALUE**

40226        Upon successful completion, *setlocale()* shall return the string associated with the specified  
 40227 category for the new locale. Otherwise, *setlocale()* shall return a null pointer and the program's  
 40228 locale is not changed.

40229 A null pointer for *locale* causes *setlocale()* to return a pointer to the string associated with the  
 40230 *category* for the program's current locale. The program's locale shall not be changed.

40231 The string returned by *setlocale()* is such that a subsequent call with that string and its associated  
 40232 *category* shall restore that part of the program's locale. The application shall not modify the string  
 40233 returned which may be overwritten by a subsequent call to *setlocale()*.

#### 40234 ERRORS

40235 No errors are defined.

#### 40236 EXAMPLES

40237 None.

#### 40238 APPLICATION USAGE

40239 The following code illustrates how a program can initialize the international environment for  
 40240 one language, while selectively modifying the program's locale such that regular expressions  
 40241 and string operations can be applied to text recorded in a different language:

```
40242 setlocale(LC_ALL, "De");
40243 setlocale(LC_COLLATE, "Fr@dict");
```

40244 Internationalized programs must call *setlocale()* to initiate a specific language operation. This can  
 40245 be done by calling *setlocale()* as follows:

```
40246 setlocale(LC_ALL, "");
```

40247 Changing the setting of *LC\_MESSAGES* has no effect on catalogs that have already been opened  
 40248 by calls to *catopen()*.

#### 40249 RATIONALE

40250 The ISO C standard defines a collection of functions to support internationalization. One of the  
 40251 most significant aspects of these functions is a facility to set and query the *international*  
 40252 *environment*. The international environment is a repository of information that affects the  
 40253 behavior of certain functionality, namely:

- 40254 1. Character handling
- 40255 2. Collating
- 40256 3. Date/time formatting
- 40257 4. Numeric editing
- 40258 5. Monetary formatting
- 40259 6. Messaging

40260 The *setlocale()* function provides the application developer with the ability to set all or portions,  
 40261 called *categories*, of the international environment. These categories correspond to the areas of  
 40262 functionality mentioned above. The syntax for *setlocale()* is as follows:

```
40263 char *setlocale(int category, const char *locale);
```

40264 where *category* is the name of one of following categories, namely:

```
40265     LC_COLLATE
40266     LC_CTYPE
40267     LC_MESSAGES
40268     LC_MONETARY
40269     LC_NUMERIC
40270     LC_TIME
```

40271 In addition, a special value called *LC\_ALL* directs *setlocale()* to set all categories.

40272 There are two primary uses of *setlocale()*:

- 40273 1. Querying the international environment to find out what it is set to
- 40274 2. Setting the international environment, or *locale*, to a specific value

40275 The behavior of *setlocale()* in these two areas is described below. Since it is difficult to describe  
40276 the behavior in words, examples are used to illustrate the behavior of specific uses.

40277 To query the international environment, *setlocale()* is invoked with a specific category and the  
40278 NULL pointer as the locale. The NULL pointer is a special directive to *setlocale()* that tells it to  
40279 query rather than set the international environment. The following syntax is used to query the  
40280 name of the international environment:

```
40281 setlocale({LC_ALL, LC_COLLATE, LC_CTYPE, LC_MESSAGES, LC_MONETARY, \
40282          LC_NUMERIC, LC_TIME}, (char *) NULL);
```

40283 The *setlocale()* function shall return the string corresponding to the current international  
40284 environment. This value may be used by a subsequent call to *setlocale()* to reset the international  
40285 environment to this value. However, it should be noted that the return value from *setlocale()*  
40286 may be a pointer to a static area within the function and is not guaranteed to remain unchanged  
40287 (that is, it may be modified by a subsequent call to *setlocale()*). Therefore, if the purpose of  
40288 calling *setlocale()* is to save the value of the current international environment so it can be  
40289 changed and reset later, the return value should be copied to an array of **char** in the calling  
40290 program.

40291 There are three ways to set the international environment with *setlocale()*:

40292 *setlocale(category, string)*

40293 This usage sets a specific *category* in the international environment to a specific value  
40294 corresponding to the value of the *string*. A specific example is provided below:

```
40295 setlocale(LC_ALL, "fr_FR.ISO-8859-1");
```

40296 In this example, all categories of the international environment are set to the locale  
40297 corresponding to the string "fr\_FR.ISO-8859-1", or to the French language as spoken in  
40298 France using the ISO/IEC 8859-1:1998 standard codeset.

40299 If the string does not correspond to a valid locale, *setlocale()* shall return a NULL pointer  
40300 and the international environment is not changed. Otherwise, *setlocale()* shall return the  
40301 name of the locale just set.

40302 *setlocale(category, "C")*

40303 The ISO C standard states that one locale must exist on all conforming implementations.  
40304 The name of the locale is C and corresponds to a minimal international environment needed  
40305 to support the C programming language.

40306 *setlocale(category, "")*

40307 This sets a specific category to an implementation-defined default. This corresponds to the  
40308 value of the environment variables.

#### 40309 FUTURE DIRECTIONS

40310 None.

40319 **CHANGE HISTORY**

40320 First released in Issue 3.

40321 **Issue 5**

40322 The DESCRIPTION is updated for alignment with the POSIX Threads Extension.

40323 **Issue 6**

40324 Extensions beyond the ISO C standard are marked.

40325 The DESCRIPTION is updated to avoid use of the term “must” for application requirements.

40326 **NAME**

40327 setlogmask — set the log priority mask

40328 **SYNOPSIS**40329 XSI `#include <syslog.h>`40330 `int setlogmask(int maskpri);`

40331

40332 **DESCRIPTION**40333 Refer to *closelog()*.

40334 **NAME**

40335           setnetent — network database function

40336 **SYNOPSIS**

40337           #include <netdb.h>

40338           void setnetent(int stayopen);

40339 **DESCRIPTION**

40340           Refer to *endnetent()*.

40341 **NAME**

40342 setpgid — set process group ID for job control

40343 **SYNOPSIS**

40344 #include &lt;unistd.h&gt;

40345 int setpgid(pid\_t pid, pid\_t pgid);

40346 **DESCRIPTION**

40347 The *setpgid()* function shall either join an existing process group or create a new process group  
 40348 within the session of the calling process. The process group ID of a session leader shall not  
 40349 change. Upon successful completion, the process group ID of the process with a process ID that  
 40350 matches *pid* shall be set to *pgid*. As a special case, if *pid* is 0, the process ID of the calling process  
 40351 shall be used. Also, if *pgid* is 0, the process group ID of the indicated process shall be used.

40352 **RETURN VALUE**

40353 Upon successful completion, *setpgid()* shall return 0; otherwise, -1 shall be returned and *errno*  
 40354 shall be set to indicate the error.

40355 **ERRORS**40356 The *setpgid()* function shall fail if:

40357 [EACCES] The value of the *pid* argument matches the process ID of a child process of the  
 40358 calling process and the child process has successfully executed one of the *exec*  
 40359 functions.

40360 [EINVAL] The value of the *pgid* argument is less than 0, or is not a value supported by  
 40361 the implementation.

40362 [EPERM] The process indicated by the *pid* argument is a session leader.

40363 [EPERM] The value of the *pid* argument matches the process ID of a child process of the  
 40364 calling process and the child process is not in the same session as the calling  
 40365 process.

40366 [EPERM] The value of the *pgid* argument is valid but does not match the process ID of  
 40367 the process indicated by the *pid* argument and there is no process with a  
 40368 process group ID that matches the value of the *pgid* argument in the same  
 40369 session as the calling process.

40370 [ESRCH] The value of the *pid* argument does not match the process ID of the calling  
 40371 process or of a child process of the calling process.

40372 **EXAMPLES**

40373 None.

40374 **APPLICATION USAGE**

40375 None.

40376 **RATIONALE**

40377 The *setpgid()* function shall group processes together for the purpose of signaling, placement in  
 40378 foreground or background, and other job control actions.

40379 The *setpgid()* function is similar to the *setpgrp()* function of 4.2 BSD, except that 4.2 BSD allowed  
 40380 the specified new process group to assume any value. This presents certain security problems  
 40381 and is more flexible than necessary to support job control.

40382 To provide tighter security, *setpgid()* only allows the calling process to join a process group  
 40383 already in use inside its session or create a new process group whose process group ID was  
 40384 equal to its process ID.

40385 When a job control shell spawns a new job, the processes in the job must be placed into a new  
40386 process group via *setpgid()*. There are two timing constraints involved in this action:

- 40387 1. The new process must be placed in the new process group before the appropriate program  
40388 is launched via one of the *exec* functions.
- 40389 2. The new process must be placed in the new process group before the shell can correctly  
40390 send signals to the new process group.

40391 To address these constraints, the following actions are performed. The new processes call  
40392 *setpgid()* to alter their own process groups after *fork()* but before *exec*. This satisfies the first  
40393 constraint. Under 4.3 BSD, the second constraint is satisfied by the synchronization property of  
40394 *vfork()*; that is, the shell is suspended until the child has completed the *exec*, thus ensuring that  
40395 the child has completed the *setpgid()*. A new version of *fork()* with this same synchronization  
40396 property was considered, but it was decided instead to merely allow the parent shell process to  
40397 adjust the process group of its child processes via *setpgid()*. Both timing constraints are now  
40398 satisfied by having both the parent shell and the child attempt to adjust the process group of the  
40399 child process; it does not matter which succeeds first.

40400 Since it would be confusing to an application to have its process group change after it began  
40401 executing (that is, after *exec*), and because the child process would already have adjusted its  
40402 process group before this, the [EACCES] error was added to disallow this.

40403 One non-obvious use of *setpgid()* is to allow a job control shell to return itself to its original  
40404 process group (the one in effect when the job control shell was executed). A job control shell  
40405 does this before returning control back to its parent when it is terminating or suspending itself as  
40406 a way of restoring its job control “state” back to what its parent would expect. (Note that the  
40407 original process group of the job control shell typically matches the process group of its parent,  
40408 but this is not necessarily always the case.)

#### 40409 FUTURE DIRECTIONS

40410 None.

#### 40411 SEE ALSO

40412 *exec*, *getpgrp()*, *setsid()*, *tcsetpgrp()*, the Base Definitions volume of IEEE Std 1003.1-2001,  
40413 [<sys/types.h>](#), [<unistd.h>](#)

#### 40414 CHANGE HISTORY

40415 First released in Issue 3. Included for alignment with the POSIX.1-1988 standard.

#### 40416 Issue 6

40417 In the SYNOPSIS, the optional include of the [<sys/types.h>](#) header is removed.

40418 The following new requirements on POSIX implementations derive from alignment with the  
40419 Single UNIX Specification:

- 40420 • The requirement to include [<sys/types.h>](#) has been removed. Although [<sys/types.h>](#) was  
40421 required for conforming implementations of previous POSIX specifications, it was not  
40422 required for UNIX applications.
- 40423 • The *setpgid()* function is mandatory since `_POSIX_JOB_CONTROL` is required to be defined  
40424 in this issue. This is a FIPS requirement.

40425 **NAME**

40426       setpgrp — set the process group ID

40427 **SYNOPSIS**

40428 XSI       #include &lt;unistd.h&gt;

40429       pid\_t setpgrp(void);

40430

40431 **DESCRIPTION**

40432       If the calling process is not already a session leader, *setpgrp()* sets the process group ID of the  
40433       calling process to the process ID of the calling process. If *setpgrp()* creates a new session, then  
40434       the new session has no controlling terminal.

40435       The *setpgrp()* function has no effect when the calling process is a session leader.

40436 **RETURN VALUE**40437       Upon completion, *setpgrp()* shall return the process group ID.40438 **ERRORS**

40439       No errors are defined.

40440 **EXAMPLES**

40441       None.

40442 **APPLICATION USAGE**

40443       None.

40444 **RATIONALE**

40445       None.

40446 **FUTURE DIRECTIONS**

40447       None.

40448 **SEE ALSO**

40449       *exec*, *fork()*, *getpid()*, *getsid()*, *kill()*, *setpgid()*, *setsid()*, the Base Definitions volume of  
40450       IEEE Std 1003.1-2001, <unistd.h>

40451 **CHANGE HISTORY**

40452       First released in Issue 4, Version 2.

40453 **Issue 5**

40454       Moved from X/OPEN UNIX extension to BASE.

40455 **NAME**

40456           setpriority — set the nice value

40457 **SYNOPSIS**

40458 XSI       #include <sys/resource.h>

40459           int setpriority(int *which*, id\_t *who*, int *nice*);

40460

40461 **DESCRIPTION**

40462           Refer to *getpriority()*.

40463 **NAME**

40464           setprotoent — network protocol database functions

40465 **SYNOPSIS**

40466           #include <netdb.h>

40467           void setprotoent(int *stayopen*);

40468 **DESCRIPTION**

40469           Refer to *endprotoent()*.

40470 **NAME**

40471           setpwent — user database function

40472 **SYNOPSIS**

40473 XSI       #include <pwd.h>

40474           void setpwent(void);

40475

40476 **DESCRIPTION**

40477           Refer to *endpwent()*.

40478 **NAME**

40479 setregid — set real and effective group IDs

40480 **SYNOPSIS**

40481 XSI #include &lt;unistd.h&gt;

40482 int setregid(gid\_t rgid, gid\_t egid);

40483

40484 **DESCRIPTION**40485 The *setregid()* function shall set the real and effective group IDs of the calling process.40486 If *rgid* is  $-1$ , the real group ID shall not be changed; if *egid* is  $-1$ , the effective group ID shall not  
40487 be changed.

40488 The real and effective group IDs may be set to different values in the same call.

40489 Only a process with appropriate privileges can set the real group ID and the effective group ID  
40490 to any valid value.40491 A non-privileged process can set either the real group ID to the saved set-group-ID from one of  
40492 the *exec* family of functions, or the effective group ID to the saved set-group-ID or the real group  
40493 ID.

40494 Any supplementary group IDs of the calling process remain unchanged.

40495 **RETURN VALUE**40496 Upon successful completion, 0 shall be returned. Otherwise,  $-1$  shall be returned and *errno* set to  
40497 indicate the error, and neither of the group IDs are changed.40498 **ERRORS**40499 The *setregid()* function shall fail if:40500 [EINVAL] The value of the *rgid* or *egid* argument is invalid or out-of-range.40501 [EPERM] The process does not have appropriate privileges and a change other than  
40502 changing the real group ID to the saved set-group-ID, or changing the  
40503 effective group ID to the real group ID or the saved set-group-ID, was  
40504 requested.40505 **EXAMPLES**

40506 None.

40507 **APPLICATION USAGE**40508 If a set-group-ID process sets its effective group ID to its real group ID, it can still set its effective  
40509 group ID back to the saved set-group-ID.40510 **RATIONALE**

40511 None.

40512 **FUTURE DIRECTIONS**

40513 None.

40514 **SEE ALSO**40515 *exec*, *getegid()*, *geteuid()*, *getgid()*, *getuid()*, *setegid()*, *seteuid()*, *setgid()*, *setreuid()*, *setuid()*, the  
40516 Base Definitions volume of IEEE Std 1003.1-2001, <unistd.h>40517 **CHANGE HISTORY**

40518 First released in Issue 4, Version 2.

40519 **Issue 5**

40520 Moved from X/OPEN UNIX extension to BASE.

40521 The DESCRIPTION is updated to indicate that the saved set-group-ID can be set by any of the  
40522 *exec* family of functions, not just *execve()*.

40523 **NAME**

40524 setreuid — set real and effective user IDs

40525 **SYNOPSIS**

40526 XSI #include &lt;unistd.h&gt;

40527 int setreuid(uid\_t ruid, uid\_t euid);

40528

40529 **DESCRIPTION**

40530 The *setreuid()* function shall set the real and effective user IDs of the current process to the  
 40531 values specified by the *ruid* and *euid* arguments. If *ruid* or *euid* is  $-1$ , the corresponding effective  
 40532 or real user ID of the current process shall be left unchanged.

40533 A process with appropriate privileges can set either ID to any value. An unprivileged process  
 40534 can only set the effective user ID if the *euid* argument is equal to either the real, effective, or  
 40535 saved user ID of the process.

40536 It is unspecified whether a process without appropriate privileges is permitted to change the real  
 40537 user ID to match the current real, effective, or saved set-user-ID of the process.

40538 **RETURN VALUE**

40539 Upon successful completion, 0 shall be returned. Otherwise,  $-1$  shall be returned and *errno* set to  
 40540 indicate the error.

40541 **ERRORS**40542 The *setreuid()* function shall fail if:

40543 [EINVAL] The value of the *ruid* or *euid* argument is invalid or out-of-range.

40544 [EPERM] The current process does not have appropriate privileges, and either an  
 40545 attempt was made to change the effective user ID to a value other than the  
 40546 real user ID or the saved set-user-ID or an attempt was made to change the  
 40547 real user ID to a value not permitted by the implementation.

40548 **EXAMPLES**40549 **Setting the Effective User ID to the Real User ID**

40550 The following example sets the effective user ID of the calling process to the real user ID, so that  
 40551 files created later will be owned by the current user.

```
40552 #include <unistd.h>
40553 #include <sys/types.h>
40554 ...
40555 setreuid(getuid(), getuid());
40556 ...
```

40557 **APPLICATION USAGE**

40558 None.

40559 **RATIONALE**

40560 None.

40561 **FUTURE DIRECTIONS**

40565 Definitions volume of IEEE Std 1003.1-2001, <**unistd.h**>

40566 **CHANGE HISTORY**

40567 First released in Issue 4, Version 2.

40568 **Issue 5**

40569 Moved from X/OPEN UNIX extension to BASE.

40570 **NAME**

40571 setrlimit — control maximum resource consumption

40572 **SYNOPSIS**

40573 XSI #include &lt;sys/resource.h&gt;

40574 int setrlimit(int resource, const struct rlimit \*rlp);

40575

40576 **DESCRIPTION**40577 Refer to *getrlimit()*.

40578 **NAME**

40579           setservent — network services database functions

40580 **SYNOPSIS**

40581           #include <netdb.h>

40582           void setservent(int *stayopen*);

40583 **DESCRIPTION**

40584           Refer to *endservent()*.

40585 **NAME**

40586 setsid — create session and set process group ID

40587 **SYNOPSIS**

40588 #include &lt;unistd.h&gt;

40589 pid\_t setsid(void);

40590 **DESCRIPTION**

40591 The *setsid()* function shall create a new session, if the calling process is not a process group  
40592 leader. Upon return the calling process shall be the session leader of this new session, shall be  
40593 the process group leader of a new process group, and shall have no controlling terminal. The  
40594 process group ID of the calling process shall be set equal to the process ID of the calling process.  
40595 The calling process shall be the only process in the new process group and the only process in  
40596 the new session.

40597 **RETURN VALUE**

40598 Upon successful completion, *setsid()* shall return the value of the new process group ID of the  
40599 calling process. Otherwise, it shall return (**pid\_t**)-1 and set *errno* to indicate the error.

40600 **ERRORS**40601 The *setsid()* function shall fail if:

40602 [EPERM] The calling process is already a process group leader, or the process group ID  
40603 of a process other than the calling process matches the process ID of the  
40604 calling process.

40605 **EXAMPLES**

40606 None.

40607 **APPLICATION USAGE**

40608 None.

40609 **RATIONALE**

40610 The *setsid()* function is similar to the *setpgid()* function of System V. System V, without job  
40611 control, groups processes into process groups and creates new process groups via *setpgid()*; only  
40612 one process group may be part of a login session.

40613 Job control allows multiple process groups within a login session. In order to limit job control  
40614 actions so that they can only affect processes in the same login session, this volume of  
40615 IEEE Std 1003.1-2001 adds the concept of a session that is created via *setsid()*. The *setsid()*  
40616 function also creates the initial process group contained in the session. Additional process  
40617 groups can be created via the *setpgid()* function. A System V process group would correspond to  
40618 a POSIX System Interfaces session containing a single POSIX process group. Note that this  
40619 function requires that the calling process not be a process group leader. The usual way to ensure  
40620 this is true is to create a new process with *fork()* and have it call *setsid()*. The *fork()* function  
40621 guarantees that the process ID of the new process does not match any existing process group ID.

40622 **FUTURE DIRECTIONS**

40623 None.

40624 **SEE ALSO**

40625 *getsid()*, *setpgid()*, *setpgid()*, the Base Definitions volume of IEEE Std 1003.1-2001, <sys/types.h>,  
40626 <unistd.h>

40627 **CHANGE HISTORY**

40628 First released in Issue 3. Included for alignment with the POSIX.1-1988 standard.

40629 **Issue 6**

40630 In the SYNOPSIS, the optional include of the `<sys/types.h>` header is removed.

40631 The following new requirements on POSIX implementations derive from alignment with the  
40632 Single UNIX Specification:

- 40633 • The requirement to include `<sys/types.h>` has been removed. Although `<sys/types.h>` was  
40634 required for conforming implementations of previous POSIX specifications, it was not  
40635 required for UNIX applications.

## 40636 NAME

40637 setsockopt — set the socket options

## 40638 SYNOPSIS

40639 #include &lt;sys/socket.h&gt;

```
40640 int setsockopt(int socket, int level, int option_name,
40641               const void *option_value, socklen_t option_len);
```

## 40642 DESCRIPTION

40643 The *setsockopt()* function shall set the option specified by the *option\_name* argument, at the  
 40644 protocol level specified by the *level* argument, to the value pointed to by the *option\_value*  
 40645 argument for the socket associated with the file descriptor specified by the *socket* argument.

40646 The *level* argument specifies the protocol level at which the option resides. To set options at the  
 40647 socket level, specify the *level* argument as SOL\_SOCKET. To set options at other levels, supply  
 40648 the appropriate *level* identifier for the protocol controlling the option. For example, to indicate  
 40649 that an option is interpreted by the TCP (Transport Control Protocol), set *level* to IPPROTO\_TCP  
 40650 as defined in the <netinet/in.h> header.

40651 The *option\_name* argument specifies a single option to set. The *option\_name* argument and any  
 40652 specified options are passed uninterpreted to the appropriate protocol module for  
 40653 interpretations. The <sys/socket.h> header defines the socket-level options. The options are as  
 40654 follows:

40655 SO\_DEBUG            Turns on recording of debugging information. This option enables or  
 40656                      disables debugging in the underlying protocol modules. This option takes  
 40657                      an **int** value. This is a Boolean option.

40658 SO\_BROADCAST       Permits sending of broadcast messages, if this is supported by the  
 40659                      protocol. This option takes an **int** value. This is a Boolean option.

40660 SO\_REUSEADDR       Specifies that the rules used in validating addresses supplied to *bind()*  
 40661                      should allow reuse of local addresses, if this is supported by the protocol.  
 40662                      This option takes an **int** value. This is a Boolean option.

40663 SO\_KEEPALIVE       Keeps connections active by enabling the periodic transmission of  
 40664                      messages, if this is supported by the protocol. This option takes an **int**  
 40665                      value.

40666                      If the connected socket fails to respond to these messages, the connection  
 40667                      is broken and threads writing to that socket are notified with a SIGPIPE  
 40668                      signal. This is a Boolean option.

40669 SO\_LINGER           Lingers on a *close()* if data is present. This option controls the action  
 40670                      taken when unsent messages queue on a socket and *close()* is performed.  
 40671                      If SO\_LINGER is set, the system shall block the process during *close()*  
 40672                      until it can transmit the data or until the time expires. If SO\_LINGER is  
 40673                      not specified, and *close()* is issued, the system handles the call in a way  
 40674                      that allows the process to continue as quickly as possible. This option  
 40675                      takes a **linger** structure, as defined in the <sys/socket.h> header, to  
 40676                      specify the state of the option and linger interval.

40677 SO\_OOBINLINE       Leaves received out-of-band data (data marked urgent) inline. This  
 40678                      option takes an **int** value. This is a Boolean option.

40679 SO\_SNDBUF           Sets send buffer size. This option takes an **int** value.

|       |                                                                                                                  |                                                                                      |
|-------|------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------|
| 40680 | SO_RCVBUF                                                                                                        | Sets receive buffer size. This option takes an <b>int</b> value.                     |
| 40681 | SO_DONTROUTE                                                                                                     | Requests that outgoing messages bypass the standard routing facilities.              |
| 40682 |                                                                                                                  | The destination shall be on a directly-connected network, and messages               |
| 40683 |                                                                                                                  | are directed to the appropriate network interface according to the                   |
| 40684 |                                                                                                                  | destination address. The effect, if any, of this option depends on what              |
| 40685 |                                                                                                                  | protocol is in use. This option takes an <b>int</b> value. This is a Boolean option. |
| 40686 | SO_RCVLOWAT                                                                                                      | Sets the minimum number of bytes to process for socket input operations.             |
| 40687 |                                                                                                                  | The default value for SO_RCVLOWAT is 1. If SO_RCVLOWAT is set to a                   |
| 40688 |                                                                                                                  | larger value, blocking receive calls normally wait until they have received          |
| 40689 |                                                                                                                  | the smaller of the low water mark value or the requested amount. (They               |
| 40690 |                                                                                                                  | may return less than the low water mark if an error occurs, a signal is              |
| 40691 |                                                                                                                  | caught, or the type of data next in the receive queue is different from that         |
| 40692 |                                                                                                                  | returned; for example, out-of-band data.) This option takes an <b>int</b> value.     |
| 40693 | Note that not all implementations allow this option to be set.                                                   |                                                                                      |
| 40694 | SO_RCVTIMEO                                                                                                      | Sets the timeout value that specifies the maximum amount of time an                  |
| 40695 |                                                                                                                  | input function waits until it completes. It accepts a <b>timeval</b> structure with  |
| 40696 |                                                                                                                  | the number of seconds and microseconds specifying the limit on how                   |
| 40697 |                                                                                                                  | long to wait for an input operation to complete. If a receive operation has          |
| 40698 |                                                                                                                  | blocked for this much time without receiving additional data, it shall               |
| 40699 |                                                                                                                  | return with a partial count or <i>errno</i> set to [EAGAIN] or                       |
| 40700 |                                                                                                                  | [EWOULDBLOCK] if no data is received. The default for this option is                 |
| 40701 |                                                                                                                  | zero, which indicates that a receive operation shall not time out. This              |
| 40702 |                                                                                                                  | option takes a <b>timeval</b> structure. Note that not all implementations allow     |
| 40703 | this option to be set.                                                                                           |                                                                                      |
| 40704 | SO_SNDLOWAT                                                                                                      | Sets the minimum number of bytes to process for socket output                        |
| 40705 |                                                                                                                  | operations. Non-blocking output operations shall process no data if flow             |
| 40706 |                                                                                                                  | control does not allow the smaller of the send low water mark value or               |
| 40707 |                                                                                                                  | the entire request to be processed. This option takes an <b>int</b> value. Note      |
| 40708 |                                                                                                                  | that not all implementations allow this option to be set.                            |
| 40709 | SO_SNDTIMEO                                                                                                      | Sets the timeout value specifying the amount of time that an output                  |
| 40710 |                                                                                                                  | function blocks because flow control prevents data from being sent. If a             |
| 40711 |                                                                                                                  | send operation has blocked for this time, it shall return with a partial             |
| 40712 |                                                                                                                  | count or with <i>errno</i> set to [EAGAIN] or [EWOULDBLOCK] if no data is            |
| 40713 |                                                                                                                  | sent. The default for this option is zero, which indicates that a send               |
| 40714 |                                                                                                                  | operation shall not time out. This option stores a <b>timeval</b> structure. Note    |
| 40715 |                                                                                                                  | that not all implementations allow this option to be set.                            |
| 40716 | For Boolean options, 0 indicates that the option is disabled and 1 indicates that the option is                  |                                                                                      |
| 40717 | enabled.                                                                                                         |                                                                                      |
| 40718 | Options at other protocol levels vary in format and name.                                                        |                                                                                      |
| 40719 | <b>RETURN VALUE</b>                                                                                              |                                                                                      |
| 40720 | Upon successful completion, <i>setsockopt()</i> shall return 0. Otherwise, -1 shall be returned and <i>errno</i> |                                                                                      |
| 40721 | set to indicate the error.                                                                                       |                                                                                      |
| 40722 | <b>ERRORS</b>                                                                                                    |                                                                                      |
| 40723 | The <i>setsockopt()</i> function shall fail if:                                                                  |                                                                                      |
| 40724 | [EBADF]                                                                                                          | The <i>socket</i> argument is not a valid file descriptor.                           |
| 40725 | [EDOM]                                                                                                           | The send and receive timeout values are too big to fit into the timeout fields in    |
| 40726 |                                                                                                                  | the socket structure.                                                                |

- 40727 [EINVAL] The specified option is invalid at the specified socket level or the socket has  
40728 been shut down.
- 40729 [EISCONN] The socket is already connected, and a specified option cannot be set while the  
40730 socket is connected.
- 40731 [ENOPROTOOPT]  
40732 The option is not supported by the protocol.
- 40733 [ENOTSOCK] The *socket* argument does not refer to a socket.
- 40734 The *setsockopt()* function may fail if:
- 40735 [ENOMEM] There was insufficient memory available for the operation to complete.
- 40736 [ENOBUFS] Insufficient resources are available in the system to complete the call.
- 40737 **EXAMPLES**
- 40738 None.
- 40739 **APPLICATION USAGE**
- 40740 The *setsockopt()* function provides an application program with the means to control socket  
40741 behavior. An application program can use *setsockopt()* to allocate buffer space, control timeouts,  
40742 or permit socket data broadcasts. The `<sys/socket.h>` header defines the socket-level options  
40743 available to *setsockopt()*.
- 40744 Options may exist at multiple protocol levels. The `SO_` options are always present at the  
40745 uppermost socket level.
- 40746 **RATIONALE**
- 40747 None.
- 40748 **FUTURE DIRECTIONS**
- 40749 None.
- 40750 **SEE ALSO**

- 40753 **CHANGE HISTORY**
- 40754 First released in Issue 6. Derived from the XNS, Issue 5.2 specification.

40755 **NAME**

40756            setstate — switch pseudo-random number generator state arrays

40757 **SYNOPSIS**

40758 XSI        #include <stdlib.h>

40759            char \*setstate(const char \*state);

40760

40761 **DESCRIPTION**

40762            Refer to *initstate()*.

40763 **NAME**

40764        setuid — set user ID

40765 **SYNOPSIS**

40766        #include &lt;unistd.h&gt;

40767        int setuid(uid\_t uid);

40768 **DESCRIPTION**40769        If the process has appropriate privileges, *setuid()* shall set the real user ID, effective user ID, and  
40770        the saved set-user-ID of the calling process to *uid*.40771        If the process does not have appropriate privileges, but *uid* is equal to the real user ID or the  
40772        saved set-user-ID, *setuid()* shall set the effective user ID to *uid*; the real user ID and saved set-  
40773        user-ID shall remain unchanged.40774        The *setuid()* function shall not affect the supplementary group list in any way.40775 **RETURN VALUE**40776        Upon successful completion, 0 shall be returned. Otherwise, -1 shall be returned and *errno* set to  
40777        indicate the error.40778 **ERRORS**40779        The *setuid()* function shall fail, return -1, and set *errno* to the corresponding value if one or more  
40780        of the following are true:40781        [EINVAL]        The value of the *uid* argument is invalid and not supported by the  
40782        implementation.40783        [EPERM]        The process does not have appropriate privileges and *uid* does not match the  
40784        real user ID or the saved set-user-ID.40785 **EXAMPLES**

40786        None.

40787 **APPLICATION USAGE**

40788        None.

40789 **RATIONALE**40790        The various behaviors of the *setuid()* and *setgid()* functions when called by non-privileged  
40791        processes reflect the behavior of different historical implementations. For portability, it is  
40792        recommended that new non-privileged applications use the *seteuid()* and *setegid()* functions  
40793        instead.40794        The saved set-user-ID capability allows a program to regain the effective user ID established at  
40795        the last *exec* call. Similarly, the saved set-group-ID capability allows a program to regain the  
40796        effective group ID established at the last *exec* call. These capabilities are derived from System V.  
40797        Without them, a program might have to run as superuser in order to perform the same  
40798        functions, because superuser can write on the user's files. This is a problem because such a  
40799        program can write on any user's files, and so must be carefully written to emulate the  
40800        permissions of the calling process properly. In System V, these capabilities have traditionally  
40801        been implemented only via the *setuid()* and *setgid()* functions for non-privileged processes. The  
40802        fact that the behavior of those functions was different for privileged processes made them  
40803        difficult to use. The POSIX.1-1990 standard defined the *setuid()* function to behave differently  
40804        for privileged and unprivileged users. When the caller had the appropriate privilege, the  
40805        function set the calling process' real user ID, effective user ID, and saved set-user ID on  
40806        implementations that supported it. When the caller did not have the appropriate privilege, the  
40807        function set only the effective user ID, subject to permission checks. The former use is generally  
40808        needed for utilities like *login* and *su*, which are not conforming applications and thus outside the

40809 scope of IEEE Std 1003.1-2001. These utilities wish to change the user ID irrevocably to a new  
40810 value, generally that of an unprivileged user. The latter use is needed for conforming  
40811 applications that are installed with the set-user-ID bit and need to perform operations using the  
40812 real user ID.

40813 IEEE Std 1003.1-2001 augments the latter functionality with a mandatory feature named  
40814 `_POSIX_SAVED_IDS`. This feature permits a set-user-ID application to switch its effective user  
40815 ID back and forth between the values of its *exec*-time real user ID and effective user ID.  
40816 Unfortunately, the POSIX.1-1990 standard did not permit a conforming application using this  
40817 feature to work properly when it happened to be executed with the (implementation-defined)  
40818 appropriate privilege. Furthermore, the application did not even have a means to tell whether it  
40819 had this privilege. Since the saved set-user-ID feature is quite desirable for applications, as  
40820 evidenced by the fact that NIST required it in FIPS 151-2, it has been mandated by  
40821 IEEE Std 1003.1-2001. However, there are implementors who have been reluctant to support it  
40822 given the limitation described above.

40823 The 4.3BSD system handles the problem by supporting separate functions: *setuid()* (which  
40824 always sets both the real and effective user IDs, like *setuid()* in IEEE Std 1003.1-2001 for  
40825 privileged users), and *seteuid()* (which always sets just the effective user ID, like *setuid()* in  
40826 IEEE Std 1003.1-2001 for non-privileged users). This separation of functionality into distinct  
40827 functions seems desirable. 4.3BSD does not support the saved set-user-ID feature. It supports  
40828 similar functionality of switching the effective user ID back and forth via *setreuid()*, which  
40829 permits reversing the real and effective user IDs. This model seems less desirable than the saved  
40830 set-user-ID because the real user ID changes as a side effect. The current 4.4BSD includes saved  
40831 effective IDs and uses them for *seteuid()* and *setegid()* as described above. The *setreuid()* and  
40832 *setregid()* functions will be deprecated or removed.

40833 The solution here is:

- 40834 • Require that all implementations support the functionality of the saved set-user-ID, which is  
40835 set by the *exec* functions and by privileged calls to *setuid()*.
- 40836 • Add the *seteuid()* and *setegid()* functions as portable alternatives to *setuid()* and *setgid()* for  
40837 non-privileged and privileged processes.

40838 Historical systems have provided two mechanisms for a set-user-ID process to change its  
40839 effective user ID to be the same as its real user ID in such a way that it could return to the  
40840 original effective user ID: the use of the *setuid()* function in the presence of a saved set-user-ID,  
40841 or the use of the BSD *setreuid()* function, which was able to swap the real and effective user IDs.  
40842 The changes included in IEEE Std 1003.1-2001 provide a new mechanism using *seteuid()*  
40843 in conjunction with a saved set-user-ID. Thus, all implementations with the new *seteuid()*  
40844 mechanism will have a saved set-user-ID for each process, and most of the behavior controlled  
40845 by `_POSIX_SAVED_IDS` has been changed to agree with the case where the option was defined.  
40846 The *kill()* function is an exception. Implementors of the new *seteuid()* mechanism will generally  
40847 be required to maintain compatibility with the older mechanisms previously supported by their  
40848 systems. However, compatibility with this use of *setreuid()* and with the `_POSIX_SAVED_IDS`  
40849 behavior of *kill()* is unfortunately complicated. If an implementation with a saved set-user-ID  
40850 allows a process to use *setreuid()* to swap its real and effective user IDs, but were to leave the  
40851 saved set-user-ID unmodified, the process would then have an effective user ID equal to the  
40852 original real user ID, and both real and saved set-user-ID would be equal to the original effective  
40853 user ID. In that state, the real user would be unable to kill the process, even though the effective  
40854 user ID of the process matches that of the real user, if the *kill()* behavior of `_POSIX_SAVED_IDS`  
40855 was used. This is obviously not acceptable. The alternative choice, which is used in at least one  
40856 implementation, is to change the saved set-user-ID to the effective user ID during most calls to  
40857 *setreuid()*. The standard developers considered that alternative to be less correct than the

40858 retention of the old behavior of *kill()* in such systems. Current conforming applications shall  
40859 accommodate either behavior from *kill()*, and there appears to be no strong reason for *kill()* to  
40860 check the saved set-user-ID rather than the effective user ID.

40861 **FUTURE DIRECTIONS**

40862 None.

40863 **SEE ALSO**

40865 Base Definitions volume of IEEE Std 1003.1-2001, `<sys/types.h>`, `<unistd.h>`

40866 **CHANGE HISTORY**

40867 First released in Issue 1. Derived from Issue 1 of the SVID.

40868 **Issue 6**

40869 In the SYNOPSIS, the optional include of the `<sys/types.h>` header is removed.

40870 The following new requirements on POSIX implementations derive from alignment with the  
40871 Single UNIX Specification:

- 40872 • The requirement to include `<sys/types.h>` has been removed. Although `<sys/types.h>` was  
40873 required for conforming implementations of previous POSIX specifications, it was not  
40874 required for UNIX applications.
- 40875 • The functionality associated with `_POSIX_SAVED_IDS` is now mandatory. This is a FIPS  
40876 requirement.

40877 The following changes were made to align with the IEEE P1003.1a draft standard:

- 40878 • The effects of *setuid()* in processes without appropriate privileges are changed.
- 40879 • A requirement that the supplementary group list is not affected is added.

40880 **NAME**

40881           setutxent — reset the user accounting database to the first entry

40882 **SYNOPSIS**

40883 XSI       #include <utmpx.h>

40884           void setutxent(void);

40885

40886 **DESCRIPTION**

40887           Refer to *endutxent()*.

40888 **NAME**

40889           setvbuf — assign buffering to a stream

40890 **SYNOPSIS**

40891           #include &lt;stdio.h&gt;

40892           int setvbuf(FILE \*restrict *stream*, char \*restrict *buf*, int *type*,  
40893                 size\_t *size*);40894 **DESCRIPTION**40895 **CX**       The functionality described on this reference page is aligned with the ISO C standard. Any  
40896 conflict between the requirements described here and the ISO C standard is unintentional. This  
40897 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.40898       The *setvbuf()* function may be used after the stream pointed to by *stream* is associated with an  
40899 open file but before any other operation (other than an unsuccessful call to *setvbuf()*) is  
40900 performed on the stream. The argument *type* determines how *stream* shall be buffered, as  
40901 follows:

- 40902           • {\_IOFBF} shall cause input/output to be fully buffered.
- 
- 40903           • {\_IOLBF} shall cause input/output to be line buffered.
- 
- 40904           • {\_IONBF} shall cause input/output to be unbuffered.

40905       If *buf* is not a null pointer, the array it points to may be used instead of a buffer allocated by  
40906 *setvbuf()* and the argument *size* specifies the size of the array; otherwise, *size* may determine the  
40907 size of a buffer allocated by the *setvbuf()* function. The contents of the array at any time are  
40908 unspecified.

40909       For information about streams, see Section 2.5 (on page 34).

40910 **RETURN VALUE**40911       Upon successful completion, *setvbuf()* shall return 0. Otherwise, it shall return a non-zero value  
40912 **CX**       if an invalid value is given for *type* or if the request cannot be honored, and may set *errno* to  
40913 indicate the error.40914 **ERRORS**40915       The *setvbuf()* function may fail if:40916 **CX**       [EBADF]       The file descriptor underlying *stream* is not valid.40917 **EXAMPLES**

40918       None.

40919 **APPLICATION USAGE**40920       A common source of error is allocating buffer space as an “automatic” variable in a code block,  
40921 and then failing to close the stream in the same block.40922       With *setvbuf()*, allocating a buffer of *size* bytes does not necessarily imply that all of *size* bytes are  
40923 used for the buffer area.40924       Applications should note that many implementations only provide line buffering on input from  
40925 terminal devices.40926 **RATIONALE**

40927       None.

40928 **FUTURE DIRECTIONS**

40929           None.

40930 **SEE ALSO**

40931           Section 2.5 (on page 34), *fopen()*, *setbuf()*, the Base Definitions volume of IEEE Std 1003.1-2001,  
40932           <**stdio.h**>

40933 **CHANGE HISTORY**

40934           First released in Issue 1. Derived from Issue 1 of the SVID.

40935 **Issue 6**

40936           Extensions beyond the ISO C standard are marked.

40937           The *setvbuf()* prototype is updated for alignment with the ISO/IEC 9899: 1999 standard.

## 40938 NAME

40939 shm\_open — open a shared memory object (**REALTIME**)

## 40940 SYNOPSIS

40941 SHM #include &lt;sys/mman.h&gt;

40942 int shm\_open(const char \*name, int oflag, mode\_t mode);

40943

## 40944 DESCRIPTION

40945 The *shm\_open()* function shall establish a connection between a shared memory object and a file  
 40946 descriptor. It shall create an open file description that refers to the shared memory object and a  
 40947 file descriptor that refers to that open file description. The file descriptor is used by other  
 40948 functions to refer to that shared memory object. The *name* argument points to a string naming a  
 40949 shared memory object. It is unspecified whether the name appears in the file system and is  
 40950 visible to other functions that take pathnames as arguments. The *name* argument conforms to the  
 40951 construction rules for a pathname. If *name* begins with the slash character, then processes calling  
 40952 *shm\_open()* with the same value of *name* refer to the same shared memory object, as long as that  
 40953 name has not been removed. If *name* does not begin with the slash character, the effect is  
 40954 implementation-defined. The interpretation of slash characters other than the leading slash  
 40955 character in *name* is implementation-defined.

40956 If successful, *shm\_open()* shall return a file descriptor for the shared memory object that is the  
 40957 lowest numbered file descriptor not currently open for that process. The open file description is  
 40958 new, and therefore the file descriptor does not share it with any other processes. It is unspecified  
 40959 whether the file offset is set. The FD\_CLOEXEC file descriptor flag associated with the new file  
 40960 descriptor is set.

40961 The file status flags and file access modes of the open file description are according to the value  
 40962 of *oflag*. The *oflag* argument is the bitwise-inclusive OR of the following flags defined in the  
 40963 <fcntl.h> header. Applications specify exactly one of the first two values (access modes) below  
 40964 in the value of *oflag*:

40965 O\_RDONLY Open for read access only.

40966 O\_RDWR Open for read or write access.

40967 Any combination of the remaining flags may be specified in the value of *oflag*:

40968 O\_CREAT If the shared memory object exists, this flag has no effect, except as noted  
 40969 under O\_EXCL below. Otherwise, the shared memory object is created; the user ID of the shared memory object shall be set to the effective user ID of the  
 40970 process; the group ID of the shared memory object is set to a system default  
 40971 group ID or to the effective group ID of the process. The permission bits of the  
 40972 shared memory object shall be set to the value of the *mode* argument except  
 40973 those set in the file mode creation mask of the process. When bits in *mode*  
 40974 other than the file permission bits are set, the effect is unspecified. The *mode*  
 40975 argument does not affect whether the shared memory object is opened for  
 40976 reading, for writing, or for both. The shared memory object has a size of zero.  
 40977

40978 O\_EXCL If O\_EXCL and O\_CREAT are set, *shm\_open()* fails if the shared memory  
 40979 object exists. The check for the existence of the shared memory object and the  
 40980 creation of the object if it does not exist is atomic with respect to other  
 40981 processes executing *shm\_open()* naming the same shared memory object with  
 40982 O\_EXCL and O\_CREAT set. If O\_EXCL is set and O\_CREAT is not set, the  
 40983 result is undefined.

40984 O\_TRUNC If the shared memory object exists, and it is successfully opened O\_RDWR,  
 40985 the object shall be truncated to zero length and the mode and owner shall be  
 40986 unchanged by this function call. The result of using O\_TRUNC with  
 40987 O\_RDONLY is undefined.

40988 When a shared memory object is created, the state of the shared memory object, including all  
 40989 data associated with the shared memory object, persists until the shared memory object is  
 40990 unlinked and all other references are gone. It is unspecified whether the name and shared  
 40991 memory object state remain valid after a system reboot.

#### 40992 RETURN VALUE

40993 Upon successful completion, the *shm\_open()* function shall return a non-negative integer  
 40994 representing the lowest numbered unused file descriptor. Otherwise, it shall return  $-1$  and set  
 40995 *errno* to indicate the error.

#### 40996 ERRORS

40997 The *shm\_open()* function shall fail if:

40998 [EACCES] The shared memory object exists and the permissions specified by *oflag* are  
 40999 denied, or the shared memory object does not exist and permission to create  
 41000 the shared memory object is denied, or O\_TRUNC is specified and write  
 41001 permission is denied.

41002 [EEXIST] O\_CREAT and O\_EXCL are set and the named shared memory object already  
 41003 exists.

41004 [EINTR] The *shm\_open()* operation was interrupted by a signal.

41005 [EINVAL] The *shm\_open()* operation is not supported for the given name.

41006 [EMFILE] Too many file descriptors are currently in use by this process.

41007 [ENAMETOOLONG]

41008 The length of the *name* argument exceeds {PATH\_MAX} or a pathname  
 41009 component is longer than {NAME\_MAX}.

41010 [ENFILE] Too many shared memory objects are currently open in the system.

41011 [ENOENT] O\_CREAT is not set and the named shared memory object does not exist.

41012 [ENOSPC] There is insufficient space for the creation of the new shared memory object.

#### 41013 EXAMPLES

41014 None.

#### 41015 APPLICATION USAGE

41016 None.

#### 41017 RATIONALE

41018 When the Memory Mapped Files option is supported, the normal *open()* call is used to obtain a  
 41019 descriptor to a file to be mapped according to existing practice with *mmap()*. When the Shared  
 41020 Memory Objects option is supported, the *shm\_open()* function shall obtain a descriptor to the  
 41021 shared memory object to be mapped.

41022 There is ample precedent for having a file descriptor represent several types of objects. In the  
 41023 POSIX.1-1990 standard, a file descriptor can represent a file, a pipe, a FIFO, a tty, or a directory.  
 41024 Many implementations simply have an operations vector, which is indexed by the file descriptor  
 41025 type and does very different operations. Note that in some cases the file descriptor passed to  
 41026 generic operations on file descriptors is returned by *open()* or *creat()* and in some cases returned  
 41027 by alternate functions, such as *pipe()*. The latter technique is used by *shm\_open()*.

41028 Note that such shared memory objects can actually be implemented as mapped files. In both  
41029 cases, the size can be set after the open using *ftruncate()*. The *shm\_open()* function itself does not  
41030 create a shared object of a specified size because this would duplicate an extant function that set  
41031 the size of an object referenced by a file descriptor.

41032 On implementations where memory objects are implemented using the existing file system, the  
41033 *shm\_open()* function may be implemented using a macro that invokes *open()*, and the  
41034 *shm\_unlink()* function may be implemented using a macro that invokes *unlink()*.

41035 For implementations without a permanent file system, the definition of the name of the memory  
41036 objects is allowed not to survive a system reboot. Note that this allows systems with a  
41037 permanent file system to implement memory objects as data structures internal to the  
41038 implementation as well.

41039 On implementations that choose to implement memory objects using memory directly, a  
41040 *shm\_open()* followed by an *ftruncate()* and *close()* can be used to preallocate a shared memory  
41041 area and to set the size of that preallocation. This may be necessary for systems without virtual  
41042 memory hardware support in order to ensure that the memory is contiguous.

41043 The set of valid open flags to *shm\_open()* was restricted to *O\_RDONLY*, *O\_RDWR*, *O\_CREAT*,  
41044 and *O\_TRUNC* because these could be easily implemented on most memory mapping systems.  
41045 This volume of IEEE Std 1003.1-2001 is silent on the results if the implementation cannot supply  
41046 the requested file access because of implementation-defined reasons, including hardware ones.

41047 The error conditions [EACCES] and [ENOTSUP] are provided to inform the application that the  
41048 implementation cannot complete a request.

41049 [EACCES] indicates for implementation-defined reasons, probably hardware-related, that the  
41050 implementation cannot comply with a requested mode because it conflicts with another  
41051 requested mode. An example might be that an application desires to open a memory object two  
41052 times, mapping different areas with different access modes. If the implementation cannot map a  
41053 single area into a process space in two places, which would be required if different access modes  
41054 were required for the two areas, then the implementation may inform the application at the time  
41055 of the second open.

41056 [ENOTSUP] indicates for implementation-defined reasons, probably hardware-related, that the  
41057 implementation cannot comply with a requested mode at all. An example would be that the  
41058 hardware of the implementation cannot support write-only shared memory areas.

41059 On all implementations, it may be desirable to restrict the location of the memory objects to  
41060 specific file systems for performance (such as a RAM disk) or implementation-defined reasons  
41061 (shared memory supported directly only on certain file systems). The *shm\_open()* function may  
41062 be used to enforce these restrictions. There are a number of methods available to the application  
41063 to determine an appropriate name of the file or the location of an appropriate directory. One  
41064 way is from the environment via *getenv()*. Another would be from a configuration file.

41065 This volume of IEEE Std 1003.1-2001 specifies that memory objects have initial contents of zero  
41066 when created. This is consistent with current behavior for both files and newly allocated  
41067 memory. For those implementations that use physical memory, it would be possible that such  
41068 implementations could simply use available memory and give it to the process uninitialized.  
41069 This, however, is not consistent with standard behavior for the uninitialized data area, the stack,  
41070 and of course, files. Finally, it is highly desirable to set the allocated memory to zero for security  
41071 reasons. Thus, initializing memory objects to zero is required.

41072 **FUTURE DIRECTIONS**

41073       None.

41077 **CHANGE HISTORY**

41078       First released in Issue 5. Included for alignment with the POSIX Realtime Extension.

41079 **Issue 6**

41080       The *shm\_open()* function is marked as part of the Shared Memory Objects option.

41081       The [ENOSYS] error condition has been removed as stubs need not be provided if an  
41082       implementation does not support the Shared Memory Objects option.

41083 **NAME**41084 shm\_unlink — remove a shared memory object (**REALTIME**)41085 **SYNOPSIS**

41086 SHM #include &lt;sys/mman.h&gt;

41087 int shm\_unlink(const char \*name);

41088

41089 **DESCRIPTION**41090 The *shm\_unlink()* function shall remove the name of the shared memory object named by the  
41091 string pointed to by *name*.41092 If one or more references to the shared memory object exist when the object is unlinked, the  
41093 name shall be removed before *shm\_unlink()* returns, but the removal of the memory object  
41094 contents shall be postponed until all open and map references to the shared memory object have  
41095 been removed.41096 Even if the object continues to exist after the last *shm\_unlink()*, reuse of the name shall  
41097 subsequently cause *shm\_open()* to behave as if no shared memory object of this name exists (that  
41098 is, *shm\_open()* will fail if *O\_CREAT* is not set, or will create a new shared memory object if  
41099 *O\_CREAT* is set).41100 **RETURN VALUE**41101 Upon successful completion, a value of zero shall be returned. Otherwise, a value of -1 shall be  
41102 returned and *errno* set to indicate the error. If -1 is returned, the named shared memory object  
41103 shall not be changed by this function call.41104 **ERRORS**41105 The *shm\_unlink()* function shall fail if:

41106 [EACCES] Permission is denied to unlink the named shared memory object.

41107 [ENAMETOOLONG]

41108 The length of the *name* argument exceeds {*PATH\_MAX*} or a pathname  
41109 component is longer than {*NAME\_MAX*}.

41110 [ENOENT] The named shared memory object does not exist.

41111 **EXAMPLES**

41112 None.

41113 **APPLICATION USAGE**41114 Names of memory objects that were allocated with *open()* are deleted with *unlink()* in the usual  
41115 fashion. Names of memory objects that were allocated with *shm\_open()* are deleted with  
41116 *shm\_unlink()*. Note that the actual memory object is not destroyed until the last close and  
41117 unmap on it have occurred if it was already in use.41118 **RATIONALE**

41119 None.

41120 **FUTURE DIRECTIONS**

41121 None.

41124 of IEEE Std 1003.1-2001, <sys/mman.h>

## 41125 CHANGE HISTORY

41126 First released in Issue 5. Included for alignment with the POSIX Realtime Extension.

## 41127 Issue 6

41128 The *shm\_unlink()* function is marked as part of the Shared Memory Objects option.

41129 In the DESCRIPTION, text is added to clarify that reusing the same name after a *shm\_unlink()*  
41130 will not attach to the old shared memory object.

41131 The [ENOSYS] error condition has been removed as stubs need not be provided if an  
41132 implementation does not support the Shared Memory Objects option.

41133 **NAME**41134 `shmat` — XSI shared memory attach operation41135 **SYNOPSIS**41136 XSI 

```
#include <sys/shm.h>
```

41137 

```
void *shmat(int shmid, const void *shmaddr, int shmflg);
```

41138

41139 **DESCRIPTION**

41140 The `shmat()` function operates on XSI shared memory (see the Base Definitions volume of  
 41141 IEEE Std 1003.1-2001, Section 3.340, Shared Memory Object). It is unspecified whether this  
 41142 function interoperates with the realtime interprocess communication facilities defined in Section  
 41143 2.8 (on page 41).

41144 The `shmat()` function attaches the shared memory segment associated with the shared memory  
 41145 identifier specified by `shmid` to the address space of the calling process. The segment is attached  
 41146 at the address specified by one of the following criteria:

- 41147 • If `shmaddr` is a null pointer, the segment is attached at the first available address as selected  
 41148 by the system.
- 41149 • If `shmaddr` is not a null pointer and `(shmflg &SHM_RND)` is non-zero, the segment is attached  
 41150 at the address given by `(shmaddr - ((uintptr_t)shmaddr %SHMLBA))`. The character `'%'` is the  
 41151 C-language remainder operator.
- 41152 • If `shmaddr` is not a null pointer and `(shmflg &SHM_RND)` is 0, the segment is attached at the  
 41153 address given by `shmaddr`.
- 41154 • The segment is attached for reading if `(shmflg &SHM_RDONLY)` is non-zero and the calling  
 41155 process has read permission; otherwise, if it is 0 and the calling process has read and write  
 41156 permission, the segment is attached for reading and writing.

41157 **RETURN VALUE**

41158 Upon successful completion, `shmat()` shall increment the value of `shm_nattch` in the data  
 41159 structure associated with the shared memory ID of the attached shared memory segment and  
 41160 return the segment's start address.

41161 Otherwise, the shared memory segment shall not be attached, `shmat()` shall return `-1`, and `errno`  
 41162 shall be set to indicate the error.

41163 **ERRORS**41164 The `shmat()` function shall fail if:

- |                                           |          |                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|-------------------------------------------|----------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 41165<br>41166                            | [EACCES] | Operation permission is denied to the calling process; see Section 2.7 (on page 39).                                                                                                                                                                                                                                                                                                                                                    |
| 41167<br>41168<br>41169<br>41170<br>41171 | [EINVAL] | The value of <code>shmid</code> is not a valid shared memory identifier, the <code>shmaddr</code> is not a null pointer, and the value of <code>(shmaddr - ((uintptr_t)shmaddr %SHMLBA))</code> is an illegal address for attaching shared memory; or the <code>shmaddr</code> is not a null pointer, <code>(shmflg &amp;SHM_RND)</code> is 0, and the value of <code>shmaddr</code> is an illegal address for attaching shared memory. |
| 41172<br>41173                            | [EMFILE] | The number of shared memory segments attached to the calling process would exceed the system-imposed limit.                                                                                                                                                                                                                                                                                                                             |
| 41174<br>41175                            | [ENOMEM] | The available data space is not large enough to accommodate the shared memory segment.                                                                                                                                                                                                                                                                                                                                                  |

41176 **EXAMPLES**

41177 None.

41178 **APPLICATION USAGE**

41179 The POSIX Realtime Extension defines alternative interfaces for interprocess communication.  
41180 Application developers who need to use IPC should design their applications so that modules  
41181 using the IPC routines described in Section 2.7 (on page 39) can be easily modified to use the  
41182 alternative interfaces.

41183 **RATIONALE**

41184 None.

41185 **FUTURE DIRECTIONS**

41186 None.

41190 **CHANGE HISTORY**

41191 First released in Issue 2. Derived from Issue 2 of the SVID.

41192 **Issue 5**

41193 Moved from SHARED MEMORY to BASE.

41194 The note about use of POSIX Realtime Extension IPC routines has been moved from FUTURE  
41195 DIRECTIONS to a new APPLICATION USAGE section.

41196 **Issue 6**

41197 The Open Group Corrigendum U021/13 is applied.

41198 **NAME**

41199 shmctl — XSI shared memory control operations

41200 **SYNOPSIS**

41201 XSI #include &lt;sys/shm.h&gt;

41202 int shmctl(int *shmid*, int *cmd*, struct shm\_id\_ds \**buf*);

41203

41204 **DESCRIPTION**

41205 The *shmctl()* function operates on XSI shared memory (see the Base Definitions volume of  
 41206 IEEE Std 1003.1-2001, Section 3.340, Shared Memory Object). It is unspecified whether this  
 41207 function interoperates with the realtime interprocess communication facilities defined in Section  
 41208 2.8 (on page 41).

41209 The *shmctl()* function provides a variety of shared memory control operations as specified by  
 41210 *cmd*. The following values for *cmd* are available:

41211 **IPC\_STAT** Place the current value of each member of the **shm\_id\_ds** data structure  
 41212 associated with *shmid* into the structure pointed to by *buf*. The contents of the  
 41213 structure are defined in <sys/shm.h>.

41214 **IPC\_SET** Set the value of the following members of the **shm\_id\_ds** data structure  
 41215 associated with *shmid* to the corresponding value found in the structure  
 41216 pointed to by *buf*:

41217 shm\_perm.uid

41218 shm\_perm.gid

41219 shm\_perm.mode Low-order nine bits.

41220 **IPC\_SET** can only be executed by a process that has an effective user ID equal  
 41221 to either that of a process with appropriate privileges or to the value of  
 41222 *shm\_perm.cuid* or *shm\_perm.uid* in the **shm\_id\_ds** data structure associated with  
 41223 *shmid*.

41224 **IPC\_RMID** Remove the shared memory identifier specified by *shmid* from the system and  
 41225 destroy the shared memory segment and **shm\_id\_ds** data structure associated  
 41226 with it. **IPC\_RMID** can only be executed by a process that has an effective user  
 41227 ID equal to either that of a process with appropriate privileges or to the value  
 41228 of *shm\_perm.cuid* or *shm\_perm.uid* in the **shm\_id\_ds** data structure associated  
 41229 with *shmid*.

41230 **RETURN VALUE**

41231 Upon successful completion, *shmctl()* shall return 0; otherwise, it shall return -1 and set *errno* to  
 41232 indicate the error.

41233 **ERRORS**41234 The *shmctl()* function shall fail if:

41235 **[EACCES]** The argument *cmd* is equal to **IPC\_STAT** and the calling process does not have  
 41236 read permission; see Section 2.7 (on page 39).

41237 **[EINVAL]** The value of *shmid* is not a valid shared memory identifier, or the value of *cmd*  
 41238 is not a valid command.

41239 **[EPERM]** The argument *cmd* is equal to **IPC\_RMID** or **IPC\_SET** and the effective user ID  
 41240 of the calling process is not equal to that of a process with appropriate  
 41241 privileges and it is not equal to the value of *shm\_perm.cuid* or *shm\_perm.uid* in  
 41242 the data structure associated with *shmid*.

- 41243 The *shmctl()* function may fail if:
- 41244 [EOVERFLOW] The *cmd* argument is `IPC_STAT` and the *gid* or *uid* value is too large to be  
41245 stored in the structure pointed to by the *buf* argument.
- 41246 **EXAMPLES**
- 41247 None.
- 41248 **APPLICATION USAGE**
- 41249 The POSIX Realtime Extension defines alternative interfaces for interprocess communication.  
41250 Application developers who need to use IPC should design their applications so that modules  
41251 using the IPC routines described in Section 2.7 (on page 39) can be easily modified to use the  
41252 alternative interfaces.

41266 **NAME**

41267 shmdt — XSI shared memory detach operation

41268 **SYNOPSIS**41269 XSI 

```
#include <sys/shm.h>
```

41270 

```
int shmdt(const void *shmaddr);
```

41271

41272 **DESCRIPTION**

41273 The *shmdt()* function operates on XSI shared memory (see the Base Definitions volume of  
 41274 IEEE Std 1003.1-2001, Section 3.340, Shared Memory Object). It is unspecified whether this  
 41275 function interoperates with the realtime interprocess communication facilities defined in Section  
 41276 2.8 (on page 41).

41277 The *shmdt()* function detaches the shared memory segment located at the address specified by  
 41278 *shmaddr* from the address space of the calling process.

41279 **RETURN VALUE**

41280 Upon successful completion, *shmdt()* shall decrement the value of *shm\_nattch* in the data  
 41281 structure associated with the shared memory ID of the attached shared memory segment and  
 41282 return 0.

41283 Otherwise, the shared memory segment shall not be detached, *shmdt()* shall return  $-1$ , and *errno*  
 41284 shall be set to indicate the error.

41285 **ERRORS**41286 The *shmdt()* function shall fail if:

41287 [EINVAL] The value of *shmaddr* is not the data segment start address of a shared  
 41288 memory segment.

41289 **EXAMPLES**

41290 None.

41291 **APPLICATION USAGE**

41292 The POSIX Realtime Extension defines alternative interfaces for interprocess communication.  
 41293 Application developers who need to use IPC should design their applications so that modules  
 41294 using the IPC routines described in Section 2.7 (on page 39) can be easily modified to use the  
 41295 alternative interfaces.

41296 **RATIONALE**

41297 None.

41298 **FUTURE DIRECTIONS**

41299 None.

## 41309 NAME

41310 shmget — get an XSI shared memory segment

## 41311 SYNOPSIS

41312 XSI 

```
#include <sys/shm.h>
```

41313 

```
int shmget(key_t key, size_t size, int shmflg);
```

41314

## 41315 DESCRIPTION

41316 The *shmget()* function operates on XSI shared memory (see the Base Definitions volume of  
 41317 IEEE Std 1003.1-2001, Section 3.340, Shared Memory Object). It is unspecified whether this  
 41318 function interoperates with the realtime interprocess communication facilities defined in Section  
 41319 2.8 (on page 41).

41320 The *shmget()* function shall return the shared memory identifier associated with *key*.

41321 A shared memory identifier, associated data structure, and shared memory segment of at least  
 41322 *size* bytes (see <sys/shm.h>) are created for *key* if one of the following is true:

- 41323 • The argument *key* is equal to `IPC_PRIVATE`.
- 41324 • The argument *key* does not already have a shared memory identifier associated with it and  
 41325 (*shmflg* & `IPC_CREAT`) is non-zero.

41326 Upon creation, the data structure associated with the new shared memory identifier shall be  
 41327 initialized as follows:

- 41328 • The values of *shm\_perm.cuid*, *shm\_perm.uid*, *shm\_perm.cgid*, and *shm\_perm.gid* are set equal to  
 41329 the effective user ID and effective group ID, respectively, of the calling process.
- 41330 • The low-order nine bits of *shm\_perm.mode* are set equal to the low-order nine bits of *shmflg*.
- 41331 • The value of *shm\_segsz* is set equal to the value of *size*.
- 41332 • The values of *shm\_lpid*, *shm\_nattch*, *shm\_atime*, and *shm\_dtime* are set equal to 0.
- 41333 • The value of *shm\_ctime* is set equal to the current time.

41334 When the shared memory segment is created, it shall be initialized with all zero values.

## 41335 RETURN VALUE

41336 Upon successful completion, *shmget()* shall return a non-negative integer, namely a shared  
 41337 memory identifier; otherwise, it shall return `-1` and set *errno* to indicate the error.

## 41338 ERRORS

41339 The *shmget()* function shall fail if:

- |                         |          |                                                                                                                                                                                               |
|-------------------------|----------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 41340<br>41341<br>41342 | [EACCES] | A shared memory identifier exists for <i>key</i> but operation permission as specified by the low-order nine bits of <i>shmflg</i> would not be granted; see Section 2.7 (on page 39).        |
| 41343<br>41344          | [EEXIST] | A shared memory identifier exists for the argument <i>key</i> but ( <i>shmflg</i> & <code>IPC_CREAT</code> ) && ( <i>shmflg</i> & <code>IPC_EXCL</code> ) is non-zero.                        |
| 41345<br>41346          | [EINVAL] | A shared memory segment is to be created and the value of <i>size</i> is less than the system-imposed minimum or greater than the system-imposed maximum.                                     |
| 41347<br>41348<br>41349 | [EINVAL] | No shared memory segment is to be created and a shared memory segment exists for <i>key</i> but the size of the segment associated with it is less than <i>size</i> and <i>size</i> is not 0. |

- 41350 [ENOENT] A shared memory identifier does not exist for the argument *key* and (*shmflg*  
41351 &IPC\_CREAT) is 0.
- 41352 [ENOMEM] A shared memory identifier and associated shared memory segment shall be  
41353 created, but the amount of available physical memory is not sufficient to fill  
41354 the request.
- 41355 [ENOSPC] A shared memory identifier is to be created, but the system-imposed limit on  
41356 the maximum number of allowed shared memory identifiers system-wide  
41357 would be exceeded.
- 41358 **EXAMPLES**
- 41359 None.

41378 **NAME**

41379 shutdown — shut down socket send and receive operations

41380 **SYNOPSIS**

```
41381 #include <sys/socket.h>
41382 int shutdown(int socket, int how);
```

41383 **DESCRIPTION**

41384 The *shutdown()* function shall cause all or part of a full-duplex connection on the socket  
41385 associated with the file descriptor *socket* to be shut down.

41386 The *shutdown()* function takes the following arguments:

|       |               |                                                            |
|-------|---------------|------------------------------------------------------------|
| 41387 | <i>socket</i> | Specifies the file descriptor of the socket.               |
| 41388 | <i>how</i>    | Specifies the type of shutdown. The values are as follows: |
| 41389 | SHUT_RD       | Disables further receive operations.                       |
| 41390 | SHUT_WR       | Disables further send operations.                          |
| 41391 | SHUT_RDWR     | Disables further send and receive operations.              |

41392 The *shutdown()* function disables subsequent send and/or receive operations on a socket,  
41393 depending on the value of the *how* argument.

41394 **RETURN VALUE**

41395 Upon successful completion, *shutdown()* shall return 0; otherwise, -1 shall be returned and *errno*  
41396 set to indicate the error.

41397 **ERRORS**

41398 The *shutdown()* function shall fail if:

|       |            |                                                            |
|-------|------------|------------------------------------------------------------|
| 41399 | [EBADF]    | The <i>socket</i> argument is not a valid file descriptor. |
| 41400 | [EINVAL]   | The <i>how</i> argument is invalid.                        |
| 41401 | [ENOTCONN] | The socket is not connected.                               |
| 41402 | [ENOTSOCK] | The <i>socket</i> argument does not refer to a socket.     |

41403 The *shutdown()* function may fail if:

|       |           |                                                                               |
|-------|-----------|-------------------------------------------------------------------------------|
| 41404 | [ENOBUFS] | Insufficient resources were available in the system to perform the operation. |
|-------|-----------|-------------------------------------------------------------------------------|

41405 **EXAMPLES**

41416 **CHANGE HISTORY**

41417 First released in Issue 6. Derived from the XNS, Issue 5.2 specification.

## 41418 NAME

41419 sigaction — examine and change a signal action

## 41420 SYNOPSIS

41421 cx #include &lt;signal.h&gt;

```
41422 int sigaction(int sig, const struct sigaction *restrict act,
41423             struct sigaction *restrict oact);
41424
```

## 41425 DESCRIPTION

41426 The *sigaction()* function allows the calling process to examine and/or specify the action to be  
 41427 associated with a specific signal. The argument *sig* specifies the signal; acceptable values are  
 41428 defined in <signal.h>.

41429 The structure **sigaction**, used to describe an action to be taken, is defined in the <signal.h>  
 41430 header to include at least the following members:

41431

41432

41433

41434

41435

41436

41437

41438

41439

| Member Type                               | Member Name         | Description                                                                           |
|-------------------------------------------|---------------------|---------------------------------------------------------------------------------------|
| <b>void(*) (int)</b>                      | <i>sa_handler</i>   | SIG_DFL, SIG_IGN, or pointer to a function.                                           |
| <b>sigset_t</b>                           | <i>sa_mask</i>      | Additional set of signals to be blocked during execution of signal-catching function. |
| <b>int</b>                                | <i>sa_flags</i>     | Special flags to affect behavior of signal.                                           |
| <b>void(*) (int, siginfo_t *, void *)</b> | <i>sa_sigaction</i> | Signal-catching function.                                                             |

41440

41441

The storage occupied by *sa\_handler* and *sa\_sigaction* may overlap, and a conforming application shall not use both simultaneously.

41442

41443

41444

41445

41446

41447

41448

If the argument *act* is not a null pointer, it points to a structure specifying the action to be associated with the specified signal. If the argument *oact* is not a null pointer, the action previously associated with the signal is stored in the location pointed to by the argument *oact*. If the argument *act* is a null pointer, signal handling is unchanged; thus, the call can be used to enquire about the current handling of a given signal. The SIGKILL and SIGSTOP signals shall not be added to the signal mask using this mechanism; this restriction shall be enforced by the system without causing an error to be indicated.

41449

41450 XSI|RTS

41451

41452

41453

41454

41455

41456

41457

41458

If the SA\_SIGINFO flag (see below) is cleared in the *sa\_flags* field of the **sigaction** structure, the *sa\_handler* field identifies the action to be associated with the specified signal. If the SA\_SIGINFO flag is set in the *sa\_flags* field, and the implementation supports the Realtime Signals Extension option or the XSI Extension option, the *sa\_sigaction* field specifies a signal-catching function. If the SA\_SIGINFO bit is cleared and the *sa\_handler* field specifies a signal-catching function, or if the SA\_SIGINFO bit is set, the *sa\_mask* field identifies a set of signals that shall be added to the signal mask of the thread before the signal-catching function is invoked. If the *sa\_handler* field specifies a signal-catching function, the *sa\_mask* field identifies a set of signals that shall be added to the process' signal mask before the signal-catching function is invoked.

41459

The *sa\_flags* field can be used to modify the behavior of the specified signal.

41460

The following flags, defined in the <signal.h> header, can be set in *sa\_flags*:

41461 XSI

41462

SA\_NOCLDSTOP Do not generate SIGCHLD when children stop or stopped children continue.

|               |              |                                                                                        |
|---------------|--------------|----------------------------------------------------------------------------------------|
| 41463         |              | If <i>sig</i> is SIGCHLD and the SA_NOCLDSTOP flag is not set in <i>sa_flags</i> , and |
| 41464         |              | the implementation supports the SIGCHLD signal, then a SIGCHLD                         |
| 41465         |              | signal shall be generated for the calling process whenever any of its child            |
| 41466 XSI     |              | processes stop and a SIGCHLD signal may be generated for the calling                   |
| 41467         |              | process whenever any of its stopped child processes are continued. If <i>sig</i>       |
| 41468         |              | is SIGCHLD and the SA_NOCLDSTOP flag is set in <i>sa_flags</i> , then the              |
| 41469         |              | implementation shall not generate a SIGCHLD signal in this way.                        |
| 41470 XSI     | SA_ONSTACK   | If set and an alternate signal stack has been declared with <i>sigaltstack()</i> , the |
| 41471         |              | signal shall be delivered to the calling process on that stack. Otherwise,             |
| 41472         |              | the signal shall be delivered on the current stack.                                    |
| 41473 XSI     | SA_RESETHAND | If set, the disposition of the signal shall be reset to SIG_DFL and the                |
| 41474         |              | SA_SIGINFO flag shall be cleared on entry to the signal handler.                       |
| 41475         |              | <b>Note:</b> SIGILL and SIGTRAP cannot be automatically reset when delivered;          |
| 41476         |              | the system silently enforces this restriction.                                         |
| 41477         |              | Otherwise, the disposition of the signal shall not be modified on entry to             |
| 41478         |              | the signal handler.                                                                    |
| 41479         |              | In addition, if this flag is set, <i>sigaction()</i> behaves as if the SA_NODEFER      |
| 41480         |              | flag were also set.                                                                    |
| 41481 XSI     | SA_RESTART   | This flag affects the behavior of interruptible functions; that is, those              |
| 41482         |              | specified to fail with <i>errno</i> set to [EINTR]. If set, and a function specified   |
| 41483         |              | as interruptible is interrupted by this signal, the function shall restart and         |
| 41484         |              | shall not fail with [EINTR] unless otherwise specified. If the flag is not             |
| 41485         |              | set, interruptible functions interrupted by this signal shall fail with <i>errno</i>   |
| 41486         |              | set to [EINTR].                                                                        |
| 41487         | SA_SIGINFO   | If cleared and the signal is caught, the signal-catching function shall be             |
| 41488         |              | entered as:                                                                            |
| 41489         |              | <pre>void func(int signo);</pre>                                                       |
| 41490         |              | where <i>signo</i> is the only argument to the signal-catching function. In this       |
| 41491         |              | case, the application shall use the <i>sa_handler</i> member to describe the           |
| 41492         |              | signal-catching function and the application shall not modify the                      |
| 41493         |              | <i>sa_sigaction</i> member.                                                            |
| 41494 XSI RTS |              | If SA_SIGINFO is set and the signal is caught, the signal-catching                     |
| 41495         |              | function shall be entered as:                                                          |
| 41496         |              | <pre>void func(int signo, siginfo_t *info, void *context);</pre>                       |
| 41497         |              | where two additional arguments are passed to the signal-catching                       |
| 41498         |              | function. The second argument shall point to an object of type <b>siginfo_t</b>        |
| 41499         |              | explaining the reason why the signal was generated; the third argument                 |
| 41500         |              | can be cast to a pointer to an object of type <b>ucontext_t</b> to refer to the        |
| 41501         |              | receiving process' context that was interrupted when the signal was                    |
| 41502         |              | delivered. In this case, the application shall use the <i>sa_sigaction</i> member      |
| 41503         |              | to describe the signal-catching function and the application shall not                 |
| 41504         |              | modify the <i>sa_handler</i> member.                                                   |
| 41505         |              | The <i>si_signo</i> member contains the system-generated signal number.                |
| 41506 XSI     |              | The <i>si_errno</i> member may contain implementation-defined additional               |
| 41507         |              | error information; if non-zero, it contains an error number identifying the            |
| 41508         |              | condition that caused the signal to be generated.                                      |

41509 XSI|RTS           The *si\_code* member contains a code identifying the cause of the signal.

41510 XSI           If the value of *si\_code* is less than or equal to 0, then the signal was  
41511           generated by a process and *si\_pid* and *si\_uid*, respectively, indicate the  
41512           process ID and the real user ID of the sender. The `<signal.h>` header  
41513           description contains information about the signal-specific contents of the  
41514           elements of the `siginfo_t` type.

41515 XSI           SA\_NOCLDWAIT   If set, and *sig* equals SIGCHLD, child processes of the calling processes  
41516           shall not be transformed into zombie processes when they terminate. If  
41517           the calling process subsequently waits for its children, and the process  
41518           has no unwaited-for children that were transformed into zombie  
41519           processes, it shall block until all of its children terminate, and *wait()*,  
41520           *waitid()*, and *waitpid()* shall fail and set *errno* to [ECHILD]. Otherwise,  
41521           terminating child processes shall be transformed into zombie processes,  
41522           unless SIGCHLD is set to SIG\_IGN.

41523 XSI           SA\_NODEFER       If set and *sig* is caught, *sig* shall not be added to the process' signal mask  
41524           on entry to the signal handler unless it is included in *sa\_mask*. Otherwise,  
41525           *sig* shall always be added to the process' signal mask on entry to the  
41526           signal handler.

41527           When a signal is caught by a signal-catching function installed by *sigaction()*, a new signal mask  
41528           is calculated and installed for the duration of the signal-catching function (or until a call to either  
41529           *sigprocmask()* or *sigsuspend()* is made). This mask is formed by taking the union of the current  
41530 XSI           signal mask and the value of the *sa\_mask* for the signal being delivered unless SA\_NODEFER or  
41531           SA\_RESETHAND is set, and then including the signal being delivered. If and when the user's  
41532           signal handler returns normally, the original signal mask is restored.

41533           Once an action is installed for a specific signal, it shall remain installed until another action is  
41534 XSI           explicitly requested (by another call to *sigaction()*), until the SA\_RESETHAND flag causes  
41535           resetting of the handler, or until one of the *exec* functions is called.

41536           If the previous action for *sig* had been established by *signal()*, the values of the fields returned in  
41537           the structure pointed to by *oact* are unspecified, and in particular *oact->sa\_handler* is not  
41538           necessarily the same value passed to *signal()*. However, if a pointer to the same structure or a  
41539           copy thereof is passed to a subsequent call to *sigaction()* via the *act* argument, handling of the  
41540           signal shall be as if the original call to *signal()* were repeated.

41541           If *sigaction()* fails, no new signal handler is installed.

41542           It is unspecified whether an attempt to set the action for a signal that cannot be caught or  
41543           ignored to SIG\_DFL is ignored or causes an error to be returned with *errno* set to [EINVAL].

41544           If SA\_SIGINFO is not set in *sa\_flags*, then the disposition of subsequent occurrences of *sig* when  
41545           it is already pending is implementation-defined; the signal-catching function shall be invoked  
41546 RTS           with a single argument. If the implementation supports the Realtime Signals Extension option,  
41547           and if SA\_SIGINFO is set in *sa\_flags*, then subsequent occurrences of *sig* generated by *sigqueue()*  
41548           or as a result of any signal-generating function that supports the specification of an application-  
41549           defined value (when *sig* is already pending) shall be queued in FIFO order until delivered or  
41550           accepted; the signal-catching function shall be invoked with three arguments. The application  
41551           specified value is passed to the signal-catching function as the *si\_value* member of the `siginfo_t`  
41552           structure.

41553           The result of the use of *sigaction()* and a *sigwait()* function concurrently within a process on the  
41554           same signal is unspecified.

## 41555 RETURN VALUE

41556 Upon successful completion, *sigaction()* shall return 0; otherwise, -1 shall be returned, *errno* shall  
 41557 be set to indicate the error, and no new signal-catching function shall be installed.

## 41558 ERRORS

41559 The *sigaction()* function shall fail if:

41560 [EINVAL] The *sig* argument is not a valid signal number or an attempt is made to catch a  
 41561 signal that cannot be caught or ignore a signal that cannot be ignored.

41562 [ENOTSUP] The SA\_SIGINFO bit flag is set in the *sa\_flags* field of the **sigaction** structure,  
 41563 and the implementation does not support either the Realtime Signals  
 41564 Extension option, or the XSI Extension option.

41565 The *sigaction()* function may fail if:

41566 [EINVAL] An attempt was made to set the action to SIG\_DFL for a signal that cannot be  
 41567 caught or ignored (or both).

## 41568 EXAMPLES

41569 None.

## 41570 APPLICATION USAGE

41571 The *sigaction()* function supersedes the *signal()* function, and should be used in preference. In  
 41572 particular, *sigaction()* and *signal()* should not be used in the same process to control the same  
 41573 signal. The behavior of reentrant functions, as defined in the DESCRIPTION, is as specified by  
 41574 this volume of IEEE Std 1003.1-2001, regardless of invocation from a signal-catching function.  
 41575 This is the only intended meaning of the statement that reentrant functions may be used in  
 41576 signal-catching functions without restrictions. Applications must still consider all effects of such  
 41577 functions on such things as data structures, files, and process state. In particular, application  
 41578 writers need to consider the restrictions on interactions when interrupting *sleep()* and  
 41579 interactions among multiple handles for a file description. The fact that any specific function is  
 41580 listed as reentrant does not necessarily mean that invocation of that function from a signal-  
 41581 catching function is recommended.

41582 In order to prevent errors arising from interrupting non-reentrant function calls, applications  
 41583 should protect calls to these functions either by blocking the appropriate signals or through the  
 41584 use of some programmatic semaphore (see *semget()*, *sem\_init()*, *sem\_open()*, and so on). Note in  
 41585 particular that even the “safe” functions may modify *errno*; the signal-catching function, if not  
 41586 executing as an independent thread, may want to save and restore its value. Naturally, the same  
 41587 principles apply to the reentrancy of application routines and asynchronous data access. Note  
 41588 that *longjmp()* and *siglongjmp()* are not in the list of reentrant functions. This is because the code  
 41589 executing after *longjmp()* and *siglongjmp()* can call any unsafe functions with the same danger as  
 41590 calling those unsafe functions directly from the signal handler. Applications that use *longjmp()*  
 41591 and *siglongjmp()* from within signal handlers require rigorous protection in order to be portable.  
 41592 Many of the other functions that are excluded from the list are traditionally implemented using  
 41593 either *malloc()* or *free()* functions or the standard I/O library, both of which traditionally use  
 41594 data structures in a non-reentrant manner. Since any combination of different functions using a  
 41595 common data structure can cause reentrancy problems, this volume of IEEE Std 1003.1-2001  
 41596 does not define the behavior when any unsafe function is called in a signal handler that  
 41597 interrupts an unsafe function.

41598 If the signal occurs other than as the result of calling *abort()*, *kill()*, or *raise()*, the behavior is  
 41599 undefined if the signal handler calls any function in the standard library other than one of the  
 41600 functions listed in the table above or refers to any object with static storage duration other than  
 41601 by assigning a value to a static storage duration variable of type **volatile sig\_atomic\_t**.  
 41602 Furthermore, if such a call fails, the value of *errno* is unspecified.

41603 Usually, the signal is executed on the stack that was in effect before the signal was delivered. An  
41604 alternate stack may be specified to receive a subset of the signals being caught.

41605 When the signal handler returns, the receiving process resumes execution at the point it was  
41606 interrupted unless the signal handler makes other arrangements. If *longjmp()* or *\_longjmp()* is  
41607 used to leave the signal handler, then the signal mask must be explicitly restored by the process.

41608 This volume of IEEE Std 1003.1-2001 defines the third argument of a signal handling function  
41609 when SA\_SIGINFO is set as a **void \*** instead of a **ucontext\_t \***, but without requiring type  
41610 checking. New applications should explicitly cast the third argument of the signal handling  
41611 function to **ucontext\_t \***.

41612 The BSD optional four argument signal handling function is not supported by this volume of  
41613 IEEE Std 1003.1-2001. The BSD declaration would be:

```
41614 void handler(int sig, int code, struct sigcontext *scp,  
41615             char *addr);
```

41616 where *sig* is the signal number, *code* is additional information on certain signals, *scp* is a pointer  
41617 to the **sigcontext** structure, and *addr* is additional address information. Much the same  
41618 information is available in the objects pointed to by the second argument of the signal handler  
41619 specified when SA\_SIGINFO is set.

#### 41620 RATIONALE

41621 Although this volume of IEEE Std 1003.1-2001 requires that signals that cannot be ignored shall  
41622 not be added to the signal mask when a signal-catching function is entered, there is no explicit  
41623 requirement that subsequent calls to *sigaction()* reflect this in the information returned in the *oact*  
41624 argument. In other words, if SIGKILL is included in the *sa\_mask* field of *act*, it is unspecified  
41625 whether or not a subsequent call to *sigaction()* returns with SIGKILL included in the *sa\_mask*  
41626 field of *oact*.

41627 The SA\_NOCLDSTOP flag, when supplied in the *act->sa\_flags* parameter, allows overloading  
41628 SIGCHLD with the System V semantics that each SIGCLD signal indicates a single terminated  
41629 child. Most conforming applications that catch SIGCHLD are expected to install signal-catching  
41630 functions that repeatedly call the *waitpid()* function with the WNOHANG flag set, acting on  
41631 each child for which status is returned, until *waitpid()* returns zero. If stopped children are not of  
41632 interest, the use of the SA\_NOCLDSTOP flag can prevent the overhead from invoking the  
41633 signal-catching routine when they stop.

41634 Some historical implementations also define other mechanisms for stopping processes, such as  
41635 the *ptrace()* function. These implementations usually do not generate a SIGCHLD signal when  
41636 processes stop due to this mechanism; however, that is beyond the scope of this volume of  
41637 IEEE Std 1003.1-2001.

41638 This volume of IEEE Std 1003.1-2001 requires that calls to *sigaction()* that supply a NULL *act*  
41639 argument succeed, even in the case of signals that cannot be caught or ignored (that is, SIGKILL  
41640 or SIGSTOP). The System V *signal()* and BSD *sigvec()* functions return [EINVAL] in these cases  
41641 and, in this respect, their behavior varies from *sigaction()*.

41642 This volume of IEEE Std 1003.1-2001 requires that *sigaction()* properly save and restore a signal  
41643 action set up by the ISO C standard *signal()* function. However, there is no guarantee that the  
41644 reverse is true, nor could there be given the greater amount of information conveyed by the  
41645 **sigaction** structure. Because of this, applications should avoid using both functions for the same  
41646 signal in the same process. Since this cannot always be avoided in case of general-purpose  
41647 library routines, they should always be implemented with *sigaction()*.

41648 It was intended that the *signal()* function should be implementable as a library routine using  
41649 *sigaction()*.

41650 The POSIX Realtime Extension extends the *sigaction()* function as specified by the POSIX.1-1990  
41651 standard to allow the application to request on a per-signal basis via an additional signal action  
41652 flag that the extra parameters, including the application-defined signal value, if any, be passed  
41653 to the signal-catching function.

#### 41654 FUTURE DIRECTIONS

41655 None.

41659 *sigprocmask()*, *sigsuspend()*, *wait()*, *waitid()*, *waitpid()*, the Base Definitions volume of  
41660 IEEE Std 1003.1-2001, <**signal.h**>, <**ucontext.h**>

#### 41661 CHANGE HISTORY

41662 First released in Issue 3. Included for alignment with the POSIX.1-1988 standard.

#### 41663 Issue 5

41664 The DESCRIPTION is updated for alignment with the POSIX Realtime Extension and POSIX  
41665 Threads Extension.

41666 In the DESCRIPTION, the second argument to *func* when SA\_SIGINFO is set is no longer  
41667 permitted to be NULL, and the description of permitted **siginfo\_t** contents is expanded by  
41668 reference to <**signal.h**>.

41669 Since the X/OPEN UNIX Extension functionality is now folded into the BASE, the [ENOTSUP]  
41670 error is deleted.

#### 41671 Issue 6

41672 The Open Group Corrigendum U028/7 is applied. In the paragraph entitled “Signal Effects on  
41673 Other Functions”, a reference to *sigpending()* is added.

41674 In the DESCRIPTION, the text “Signal Generation and Delivery”, “Signal Actions”, and “Signal  
41675 Effects on Other Functions” are moved to a separate section of this volume of  
41676 IEEE Std 1003.1-2001.

41677 Text describing functionality from the Realtime Signals option is marked.

41678 The following changes are made for alignment with the ISO POSIX-1: 1996 standard:

- 41679 • The [ENOTSUP] error condition is added.

41680 The DESCRIPTION is updated to avoid use of the term “must” for application requirements.

41681 The **restrict** keyword is added to the *sigaction()* prototype for alignment with the  
41682 ISO/IEC 9899: 1999 standard.

41683 References to the *wait3()* function are removed.

41684 The SYNOPSIS is marked CX since the presence of this function in the <**signal.h**> header is an  
41685 extension over the ISO C standard.

41686 **NAME**

41687 sigaddset — add a signal to a signal set

41688 **SYNOPSIS**

41689 **CX** #include <signal.h>

41690 int sigaddset(sigset\_t \*set, int signo);

41691

41692 **DESCRIPTION**

41693 The *sigaddset()* function adds the individual signal specified by the *signo* to the signal set pointed  
41694 to by *set*.

41695 Applications shall call either *sigemptyset()* or *sigfillset()* at least once for each object of type  
41696 **sigset\_t** prior to any other use of that object. If such an object is not initialized in this way, but is  
41697 nonetheless supplied as an argument to any of *pthread\_sigmask()*, *sigaction()*, *sigaddset()*,  
41698 *sigdelset()*, *sigismember()*, *sigpending()*, *sigprocmask()*, *sigsuspend()*, *sigtimedwait()*, *sigwait()*, or  
41699 *sigwaitinfo()*, the results are undefined.

41700 **RETURN VALUE**

41701 Upon successful completion, *sigaddset()* shall return 0; otherwise, it shall return -1 and set *errno*  
41702 to indicate the error.

41703 **ERRORS**

41704 The *sigaddset()* function may fail if:

41705 [EINVAL] The value of the *signo* argument is an invalid or unsupported signal number.

41706 **EXAMPLES**

41707 None.

41708 **APPLICATION USAGE**

41709 None.

41710 **RATIONALE**

41711 None.

41712 **FUTURE DIRECTIONS**

41713 None.

41714 **SEE ALSO**

41715 Section 2.4 (on page 28), *sigaction()*, *sigdelset()*, *sigemptyset()*, *sigfillset()*, *sigismember()*,

41717 <signal.h>

41718 **CHANGE HISTORY**

41719 First released in Issue 3. Included for alignment with the POSIX.1-1988 standard.

41720 **Issue 5**

41721 The last paragraph of the DESCRIPTION was included as an APPLICATION USAGE note in  
41722 previous issues.

41723 **Issue 6**

41724 The DESCRIPTION is updated to avoid use of the term “must” for application requirements.

41725 The SYNOPSIS is marked CX since the presence of this function in the <signal.h> header is an  
41726 extension over the ISO C standard.

41727 **NAME**

41728 sigaltstack — set and get signal alternate stack context

41729 **SYNOPSIS**41730 XSI 

```
#include <signal.h>
```

41731 

```
int sigaltstack(const stack_t *restrict ss, stack_t *restrict oss);
```

41732

41733 **DESCRIPTION**

41734 The *sigaltstack()* function allows a process to define and examine the state of an alternate stack  
 41735 for signal handlers. Signals that have been explicitly declared to execute on the alternate stack  
 41736 shall be delivered on the alternate stack.

41737 If *ss* is not a null pointer, it points to a **stack\_t** structure that specifies the alternate signal stack  
 41738 that shall take effect upon return from *sigaltstack()*. The *ss\_flags* member specifies the new stack  
 41739 state. If it is set to *SS\_DISABLE*, the stack is disabled and *ss\_sp* and *ss\_size* are ignored.  
 41740 Otherwise, the stack shall be enabled, and the *ss\_sp* and *ss\_size* members specify the new address  
 41741 and size of the stack.

41742 The range of addresses starting at *ss\_sp* up to but not including *ss\_sp+ss\_size* is available to the  
 41743 implementation for use as the stack. This function makes no assumptions regarding which end  
 41744 is the stack base and in which direction the stack grows as items are pushed.

41745 If *oss* is not a null pointer, on successful completion it shall point to a **stack\_t** structure that  
 41746 specifies the alternate signal stack that was in effect prior to the call to *sigaltstack()*. The *ss\_sp*  
 41747 and *ss\_size* members specify the address and size of that stack. The *ss\_flags* member specifies the  
 41748 stack's state, and may contain one of the following values:

41749 **SS\_ONSTACK** The process is currently executing on the alternate signal stack. Attempts to  
 41750 modify the alternate signal stack while the process is executing on it fail. This  
 41751 flag shall not be modified by processes.

41752 **SS\_DISABLE** The alternate signal stack is currently disabled.

41753 The value *SIGSTKSZ* is a system default specifying the number of bytes that would be used to  
 41754 cover the usual case when manually allocating an alternate stack area. The value *MINSIGSTKSZ*  
 41755 is defined to be the minimum stack size for a signal handler. In computing an alternate stack  
 41756 size, a program should add that amount to its stack requirements to allow for the system  
 41757 implementation overhead. The constants *SS\_ONSTACK*, *SS\_DISABLE*, *SIGSTKSZ*, and  
 41758 *MINSIGSTKSZ* are defined in **<signal.h>**.

41759 After a successful call to one of the *exec* functions, there are no alternate signal stacks in the new  
 41760 process image.

41761 In some implementations, a signal (whether or not indicated to execute on the alternate stack)  
 41762 shall always execute on the alternate stack if it is delivered while another signal is being caught  
 41763 using the alternate stack.

41764 Use of this function by library threads that are not bound to kernel-scheduled entities results in  
 41765 undefined behavior.

41766 **RETURN VALUE**

41767 Upon successful completion, *sigaltstack()* shall return 0; otherwise, it shall return *-1* and set *errno*  
 41768 to indicate the error.

41769 **ERRORS**

41770 The *sigaltstack()* function shall fail if:

41771 [EINVAL] The *ss* argument is not a null pointer, and the *ss\_flags* member pointed to by *ss*  
41772 contains flags other than *SS\_DISABLE*.

41773 [ENOMEM] The size of the alternate stack area is less than *MINSIGSTKSZ*.

41774 [EPERM] An attempt was made to modify an active stack.

41775 **EXAMPLES**41776 **Allocating Memory for an Alternate Stack**

41777 The following example illustrates a method for allocating memory for an alternate stack.

```
41778 #include <signal.h>
41779 ...
41780 if ((sigstk.ss_sp = malloc(SIGSTKSZ)) == NULL)
41781     /* Error return. */
41782     sigstk.ss_size = SIGSTKSZ;
41783     sigstk.ss_flags = 0;
41784     if (sigaltstack(&sigstk, (stack_t *)0) < 0)
41785         perror("sigaltstack");
```

41786 **APPLICATION USAGE**

41787 On some implementations, stack space is automatically extended as needed. On those  
41788 implementations, automatic extension is typically not available for an alternate stack. If the stack  
41789 overflows, the behavior is undefined.

41790 **RATIONALE**

41791 None.

41792 **FUTURE DIRECTIONS**

41793 None.

41794 **SEE ALSO**

41795 Section 2.4 (on page 28), *sigaction()*, *sigsetjmp()*, the Base Definitions volume of  
41796 IEEE Std 1003.1-2001, <signal.h>

41797 **CHANGE HISTORY**

41798 First released in Issue 4, Version 2.

41799 **Issue 5**

41800 Moved from X/OPEN UNIX extension to BASE.

41801 The last sentence of the DESCRIPTION was included as an APPLICATION USAGE note in  
41802 previous issues.

41803 **Issue 6**

41804 The DESCRIPTION is updated to avoid use of the term “must” for application requirements.

41805 The **restrict** keyword is added to the *sigaltstack()* prototype for alignment with the  
41806 ISO/IEC 9899:1999 standard.

41807 **NAME**

41808 sigdelset — delete a signal from a signal set

41809 **SYNOPSIS**41810 **CX** #include <signal.h>

41811 int sigdelset(sigset\_t \*set, int signo);

41812

41813 **DESCRIPTION**41814 The *sigdelset()* function deletes the individual signal specified by *signo* from the signal set  
41815 pointed to by *set*.41816 Applications should call either *sigemptyset()* or *sigfillset()* at least once for each object of type  
41817 **sigset\_t** prior to any other use of that object. If such an object is not initialized in this way, but is  
41818 nonetheless supplied as an argument to any of *pthread\_sigmask()*, *sigaction()*, *sigaddset()*,  
41819 *sigdelset()*, *sigismember()*, *sigpending()*, *sigprocmask()*, *sigsuspend()*, *sigtimedwait()*, *sigwait()*, or  
41820 *sigwaitinfo()*, the results are undefined.41821 **RETURN VALUE**41822 Upon successful completion, *sigdelset()* shall return 0; otherwise, it shall return -1 and set *errno*  
41823 to indicate the error.41824 **ERRORS**41825 The *sigdelset()* function may fail if:41826 [EINVAL] The *signo* argument is not a valid signal number, or is an unsupported signal  
41827 number.41828 **EXAMPLES**

41829 None.

41830 **APPLICATION USAGE**

41831 None.

41832 **RATIONALE**

41833 None.

41834 **FUTURE DIRECTIONS**

41835 None.

41836 **SEE ALSO**41837 Section 2.4 (on page 28), *sigaction()*, *sigaddset()*, *sigemptyset()*, *sigfillset()*, *sigismember()*,  
41838 *sigpending()*, *sigprocmask()*, *sigsuspend()*, the Base Definitions volume of IEEE Std 1003.1-2001,  
41839 <**signal.h**>41840 **CHANGE HISTORY**

41841 First released in Issue 3. Included for alignment with the POSIX.1-1988 standard.

41842 **Issue 5**41843 The last paragraph of the DESCRIPTION was included as an APPLICATION USAGE note in  
41844 previous issues.41845 **Issue 6**41846 The SYNOPSIS is marked CX since the presence of this function in the <**signal.h**> header is an  
41847 extension over the ISO C standard.

41848 **NAME**

41849 sigemptyset — initialize and empty a signal set

41850 **SYNOPSIS**

41851 cx #include &lt;signal.h&gt;

41852 int sigemptyset(sigset\_t \*set);

41853

41854 **DESCRIPTION**41855 The *sigemptyset()* function initializes the signal set pointed to by *set*, such that all signals defined  
41856 in IEEE Std 1003.1-2001 are excluded.41857 **RETURN VALUE**41858 Upon successful completion, *sigemptyset()* shall return 0; otherwise, it shall return  $-1$  and set  
41859 *errno* to indicate the error.41860 **ERRORS**

41861 No errors are defined.

41862 **EXAMPLES**

41863 None.

41864 **APPLICATION USAGE**

41865 None.

41866 **RATIONALE**41867 The implementation of the *sigemptyset()* (or *sigfillset()*) function could quite trivially clear (or  
41868 set) all the bits in the signal set. Alternatively, it would be reasonable to initialize part of the  
41869 structure, such as a version field, to permit binary-compatibility between releases where the size  
41870 of the set varies. For such reasons, either *sigemptyset()* or *sigfillset()* must be called prior to any  
41871 other use of the signal set, even if such use is read-only (for example, as an argument to  
41872 *sigpending()*). This function is not intended for dynamic allocation.41873 The *sigfillset()* and *sigemptyset()* functions require that the resulting signal set include (or  
41874 exclude) all the signals defined in this volume of IEEE Std 1003.1-2001. Although it is outside the  
41875 scope of this volume of IEEE Std 1003.1-2001 to place this requirement on signals that are  
41876 implemented as extensions, it is recommended that implementation-defined signals also be  
41877 affected by these functions. However, there may be a good reason for a particular signal not to  
41878 be affected. For example, blocking or ignoring an implementation-defined signal may have  
41879 undesirable side effects, whereas the default action for that signal is harmless. In such a case, it  
41880 would be preferable for such a signal to be excluded from the signal set returned by *sigfillset()*.41881 In early proposals there was no distinction between invalid and unsupported signals (the names  
41882 of optional signals that were not supported by an implementation were not defined by that  
41883 implementation). The [EINVAL] error was thus specified as a required error for invalid signals.  
41884 With that distinction, it is not necessary to require implementations of these functions to  
41885 determine whether an optional signal is actually supported, as that could have a significant  
41886 performance impact for little value. The error could have been required for invalid signals and  
41887 optional for unsupported signals, but this seemed unnecessarily complex. Thus, the error is  
41888 optional in both cases.41889 **FUTURE DIRECTIONS**

41890 None.

41891 **SEE ALSO**

41894 **CHANGE HISTORY**

41895 First released in Issue 3. Included for alignment with the POSIX.1-1988 standard.

41896 **Issue 6**

41897 The SYNOPSIS is marked CX since the presence of this function in the <signal.h> header is an  
41898 extension over the ISO C standard.

41899 **NAME**

41900 sigfillset — initialize and fill a signal set

41901 **SYNOPSIS**

41902 **CX** #include <signal.h>

41903 int sigfillset(sigset\_t \*set);

41904

41905 **DESCRIPTION**

41906 The *sigfillset()* function shall initialize the signal set pointed to by *set*, such that all signals  
41907 defined in this volume of IEEE Std 1003.1-2001 are included.

41908 **RETURN VALUE**

41909 Upon successful completion, *sigfillset()* shall return 0; otherwise, it shall return -1 and set *errno*  
41910 to indicate the error.

41911 **ERRORS**

41912 No errors are defined.

41913 **EXAMPLES**

41914 None.

41915 **APPLICATION USAGE**

41916 None.

41917 **RATIONALE**

41918 Refer to *sigemptyset()* (on page 1348).

41919 **FUTURE DIRECTIONS**

41920 None.

41926 First released in Issue 3. Included for alignment with the POSIX.1-1988 standard.

41927 **Issue 6**

41928 The SYNOPSIS is marked CX since the presence of this function in the <signal.h> header is an  
41929 extension over the ISO C standard.

## 41930 NAME

41931 sighold, sigignore, sigpause, sigrelse, sigset — signal management

## 41932 SYNOPSIS

```
41933 XSI #include <signal.h>
41934 int sighold(int sig);
41935 int sigignore(int sig);
41936 int sigpause(int sig);
41937 int sigrelse(int sig);
41938 void (*sigset(int sig, void (*disp)(int)))(int);
41939
```

## 41940 DESCRIPTION

41941 Use of any of these functions is unspecified in a multi-threaded process.

41942 The *sighold()*, *sigignore()*, *sigpause()*, *sigrelse()*, and *sigset()* functions provide simplified signal management.  
41943

41944 The *sigset()* function shall modify signal dispositions. The *sig* argument specifies the signal, which may be any signal except SIGKILL and SIGSTOP. The *disp* argument specifies the signal's disposition, which may be SIG\_DFL, SIG\_IGN, or the address of a signal handler. If *sigset()* is used, and *disp* is the address of a signal handler, the system shall add *sig* to the calling process' signal mask before executing the signal handler; when the signal handler returns, the system shall restore the calling process' signal mask to its state prior to the delivery of the signal. In addition, if *sigset()* is used, and *disp* is equal to SIG\_HOLD, *sig* shall be added to the calling process' signal mask and *sig*'s disposition shall remain unchanged. If *sigset()* is used, and *disp* is not equal to SIG\_HOLD, *sig* shall be removed from the calling process' signal mask.

41953 The *sighold()* function shall add *sig* to the calling process' signal mask.41954 The *sigrelse()* function shall remove *sig* from the calling process' signal mask.41955 The *sigignore()* function shall set the disposition of *sig* to SIG\_IGN.

41956 The *sigpause()* function shall remove *sig* from the calling process' signal mask and suspend the calling process until a signal is received. The *sigpause()* function shall restore the process' signal mask to its original state before returning.

41959 If the action for the SIGCHLD signal is set to SIG\_IGN, child processes of the calling processes shall not be transformed into zombie processes when they terminate. If the calling process subsequently waits for its children, and the process has no unwaited-for children that were transformed into zombie processes, it shall block until all of its children terminate, and *wait()*, *waitid()*, and *waitpid()* shall fail and set *errno* to [ECHILD].

## 41964 RETURN VALUE

41965 Upon successful completion, *sigset()* shall return SIG\_HOLD if the signal had been blocked and the signal's previous disposition if it had not been blocked. Otherwise, SIG\_ERR shall be returned and *errno* set to indicate the error.

41968 The *sigpause()* function shall suspend execution of the thread until a signal is received, whereupon it shall return -1 and set *errno* to [EINTR].

41970 For all other functions, upon successful completion, 0 shall be returned. Otherwise, -1 shall be returned and *errno* set to indicate the error.

41971

41972 **ERRORS**

41973 These functions shall fail if:

41974 [EINVAL] The *sig* argument is an illegal signal number.41975 The *sigset()* and *sigignore()* functions shall fail if:41976 [EINVAL] An attempt is made to catch a signal that cannot be caught, or to ignore a  
41977 signal that cannot be ignored.41978 **EXAMPLES**

41979 None.

41980 **APPLICATION USAGE**41981 The *sigaction()* function provides a more comprehensive and reliable mechanism for controlling  
41982 signals; new applications should use *sigaction()* rather than *sigset()*.41983 The *sighold()* function, in conjunction with *sigrelse()* or *sigpause()*, may be used to establish  
41984 critical regions of code that require the delivery of a signal to be temporarily deferred.41985 The *sigsuspend()* function should be used in preference to *sigpause()* for broader portability.41986 **RATIONALE**

41987 None.

41988 **FUTURE DIRECTIONS**

41989 None.

41990 **SEE ALSO**41991 Section 2.4 (on page 28), *exec*, *pause()*, *sigaction()*, *signal()*, *sigsuspend()*, *waitid()*, the Base  
41992 Definitions volume of IEEE Std 1003.1-2001, <**signal.h**>41993 **CHANGE HISTORY**

41994 First released in Issue 4, Version 2.

41995 **Issue 5**

41996 Moved from X/OPEN UNIX extension to BASE.

41997 The DESCRIPTION is updated to indicate that the *sigpause()* function restores the process'  
41998 signal mask to its original state before returning.41999 The RETURN VALUE section is updated to indicate that the *sigpause()* function suspends  
42000 execution of the process until a signal is received, whereupon it returns -1 and sets *errno* to  
42001 [EINTR].42002 **Issue 6**

42003 The DESCRIPTION is updated to avoid use of the term “must” for application requirements.

42004 References to the *wait3()* function are removed.

42005 The XSI functions are split out into their own reference page.

42006 **NAME**

42007 siginterrupt — allow signals to interrupt functions

42008 **SYNOPSIS**

42009 XSI #include &lt;signal.h&gt;

42010 int siginterrupt(int sig, int flag);

42011

42012 **DESCRIPTION**42013 The *siginterrupt()* function shall change the restart behavior when a function is interrupted by  
42014 the specified signal. The function *siginterrupt(sig, flag)* has an effect as if implemented as:

```

42015 siginterrupt(int sig, int flag) {
42016     int ret;
42017     struct sigaction act;
42018
42019     (void) sigaction(sig, NULL, &act);
42020     if (flag)
42021         act.sa_flags &= ~SA_RESTART;
42022     else
42023         act.sa_flags |= SA_RESTART;
42024     ret = sigaction(sig, &act, NULL);
42025     return ret;
42026 }
```

42026 **RETURN VALUE**42027 Upon successful completion, *siginterrupt()* shall return 0; otherwise,  $-1$  shall be returned and  
42028 *errno* set to indicate the error.42029 **ERRORS**42030 The *siginterrupt()* function shall fail if:42031 [EINVAL] The *sig* argument is not a valid signal number.42032 **EXAMPLES**

42033 None.

42034 **APPLICATION USAGE**42035 The *siginterrupt()* function supports programs written to historical system interfaces. A  
42036 conforming application, when being written or rewritten, should use *sigaction()* with the  
42037 SA\_RESTART flag instead of *siginterrupt()*.42038 **RATIONALE**

42039 None.

42040 **FUTURE DIRECTIONS**

42041 None.

42042 **SEE ALSO**42043 Section 2.4 (on page 28), *sigaction()*, the Base Definitions volume of IEEE Std 1003.1-2001,  
42044 <signal.h>42045 **CHANGE HISTORY**

42046 First released in Issue 4, Version 2.

42047 **Issue 5**

42048 Moved from X/OPEN UNIX extension to BASE.

42049 **NAME**

42050 sigismember — test for a signal in a signal set

42051 **SYNOPSIS**42052 **CX** #include <signal.h>

42053 int sigismember(const sigset\_t \*set, int signo);

42054

42055 **DESCRIPTION**42056 The *sigismember()* function shall test whether the signal specified by *signo* is a member of the set  
42057 pointed to by *set*.42058 Applications should call either *sigemptyset()* or *sigfillset()* at least once for each object of type  
42059 **sigset\_t** prior to any other use of that object. If such an object is not initialized in this way, but is  
42060 nonetheless supplied as an argument to any of *pthread\_sigmask()*, *sigaction()*, *sigaddset()*,  
42061 *sigdelset()*, *sigismember()*, *sigpending()*, *sigprocmask()*, *sigsuspend()*, *sigtimedwait()*, *sigwait()*, or  
42062 *sigwaitinfo()*, the results are undefined.42063 **RETURN VALUE**42064 Upon successful completion, *sigismember()* shall return 1 if the specified signal is a member of  
42065 the specified set, or 0 if it is not. Otherwise, it shall return -1 and set *errno* to indicate the error.42066 **ERRORS**42067 The *sigismember()* function may fail if:42068 [EINVAL] The *signo* argument is not a valid signal number, or is an unsupported signal  
42069 number.42070 **EXAMPLES**

42071 None.

42072 **APPLICATION USAGE**

42073 None.

42074 **RATIONALE**

42075 None.

42076 **FUTURE DIRECTIONS**

42077 None.

42078 **SEE ALSO**42079 Section 2.4 (on page 28), *sigaction()*, *sigaddset()*, *sigdelset()*, *sigfillset()*, *sigemptyset()*, *sigpending()*,  
42080 *sigprocmask()*, *sigsuspend()*, the Base Definitions volume of IEEE Std 1003.1-2001, <signal.h>42081 **CHANGE HISTORY**

42082 First released in Issue 3. Included for alignment with the POSIX.1-1988 standard.

42083 **Issue 5**42084 The last paragraph of the DESCRIPTION was included as an APPLICATION USAGE note in  
42085 previous issues.42086 **Issue 6**42087 The SYNOPSIS is marked CX since the presence of this function in the <signal.h> header is an  
42088 extension over the ISO C standard.

42089 **NAME**

42090 siglongjmp — non-local goto with signal handling

42091 **SYNOPSIS**42092 **CX** #include <setjmp.h>

42093 void siglongjmp(sigjmp\_buf env, int val);

42094

42095 **DESCRIPTION**42096 The *siglongjmp()* function shall be equivalent to the *longjmp()* function, except as follows:

- 42097
- References to *setjmp()* shall be equivalent to *sigsetjmp()*.
  - The *siglongjmp()* function shall restore the saved signal mask if and only if the *env* argument was initialized by a call to *sigsetjmp()* with a non-zero *savemask* argument.

42100 **RETURN VALUE**42101 After *siglongjmp()* is completed, program execution shall continue as if the corresponding  
42102 invocation of *sigsetjmp()* had just returned the value specified by *val*. The *siglongjmp()* function  
42103 shall not cause *sigsetjmp()* to return 0; if *val* is 0, *sigsetjmp()* shall return the value 1.42104 **ERRORS**

42105 No errors are defined.

42106 **EXAMPLES**

42107 None.

42108 **APPLICATION USAGE**42109 The distinction between *setjmp()* or *longjmp()* and *sigsetjmp()* or *siglongjmp()* is only significant  
42110 for programs which use *sigaction()*, *sigprocmask()*, or *sigsuspend()*.42111 **RATIONALE**

42112 None.

42113 **FUTURE DIRECTIONS**

42114 None.

42115 **SEE ALSO**42116 *longjmp()*, *setjmp()*, *sigprocmask()*, *sigsetjmp()*, *sigsuspend()*, the Base Definitions volume of  
42117 IEEE Std 1003.1-2001, <setjmp.h>42118 **CHANGE HISTORY**

42119 First released in Issue 3. Included for alignment with the ISO POSIX-1 standard.

42120 **Issue 5**

42121 The DESCRIPTION is updated for alignment with the POSIX Threads Extension.

42122 **Issue 6**42123 The DESCRIPTION is rewritten in terms of *longjmp()*.42124 The SYNOPSIS is marked CX since the presence of this function in the <setjmp.h> header is an  
42125 extension over the ISO C standard.

42126 **NAME**42127        **signal** — signal management42128 **SYNOPSIS**

42129        #include &lt;signal.h&gt;

42130        void (\*signal(int *sig*, void (\**func*)(int)))(int);42131 **DESCRIPTION**

42132 **CX**        The functionality described on this reference page is aligned with the ISO C standard. Any  
 42133 conflict between the requirements described here and the ISO C standard is unintentional. This  
 42134 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

42135 **CX**        Use of this function is unspecified in a multi-threaded process.

42136        The *signal()* function chooses one of three ways in which receipt of the signal number *sig* is to be  
 42137 subsequently handled. If the value of *func* is SIG\_DFL, default handling for that signal shall  
 42138 occur. If the value of *func* is SIG\_IGN, the signal shall be ignored. Otherwise, the application  
 42139 shall ensure that *func* points to a function to be called when that signal occurs. An invocation of  
 42140 such a function because of a signal, or (recursively) of any further functions called by that  
 42141 invocation (other than functions in the standard library), is called a “signal handler”.

42142        When a signal occurs, and *func* points to a function, it is implementation-defined whether the  
 42143 equivalent of a:

42144        signal(*sig*, SIG\_DFL);

42145        is executed or the implementation prevents some implementation-defined set of signals (at least  
 42146 including *sig*) from occurring until the current signal handling has completed. (If the value of *sig*  
 42147 is SIGILL, the implementation may alternatively define that no action is taken.) Next the  
 42148 equivalent of:

42149        (\**func*)(*sig*);

42150        is executed. If and when the function returns, if the value of *sig* was SIGFPE, SIGILL, or  
 42151 SIGSEGV or any other implementation-defined value corresponding to a computational  
 42152 exception, the behavior is undefined. Otherwise, the program shall resume execution at the  
 42153 **CX** point it was interrupted. If the signal occurs as the result of calling the *abort()*, *raise()*, *kill()*,  
 42154 *pthread\_kill()*, or *sigqueue()* function, the signal handler shall not call the *raise()* function.

42155 **CX**        If the signal occurs other than as the result of calling *abort()*, *raise()*, *kill()*, *pthread\_kill()*, or  
 42156 *sigqueue()*, the behavior is undefined if the signal handler refers to any object with static storage  
 42157 duration other than by assigning a value to an object declared as volatile **sig\_atomic\_t**, or if the  
 42158 signal handler calls any function in the standard library other than one of the functions listed in  
 42159 Section 2.4 (on page 28). Furthermore, if such a call fails, the value of *errno* is unspecified.

42160        At program start-up, the equivalent of:

42161        signal(*sig*, SIG\_IGN);

42162        is executed for some signals, and the equivalent of:

42163        signal(*sig*, SIG\_DFL);

42164 **CX**        is executed for all other signals (see *exec*).

42165 **RETURN VALUE**

42166        If the request can be honored, *signal()* shall return the value of *func* for the most recent call to  
 42167 *signal()* for the specified signal *sig*. Otherwise, SIG\_ERR shall be returned and a positive value  
 42168 shall be stored in *errno*.

42169 **ERRORS**

42170 The *signal()* function shall fail if:

42171 CX [EINVAL] The *sig* argument is not a valid signal number or an attempt is made to catch a  
42172 signal that cannot be caught or ignore a signal that cannot be ignored.

42173 The *signal()* function may fail if:

42174 CX [EINVAL] An attempt was made to set the action to SIG\_DFL for a signal that cannot be  
42175 caught or ignored (or both).

42176 **EXAMPLES**

42177 None.

42178 **APPLICATION USAGE**

42179 The *sigaction()* function provides a more comprehensive and reliable mechanism for controlling  
42180 signals; new applications should use *sigaction()* rather than *signal()*.

42181 **RATIONALE**

42182 None.

42183 **FUTURE DIRECTIONS**

42184 None.

42185 **SEE ALSO**

42186 Section 2.4 (on page 28), *exec*, *pause()*, *sigaction()*, *sigsuspend()*, *waitid()*, the Base Definitions  
42187 volume of IEEE Std 1003.1-2001, <signal.h>

42188 **CHANGE HISTORY**

42189 First released in Issue 1. Derived from Issue 1 of the SVID.

42190 **Issue 5**

42191 Moved from X/OPEN UNIX extension to BASE.

42192 The DESCRIPTION is updated to indicate that the *sigpause()* function restores the process'  
42193 signal mask to its original state before returning.

42194 The RETURN VALUE section is updated to indicate that the *sigpause()* function suspends  
42195 execution of the process until a signal is received, whereupon it returns -1 and sets *errno* to  
42196 [EINTR].

42197 **Issue 6**

42198 Extensions beyond the ISO C standard are marked.

42199 The DESCRIPTION is updated to avoid use of the term “must” for application requirements.

42200 The DESCRIPTION is updated for alignment with the ISO/IEC 9899:1999 standard.

42201 References to the *wait3()* function are removed.

42202 The *sighold()*, *sigignore()*, *sigrelse()*, and *sigset()* functions are split out onto their own reference  
42203 page.

42204 **NAME**

42205 signbit — test sign

42206 **SYNOPSIS**

42207 #include &lt;math.h&gt;

42208 int signbit(real-floating x);

42209 **DESCRIPTION**

42210 cx The functionality described on this reference page is aligned with the ISO C standard. Any  
42211 conflict between the requirements described here and the ISO C standard is unintentional. This  
42212 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

42213 The *signbit()* macro shall determine whether the sign of its argument value is negative. NaNs,  
42214 zeros, and infinities have a sign bit.

42215 **RETURN VALUE**

42216 The *signbit()* macro shall return a non-zero value if and only if the sign of its argument value is  
42217 negative.

42218 **ERRORS**

42219 No errors are defined.

42220 **EXAMPLES**

42221 None.

42222 **APPLICATION USAGE**

42223 None.

42224 **RATIONALE**

42225 None.

42226 **FUTURE DIRECTIONS**

42227 None.

42228 **SEE ALSO**

42229 *fpclassify()*, *isfinite()*, *isinf()*, *isnan()*, *isnormal()*, the Base Definitions volume of  
42230 IEEE Std 1003.1-2001, <math.h>

42231 **CHANGE HISTORY**

42232 First released in Issue 6. Derived from the ISO/IEC 9899:1999 standard.

42233 **NAME**

42234 sigpause — remove a signal from the signal mask and suspend the thread

42235 **SYNOPSIS**

42236 XSI #include <signal.h>

42237 int sigpause(int sig);

42238

42239 **DESCRIPTION**

42240 Refer to *sighold()*.

42241 **NAME**

42242 sigpending — examine pending signals

42243 **SYNOPSIS**

42244 CX #include &lt;signal.h&gt;

42245 int sigpending(sigset\_t \*set);

42246

42247 **DESCRIPTION**

42248 The *sigpending()* function shall store, in the location referenced by the *set* argument, the set of  
42249 signals that are blocked from delivery to the calling thread and that are pending on the process  
42250 or the calling thread.

42251 **RETURN VALUE**

42252 Upon successful completion, *sigpending()* shall return 0; otherwise, -1 shall be returned and  
42253 *errno* set to indicate the error.

42254 **ERRORS**

42255 No errors are defined.

42256 **EXAMPLES**

42257 None.

42258 **APPLICATION USAGE**

42259 None.

42260 **RATIONALE**

42261 None.

42262 **FUTURE DIRECTIONS**

42263 None.

42264 **SEE ALSO**

42265 *sigaddset()*, *sigdelset()*, *sigemptyset()*, *sigfillset()*, *sigismember()*, *sigprocmask()*, the Base Definitions  
42266 volume of IEEE Std 1003.1-2001, <**signal.h**>

42267 **CHANGE HISTORY**

42268 First released in Issue 3.

42269 **Issue 5**

42270 The DESCRIPTION is updated for alignment with the POSIX Threads Extension.

42271 **Issue 6**

42272 The SYNOPSIS is marked CX since the presence of this function in the <**signal.h**> header is an  
42273 extension over the ISO C standard.

42274 **NAME**

42275 sigprocmask — examine and change blocked signals

42276 **SYNOPSIS**

42277 cx `#include <signal.h>`

42278 `int sigprocmask(int how, const sigset_t *restrict set,`  
42279 `sigset_t *restrict oset);`

42280

42281 **DESCRIPTION**

42282 Refer to *pthread\_sigmask()*.

## 42283 NAME

42284 sigqueue — queue a signal to a process (REALTIME)

## 42285 SYNOPSIS

42286 RTS #include &lt;signal.h&gt;

42287 int sigqueue(pid\_t pid, int signo, const union sigval value);

42288

## 42289 DESCRIPTION

42290 The *sigqueue()* function shall cause the signal specified by *signo* to be sent with the value  
 42291 specified by *value* to the process specified by *pid*. If *signo* is zero (the null signal), error checking  
 42292 is performed but no signal is actually sent. The null signal can be used to check the validity of  
 42293 *pid*.

42294 The conditions required for a process to have permission to queue a signal to another process  
 42295 are the same as for the *kill()* function.

42296 The *sigqueue()* function shall return immediately. If SA\_SIGINFO is set for *signo* and if the  
 42297 resources were available to queue the signal, the signal shall be queued and sent to the receiving  
 42298 process. If SA\_SIGINFO is not set for *signo*, then *signo* shall be sent at least once to the receiving  
 42299 process; it is unspecified whether *value* shall be sent to the receiving process as a result of this  
 42300 call.

42301 If the value of *pid* causes *signo* to be generated for the sending process, and if *signo* is not blocked  
 42302 for the calling thread and if no other thread has *signo* unblocked or is waiting in a *sigwait()*  
 42303 function for *signo*, either *signo* or at least the pending, unblocked signal shall be delivered to the  
 42304 calling thread before the *sigqueue()* function returns. Should any multiple pending signals in the  
 42305 range SIGRTMIN to SIGRTMAX be selected for delivery, it shall be the lowest numbered one.  
 42306 The selection order between realtime and non-realtime signals, or between multiple pending  
 42307 non-realtime signals, is unspecified.

## 42308 RETURN VALUE

42309 Upon successful completion, the specified signal shall have been queued, and the *sigqueue()*  
 42310 function shall return a value of zero. Otherwise, the function shall return a value of -1 and set  
 42311 *errno* to indicate the error.

## 42312 ERRORS

42313 The *sigqueue()* function shall fail if:

42314 [EAGAIN] No resources are available to queue the signal. The process has already  
 42315 queued {SIGQUEUE\_MAX} signals that are still pending at the receiver(s), or  
 42316 a system-wide resource limit has been exceeded.

42317 [EINVAL] The value of the *signo* argument is an invalid or unsupported signal number.

42318 [EPERM] The process does not have the appropriate privilege to send the signal to the  
 42319 receiving process.

42320 [ESRCH] The process *pid* does not exist.

42321 **EXAMPLES**

42322 None.

42323 **APPLICATION USAGE**

42324 None.

42325 **RATIONALE**

42326 The *sigqueue()* function allows an application to queue a realtime signal to itself or to another  
42327 process, specifying the application-defined value. This is common practice in realtime  
42328 applications on existing realtime systems. It was felt that specifying another function in the  
42329 *sig...* name space already carved out for signals was preferable to extending the interface to  
42330 *kill()*.

42331 Such a function became necessary when the put/get event function of the message queues was  
42332 removed. It should be noted that the *sigqueue()* function implies reduced performance in a  
42333 security-conscious implementation as the access permissions between the sender and receiver  
42334 have to be checked on each send when the *pid* is resolved into a target process. Such access  
42335 checks were necessary only at message queue open in the previous interface.

42336 The standard developers required that *sigqueue()* have the same semantics with respect to the  
42337 null signal as *kill()*, and that the same permission checking be used. But because of the difficulty  
42338 of implementing the “broadcast” semantic of *kill()* (for example, to process groups) and the  
42339 interaction with resource allocation, this semantic was not adopted. The *sigqueue()* function  
42340 queues a signal to a single process specified by the *pid* argument.

42341 The *sigqueue()* function can fail if the system has insufficient resources to queue the signal. An  
42342 explicit limit on the number of queued signals that a process could send was introduced. While  
42343 the limit is “per-sender”, this volume of IEEE Std 1003.1-2001 does not specify that the resources  
42344 be part of the state of the sender. This would require either that the sender be maintained after  
42345 exit until all signals that it had sent to other processes were handled or that all such signals that  
42346 had not yet been acted upon be removed from the queue(s) of the receivers. This volume of  
42347 IEEE Std 1003.1-2001 does not preclude this behavior, but an implementation that allocated  
42348 queuing resources from a system-wide pool (with per-sender limits) and that leaves queued  
42349 signals pending after the sender exits is also permitted.

42350 **FUTURE DIRECTIONS**

42351 None.

42352 **SEE ALSO**

42353 Section 2.8.1 (on page 41), the Base Definitions volume of IEEE Std 1003.1-2001, &lt;signal.h&gt;

42354 **CHANGE HISTORY**

42355 First released in Issue 5. Included for alignment with the POSIX Realtime Extension and the  
42356 POSIX Threads Extension.

42357 **Issue 6**42358 The *sigqueue()* function is marked as part of the Realtime Signals Extension option.

42359 The [ENOSYS] error condition has been removed as stubs need not be provided if an  
42360 implementation does not support the Realtime Signals Extension option.

42361 **NAME**

42362 sigrelse, sigset — signal management

42363 **SYNOPSIS**

42364 XSI #include &lt;signal.h&gt;

42365 int sigrelse(int *sig*);42366 void (\*sigset(int *sig*, void (\**disp*)(int)))(int);

42367

42368 **DESCRIPTION**42369 Refer to *sighold*().

## 42370 NAME

42371 sigsetjmp — set jump point for a non-local goto

## 42372 SYNOPSIS

42373 cx `#include <setjmp.h>`42374 `int sigsetjmp(sigjmp_buf env, int savemask);`

42375

## 42376 DESCRIPTION

42377 The *sigsetjmp()* function shall be equivalent to the *setjmp()* function, except as follows:

- 42378 • References to *setjmp()* are equivalent to *sigsetjmp()*.
- 42379 • References to *longjmp()* are equivalent to *siglongjmp()*.
- 42380 • If the value of the *savemask* argument is not 0, *sigsetjmp()* shall also save the current signal mask of the calling thread as part of the calling environment.

## 42382 RETURN VALUE

42383 If the return is from a successful direct invocation, *sigsetjmp()* shall return 0. If the return is from  
 42384 a call to *siglongjmp()*, *sigsetjmp()* shall return a non-zero value.

## 42385 ERRORS

42386 No errors are defined.

## 42387 EXAMPLES

42388 None.

## 42389 APPLICATION USAGE

42390 The distinction between *setjmp()/longjmp()* and *sigsetjmp()/siglongjmp()* is only significant for  
 42391 programs which use *sigaction()*, *sigprocmask()*, or *sigsuspend()*.

42392 Note that since this function is defined in terms of *setjmp()*, if *savemask* is zero, it is unspecified  
 42393 whether the signal mask is saved.

## 42394 RATIONALE

42395 The ISO C standard specifies various restrictions on the usage of the *setjmp()* macro in order to  
 42396 permit implementors to recognize the name in the compiler and not implement an actual  
 42397 function. These same restrictions apply to the *sigsetjmp()* macro.

42398 There are processors that cannot easily support these calls, but this was not considered a  
 42399 sufficient reason to exclude them.

42400 4.2 BSD, 4.3 BSD, and XSI-conformant systems provide functions named *\_setjmp()* and  
 42401 *\_longjmp()* that, together with *setjmp()* and *longjmp()*, provide the same functionality as  
 42402 *sigsetjmp()* and *siglongjmp()*. On those systems, *setjmp()* and *longjmp()* save and restore signal  
 42403 masks, while *\_setjmp()* and *\_longjmp()* do not. On System V Release 3 and in corresponding  
 42404 issues of the SVID, *setjmp()* and *longjmp()* are explicitly defined not to save and restore signal  
 42405 masks. In order to permit existing practice in both cases, the relation of *setjmp()* and *longjmp()* to  
 42406 signal masks is not specified, and a new set of functions is defined instead.

42407 The *longjmp()* and *siglongjmp()* functions operate as in the previous issue provided the matching  
 42408 *setjmp()* or *sigsetjmp()* has been performed in the same thread. Non-local jumps into contexts  
 42409 saved by other threads would be at best a questionable practice and were not considered worthy  
 42410 of standardization.

42411 **FUTURE DIRECTIONS**

42412 None.

42413 **SEE ALSO**42414 *siglongjmp()*, *signal()*, *sigprocmask()*, *sigsuspend()*, the Base Definitions volume of  
42415 IEEE Std 1003.1-2001, <**setjmp.h**>42416 **CHANGE HISTORY**

42417 First released in Issue 3. Included for alignment with the POSIX.1-1988 standard.

42418 **Issue 5**

42419 The DESCRIPTION is updated for alignment with the POSIX Threads Extension.

42420 **Issue 6**42421 The DESCRIPTION is reworded in terms of *setjmp()*.42422 The SYNOPSIS is marked CX since the presence of this function in the <**setjmp.h**> header is an  
42423 extension over the ISO C standard.

42424 **NAME**

42425 sigsuspend — wait for a signal

42426 **SYNOPSIS**42427 cx `#include <signal.h>`42428 `int sigsuspend(const sigset_t *sigmask);`

42429

42430 **DESCRIPTION**

42431 The *sigsuspend()* function shall replace the current signal mask of the calling thread with the set  
42432 of signals pointed to by *sigmask* and then suspend the thread until delivery of a signal whose  
42433 action is either to execute a signal-catching function or to terminate the process. This shall not  
42434 cause any other signals that may have been pending on the process to become pending on the  
42435 thread.

42436 If the action is to terminate the process then *sigsuspend()* shall never return. If the action is to  
42437 execute a signal-catching function, then *sigsuspend()* shall return after the signal-catching  
42438 function returns, with the signal mask restored to the set that existed prior to the *sigsuspend()*  
42439 call.

42440 It is not possible to block signals that cannot be ignored. This is enforced by the system without  
42441 causing an error to be indicated.

42442 **RETURN VALUE**

42443 Since *sigsuspend()* suspends thread execution indefinitely, there is no successful completion  
42444 return value. If a return occurs, `-1` shall be returned and *errno* set to indicate the error.

42445 **ERRORS**42446 The *sigsuspend()* function shall fail if:

42447 [EINTR] A signal is caught by the calling process and control is returned from the  
42448 signal-catching function.

42449 **EXAMPLES**

42450 None.

42451 **APPLICATION USAGE**

42452 Normally, at the beginning of a critical code section, a specified set of signals is blocked using  
42453 the *sigprocmask()* function. When the thread has completed the critical section and needs to wait  
42454 for the previously blocked signal(s), it pauses by calling *sigsuspend()* with the mask that was  
42455 returned by the *sigprocmask()* call.

42456 **RATIONALE**

42457 None.

42458 **FUTURE DIRECTIONS**

42459 None.

42460 **SEE ALSO**

42461 Section 2.4 (on page 28), *pause()*, *sigaction()*, *sigaddset()*, *sigdelset()*, *sigemptyset()*, *sigfillset()*, the  
42462 Base Definitions volume of IEEE Std 1003.1-2001, `<signal.h>`

42463 **CHANGE HISTORY**

42464 First released in Issue 3. Included for alignment with the POSIX.1-1988 standard.

42465 **Issue 5**

42466 The DESCRIPTION is updated for alignment with the POSIX Threads Extension.

42467 **Issue 6**

42468 The text in the RETURN VALUE section has been changed from “suspends process execution”  
42469 to “suspends thread execution”. This reflects IEEE PASC Interpretation 1003.1c #40.

42470 Text in the APPLICATION USAGE section has been replaced.

42471 The SYNOPSIS is marked CX since the presence of this function in the <signal.h> header is an  
42472 extension over the ISO C standard.

## 42473 NAME

42474 sigtimedwait, sigwaitinfo — wait for queued signals (**REALTIME**)

## 42475 SYNOPSIS

```
42476 RTS    #include <signal.h>
42477
42477     int sigtimedwait(const sigset_t *restrict set,
42478                   siginfo_t *restrict info,
42479                   const struct timespec *restrict timeout);
42480     int sigwaitinfo(const sigset_t *restrict set,
42481                   siginfo_t *restrict info);
42482
```

## 42483 DESCRIPTION

42484 The *sigtimedwait()* function shall be equivalent to *sigwaitinfo()* except that if none of the signals  
 42485 specified by *set* are pending, *sigtimedwait()* shall wait for the time interval specified in the  
 42486 **timespec** structure referenced by *timeout*. If the **timespec** structure pointed to by *timeout* is  
 42487 zero-valued and if none of the signals specified by *set* are pending, then *sigtimedwait()* shall  
 42488 MON return immediately with an error. If *timeout* is the NULL pointer, the behavior is unspecified. If  
 42489 the Monotonic Clock option is supported, the CLOCK\_MONOTONIC clock shall be used to  
 42490 measure the time interval specified by the *timeout* argument.

42491 The *sigwaitinfo()* function selects the pending signal from the set specified by *set*. Should any of  
 42492 multiple pending signals in the range SIGRTMIN to SIGRTMAX be selected, it shall be the  
 42493 lowest numbered one. The selection order between realtime and non-realtime signals, or  
 42494 between multiple pending non-realtime signals, is unspecified. If no signal in *set* is pending at  
 42495 the time of the call, the calling thread shall be suspended until one or more signals in *set* become  
 42496 pending or until it is interrupted by an unblocked, caught signal.

42497 The *sigwaitinfo()* function shall be equivalent to the *sigwait()* function if the *info* argument is  
 42498 NULL. If the *info* argument is non-NULL, the *sigwaitinfo()* function shall be equivalent to  
 42499 *sigwait()*, except that the selected signal number shall be stored in the *si\_signo* member, and the  
 42500 cause of the signal shall be stored in the *si\_code* member. If any value is queued to the selected  
 42501 signal, the first such queued value shall be dequeued and, if the *info* argument is non-NULL, the  
 42502 value shall be stored in the *si\_value* member of *info*. The system resource used to queue the  
 42503 signal shall be released and returned to the system for other use. If no value is queued, the  
 42504 content of the *si\_value* member is undefined. If no further signals are queued for the selected  
 42505 signal, the pending indication for that signal shall be reset.

## 42506 RETURN VALUE

42507 Upon successful completion (that is, one of the signals specified by *set* is pending or is  
 42508 generated) *sigwaitinfo()* and *sigtimedwait()* shall return the selected signal number. Otherwise,  
 42509 the function shall return a value of -1 and set *errno* to indicate the error.

## 42510 ERRORS

42511 The *sigtimedwait()* function shall fail if:

42512 [EAGAIN] No signal specified by *set* was generated within the specified timeout period.

42513 The *sigtimedwait()* and *sigwaitinfo()* functions may fail if:

42514 [EINTR] The wait was interrupted by an unblocked, caught signal. It shall be  
 42515 documented in system documentation whether this error causes these  
 42516 functions to fail.

42517 The *sigtimedwait()* function may also fail if:

- 42518 [EINVAL] The *timeout* argument specified a *tv\_nsec* value less than zero or greater than  
42519 or equal to 1 000 million.
- 42520 An implementation only checks for this error if no signal is pending in *set* and it is necessary to  
42521 wait.
- 42522 **EXAMPLES**
- 42523 None.
- 42524 **APPLICATION USAGE**
- 42525 The *sigtimedwait()* function times out and returns an [EAGAIN] error. Application writers  
42526 should note that this is inconsistent with other functions such as *pthread\_cond\_timedwait()* that  
42527 return [ETIMEDOUT].
- 42528 **RATIONALE**
- 42529 Existing programming practice on realtime systems uses the ability to pause waiting for a  
42530 selected set of events and handle the first event that occurs in-line instead of in a signal-handling  
42531 function. This allows applications to be written in an event-directed style similar to a state  
42532 machine. This style of programming is useful for largescale transaction processing in which the  
42533 overall throughput of an application and the ability to clearly track states are more important  
42534 than the ability to minimize the response time of individual event handling.
- 42535 It is possible to construct a signal-waiting macro function out of the realtime signal function  
42536 mechanism defined in this volume of IEEE Std 1003.1-2001. However, such a macro has to  
42537 include the definition of a generalized handler for all signals to be waited on. A significant  
42538 portion of the overhead of handler processing can be avoided if the signal-waiting function is  
42539 provided by the kernel. This volume of IEEE Std 1003.1-2001 therefore provides two signal-  
42540 waiting functions—one that waits indefinitely and one with a timeout—as part of the overall  
42541 realtime signal function specification.
- 42542 The specification of a function with a timeout allows an application to be written that can be  
42543 broken out of a wait after a set period of time if no event has occurred. It was argued that setting  
42544 a timer event before the wait and recognizing the timer event in the wait would also implement  
42545 the same functionality, but at a lower performance level. Because of the performance  
42546 degradation associated with the user-level specification of a timer event and the subsequent  
42547 cancelation of that timer event after the wait completes for a valid event, and the complexity  
42548 associated with handling potential race conditions associated with the user-level method, the  
42549 separate function has been included.
- 42550 Note that the semantics of the *sigwaitinfo()* function are nearly identical to that of the *sigwait()*  
42551 function defined by this volume of IEEE Std 1003.1-2001. The only difference is that *sigwaitinfo()*  
42552 returns the queued signal value in the *value* argument. The return of the queued value is  
42553 required so that applications can differentiate between multiple events queued to the same  
42554 signal number.
- 42555 The two distinct functions are being maintained because some implementations may choose to  
42556 implement the POSIX Threads Extension functions and not implement the queued signals  
42557 extensions. Note, though, that *sigwaitinfo()* does not return the queued value if the *value*  
42558 argument is NULL, so the POSIX Threads Extension *sigwait()* function can be implemented as a  
42559 macro on *sigwaitinfo()*.
- 42560 The *sigtimedwait()* function was separated from the *sigwaitinfo()* function to address concerns  
42561 regarding the overloading of the *timeout* pointer to indicate indefinite wait (no timeout), timed  
42562 wait, and immediate return, and concerns regarding consistency with other functions where the  
42563 conditional and timed waits were separate functions from the pure blocking function. The  
42564 semantics of *sigtimedwait()* are specified such that *sigwaitinfo()* could be implemented as a  
42565 macro with a NULL pointer for *timeout*.

42566 The *sigwait* functions provide a synchronous mechanism for threads to wait for  
 42567 asynchronously-generated signals. One important question was how many threads that are  
 42568 suspended in a call to a *sigwait()* function for a signal should return from the call when the  
 42569 signal is sent. Four choices were considered:

- 42570 1. Return an error for multiple simultaneous calls to *sigwait* functions for the same signal.
- 42571 2. One or more threads return.
- 42572 3. All waiting threads return.
- 42573 4. Exactly one thread returns.

42574 Prohibiting multiple calls to *sigwait()* for the same signal was felt to be overly restrictive. The  
 42575 “one or more” behavior made implementation of conforming packages easy at the expense of  
 42576 forcing POSIX threads clients to protect against multiple simultaneous calls to *sigwait()* in  
 42577 application code in order to achieve predictable behavior. There was concern that the “all  
 42578 waiting threads” behavior would result in “signal broadcast storms”, consuming excessive CPU  
 42579 resources by replicating the signals in the general case. Furthermore, no convincing examples  
 42580 could be presented that delivery to all was either simpler or more powerful than delivery to one.

42581 Thus, the consensus was that exactly one thread that was suspended in a call to a *sigwait*  
 42582 function for a signal should return when that signal occurs. This is not an onerous restriction as:

- 42583 • A multi-way signal wait can be built from the single-way wait.
- 42584 • Signals should only be handled by application-level code, as library routines cannot guess  
 42585 what the application wants to do with signals generated for the entire process.
- 42586 • Applications can thus arrange for a single thread to wait for any given signal and call any  
 42587 needed routines upon its arrival.

42588 In an application that is using signals for interprocess communication, signal processing is  
 42589 typically done in one place. Alternatively, if the signal is being caught so that process cleanup  
 42590 can be done, the signal handler thread can call separate process cleanup routines for each  
 42591 portion of the application. Since the application main line started each portion of the application,  
 42592 it is at the right abstraction level to tell each portion of the application to clean up.

42593 Certainly, there exist programming styles where it is logical to consider waiting for a single  
 42594 signal in multiple threads. A simple *sigwait\_multiple()* routine can be constructed to achieve this  
 42595 goal. A possible implementation would be to have each *sigwait\_multiple()* caller registered as  
 42596 having expressed interest in a set of signals. The caller then waits on a thread-specific condition  
 42597 variable. A single server thread calls a *sigwait()* function on the union of all registered signals.  
 42598 When the *sigwait()* function returns, the appropriate state is set and condition variables are  
 42599 broadcast. New *sigwait\_multiple()* callers may cause the pending *sigwait()* call to be canceled  
 42600 and reissued in order to update the set of signals being waited for.

#### 42601 FUTURE DIRECTIONS

42602 None.

#### 42606 CHANGE HISTORY

42607 First released in Issue 5. Included for alignment with the POSIX Realtime Extension and the  
 42608 POSIX Threads Extension.

42609 **Issue 6**

- 42610 These functions are marked as part of the Realtime Signals Extension option.
- 42611 The Open Group Corrigendum U035/3 is applied. The SYNOPSIS of the *sigwaitinfo()* function  
42612 has been corrected so that the second argument is of type **siginfo\_t\***.
- 42613 The [ENOSYS] error condition has been removed as stubs need not be provided if an  
42614 implementation does not support the Realtime Signals Extension option.
- 42615 The DESCRIPTION is updated for alignment with IEEE Std 1003.1j-2000 by specifying that the  
42616 CLOCK\_MONOTONIC clock, if supported, is used to measure timeout intervals.
- 42617 The **restrict** keyword is added to the *sigtimedwait()* and *sigwaitinfo()* prototypes for alignment  
42618 with the ISO/IEC 9899:1999 standard.

42619 **NAME**

42620 sigwait — wait for queued signals

42621 **SYNOPSIS**42622 `CX` #include <signal.h>

42623 int sigwait(const sigset\_t \*restrict set, int \*restrict sig);

42624

42625 **DESCRIPTION**

42626 The *sigwait()* function shall select a pending signal from *set*, atomically clear it from the system's  
 42627 set of pending signals, and return that signal number in the location referenced by *sig*. If prior to  
 42628 the call to *sigwait()* there are multiple pending instances of a single signal number, it is  
 42629 implementation-defined whether upon successful return there are any remaining pending  
 42630 signals for that signal number. If the implementation supports queued signals and there are  
 42631 multiple signals queued for the signal number selected, the first such queued signal shall cause a  
 42632 return from *sigwait()* and the remainder shall remain queued. If no signal in *set* is pending at the  
 42633 time of the call, the thread shall be suspended until one or more becomes pending. The signals  
 42634 defined by *set* shall have been blocked at the time of the call to *sigwait()*; otherwise, the behavior  
 42635 is undefined. The effect of *sigwait()* on the signal actions for the signals in *set* is unspecified.

42636 If more than one thread is using *sigwait()* to wait for the same signal, no more than one of these  
 42637 threads shall return from *sigwait()* with the signal number. Which thread returns from *sigwait()*  
 42638 if more than a single thread is waiting is unspecified.

42639 `RTS` Should any of the multiple pending signals in the range SIGRTMIN to SIGRTMAX be selected, it  
 42640 shall be the lowest numbered one. The selection order between realtime and non-realtime  
 42641 signals, or between multiple pending non-realtime signals, is unspecified.

42642 **RETURN VALUE**

42643 Upon successful completion, *sigwait()* shall store the signal number of the received signal at the  
 42644 location referenced by *sig* and return zero. Otherwise, an error number shall be returned to  
 42645 indicate the error.

42646 **ERRORS**42647 The *sigwait()* function may fail if:42648 [EINVAL] The *set* argument contains an invalid or unsupported signal number.42649 **EXAMPLES**

42650 None.

42651 **APPLICATION USAGE**

42652 None.

42653 **RATIONALE**

42654 To provide a convenient way for a thread to wait for a signal, this volume of  
 42655 IEEE Std 1003.1-2001 provides the *sigwait()* function. For most cases where a thread has to wait  
 42656 for a signal, the *sigwait()* function should be quite convenient, efficient, and adequate.

42657 However, requests were made for a lower-level primitive than *sigwait()* and for semaphores that  
 42658 could be used by threads. After some consideration, threads were allowed to use semaphores  
 42659 and *sem\_post()* was defined to be async-signal and async-cancel-safe.

42660 In summary, when it is necessary for code run in response to an asynchronous signal to notify a  
 42661 thread, *sigwait()* should be used to handle the signal. Alternatively, if the implementation  
 42662 provides semaphores, they also can be used, either following *sigwait()* or from within a signal  
 42663 handling routine previously registered with *sigaction()*.

42664 **FUTURE DIRECTIONS**

42665 None.

42666 **SEE ALSO**

42669 **<signal.h>**, **<time.h>**

42670 **CHANGE HISTORY**

42671 First released in Issue 5. Included for alignment with the POSIX Realtime Extension and the  
42672 POSIX Threads Extension.

42673 **Issue 6**

42674 The **restrict** keyword is added to the *sigwait()* prototype for alignment with the  
42675 ISO/IEC 9899:1999 standard.

42676 **NAME**

42677 sigwaitinfo — wait for queued signals (**REALTIME**)

42678 **SYNOPSIS**

42679 RTS `#include <signal.h>`

42680 `int sigwaitinfo(const sigset_t *restrict set, siginfo_t *restrict info);`

42681

42682 **DESCRIPTION**

42683 Refer to *sigtimedwait()*.

42684 **NAME**

42685 sin, sinf, sinl — sine function

42686 **SYNOPSIS**

42687 #include &lt;math.h&gt;

42688 double sin(double x);

42689 float sinf(float x);

42690 long double sinl(long double x);

42691 **DESCRIPTION**

42692 **CX** The functionality described on this reference page is aligned with the ISO C standard. Any  
 42693 conflict between the requirements described here and the ISO C standard is unintentional. This  
 42694 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

42695 These functions shall compute the sine of their argument *x*, measured in radians.

42696 An application wishing to check for error situations should set *errno* to zero and call  
 42697 *feclearexcept*(FE\_ALL\_EXCEPT) before calling these functions. On return, if *errno* is non-zero or  
 42698 *fetestexcept*(FE\_INVALID | FE\_DIVBYZERO | FE\_OVERFLOW | FE\_UNDERFLOW) is non-  
 42699 zero, an error has occurred.

42700 **RETURN VALUE**42701 Upon successful completion, these functions shall return the sine of *x*.42702 **MX** If *x* is NaN, a NaN shall be returned.42703 If *x* is  $\pm 0$ , *x* shall be returned.42704 If *x* is subnormal, a range error may occur and *x* should be returned.

42705 If *x* is  $\pm\text{Inf}$ , a domain error shall occur, and either a NaN (if supported), or an implementation-  
 42706 defined value shall be returned.

42707 **ERRORS**

42708 These functions shall fail if:

42709 **MX** **Domain Error** The *x* argument is  $\pm\text{Inf}$ .

42710 If the integer expression (math\_errhandling & MATH\_ERRNO) is non-zero,  
 42711 then *errno* shall be set to [EDOM]. If the integer expression (math\_errhandling  
 42712 & MATH\_ERREXCEPT) is non-zero, then the invalid floating-point exception  
 42713 shall be raised.

42714 These functions may fail if:

42715 **MX** **Range Error** The value of *x* is subnormal

42716 If the integer expression (math\_errhandling & MATH\_ERRNO) is non-zero,  
 42717 then *errno* shall be set to [ERANGE]. If the integer expression  
 42718 (math\_errhandling & MATH\_ERREXCEPT) is non-zero, then the underflow  
 42719 floating-point exception shall be raised.

42720 **EXAMPLES**42721 **Taking the Sine of a 45-Degree Angle**

```
42722 #include <math.h>
42723 ...
42724 double radians = 45.0 * M_PI / 180;
42725 double result;
42726 ...
42727 result = sin(radians);
```

42728 **APPLICATION USAGE**

42729 These functions may lose accuracy when their argument is near a multiple of  $\pi$  or is far from 0.0.

42730 On error, the expressions (`math_errhandling & MATH_ERRNO`) and (`math_errhandling &`  
42731 `MATH_ERREXCEPT`) are independent of each other, but at least one of them must be non-zero.

42732 **RATIONALE**

42733 None.

42734 **FUTURE DIRECTIONS**

42735 None.

42736 **SEE ALSO**

42739 **CHANGE HISTORY**

42740 First released in Issue 1. Derived from Issue 1 of the SVID.

42741 **Issue 5**

42742 The last two paragraphs of the DESCRIPTION were included as APPLICATION USAGE notes  
42743 in previous issues.

42744 **Issue 6**

42745 The *sinf()* and *sinl()* functions are added for alignment with the ISO/IEC 9899:1999 standard.

42746 The DESCRIPTION, RETURN VALUE, ERRORS, and APPLICATION USAGE sections are  
42747 revised to align with the ISO/IEC 9899:1999 standard.

42748 IEC 60559:1989 standard floating-point extensions over the ISO/IEC 9899:1999 standard are  
42749 marked.

42750 **NAME**

42751           sinh, sinhf, sinhl — hyperbolic sine functions

42752 **SYNOPSIS**

42753           #include &lt;math.h&gt;

42754           double sinh(double x);

42755           float sinhf(float x);

42756           long double sinhl(long double x);

42757 **DESCRIPTION**

42758 **CX**       The functionality described on this reference page is aligned with the ISO C standard. Any  
 42759 conflict between the requirements described here and the ISO C standard is unintentional. This  
 42760 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

42761       These functions shall compute the hyperbolic sine of their argument *x*.

42762       An application wishing to check for error situations should set *errno* to zero and call  
 42763 *feclearexcept*(FE\_ALL\_EXCEPT) before calling these functions. On return, if *errno* is non-zero or  
 42764 *fetestexcept*(FE\_INVALID | FE\_DIVBYZERO | FE\_OVERFLOW | FE\_UNDERFLOW) is non-  
 42765 zero, an error has occurred.

42766 **RETURN VALUE**42767       Upon successful completion, these functions shall return the hyperbolic sine of *x*.

42768       If the result would cause an overflow, a range error shall occur and  $\pm$ HUGE\_VAL,  
 42769  $\pm$ HUGE\_VALF, and  $\pm$ HUGE\_VALL (with the same sign as *x*) shall be returned as appropriate for  
 42770 the type of the function.

42771 **MX**       If *x* is NaN, a NaN shall be returned.42772       If *x* is  $\pm 0$  or  $\pm$ Inf, *x* shall be returned.42773       If *x* is subnormal, a range error may occur and *x* should be returned.42774 **ERRORS**

42775       These functions shall fail if:

42776       Range Error       The result would cause an overflow.

42777               If the integer expression (math\_errhandling & MATH\_ERRNO) is non-zero,  
 42778 then *errno* shall be set to [ERANGE]. If the integer expression  
 42779 (math\_errhandling & MATH\_ERREXCEPT) is non-zero, then the overflow  
 42780 floating-point exception shall be raised.

42781       These functions may fail if:

42782 **MX**       Range Error       The value *x* is subnormal.

42783               If the integer expression (math\_errhandling & MATH\_ERRNO) is non-zero,  
 42784 then *errno* shall be set to [ERANGE]. If the integer expression  
 42785 (math\_errhandling & MATH\_ERREXCEPT) is non-zero, then the underflow  
 42786 floating-point exception shall be raised.

42787 **EXAMPLES**

42788 None.

42789 **APPLICATION USAGE**

42790 On error, the expressions (math\_errhandling & MATH\_ERRNO) and (math\_errhandling &  
42791 MATH\_ERREXCEPT) are independent of each other, but at least one of them must be non-zero.

42792 **RATIONALE**

42793 None.

42794 **FUTURE DIRECTIONS**

42795 None.

42800 **CHANGE HISTORY**

42801 First released in Issue 1. Derived from Issue 1 of the SVID.

42802 **Issue 5**

42803 The DESCRIPTION is updated to indicate how an application should check for an error. This  
42804 text was previously published in the APPLICATION USAGE section.

42805 **Issue 6**42806 The *sinhf()* and *sinhl()* functions are added for alignment with the ISO/IEC 9899:1999 standard.

42807 The DESCRIPTION, RETURN VALUE, ERRORS, and APPLICATION USAGE sections are  
42808 revised to align with the ISO/IEC 9899:1999 standard.

42809 IEC 60559:1989 standard floating-point extensions over the ISO/IEC 9899:1999 standard are  
42810 marked.

42811 **NAME**

42812       sinl — sine function

42813 **SYNOPSIS**

42814       #include &lt;math.h&gt;

42815       long double sinl(long double x);

42816 **DESCRIPTION**42817       Refer to *sin()*.

42818 **NAME**

42819 sleep — suspend execution for an interval of time

42820 **SYNOPSIS**

42821 #include &lt;unistd.h&gt;

42822 unsigned sleep(unsigned *seconds*);42823 **DESCRIPTION**

42824 The *sleep()* function shall cause the calling thread to be suspended from execution until either  
42825 the number of realtime seconds specified by the argument *seconds* has elapsed or a signal is  
42826 delivered to the calling thread and its action is to invoke a signal-catching function or to  
42827 terminate the process. The suspension time may be longer than requested due to the scheduling  
42828 of other activity by the system.

42829 If a SIGALRM signal is generated for the calling process during execution of *sleep()* and if the  
42830 SIGALRM signal is being ignored or blocked from delivery, it is unspecified whether *sleep()*  
42831 returns when the SIGALRM signal is scheduled. If the signal is being blocked, it is also  
42832 unspecified whether it remains pending after *sleep()* returns or it is discarded.

42833 If a SIGALRM signal is generated for the calling process during execution of *sleep()*, except as a  
42834 result of a prior call to *alarm()*, and if the SIGALRM signal is not being ignored or blocked from  
42835 delivery, it is unspecified whether that signal has any effect other than causing *sleep()* to return.

42836 If a signal-catching function interrupts *sleep()* and examines or changes either the time a  
42837 SIGALRM is scheduled to be generated, the action associated with the SIGALRM signal, or  
42838 whether the SIGALRM signal is blocked from delivery, the results are unspecified.

42839 If a signal-catching function interrupts *sleep()* and calls *siglongjmp()* or *longjmp()* to restore an  
42840 environment saved prior to the *sleep()* call, the action associated with the SIGALRM signal and  
42841 the time at which a SIGALRM signal is scheduled to be generated are unspecified. It is also  
42842 unspecified whether the SIGALRM signal is blocked, unless the process' signal mask is restored  
42843 as part of the environment.

42844 XSI Interactions between *sleep()* and any of *setitimer()*, *ualarm()*, or *usleep()* are unspecified.42845 **RETURN VALUE**

42846 If *sleep()* returns because the requested time has elapsed, the value returned shall be 0. If *sleep()*  
42847 returns due to delivery of a signal, the return value shall be the “unslept” amount (the requested  
42848 time minus the time actually slept) in seconds.

42849 **ERRORS**

42850 No errors are defined.

42851 **EXAMPLES**

42852 None.

42853 **APPLICATION USAGE**

42854 None.

42855 **RATIONALE**

42856 There are two general approaches to the implementation of the *sleep()* function. One is to use the  
42857 *alarm()* function to schedule a SIGALRM signal and then suspend the process waiting for that  
42858 signal. The other is to implement an independent facility. This volume of IEEE Std 1003.1-2001  
42859 permits either approach.

42860 In order to comply with the requirement that no primitive shall change a process attribute unless  
42861 explicitly described by this volume of IEEE Std 1003.1-2001, an implementation using SIGALRM  
42862 must carefully take into account any SIGALRM signal scheduled by previous *alarm()* calls, the

42863 action previously established for SIGALRM, and whether SIGALRM was blocked. If a SIGALRM  
 42864 has been scheduled before the *sleep()* would ordinarily complete, the *sleep()* must be shortened  
 42865 to that time and a SIGALRM generated (possibly simulated by direct invocation of the signal-  
 42866 catching function) before *sleep()* returns. If a SIGALRM has been scheduled after the *sleep()*  
 42867 would ordinarily complete, it must be rescheduled for the same time before *sleep()* returns. The  
 42868 action and blocking for SIGALRM must be saved and restored.

42869 Historical implementations often implement the SIGALRM-based version using *alarm()* and  
 42870 *pause()*. One such implementation is prone to infinite hangups, as described in *pause()*. Another  
 42871 such implementation uses the C-language *setjmp()* and *longjmp()* functions to avoid that  
 42872 window. That implementation introduces a different problem: when the SIGALRM signal  
 42873 interrupts a signal-catching function installed by the user to catch a different signal, the  
 42874 *longjmp()* aborts that signal-catching function. An implementation based on *sigprocmask()*,  
 42875 *alarm()*, and *sigsuspend()* can avoid these problems.

42876 Despite all reasonable care, there are several very subtle, but detectable and unavoidable,  
 42877 differences between the two types of implementations. These are the cases mentioned in this  
 42878 volume of IEEE Std 1003.1-2001 where some other activity relating to SIGALRM takes place, and  
 42879 the results are stated to be unspecified. All of these cases are sufficiently unusual as not to be of  
 42880 concern to most applications.

42881 See also the discussion of the term *realtime* in *alarm()*.

42882 Since *sleep()* can be implemented using *alarm()*, the discussion about alarms occurring early  
 42883 under *alarm()* applies to *sleep()* as well.

42884 Application writers should note that the type of the argument *seconds* and the return value of  
 42885 *sleep()* is **unsigned**. That means that a Strictly Conforming POSIX System Interfaces Application  
 42886 cannot pass a value greater than the minimum guaranteed value for {UINT\_MAX}, which the  
 42887 ISO C standard sets as 65 535, and any application passing a larger value is restricting its  
 42888 portability. A different type was considered, but historical implementations, including those  
 42889 with a 16-bit **int** type, consistently use either **unsigned** or **int**.

42890 Scheduling delays may cause the process to return from the *sleep()* function significantly after  
 42891 the requested time. In such cases, the return value should be set to zero, since the formula  
 42892 (requested time minus the time actually spent) yields a negative number and *sleep()* returns an  
 42893 **unsigned**.

#### 42894 FUTURE DIRECTIONS

42895 None.

#### 42899 CHANGE HISTORY

42900 First released in Issue 1. Derived from Issue 1 of the SVID.

#### 42901 Issue 5

42902 The DESCRIPTION is updated for alignment with the POSIX Threads Extension.

42903 **NAME**

42904        **snprintf** — print formatted output

42905 **SYNOPSIS**

42906        #include <stdio.h>

42907        int snprintf(char \*restrict *s*, size\_t *n*,

42908            const char \*restrict *format*, ...);

42909 **DESCRIPTION**

42910        Refer to *fprintf*().

42911 **NAME**

42912 socketmark — determine whether a socket is at the out-of-band mark

42913 **SYNOPSIS**

42914 #include &lt;sys/socket.h&gt;

42915 int socketmark(int s);

42916 **DESCRIPTION**

42917 The *socketmark()* function shall determine whether the socket specified by the descriptor *s* is at  
 42918 the out-of-band data mark (see the System Interfaces volume of IEEE Std 1003.1-2001, Section  
 42919 2.10.12, Socket Out-of-Band Data State). If the protocol for the socket supports out-of-band data  
 42920 by marking the stream with an out-of-band data mark, the *socketmark()* function shall return 1  
 42921 when all data preceding the mark has been read and the out-of-band data mark is the first  
 42922 element in the receive queue. The *socketmark()* function shall not remove the mark from the  
 42923 stream.

42924 **RETURN VALUE**

42925 Upon successful completion, the *socketmark()* function shall return a value indicating whether  
 42926 the socket is at an out-of-band data mark. If the protocol has marked the data stream and all data  
 42927 preceding the mark has been read, the return value shall be 1; if there is no mark, or if data  
 42928 precedes the mark in the receive queue, the *socketmark()* function shall return 0. Otherwise, it  
 42929 shall return a value of  $-1$  and set *errno* to indicate the error.

42930 **ERRORS**42931 The *socketmark()* function shall fail if:42932 [EBADF] The *s* argument is not a valid file descriptor.42933 [ENOTTY] The *s* argument does not specify a descriptor for a socket.42934 **EXAMPLES**

42935 None.

42936 **APPLICATION USAGE**

42937 The use of this function between receive operations allows an application to determine which  
 42938 received data precedes the out-of-band data and which follows the out-of-band data.

42939 There is an inherent race condition in the use of this function. On an empty receive queue, the  
 42940 current read of the location might well be at the “mark”, but the system has no way of knowing  
 42941 that the next data segment that will arrive from the network will carry the mark, and  
 42942 *socketmark()* will return false, and the next read operation will silently consume the mark.

42943 Hence, this function can only be used reliably when the application already knows that the out-  
 42944 of-band data has been seen by the system or that it is known that there is data waiting to be read  
 42945 at the socket (via SIGURG or *select()*). See Section 2.10.11 (on page 61), Section 2.10.12 (on page  
 42946 61), Section 2.10.14 (on page 62), and *pselect()* for details.

42947 **RATIONALE**

42948 The *socketmark()* function replaces the historical SIOCATMARK command to *ioctl()* which  
 42949 implemented the same functionality on many implementations. Using a wrapper function  
 42950 follows the adopted conventions to avoid specifying commands to the *ioctl()* function, other  
 42951 than those now included to support XSI STREAMS. The *socketmark()* function could be  
 42952 implemented as follows:

42953 #include &lt;sys/ioctl.h&gt;

42954 int socketmark(int s)

42955 {

```
42956         int val;
42957         if (ioctl(s,SIOCATMARK,&val)==-1)
42958             return(-1);
42959         return(val);
42960     }
```

42961 The use of [ENOTTY] to indicate an incorrect descriptor type matches the historical behavior of  
42962 SIOCATMARK.

42963 **FUTURE DIRECTIONS**

42964 None.

42965 **SEE ALSO**

42966 *pselect()*, *recv()*, *recvmsg()*, the Base Definitions volume of IEEE Std 1003.1-2001, <sys/socket.h>

42967 **CHANGE HISTORY**

42968 First released in Issue 6. Derived from IEEE Std 1003.1g-2000.

42969 **NAME**

42970 socket — create an endpoint for communication

42971 **SYNOPSIS**

42972 #include &lt;sys/socket.h&gt;

42973 int socket(int *domain*, int *type*, int *protocol*);42974 **DESCRIPTION**42975 The *socket()* function shall create an unbound socket in a communications domain, and return a  
42976 file descriptor that can be used in later function calls that operate on sockets.42977 The *socket()* function takes the following arguments:42978 *domain* Specifies the communications domain in which a socket is to be created.42979 *type* Specifies the type of socket to be created.42980 *protocol* Specifies a particular protocol to be used with the socket. Specifying a *protocol*  
42981 of 0 causes *socket()* to use an unspecified default protocol appropriate for the  
42982 requested socket type.42983 The *domain* argument specifies the address family used in the communications domain. The  
42984 address families supported by the system are implementation-defined.42985 Symbolic constants that can be used for the domain argument are defined in the <sys/socket.h>  
42986 header.42987 The *type* argument specifies the socket type, which determines the semantics of communication  
42988 over the socket. The following socket types are defined; implementations may specify additional  
42989 socket types:42990 SOCK\_STREAM Provides sequenced, reliable, bidirectional, connection-mode byte  
42991 streams, and may provide a transmission mechanism for out-of-band  
42992 data.42993 SOCK\_DGRAM Provides datagrams, which are connectionless-mode, unreliable messages  
42994 of fixed maximum length.42995 SOCK\_SEQPACKET Provides sequenced, reliable, bidirectional, connection-mode  
42996 transmission paths for records. A record can be sent using one or more  
42997 output operations and received using one or more input operations, but a  
42998 single operation never transfers part of more than one record. Record  
42999 boundaries are visible to the receiver via the MSG\_EOR flag.43000 If the *protocol* argument is non-zero, it shall specify a protocol that is supported by the address  
43001 family. If the *protocol* argument is zero, the default protocol for this address family and type shall  
43002 be used. The protocols supported by the system are implementation-defined.43003 The process may need to have appropriate privileges to use the *socket()* function or to create  
43004 some sockets.43005 **RETURN VALUE**43006 Upon successful completion, *socket()* shall return a non-negative integer, the socket file  
43007 descriptor. Otherwise, a value of -1 shall be returned and *errno* set to indicate the error.43008 **ERRORS**43009 The *socket()* function shall fail if:

43010 [EAFNOSUPPORT]

43011 The implementation does not support the specified address family.

- 43012 [EMFILE] No more file descriptors are available for this process.
- 43013 [ENFILE] No more file descriptors are available for the system.
- 43014 [EPROTONOSUPPORT]  
 43015 The protocol is not supported by the address family, or the protocol is not  
 43016 supported by the implementation.
- 43017 [EPROTOTYPE] The socket type is not supported by the protocol.
- 43018 The *socket()* function may fail if:
- 43019 [EACCES] The process does not have appropriate privileges.
- 43020 [ENOBUFS] Insufficient resources were available in the system to perform the operation.
- 43021 [ENOMEM] Insufficient memory was available to fulfill the request.
- 43022 **EXAMPLES**
- 43023 None.
- 43024 **APPLICATION USAGE**
- 43025 The documentation for specific address families specifies which protocols each address family  
 43026 supports. The documentation for specific protocols specifies which socket types each protocol  
 43027 supports.
- 43028 The application can determine whether an address family is supported by trying to create a  
 43029 socket with *domain* set to the protocol in question.
- 43030 **RATIONALE**
- 43031 None.
- 43032 **FUTURE DIRECTIONS**

43040 **NAME**

43041 socketpair — create a pair of connected sockets

43042 **SYNOPSIS**

43043 #include &lt;sys/socket.h&gt;

43044 int socketpair(int *domain*, int *type*, int *protocol*,  
43045 int *socket\_vector*[2]);43046 **DESCRIPTION**43047 The *socketpair()* function shall create an unbound pair of connected sockets in a specified *domain*,  
43048 of a specified *type*, under the protocol optionally specified by the *protocol* argument. The two  
43049 sockets shall be identical. The file descriptors used in referencing the created sockets shall be  
43050 returned in *socket\_vector*[0] and *socket\_vector*[1].43051 The *socketpair()* function takes the following arguments:

|       |                      |                                                                                                                                                                                                                               |
|-------|----------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 43052 | <i>domain</i>        | Specifies the communications domain in which the sockets are to be created.                                                                                                                                                   |
| 43053 | <i>type</i>          | Specifies the type of sockets to be created.                                                                                                                                                                                  |
| 43054 | <i>protocol</i>      | Specifies a particular protocol to be used with the sockets. Specifying a<br>43055 <i>protocol</i> of 0 causes <i>socketpair()</i> to use an unspecified default protocol<br>43056 appropriate for the requested socket type. |
| 43057 | <i>socket_vector</i> | Specifies a 2-integer array to hold the file descriptors of the created socket<br>43058 pair.                                                                                                                                 |

43059 The *type* argument specifies the socket type, which determines the semantics of communications  
43060 over the socket. The following socket types are defined; implementations may specify additional  
43061 socket types:

|       |                |                                                                                                                                                                                                                                                                                                                                                                                     |
|-------|----------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 43062 | SOCK_STREAM    | Provides sequenced, reliable, bidirectional, connection-mode byte<br>43063 streams, and may provide a transmission mechanism for out-of-band<br>43064 data.                                                                                                                                                                                                                         |
| 43065 | SOCK_DGRAM     | Provides datagrams, which are connectionless-mode, unreliable messages<br>43066 of fixed maximum length.                                                                                                                                                                                                                                                                            |
| 43067 | SOCK_SEQPACKET | Provides sequenced, reliable, bidirectional, connection-mode<br>43068 transmission paths for records. A record can be sent using one or more<br>43069 output operations and received using one or more input operations, but a<br>43070 single operation never transfers part of more than one record. Record<br>43071 boundaries are visible to the receiver via the MSG_EOR flag. |

43072 If the *protocol* argument is non-zero, it shall specify a protocol that is supported by the address  
43073 family. If the *protocol* argument is zero, the default protocol for this address family and type shall  
43074 be used. The protocols supported by the system are implementation-defined.43075 The process may need to have appropriate privileges to use the *socketpair()* function or to create  
43076 some sockets.43077 **RETURN VALUE**43078 Upon successful completion, this function shall return 0; otherwise,  $-1$  shall be returned and  
43079 *errno* set to indicate the error.43080 **ERRORS**43081 The *socketpair()* function shall fail if:

43082 [EAFNOSUPPORT]

43083 The implementation does not support the specified address family.

- 43084 [EMFILE] No more file descriptors are available for this process.
- 43085 [ENFILE] No more file descriptors are available for the system.
- 43086 [EOPNOTSUPP] The specified protocol does not permit creation of socket pairs.
- 43087 [EPROTONOSUPPORT]  
43088 The protocol is not supported by the address family, or the protocol is not  
43089 supported by the implementation.
- 43090 [EPROTOTYPE] The socket type is not supported by the protocol.
- 43091 The *socketpair()* function may fail if:
- 43092 [EACCES] The process does not have appropriate privileges.
- 43093 [ENOBUFS] Insufficient resources were available in the system to perform the operation.
- 43094 [ENOMEM] Insufficient memory was available to fulfill the request.
- 43095 **EXAMPLES**
- 43096 None.
- 43097 **APPLICATION USAGE**
- 43098 The documentation for specific address families specifies which protocols each address family  
43099 supports. The documentation for specific protocols specifies which socket types each protocol  
43100 supports.
- 43101 The *socketpair()* function is used primarily with UNIX domain sockets and need not be  
43102 supported for other domains.
- 43103 **RATIONALE**
- 43104 None.
- 43105 **FUTURE DIRECTIONS**
- 43106 None.
- 43107 **SEE ALSO**
- 43108 *socket()*, the Base Definitions volume of IEEE Std 1003.1-2001, <sys/socket.h>
- 43109 **CHANGE HISTORY**
- 43110 First released in Issue 6. Derived from the XNS, Issue 5.2 specification.

43111 **NAME**

43112            sprintf — print formatted output

43113 **SYNOPSIS**

43114            #include &lt;stdio.h&gt;

43115            int sprintf(char \*restrict *s*, const char \*restrict *format*, ...);43116 **DESCRIPTION**43117            Refer to *fprintf()*.

## 43118 NAME

43119 sqrt, sqrtf, sqrtl — square root function

## 43120 SYNOPSIS

43121 #include &lt;math.h&gt;

43122 double sqrt(double x);

43123 float sqrtf(float x);

43124 long double sqrtl(long double x);

## 43125 DESCRIPTION

43126 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
 43127 conflict between the requirements described here and the ISO C standard is unintentional. This  
 43128 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

43129 These functions shall compute the square root of their argument  $x$ ,  $\sqrt{x}$ .

43130 An application wishing to check for error situations should set *errno* to zero and call  
 43131 *feclearexcept*(FE\_ALL\_EXCEPT) before calling these functions. On return, if *errno* is non-zero or  
 43132 *fetestexcept*(FE\_INVALID | FE\_DIVBYZERO | FE\_OVERFLOW | FE\_UNDERFLOW) is non-  
 43133 zero, an error has occurred.

## 43134 RETURN VALUE

43135 Upon successful completion, these functions shall return the square root of  $x$ .

43136 MX For finite values of  $x < -0$ , a domain error shall occur, and either a NaN (if supported), or an  
 43137 implementation-defined value shall be returned.

43138 MX If  $x$  is NaN, a NaN shall be returned.

43139 If  $x$  is  $\pm 0$  or  $+\text{Inf}$ ,  $x$  shall be returned.

43140 If  $x$  is  $-\text{Inf}$ , a domain error shall occur, and either a NaN (if supported), or an implementation-  
 43141 defined value shall be returned.

## 43142 ERRORS

43143 These functions shall fail if:

43144 MX Domain Error The finite value of  $x$  is  $< -0$ , or  $x$  is  $-\text{Inf}$ .

43145 If the integer expression (math\_errhandling & MATH\_ERRNO) is non-zero,  
 43146 then *errno* shall be set to [EDOM]. If the integer expression (math\_errhandling  
 43147 & MATH\_ERREXCEPT) is non-zero, then the invalid floating-point exception  
 43148 shall be raised.

## 43149 EXAMPLES

## 43150 Taking the Square Root of 9.0

43151 #include &lt;math.h&gt;

43152 ...

43153 double x = 9.0;

43154 double result;

43155 ...

43156 result = sqrt(x);

43157 **APPLICATION USAGE**

43158           On error, the expressions (`math_errhandling & MATH_ERRNO`) and (`math_errhandling &`  
43159           `MATH_ERREXCEPT`) are independent of each other, but at least one of them must be non-zero.

43160 **RATIONALE**

43161           None.

43162 **FUTURE DIRECTIONS**

43163           None.

43164 **SEE ALSO**

43165           *feclearexcept()*, *fetestexcept()*, *isnan()*, the Base Definitions volume of IEEE Std 1003.1-2001,  
43166           Section 4.18, Treatment of Error Conditions for Mathematical Functions, `<math.h>`, `<stdio.h>`

43167 **CHANGE HISTORY**

43168           First released in Issue 1. Derived from Issue 1 of the SVID.

43169 **Issue 5**

43170           The DESCRIPTION is updated to indicate how an application should check for an error. This  
43171           text was previously published in the APPLICATION USAGE section.

43172 **Issue 6**

43173           The *sqrtf()* and *sqrtl()* functions are added for alignment with the ISO/IEC 9899:1999 standard.

43174           The DESCRIPTION, RETURN VALUE, ERRORS, and APPLICATION USAGE sections are  
43175           revised to align with the ISO/IEC 9899:1999 standard.

43176           IEC 60559:1989 standard floating-point extensions over the ISO/IEC 9899:1999 standard are  
43177           marked.

43178 **NAME**

43179           srand — pseudo-random number generator

43180 **SYNOPSIS**

43181           #include <stdlib.h>

43182           void srand(unsigned *seed*);

43183 **DESCRIPTION**

43184           Refer to *rand()*.

43185 **NAME**

43186       srand48 — seed the uniformly distributed double-precision pseudo-random number generator

43187 **SYNOPSIS**

43188 XSI       #include <stdlib.h>

43189       void srand48(long *seedval*);

43190

43191 **DESCRIPTION**

43192       Refer to *drand48()*.

43193 **NAME**

43194           srandom — seed pseudo-random number generator

43195 **SYNOPSIS**

43196 XSI       #include <stdlib.h>

43197           void srandom(unsigned *seed*);

43198

43199 **DESCRIPTION**

43200           Refer to *initstate()*.

43201 **NAME**

43202        sscanf — convert formatted input

43203 **SYNOPSIS**

43204        #include &lt;stdio.h&gt;

43205        int sscanf(const char \*restrict *s*, const char \*restrict *format*, ...);43206 **DESCRIPTION**43207        Refer to *fscanf()*.

## 43208 NAME

43209 stat — get file status

## 43210 SYNOPSIS

43211 #include &lt;sys/stat.h&gt;

43212 int stat(const char \*restrict path, struct stat \*restrict buf);

## 43213 DESCRIPTION

43214 The *stat()* function shall obtain information about the named file and write it to the area pointed  
 43215 to by the *buf* argument. The *path* argument points to a pathname naming a file. Read, write, or  
 43216 execute permission of the named file is not required. An implementation that provides  
 43217 additional or alternate file access control mechanisms may, under implementation-defined  
 43218 conditions, cause *stat()* to fail. In particular, the system may deny the existence of the file  
 43219 specified by *path*.

43220 If the named file is a symbolic link, the *stat()* function shall continue pathname resolution using  
 43221 the contents of the symbolic link, and shall return information pertaining to the resulting file if  
 43222 the file exists.

43223 The *buf* argument is a pointer to a **stat** structure, as defined in the <sys/stat.h> header, into  
 43224 which information is placed concerning the file.

43225 The *stat()* function shall update any time-related fields (as described in the Base Definitions  
 43226 volume of IEEE Std 1003.1-2001, Section 4.7, File Times Update), before writing into the **stat**  
 43227 structure.

43228 Unless otherwise specified, the structure members *st\_mode*, *st\_ino*, *st\_dev*, *st\_uid*, *st\_gid*, *st\_atime*,  
 43229 *st\_ctime*, and *st\_mtime* shall have meaningful values for all file types defined in this volume of  
 43230 IEEE Std 1003.1-2001. The value of the member *st\_nlink* shall be set to the number of links to the  
 43231 file.

## 43232 RETURN VALUE

43233 Upon successful completion, 0 shall be returned. Otherwise, -1 shall be returned and *errno* set to  
 43234 indicate the error.

## 43235 ERRORS

43236 The *stat()* function shall fail if:

43237 [EACCES] Search permission is denied for a component of the path prefix.

43238 [EIO] An error occurred while reading from the file system.

43239 [ELOOP] A loop exists in symbolic links encountered during resolution of the *path*  
43240 argument.

43241 [ENAMETOOLONG]

43242 The length of the *path* argument exceeds {PATH\_MAX} or a pathname  
43243 component is longer than {NAME\_MAX}.43244 [ENOENT] A component of *path* does not name an existing file or *path* is an empty string.

43245 [ENOTDIR] A component of the path prefix is not a directory.

43246 [EOVERFLOW] The file size in bytes or the number of blocks allocated to the file or the file  
43247 serial number cannot be represented correctly in the structure pointed to by  
43248 *buf*.43249 The *stat()* function may fail if:

43250 [ELOOP] More than {SYMLOOP\_MAX} symbolic links were encountered during  
 43251 resolution of the *path* argument.

43252 [ENAMETOOLONG]  
 43253 As a result of encountering a symbolic link in resolution of the *path* argument,  
 43254 the length of the substituted pathname string exceeded {PATH\_MAX}.

43255 [EOVERFLOW] A value to be stored would overflow one of the members of the **stat** structure.

43256 **EXAMPLES**43257 **Obtaining File Status Information**

43258 The following example shows how to obtain file status information for a file named  
 43259 **/home/cnd/mod1**. The structure variable *buffer* is defined for the **stat** structure.

```
43260 #include <sys/types.h>
43261 #include <sys/stat.h>
43262 #include <fcntl.h>

43263 struct stat buffer;
43264 int status;
43265 ...
43266 status = stat("/home/cnd/mod1", &buffer);
```

43267 **Getting Directory Information**

43268 The following example fragment gets status information for each entry in a directory. The call to  
 43269 the *stat()* function stores file information in the **stat** structure pointed to by *statbuf*. The lines  
 43270 that follow the *stat()* call format the fields in the **stat** structure for presentation to the user of the  
 43271 program.

```
43272 #include <sys/types.h>
43273 #include <sys/stat.h>
43274 #include <dirent.h>
43275 #include <pwd.h>
43276 #include <grp.h>
43277 #include <time.h>
43278 #include <locale.h>
43279 #include <langinfo.h>
43280 #include <stdio.h>
43281 #include <stdint.h>

43282 struct dirent *dp;
43283 struct stat statbuf;
43284 struct passwd *pwd;
43285 struct group *grp;
43286 struct tm *tm;
43287 char datestring[256];
43288 ...
43289 /* Loop through directory entries. */
43290 while ((dp = readdir(dir)) != NULL) {
43291     /* Get entry's information. */
43292     if (stat(dp->d_name, &statbuf) == -1)
43293         continue;
```

```

43294     /* Print out type, permissions, and number of links. */
43295     printf("%10.10s", sperm (statbuf.st_mode));
43296     printf("%4d", statbuf.st_nlink);

43297     /* Print out owner's name if it is found using getpwuid(). */
43298     if ((pwd = getpwuid(statbuf.st_uid)) != NULL)
43299         printf(" %-8.8s", pwd->pw_name);
43300     else
43301         printf(" %-8d", statbuf.st_uid);

43302     /* Print out group name if it is found using getgrgid(). */
43303     if ((grp = getgrgid(statbuf.st_gid)) != NULL)
43304         printf(" %-8.8s", grp->gr_name);
43305     else
43306         printf(" %-8d", statbuf.st_gid);

43307     /* Print size of file. */
43308     printf(" %9jd", (intmax_t)statbuf.st_size);

43309     tm = localtime(&statbuf.st_mtime);

43310     /* Get localized date string. */
43311     strftime(datestring, sizeof(datestring), nl_langinfo(D_T_FMT), tm);

43312     printf(" %s %s\n", datestring, dp->d_name);
43313 }

```

#### 43314 APPLICATION USAGE

43315 None.

#### 43316 RATIONALE

43317 The intent of the paragraph describing “additional or alternate file access control mechanisms”  
 43318 is to allow a secure implementation where a process with a label that does not dominate the  
 43319 file’s label cannot perform a *stat()* function. This is not related to read permission; a process with  
 43320 a label that dominates the file’s label does not need read permission. An implementation that  
 43321 supports write-up operations could fail *fstat()* function calls even though it has a valid file  
 43322 descriptor open for writing.

#### 43323 FUTURE DIRECTIONS

43324 None.

#### 43325 SEE ALSO

43326 *fstat()*, *lstat()*, *readlink()*, *symlink()*, the Base Definitions volume of IEEE Std 1003.1-2001,  
 43327 <sys/stat.h>, <sys/types.h>

#### 43328 CHANGE HISTORY

43329 First released in Issue 1. Derived from Issue 1 of the SVID.

#### 43330 Issue 5

43331 Large File Summit extensions are added.

#### 43332 Issue 6

43333 In the SYNOPSIS, the optional include of the <sys/types.h> header is removed.

43334 The following new requirements on POSIX implementations derive from alignment with the  
 43335 Single UNIX Specification:

- 43336 • The requirement to include <sys/types.h> has been removed. Although <sys/types.h> was  
 43337 required for conforming implementations of previous POSIX specifications, it was not  
 43338 required for UNIX applications.

- 43339      • The [EIO] mandatory error condition is added.
- 43340      • The [ELOOP] mandatory error condition is added.
- 43341      • The [EOVERFLOW] mandatory error condition is added. This change is to support large  
43342      files.
- 43343      • The [ENAMETOOLONG] and the second [EOVERFLOW] optional error conditions are  
43344      added.
- 43345      The following changes were made to align with the IEEE P1003.1a draft standard:
- 43346
  - Details are added regarding the treatment of symbolic links.
- 43347
  - The [ELOOP] optional error condition is added.
- 43348      The DESCRIPTION is updated to avoid use of the term “must” for application requirements.
- 43349      The **restrict** keyword is added to the *stat()* prototype for alignment with the ISO/IEC 9899:1999  
43350      standard.

43351 **NAME**

43352           statvfs — get file system information

43353 **SYNOPSIS**

43354 XSI       #include <sys/statvfs.h>

43355           int statvfs(const char \*restrict path, struct statvfs \*restrict buf);

43356

43357 **DESCRIPTION**

43358           Refer to *fstatvfs()*.

43359 **NAME**

43360 stderr, stdin, stdout — standard I/O streams

43361 **SYNOPSIS**

43362 #include &lt;stdio.h&gt;

43363 extern FILE \*stderr, \*stdin, \*stdout;

43364 **DESCRIPTION**

43365 cx The functionality described on this reference page is aligned with the ISO C standard. Any  
 43366 conflict between the requirements described here and the ISO C standard is unintentional. This  
 43367 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

43368 A file with associated buffering is called a *stream* and is declared to be a pointer to a defined type  
 43369 **FILE**. The *fopen()* function shall create certain descriptive data for a stream and return a pointer  
 43370 to designate the stream in all further transactions. Normally, there are three open streams with  
 43371 constant pointers declared in the <stdio.h> header and associated with the standard open files.

43372 At program start-up, three streams shall be predefined and need not be opened explicitly:  
 43373 *standard input* (for reading conventional input), *standard output* (for writing conventional output),  
 43374 and *standard error* (for writing diagnostic output). When opened, the standard error stream is not  
 43375 fully buffered; the standard input and standard output streams are fully buffered if and only if  
 43376 the stream can be determined not to refer to an interactive device.

43377 cx The following symbolic values in <unistd.h> define the file descriptors that shall be associated  
 43378 with the C-language *stdin*, *stdout*, and *stderr* when the application is started:

43379 **STDIN\_FILENO** Standard input value, *stdin*. Its value is 0.

43380 **STDOUT\_FILENO** Standard output value, *stdout*. Its value is 1.

43381 **STDERR\_FILENO** Standard error value, *stderr*. Its value is 2.

43382 The *stderr* stream is expected to be open for reading and writing.

43383 **RETURN VALUE**

43384 None.

43385 **ERRORS**

43386 No errors are defined.

43387 **EXAMPLES**

43388 None.

43389 **APPLICATION USAGE**

43390 None.

43391 **RATIONALE**

43392 None.

43393 **FUTURE DIRECTIONS**

43394 None.

43395 **SEE ALSO**

43396 *fclose()*, *feof()*, *ferror()*, *fileno()*, *fopen()*, *fread()*, *fseek()*, *getc()*, *gets()*, *popen()*, *printf()*, *putc()*,  
 43397 *puts()*, *read()*, *scanf()*, *setbuf()*, *setvbuf()*, *tmpfile()*, *ungetc()*, *vprintf()*, the Base Definitions  
 43398 volume of IEEE Std 1003.1-2001, <stdio.h>, <unistd.h>

43399 **CHANGE HISTORY**

43400 First released in Issue 1.

43401 **Issue 6**

43402 Extensions beyond the ISO C standard are marked.

43403 A note that *stderr* is expected to be open for reading and writing is added to the DESCRIPTION.

43404 **NAME**

43405           strcasecmp, strncasecmp — case-insensitive string comparisons

43406 **SYNOPSIS**

43407 XSI       #include &lt;strings.h&gt;

43408           int strcmp(const char \*s1, const char \*s2);

43409           int strncmp(const char \*s1, const char \*s2, size\_t n);

43410

43411 **DESCRIPTION**

43412       The *strcasecmp()* function shall compare, while ignoring differences in case, the string pointed to  
43413       by *s1* to the string pointed to by *s2*. The *strncasecmp()* function shall compare, while ignoring  
43414       differences in case, not more than *n* bytes from the string pointed to by *s1* to the string pointed to  
43415       by *s2*.

43416       In the POSIX locale, *strcasecmp()* and *strncasecmp()* shall behave as if the strings had been  
43417       converted to lowercase and then a byte comparison performed. The results are unspecified in  
43418       other locales.

43419 **RETURN VALUE**

43420       Upon completion, *strcasecmp()* shall return an integer greater than, equal to, or less than 0, if the  
43421       string pointed to by *s1* is, ignoring case, greater than, equal to, or less than the string pointed to  
43422       by *s2*, respectively.

43423       Upon successful completion, *strncasecmp()* shall return an integer greater than, equal to, or less  
43424       than 0, if the possibly null-terminated array pointed to by *s1* is, ignoring case, greater than, equal  
43425       to, or less than the possibly null-terminated array pointed to by *s2*, respectively.

43426 **ERRORS**

43427       No errors are defined.

43428 **EXAMPLES**

43429       None.

43430 **APPLICATION USAGE**

43431       None.

43432 **RATIONALE**

43433       None.

43434 **FUTURE DIRECTIONS**

43435       None.

43436 **SEE ALSO**

43437       The Base Definitions volume of IEEE Std 1003.1-2001, &lt;strings.h&gt;

43438 **CHANGE HISTORY**

43439       First released in Issue 4, Version 2.

43440 **Issue 5**

43441       Moved from X/OPEN UNIX extension to BASE.

43442 **NAME**

43443       strcat — concatenate two strings

43444 **SYNOPSIS**

43445       #include <string.h>

43446       char \*strcat(char \*restrict *s1*, const char \*restrict *s2*);

43447 **DESCRIPTION**

43448 **CX**       The functionality described on this reference page is aligned with the ISO C standard. Any  
43449 conflict between the requirements described here and the ISO C standard is unintentional. This  
43450 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

43451       The *strcat()* function shall append a copy of the string pointed to by *s2* (including the  
43452 terminating null byte) to the end of the string pointed to by *s1*. The initial byte of *s2* overwrites  
43453 the null byte at the end of *s1*. If copying takes place between objects that overlap, the behavior is  
43454 undefined.

43455 **RETURN VALUE**

43456       The *strcat()* function shall return *s1*; no return value is reserved to indicate an error.

43457 **ERRORS**

43458       No errors are defined.

43459 **EXAMPLES**

43460       None.

43461 **APPLICATION USAGE**

43462       This issue is aligned with the ISO C standard; this does not affect compatibility with XPG3  
43463 applications. Reliable error detection by this function was never guaranteed.

43464 **RATIONALE**

43465       None.

43466 **FUTURE DIRECTIONS**

43467       None.

43468 **SEE ALSO**

43469       *strncat()*, the Base Definitions volume of IEEE Std 1003.1-2001, <string.h>

43470 **CHANGE HISTORY**

43471       First released in Issue 1. Derived from Issue 1 of the SVID.

43472 **Issue 6**

43473       The *strcat()* prototype is updated for alignment with the ISO/IEC 9899:1999 standard.

43474 **NAME**

43475           strchr — string scanning operation

43476 **SYNOPSIS**

43477           #include &lt;string.h&gt;

43478           char \*strchr(const char \*s, int c);

43479 **DESCRIPTION**

43480 cx       The functionality described on this reference page is aligned with the ISO C standard. Any  
43481       conflict between the requirements described here and the ISO C standard is unintentional. This  
43482       volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

43483       The *strchr()* function shall locate the first occurrence of *c* (converted to a **char**) in the string  
43484       pointed to by *s*. The terminating null byte is considered to be part of the string.

43485 **RETURN VALUE**

43486       Upon completion, *strchr()* shall return a pointer to the byte, or a null pointer if the byte was not  
43487       found.

43488 **ERRORS**

43489       No errors are defined.

43490 **EXAMPLES**

43491       None.

43492 **APPLICATION USAGE**

43493       None.

43494 **RATIONALE**

43495       None.

43496 **FUTURE DIRECTIONS**

43497       None.

43498 **SEE ALSO**43499       *strchr()*, the Base Definitions volume of IEEE Std 1003.1-2001, <string.h>43500 **CHANGE HISTORY**

43501       First released in Issue 1. Derived from Issue 1 of the SVID.

43502 **Issue 6**

43503       Extensions beyond the ISO C standard are marked.

## 43504 NAME

43505 stricmp — compare two strings

## 43506 SYNOPSIS

43507 #include &lt;string.h&gt;

43508 int stricmp(const char \*s1, const char \*s2);

## 43509 DESCRIPTION

43510 cx The functionality described on this reference page is aligned with the ISO C standard. Any  
 43511 conflict between the requirements described here and the ISO C standard is unintentional. This  
 43512 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

43513 The *stricmp()* function shall compare the string pointed to by *s1* to the string pointed to by *s2*.

43514 The sign of a non-zero return value shall be determined by the sign of the difference between the  
 43515 values of the first pair of bytes (both interpreted as type **unsigned char**) that differ in the strings  
 43516 being compared.

## 43517 RETURN VALUE

43518 Upon completion, *stricmp()* shall return an integer greater than, equal to, or less than 0, if the  
 43519 string pointed to by *s1* is greater than, equal to, or less than the string pointed to by *s2*,  
 43520 respectively.

## 43521 ERRORS

43522 No errors are defined.

## 43523 EXAMPLES

43524 **Checking a Password Entry**

43525 The following example compares the information read from standard input to the value of the  
 43526 name of the user entry. If the *stricmp()* function returns 0 (indicating a match), a further check  
 43527 will be made to see if the user entered the proper old password. The *crypt()* function shall  
 43528 encrypt the old password entered by the user, using the value of the encrypted password in the  
 43529 **passwd** structure as the salt. If this value matches the value of the encrypted **passwd** in the  
 43530 structure, the entered password *oldpasswd* is the correct user's password. Finally, the program  
 43531 encrypts the new password so that it can store the information in the **passwd** structure.

```

43532 #include <string.h>
43533 #include <unistd.h>
43534 #include <stdio.h>
43535 ...
43536 int valid_change;
43537 struct passwd *p;
43538 char user[100];
43539 char oldpasswd[100];
43540 char newpasswd[100];
43541 char savepasswd[100];
43542 ...
43543 if (stricmp(p->pw_name, user) == 0) {
43544     if (stricmp(p->pw_passwd, crypt(oldpasswd, p->pw_passwd)) == 0) {
43545         strcpy(savepasswd, crypt(newpasswd, user));
43546         p->pw_passwd = savepasswd;
43547         valid_change = 1;
43548     }
43549     else {

```

```
43550         fprintf(stderr, "Old password is not valid\n");
43551     }
43552 }
43553 ...
```

**43554 APPLICATION USAGE**

43555 None.

**43556 RATIONALE**

43557 None.

**43558 FUTURE DIRECTIONS**

43559 None.

**43560 SEE ALSO**

43561 *strncmp()*, the Base Definitions volume of IEEE Std 1003.1-2001, <**string.h**>

**43562 CHANGE HISTORY**

43563 First released in Issue 1. Derived from Issue 1 of the SVID.

**43564 Issue 6**

43565 Extensions beyond the ISO C standard are marked.

43566 **NAME**

43567 strcoll — string comparison using collating information

43568 **SYNOPSIS**

43569 #include &lt;string.h&gt;

43570 int strcoll(const char \*s1, const char \*s2);

43571 **DESCRIPTION**

43572 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
 43573 conflict between the requirements described here and the ISO C standard is unintentional. This  
 43574 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

43575 The *strcoll()* function shall compare the string pointed to by *s1* to the string pointed to by *s2*,  
 43576 both interpreted as appropriate to the *LC\_COLLATE* category of the current locale.

43577 CX The *strcoll()* function shall not change the setting of *errno* if successful.

43578 Since no return value is reserved to indicate an error, an application wishing to check for error  
 43579 situations should set *errno* to 0, then call *strcoll()*, then check *errno*.

43580 **RETURN VALUE**

43581 Upon successful completion, *strcoll()* shall return an integer greater than, equal to, or less than 0,  
 43582 according to whether the string pointed to by *s1* is greater than, equal to, or less than the string  
 43583 CX pointed to by *s2* when both are interpreted as appropriate to the current locale. On error,  
 43584 *strcoll()* may set *errno*, but no return value is reserved to indicate an error.

43585 **ERRORS**43586 The *strcoll()* function may fail if:

43587 CX [EINVAL] The *s1* or *s2* arguments contain characters outside the domain of the collating  
 43588 sequence.

43589 **EXAMPLES**43590 **Comparing Nodes**

43591 The following example uses an application-defined function, *node\_compare()*, to compare two  
 43592 nodes based on an alphabetical ordering of the *string* field.

```
43593 #include <string.h>
43594 ...
43595 struct node { /* These are stored in the table. */
43596     char *string;
43597     int length;
43598 };
43599 ...
43600 int node_compare(const void *node1, const void *node2)
43601 {
43602     return strcoll(((const struct node *)node1)->string,
43603                  ((const struct node *)node2)->string);
43604 }
43605 ...
```

43606 **APPLICATION USAGE**43607 The *strxfrm()* and *strcmp()* functions should be used for sorting large lists.

43608 **RATIONALE**

43609 None.

43610 **FUTURE DIRECTIONS**

43611 None.

43612 **SEE ALSO**43613 *strcmp()*, *strxfrm()*, the Base Definitions volume of IEEE Std 1003.1-2001, <**string.h**>43614 **CHANGE HISTORY**

43615 First released in Issue 3.

43616 **Issue 5**43617 The DESCRIPTION is updated to indicate that *errno* does not change if the function is  
43618 successful.43619 **Issue 6**

43620 Extensions beyond the ISO C standard are marked.

43621 The following new requirements on POSIX implementations derive from alignment with the  
43622 Single UNIX Specification:

43623 • The [EINVAL] optional error condition is added.

43624 An example is added.

43625 **NAME**

43626           strcpy — copy a string

43627 **SYNOPSIS**

43628           #include &lt;string.h&gt;

43629           char \*strcpy(char \*restrict *s1*, const char \*restrict *s2*);43630 **DESCRIPTION**

43631 *cx*       The functionality described on this reference page is aligned with the ISO C standard. Any  
 43632 conflict between the requirements described here and the ISO C standard is unintentional. This  
 43633 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

43634       The *strcpy()* function shall copy the string pointed to by *s2* (including the terminating null byte)  
 43635 into the array pointed to by *s1*. If copying takes place between objects that overlap, the behavior  
 43636 is undefined.

43637 **RETURN VALUE**43638       The *strcpy()* function shall return *s1*; no return value is reserved to indicate an error.43639 **ERRORS**

43640       No errors are defined.

43641 **EXAMPLES**43642       **Initializing a String**43643       The following example copies the string "-----" into the *permstring* variable.

```
43644       #include <string.h>
43645       ...
43646       static char permstring[11];
43647       ...
43648       strcpy(permstring, "-----");
43649       ...
```

43650       **Storing a Key and Data**

43651       The following example allocates space for a key using *malloc()* then uses *strcpy()* to place the  
 43652 key there. Then it allocates space for data using *malloc()*, and uses *strcpy()* to place data there.  
 43653 (The user-defined function *dbfree()* frees memory previously allocated to an array of type **struct**  
 43654 **element** \*.)

```
43655       #include <string.h>
43656       #include <stdlib.h>
43657       #include <stdio.h>
43658       ...
43659       /* Structure used to read data and store it. */
43660       struct element {
43661           char *key;
43662           char *data;
43663       };
43664       struct element *tbl, *curtbl;
43665       char *key, *data;
43666       int count;
43667       ...
43668       void dbfree(struct element *, int);
```

```
43669     ...
43670     if ((curtbl->key = malloc(strlen(key) + 1)) == NULL) {
43671         perror("malloc"); dbfree(tbl, count); return NULL;
43672     }
43673     strcpy(curtbl->key, key);
43674
43675     if ((curtbl->data = malloc(strlen(data) + 1)) == NULL) {
43676         perror("malloc"); free(curtbl->key); dbfree(tbl, count); return NULL;
43677     }
43678     strcpy(curtbl->data, data);
43679     ...
```

**43679 APPLICATION USAGE**

43680 Character movement is performed differently in different implementations. Thus, overlapping  
43681 moves may yield surprises.

43682 This issue is aligned with the ISO C standard; this does not affect compatibility with XPG3  
43683 applications. Reliable error detection by this function was never guaranteed.

**43684 RATIONALE**

43685 None.

**43686 FUTURE DIRECTIONS**

43687 None.

**43688 SEE ALSO**

**43690 CHANGE HISTORY**

43691 First released in Issue 1. Derived from Issue 1 of the SVID.

**43692 Issue 6**

43693 The *strcpy()* prototype is updated for alignment with the ISO/IEC 9899:1999 standard.

43694 **NAME**

43695 strcspn — get the length of a complementary substring

43696 **SYNOPSIS**

43697 #include <string.h>

43698 size\_t strcspn(const char \*s1, const char \*s2);

43699 **DESCRIPTION**

43700 cx The functionality described on this reference page is aligned with the ISO C standard. Any  
43701 conflict between the requirements described here and the ISO C standard is unintentional. This  
43702 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

43703 The *strcspn()* function shall compute the length (in bytes) of the maximum initial segment of the  
43704 string pointed to by *s1* which consists entirely of bytes *not* from the string pointed to by *s2*.

43705 **RETURN VALUE**

43706 The *strcspn()* function shall return the length of the computed segment of the string pointed to  
43707 by *s1*; no return value is reserved to indicate an error.

43708 **ERRORS**

43709 No errors are defined.

43710 **EXAMPLES**

43711 None.

43712 **APPLICATION USAGE**

43713 None.

43714 **RATIONALE**

43715 None.

43716 **FUTURE DIRECTIONS**

43719 *strspn()*, the Base Definitions volume of IEEE Std 1003.1-2001, <**string.h**>

43720 **CHANGE HISTORY**

43721 First released in Issue 1. Derived from Issue 1 of the SVID.

43722 **Issue 5**

43723 The RETURN VALUE section is updated to indicate that *strcspn()* returns the length of *s1*, and  
43724 not *s1* itself as was previously stated.

43725 **Issue 6**

43726 The Open Group Corrigendum U030/1 is applied. The text of the RETURN VALUE section is  
43727 updated to indicate that the computed segment length is returned, not the *s1* length.

43728 **NAME**

43729        strdup — duplicate a string

43730 **SYNOPSIS**

43731 XSI        #include &lt;string.h&gt;

43732        char \*strdup(const char \*s1);

43733

43734 **DESCRIPTION**

43735        The *strdup()* function shall return a pointer to a new string, which is a duplicate of the string  
43736        pointed to by *s1*. The returned pointer can be passed to *free()*. A null pointer is returned if the  
43737        new string cannot be created.

43738 **RETURN VALUE**

43739        The *strdup()* function shall return a pointer to a new string on success. Otherwise, it shall return  
43740        a null pointer and set *errno* to indicate the error.

43741 **ERRORS**43742        The *strdup()* function may fail if:

43743        [ENOMEM]        Storage space available is insufficient.

43744 **EXAMPLES**

43745        None.

43746 **APPLICATION USAGE**

43747        None.

43755        First released in Issue 4, Version 2.

43756 **Issue 5**

43757        Moved from X/OPEN UNIX extension to BASE.

## 43758 NAME

43759            strerror, strerror\_r — get error message string

## 43760 SYNOPSIS

43761            #include &lt;string.h&gt;

43762            char \*strerror(int *errnum*);43763 TSF        int strerror\_r(int *errnum*, char \**strerrbuf*, size\_t *buflen*);

43764

## 43765 DESCRIPTION

43766 CX        For *strerror()*: The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

43769        The *strerror()* function shall map the error number in *errnum* to a locale-dependent error message string and shall return a pointer to it. Typically, the values for *errnum* come from *errno*, but *strerror()* shall map any value of type **int** to a message.

43772        The string pointed to shall not be modified by the application, but may be overwritten by a subsequent call to *strerror()* or *perror()*.

43774 CX        The contents of the error message strings returned by *strerror()* should be determined by the setting of the *LC\_MESSAGES* category in the current locale.

43776        The implementation shall behave as if no function defined in this volume of IEEE Std 1003.1-2001 calls *strerror()*.

43778 CX        The *strerror()* function shall not change the setting of *errno* if successful.

43779        Since no return value is reserved to indicate an error, an application wishing to check for error situations should set *errno* to 0, then call *strerror()*, then check *errno*.

43781        The *strerror()* function need not be reentrant. A function that is not required to be reentrant is not required to be thread-safe.

43783 TSF        The *strerror\_r()* function shall map the error number in *errnum* to a locale-dependent error message string and shall return the string in the buffer pointed to by *strerrbuf*, with length *buflen*.

43785

## 43786 RETURN VALUE

43787        Upon successful completion, *strerror()* shall return a pointer to the generated message string. On error *errno* may be set, but no return value is reserved to indicate an error.

43789 TSF        Upon successful completion, *strerror\_r()* shall return 0. Otherwise, an error number shall be returned to indicate the error.

43790

## 43791 ERRORS

43792        These functions may fail if:

43793        [EINVAL]        The value of *errnum* is not a valid error number.

43794        The *strerror\_r()* function may fail if:

43795 TSF        [ERANGE]        Insufficient storage was supplied via *strerrbuf* and *buflen* to contain the generated message string.

43796

43797 **EXAMPLES**

43798 None.

43799 **APPLICATION USAGE**

43800 None.

43801 **RATIONALE**

43802 None.

43803 **FUTURE DIRECTIONS**

43804 None.

43805 **SEE ALSO**43806  *perror()*, the Base Definitions volume of IEEE Std 1003.1-2001, <**string.h**>43807 **CHANGE HISTORY**

43808 First released in Issue 3.

43809 **Issue 5**43810 The DESCRIPTION is updated to indicate that *errno* is not changed if the function is successful.

43811 A note indicating that this function need not be reentrant is added to the DESCRIPTION.

43812 **Issue 6**

43813 Extensions beyond the ISO C standard are marked.

43814 The following new requirements on POSIX implementations derive from alignment with the  
43815 Single UNIX Specification:

- 43816
- In the RETURN VALUE section, the fact that *errno* may be set is added.
  - The [EINVAL] optional error condition is added.

43818 The DESCRIPTION is updated to avoid use of the term “must” for application requirements.

43819 The *strerror\_r()* function is added in response to IEEE PASC Interpretation 1003.1c #39.43820 The *strerror\_r()* function is marked as part of the Thread-Safe Functions option.

## 43821 NAME

43822 strfmon — convert monetary value to a string

## 43823 SYNOPSIS

43824 XSI #include &lt;monetary.h&gt;

```
43825     ssize_t strfmon(char *restrict s, size_t maxsize,
43826                   const char *restrict format, ...);
```

43827

## 43828 DESCRIPTION

43829 The *strfmon()* function shall place characters into the array pointed to by *s* as controlled by the  
 43830 string pointed to by *format*. No more than *maxsize* bytes are placed into the array.

43831 The format is a character string, beginning and ending in its initial state, if any, that contains two  
 43832 types of objects: *plain characters*, which are simply copied to the output stream, and *conversion*  
 43833 *specifications*, each of which shall result in the fetching of zero or more arguments which are  
 43834 converted and formatted. The results are undefined if there are insufficient arguments for the  
 43835 format. If the format is exhausted while arguments remain, the excess arguments are simply  
 43836 ignored.

43837 The application shall ensure that a conversion specification consists of the following sequence:

- 43838 • A '%' character
- 43839 • Optional flags
- 43840 • Optional field width
- 43841 • Optional left precision
- 43842 • Optional right precision
- 43843 • A required conversion specifier character that determines the conversion to be performed

43844 **Flags**

43845 One or more of the following optional flags can be specified to control the conversion:

- 43846 =*f* An '=' followed by a single character *f* which is used as the numeric fill character. In  
 43847 order to work with precision or width counts, the fill character shall be a single byte  
 43848 character; if not, the behavior is undefined. The default numeric fill character is the  
 43849 <space>. This flag does not affect field width filling which always uses the <space>.  
 43850 This flag is ignored unless a left precision (see below) is specified.
- 43851 ^ Do not format the currency amount with grouping characters. The default is to insert  
 43852 the grouping characters if defined for the current locale.
- 43853 + or ( Specify the style of representing positive and negative currency amounts. Only one of  
 43854 '+' or '(' may be specified. If '+' is specified, the locale's equivalent of '+' and '-'  
 43855 are used (for example, in the U.S., the empty string if positive and '-' if negative). If  
 43856 '(' is specified, negative amounts are enclosed within parentheses. If neither flag is  
 43857 specified, the '+' style is used.
- 43858 ! Suppress the currency symbol from the output conversion.
- 43859 - Specify the alignment. If this flag is present the result of the conversion is left-justified  
 43860 (padded to the right) rather than right-justified. This flag shall be ignored unless a field  
 43861 width (see below) is specified.

43862 **Field Width**

43863 *w* A decimal digit string *w* specifying a minimum field width in bytes in which the result  
 43864 of the conversion is right-justified (or left-justified if the flag '-' is specified). The  
 43865 default is 0.

43866 **Left Precision**

43867 *#n* A '#' followed by a decimal digit string *n* specifying a maximum number of digits  
 43868 expected to be formatted to the left of the radix character. This option can be used to  
 43869 keep the formatted output from multiple calls to the *strfmon()* function aligned in the  
 43870 same columns. It can also be used to fill unused positions with a special character as in  
 43871 "\$\*\*\*123.45". This option causes an amount to be formatted as if it has the number  
 43872 of digits specified by *n*. If more than *n* digit positions are required, this conversion  
 43873 specification is ignored. Digit positions in excess of those actually required are filled  
 43874 with the numeric fill character (see the *=f* flag above).

43875 If grouping has not been suppressed with the '^' flag, and it is defined for the current  
 43876 locale, grouping separators are inserted before the fill characters (if any) are added.  
 43877 Grouping separators are not applied to fill characters even if the fill character is a digit.

43878 To ensure alignment, any characters appearing before or after the number in the  
 43879 formatted output such as currency or sign symbols are padded as necessary with  
 43880 <space>s to make their positive and negative formats an equal length.

43881 **Right Precision**

43882 *.p* A period followed by a decimal digit string *p* specifying the number of digits after the  
 43883 radix character. If the value of the right precision *p* is 0, no radix character appears. If a  
 43884 right precision is not included, a default specified by the current locale is used. The  
 43885 amount being formatted is rounded to the specified number of digits prior to  
 43886 formatting.

43887 **Conversion Specifier Characters**

43888 The conversion specifier characters and their meanings are:

43889 *i* The **double** argument is formatted according to the locale's international currency  
 43890 format (for example, in the U.S.: USD 1,234.56). If the argument is  $\pm\text{Inf}$  or NaN, the  
 43891 result of the conversion is unspecified.

43892 *n* The **double** argument is formatted according to the locale's national currency format  
 43893 (for example, in the U.S.: \$1,234.56). If the argument is  $\pm\text{Inf}$  or NaN, the result of the  
 43894 conversion is unspecified.

43895 *%* Convert to a '%'; no argument is converted. The entire conversion specification shall  
 43896 be %%.

43897 **Locale Information**

43898 The *LC\_MONETARY* category of the program's locale affects the behavior of this function  
 43899 including the monetary radix character (which may be different from the numeric radix  
 43900 character affected by the *LC\_NUMERIC* category), the grouping separator, the currency  
 43901 symbols, and formats. The international currency symbol should be conformant with the  
 43902 ISO 4217:1995 standard.

43903 If the value of *maxsize* is greater than {SSIZE\_MAX}, the result is implementation-defined.

## 43904 RETURN VALUE

43905 If the total number of resulting bytes including the terminating null byte is not more than  
 43906 *maxsize*, *strfmon()* shall return the number of bytes placed into the array pointed to by *s*, not  
 43907 including the terminating null byte. Otherwise, *-1* shall be returned, the contents of the array are  
 43908 unspecified, and *errno* shall be set to indicate the error.

## 43909 ERRORS

43910 The *strfmon()* function shall fail if:

43911 [E2BIG] Conversion stopped due to lack of space in the buffer.

## 43912 EXAMPLES

43913 Given a locale for the U.S. and the values 123.45, *-123.45*, and 3456.781, the following output  
 43914 might be produced. Square brackets ("*[ ]*") are used in this example to delimit the output.

|       |           |                   |                                          |
|-------|-----------|-------------------|------------------------------------------|
| 43915 | %n        | [\$123.45]        | Default formatting                       |
| 43916 |           | [-\$123.45]       |                                          |

| 43941 |           | [\$ 3,456.78]     |                                          |
| 43942 | %!(#5n    | [ 123.45]         | Disable the currency symbol              |
| 43943 |           | [( 123.45)]       |                                          |
| 43944 |           | [ 3,456.78]       |                                          |
| 43945 | %-14#5.4n | [ \$ 123.4500 ]   | Left-justify the output                  |
| 43946 |           | [-\$ 123.4500 ]   |                                          |
| 43947 |           | [ \$ 3,456.7810 ] |                                          |

43948           %14#5.4n   [   \$   123.4500]   Corresponding right-justified output  
43949                           [  -\$   123.4500]  
43950                           [   \$ 3,456.7810]

43951           See also the EXAMPLES section in *fprintf()*.

#### 43952 APPLICATION USAGE

43953           None.

#### 43954 RATIONALE

43955           None.

#### 43956 FUTURE DIRECTIONS

43957           Lowercase conversion characters are reserved for future standards use and uppercase for  
43958           implementation-defined use.

#### 43959 SEE ALSO

43960           *fprintf()*, *localeconv()*, the Base Definitions volume of IEEE Std 1003.1-2001, <**monetary.h**>

#### 43961 CHANGE HISTORY

43962           First released in Issue 4.

#### 43963 Issue 5

43964           Moved from ENHANCED I18N to BASE.

43965           The [ENOSYS] error is removed.

43966           A sentence is added to the DESCRIPTION warning about values of *maxsize* that are greater than  
43967           {SSIZE\_MAX}.

#### 43968 Issue 6

43969           The DESCRIPTION is updated to avoid use of the term “must” for application requirements.

43970           The **restrict** keyword is added to the *strfmon()* prototype for alignment with the  
43971           ISO/IEC 9899:1999 standard.

43972           The EXAMPLES section is reworked, clarifying the output format.

## 43973 NAME

43974 strftime — convert date and time to a string

## 43975 SYNOPSIS

43976 #include &lt;time.h&gt;

```
43977     size_t strftime(char *restrict s, size_t maxsize,
43978                   const char *restrict format, const struct tm *restrict timeptr);
```

## 43979 DESCRIPTION

43980 cx The functionality described on this reference page is aligned with the ISO C standard. Any  
 43981 conflict between the requirements described here and the ISO C standard is unintentional. This  
 43982 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

43983 The *strftime()* function shall place bytes into the array pointed to by *s* as controlled by the string  
 43984 pointed to by *format*. The format is a character string, beginning and ending in its initial shift  
 43985 state, if any. The *format* string consists of zero or more conversion specifications and ordinary  
 43986 characters. A conversion specification consists of a '%' character, possibly followed by an E or O  
 43987 modifier, and a terminating conversion specifier character that determines the conversion  
 43988 specification's behavior. All ordinary characters (including the terminating null byte) are copied  
 43989 unchanged into the array. If copying takes place between objects that overlap, the behavior is  
 43990 undefined. No more than *maxsize* bytes are placed into the array. Each conversion specifier is  
 43991 replaced by appropriate characters as described in the following list. The appropriate characters  
 43992 are determined using the *LC\_TIME* category of the current locale and by the values of zero or  
 43993 more members of the broken-down time structure pointed to by *timeptr*, as specified in brackets  
 43994 in the description. If any of the specified values are outside the normal range, the characters  
 43995 stored are unspecified.

43996 cx Local timezone information is used as though *strftime()* called *tzset()*.

43997 The following conversion specifications are supported:

|       |    |                                                                                                                                                             |
|-------|----|-------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 43998 | %a | Replaced by the locale's abbreviated weekday name. [ <i>tm_wday</i> ]                                                                                       |
| 43999 | %A | Replaced by the locale's full weekday name. [ <i>tm_wday</i> ]                                                                                              |
| 44000 | %b | Replaced by the locale's abbreviated month name. [ <i>tm_mon</i> ]                                                                                          |
| 44001 | %B | Replaced by the locale's full month name. [ <i>tm_mon</i> ]                                                                                                 |
| 44002 | %c | Replaced by the locale's appropriate date and time representation. (See the Base<br>44003 Definitions volume of IEEE Std 1003.1-2001, <time.h>.)            |
| 44004 | %C | Replaced by the year divided by 100 and truncated to an integer, as a decimal number<br>44005 [00,99]. [ <i>tm_year</i> ]                                   |
| 44006 | %d | Replaced by the day of the month as a decimal number [01,31]. [ <i>tm_mday</i> ]                                                                            |
| 44007 | %D | Equivalent to %m/%d/%Y. [ <i>tm_mon</i> , <i>tm_mday</i> , <i>tm_year</i> ]                                                                                 |
| 44008 | %e | Replaced by the day of the month as a decimal number [1,31]; a single digit is preceded<br>44009 by a space. [ <i>tm_mday</i> ]                             |
| 44010 | %F | Equivalent to %Y-%m-%d (the ISO 8601:2000 standard date format). [ <i>tm_year</i> , <i>tm_mon</i> ,<br>44011 <i>tm_mday</i> ]                               |
| 44012 | %g | Replaced by the last 2 digits of the week-based year (see below) as a decimal number<br>44013 [00,99]. [ <i>tm_year</i> , <i>tm_wday</i> , <i>tm_yday</i> ] |
| 44014 | %G | Replaced by the week-based year (see below) as a decimal number (for example, 1977).<br>44015 [ <i>tm_year</i> , <i>tm_wday</i> , <i>tm_yday</i> ]          |

|          |    |                                                                                                  |
|----------|----|--------------------------------------------------------------------------------------------------|
| 44016    | %h | Equivalent to %b. [ <i>tm_mon</i> ]                                                              |
| 44017    | %H | Replaced by the hour (24-hour clock) as a decimal number [00,23]. [ <i>tm_hour</i> ]             |
| 44018    | %I | Replaced by the hour (12-hour clock) as a decimal number [01,12]. [ <i>tm_hour</i> ]             |
| 44019    | %j | Replaced by the day of the year as a decimal number [001,366]. [ <i>tm_yday</i> ]                |
| 44020    | %m | Replaced by the month as a decimal number [01,12]. [ <i>tm_mon</i> ]                             |
| 44021    | %M | Replaced by the minute as a decimal number [00,59]. [ <i>tm_min</i> ]                            |
| 44022    | %n | Replaced by a <newline>.                                                                         |
| 44023    | %p | Replaced by the locale's equivalent of either a.m. or p.m. [ <i>tm_hour</i> ]                    |
| 44024 CX | %r | Replaced by the time in a.m. and p.m. notation; in the POSIX locale this shall be                |
| 44025    |    | equivalent to %I:%M:%S %p. [ <i>tm_hour</i> , <i>tm_min</i> , <i>tm_sec</i> ]                    |
| 44026    | %R | Replaced by the time in 24-hour notation (%H:%M). [ <i>tm_hour</i> , <i>tm_min</i> ]             |
| 44027    | %S | Replaced by the second as a decimal number [00,60]. [ <i>tm_sec</i> ]                            |
| 44028    | %t | Replaced by a <tab>.                                                                             |
| 44029    | %T | Replaced by the time (%H:%M:%S). [ <i>tm_hour</i> , <i>tm_min</i> , <i>tm_sec</i> ]              |
| 44030    | %u | Replaced by the weekday as a decimal number [1,7], with 1 representing Monday.                   |
| 44031    |    | [ <i>tm_wday</i> ]                                                                               |
| 44032    | %U | Replaced by the week number of the year as a decimal number [00,53]. The first                   |
| 44033    |    | Sunday of January is the first day of week 1; days in the new year before this are in            |
| 44034    |    | week 0. [ <i>tm_year</i> , <i>tm_wday</i> , <i>tm_yday</i> ]                                     |
| 44035    | %V | Replaced by the week number of the year (Monday as the first day of the week) as a               |
| 44036    |    | decimal number [01,53]. If the week containing 1 January has four or more days in the            |
| 44037    |    | new year, then it is considered week 1. Otherwise, it is the last week of the previous           |
| 44038    |    | year, and the next week is week 1. Both January 4th and the first Thursday of January            |
| 44039    |    | are always in week 1. [ <i>tm_year</i> , <i>tm_wday</i> , <i>tm_yday</i> ]                       |
| 44040    | %w | Replaced by the weekday as a decimal number [0,6], with 0 representing Sunday.                   |
| 44041    |    | [ <i>tm_wday</i> ]                                                                               |
| 44042    | %W | Replaced by the week number of the year as a decimal number [00,53]. The first                   |
| 44043    |    | Monday of January is the first day of week 1; days in the new year before this are in            |
| 44044    |    | week 0. [ <i>tm_year</i> , <i>tm_wday</i> , <i>tm_yday</i> ]                                     |
| 44045    | %x | Replaced by the locale's appropriate date representation. (See the Base Definitions              |
| 44046    |    | volume of IEEE Std 1003.1-2001, <time.h>.)                                                       |
| 44047    | %X | Replaced by the locale's appropriate time representation. (See the Base Definitions              |
| 44048    |    | volume of IEEE Std 1003.1-2001, <time.h>.)                                                       |
| 44049    | %y | Replaced by the last two digits of the year as a decimal number [00,99]. [ <i>tm_year</i> ]      |
| 44050    | %Y | Replaced by the year as a decimal number (for example, 1997). [ <i>tm_year</i> ]                 |
| 44051    | %z | Replaced by the offset from UTC in the ISO 8601:2000 standard format (+hhmm or                   |
| 44052    |    | -hhmm), or by no characters if no timezone is determinable. For example, "-0430"                 |
| 44053 CX |    | means 4 hours 30 minutes behind UTC (west of Greenwich). If <i>tm_isdst</i> is zero, the         |
| 44054    |    | standard time offset is used. If <i>tm_isdst</i> is greater than zero, the daylight savings time |
| 44055    |    | offset is used. If <i>tm_isdst</i> is negative, no characters are returned. [ <i>tm_isdst</i> ]  |

44056 %Z Replaced by the timezone name or abbreviation, or by no bytes if no timezone  
44057 information exists. [*tm\_isdst*]

44058 %% Replaced by %.

44059 If a conversion specification does not correspond to any of the above, the behavior is undefined.

#### 44060 **Modified Conversion Specifiers**

44061 Some conversion specifiers can be modified by the **E** or **O** modifier characters to indicate that an  
44062 alternative format or specification should be used rather than the one normally used by the  
44063 unmodified conversion specifier. If the alternative format or specification does not exist for the  
44064 current locale (see ERA in the Base Definitions volume of IEEE Std 1003.1-2001, Section 7.3.5,  
44065 LC\_TIME), the behavior shall be as if the unmodified conversion specification were used.

44066 %Ec Replaced by the locale's alternative appropriate date and time representation.

44067 %EC Replaced by the name of the base year (period) in the locale's alternative  
44068 representation.

44069 %Ex Replaced by the locale's alternative date representation.

44070 %EX Replaced by the locale's alternative time representation.

44071 %Ey Replaced by the offset from %EC (year only) in the locale's alternative representation.

44072 %EY Replaced by the full alternative year representation.

44073 %Od Replaced by the day of the month, using the locale's alternative numeric symbols, filled  
44074 as needed with leading zeros if there is any alternative symbol for zero; otherwise, with  
44075 leading spaces.

44076 %Oe Replaced by the day of the month, using the locale's alternative numeric symbols, filled  
44077 as needed with leading spaces.

44078 %OH Replaced by the hour (24-hour clock) using the locale's alternative numeric symbols.

44079 %OI Replaced by the hour (12-hour clock) using the locale's alternative numeric symbols.

44080 %Om Replaced by the month using the locale's alternative numeric symbols.

44081 %OM Replaced by the minutes using the locale's alternative numeric symbols.

44082 %OS Replaced by the seconds using the locale's alternative numeric symbols.

44083 %Ou Replaced by the weekday as a number in the locale's alternative representation  
44084 (Monday=1).

44085 %OU Replaced by the week number of the year (Sunday as the first day of the week, rules  
44086 corresponding to %U) using the locale's alternative numeric symbols.

44087 %OV Replaced by the week number of the year (Monday as the first day of the week, rules  
44088 corresponding to %V) using the locale's alternative numeric symbols.

44089 %Ow Replaced by the number of the weekday (Sunday=0) using the locale's alternative  
44090 numeric symbols.

44091 %OW Replaced by the week number of the year (Monday as the first day of the week) using  
44092 the locale's alternative numeric symbols.

44093 %Oy Replaced by the year (offset from %C) using the locale's alternative numeric symbols.

44094 %g, %G, and %V give values according to the ISO 8601:2000 standard week-based year. In this  
44095 system, weeks begin on a Monday and week 1 of the year is the week that includes January 4th,

44096 which is also the week that includes the first Thursday of the year, and is also the first week that  
 44097 contains at least four days in the year. If the first Monday of January is the 2nd, 3rd, or 4th, the  
 44098 preceding days are part of the last week of the preceding year; thus, for Saturday 2nd January  
 44099 1999, %G is replaced by 1998 and %V is replaced by 53. If December 29th, 30th, or 31st is a  
 44100 Monday, it and any following days are part of week 1 of the following year. Thus, for Tuesday  
 44101 30th December 1997, %G is replaced by 1998 and %V is replaced by 01.

44102 If a conversion specifier is not one of the above, the behavior is undefined.

#### 44103 RETURN VALUE

44104 If the total number of resulting bytes including the terminating null byte is not more than  
 44105 *maxsize*, *strptime()* shall return the number of bytes placed into the array pointed to by *s*, not  
 44106 including the terminating null byte. Otherwise, 0 shall be returned and the contents of the array  
 44107 are unspecified.

#### 44108 ERRORS

44109 No errors are defined.

#### 44110 EXAMPLES

##### 44111 Getting a Localized Date String

44112 The following example first sets the locale to the user's default. The locale information will be  
 44113 used in the *nl\_langinfo()* and *strptime()* functions. The *nl\_langinfo()* function returns the localized  
 44114 date string which specifies how the date is laid out. The *strptime()* function takes this information  
 44115 and, using the **tm** structure for values, places the date and time information into *datestring*.

```
44116 #include <time.h>
44117 #include <locale.h>
44118 #include <langinfo.h>
44119 ...
44120 struct tm *tm;
44121 char datestring[256];
44122 ...
44123 setlocale (LC_ALL, "");
44124 ...
44125 strptime (datestring, sizeof(datestring), nl_langinfo (D_T_FMT), tm);
44126 ...
```

#### 44127 APPLICATION USAGE

44128 The range of values for %S is [00,60] rather than [00,59] to allow for the occasional leap second.

44129 Some of the conversion specifications are duplicates of others. They are included for  
 44130 compatibility with *nl\_cxtime()* and *nl\_ascxtime()*, which were published in Issue 2.

44131 Applications should use %Y (4-digit years) in preference to %y (2-digit years).

44132 In the C locale, the E and O modifiers are ignored and the replacement strings for the following  
 44133 specifiers are:

|       |    |                                          |
|-------|----|------------------------------------------|
| 44134 | %a | The first three characters of %A.        |
| 44135 | %A | One of Sunday, Monday, ..., Saturday.    |
| 44136 | %b | The first three characters of %B.        |
| 44137 | %B | One of January, February, ..., December. |
| 44138 | %c | Equivalent to %a %b %e %T %Y.            |

|       |                                                                                                                                                                                          |                            |
|-------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------|

| 44172 | A new example is added.                                                                                                                                                                  |                            |

44173 **NAME**

44174        strlen — get string length

44175 **SYNOPSIS**

44176        #include &lt;string.h&gt;

44177        size\_t strlen(const char \*s);

44178 **DESCRIPTION**

44179 **CX**        The functionality described on this reference page is aligned with the ISO C standard. Any  
 44180 conflict between the requirements described here and the ISO C standard is unintentional. This  
 44181 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

44182        The *strlen()* function shall compute the number of bytes in the string to which *s* points, not  
 44183 including the terminating null byte.

44184 **RETURN VALUE**

44185        The *strlen()* function shall return the length of *s*; no return value shall be reserved to indicate an  
 44186 error.

44187 **ERRORS**

44188        No errors are defined.

44189 **EXAMPLES**44190        **Getting String Lengths**

44191        The following example sets the maximum length of *key* and *data* by using *strlen()* to get the  
 44192 lengths of those strings.

```

44193        #include <string.h>
44194        ...
44195        struct element {
44196            char *key;
44197            char *data;
44198        };
44199        ...
44200        char *key, *data;
44201        int len;

44202        *keylength = *datalength = 0;
44203        ...
44204        if ((len = strlen(key)) > *keylength)
44205            *keylength = len;
44206        if ((len = strlen(data)) > *datalength)
44207            *datalength = len;
44208        ...

```

44209 **APPLICATION USAGE**

44210        None.

44211 **RATIONALE**

44212        None.

44213 **FUTURE DIRECTIONS**

44214        None.

44215 **SEE ALSO**

44216 The Base Definitions volume of IEEE Std 1003.1-2001, <**string.h**>

44217 **CHANGE HISTORY**

44218 First released in Issue 1. Derived from Issue 1 of the SVID.

44219 **Issue 5**

44220 The RETURN VALUE section is updated to indicate that *strlen()* returns the length of *s*, and not

44221 *s* itself as was previously stated.

44222 **NAME**

44223 strncasecmp — case-insensitive string comparison

44224 **SYNOPSIS**44225 XSI `#include <strings.h>`44226 `int strncasecmp(const char *s1, const char *s2, size_t n);`

44227

44228 **DESCRIPTION**44229 Refer to *strcasecmp()*.

44230 **NAME**

44231 strncat — concatenate a string with part of another

44232 **SYNOPSIS**

44233 #include &lt;string.h&gt;

44234 char \*strncat(char \*restrict *s1*, const char \*restrict *s2*, size\_t *n*);44235 **DESCRIPTION**

44236 **CX** The functionality described on this reference page is aligned with the ISO C standard. Any  
44237 conflict between the requirements described here and the ISO C standard is unintentional. This  
44238 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

44239 The *strncat()* function shall append not more than *n* bytes (a null byte and bytes that follow it  
44240 are not appended) from the array pointed to by *s2* to the end of the string pointed to by *s1*. The  
44241 initial byte of *s2* overwrites the null byte at the end of *s1*. A terminating null byte is always  
44242 appended to the result. If copying takes place between objects that overlap, the behavior is  
44243 undefined.

44244 **RETURN VALUE**44245 The *strncat()* function shall return *s1*; no return value shall be reserved to indicate an error.44246 **ERRORS**

44247 No errors are defined.

44248 **EXAMPLES**

44249 None.

44250 **APPLICATION USAGE**

44251 None.

44252 **RATIONALE**

44253 None.

44254 **FUTURE DIRECTIONS**

44255 None.

44256 **SEE ALSO**44257 *strcat()*, the Base Definitions volume of IEEE Std 1003.1-2001, <**string.h**>44258 **CHANGE HISTORY**

44259 First released in Issue 1. Derived from Issue 1 of the SVID.

44260 **Issue 6**44261 The *strncat()* prototype is updated for alignment with the ISO/IEC 9899:1999 standard.

44262 **NAME**

44263 strncmp — compare part of two strings

44264 **SYNOPSIS**

44265 #include &lt;string.h&gt;

44266 int strncmp(const char \*s1, const char \*s2, size\_t n);

44267 **DESCRIPTION**

44268 **CX** The functionality described on this reference page is aligned with the ISO C standard. Any  
44269 conflict between the requirements described here and the ISO C standard is unintentional. This  
44270 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

44271 The *strncmp()* function shall compare not more than *n* bytes (bytes that follow a null byte are not  
44272 compared) from the array pointed to by *s1* to the array pointed to by *s2*.

44273 The sign of a non-zero return value is determined by the sign of the difference between the  
44274 values of the first pair of bytes (both interpreted as type **unsigned char**) that differ in the strings  
44275 being compared.

44276 **RETURN VALUE**

44277 Upon successful completion, *strncmp()* shall return an integer greater than, equal to, or less than  
44278 0, if the possibly null-terminated array pointed to by *s1* is greater than, equal to, or less than the  
44279 possibly null-terminated array pointed to by *s2* respectively.

44280 **ERRORS**

44281 No errors are defined.

44282 **EXAMPLES**

44283 None.

44284 **APPLICATION USAGE**

44285 None.

44286 **RATIONALE**

44287 None.

44288 **FUTURE DIRECTIONS**

44289 None.

44290 **SEE ALSO**44291 *strcmp()*, the Base Definitions volume of IEEE Std 1003.1-2001, <**string.h**>44292 **CHANGE HISTORY**

44293 First released in Issue 1. Derived from Issue 1 of the SVID.

44294 **Issue 6**

44295 Extensions beyond the ISO C standard are marked.

44296 **NAME**

44297       strncpy — copy part of a string

44298 **SYNOPSIS**

44299       #include &lt;string.h&gt;

44300       char \*strncpy(char \*restrict *s1*, const char \*restrict *s2*, size\_t *n*);44301 **DESCRIPTION**

44302 **CX**       The functionality described on this reference page is aligned with the ISO C standard. Any  
44303 conflict between the requirements described here and the ISO C standard is unintentional. This  
44304 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

44305       The *strncpy()* function shall copy not more than *n* bytes (bytes that follow a null byte are not  
44306 copied) from the array pointed to by *s2* to the array pointed to by *s1*. If copying takes place  
44307 between objects that overlap, the behavior is undefined.

44308       If the array pointed to by *s2* is a string that is shorter than *n* bytes, null bytes shall be appended  
44309 to the copy in the array pointed to by *s1*, until *n* bytes in all are written.

44310 **RETURN VALUE**44311       The *strncpy()* function shall return *s1*; no return value is reserved to indicate an error.44312 **ERRORS**

44313       No errors are defined.

44314 **EXAMPLES**

44315       None.

44316 **APPLICATION USAGE**

44317       Character movement is performed differently in different implementations. Thus, overlapping  
44318 moves may yield surprises.

44319       If there is no null byte in the first *n* bytes of the array pointed to by *s2*, the result is not null-  
44320 terminated.

44321 **RATIONALE**

44322       None.

44323 **FUTURE DIRECTIONS**

44324       None.

44325 **SEE ALSO**44326       *strcpy()*, the Base Definitions volume of IEEE Std 1003.1-2001, <**string.h**>44327 **CHANGE HISTORY**

44328       First released in Issue 1. Derived from Issue 1 of the SVID.

44329 **Issue 6**44330       The *strncpy()* prototype is updated for alignment with the ISO/IEC 9899:1999 standard.

44331 **NAME**

44332 strpbrk — scan a string for a byte

44333 **SYNOPSIS**

44334 #include &lt;string.h&gt;

44335 char \*strpbrk(const char \*s1, const char \*s2);

44336 **DESCRIPTION**

44337 cx The functionality described on this reference page is aligned with the ISO C standard. Any  
44338 conflict between the requirements described here and the ISO C standard is unintentional. This  
44339 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

44340 The *strpbrk()* function shall locate the first occurrence in the string pointed to by *s1* of any byte  
44341 from the string pointed to by *s2*.

44342 **RETURN VALUE**

44343 Upon successful completion, *strpbrk()* shall return a pointer to the byte or a null pointer if no  
44344 byte from *s2* occurs in *s1*.

44345 **ERRORS**

44346 No errors are defined.

44347 **EXAMPLES**

44348 None.

44349 **APPLICATION USAGE**

44350 None.

44351 **RATIONALE**

44352 None.

44353 **FUTURE DIRECTIONS**

44354 None.

44355 **SEE ALSO**44356 *strchr()*, *strchr()*, the Base Definitions volume of IEEE Std 1003.1-2001, <string.h>44357 **CHANGE HISTORY**

44358 First released in Issue 1. Derived from Issue 1 of the SVID.

## 44359 NAME

44360 strptime — date and time conversion

## 44361 SYNOPSIS

44362 XSI 

```
#include <time.h>
```

```
44363 char *strptime(const char *restrict buf, const char *restrict format,
44364               struct tm *restrict tm);
44365
```

## 44366 DESCRIPTION

44367 The *strptime()* function shall convert the character string pointed to by *buf* to values which are  
 44368 stored in the **tm** structure pointed to by *tm*, using the format specified by *format*.

44369 The *format* is composed of zero or more directives. Each directive is composed of one of the  
 44370 following: one or more white-space characters (as specified by *isspace()*); an ordinary character  
 44371 (neither '%' nor a white-space character); or a conversion specification. Each conversion  
 44372 specification is composed of a '%' character followed by a conversion character which specifies  
 44373 the replacement required. The application shall ensure that there is white-space or other non-  
 44374 alphanumeric characters between any two conversion specifications. The following conversion  
 44375 specifications are supported:

|       |    |                                                                                                                                                                                                     |
|-------|----|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 44376 | %a | The day of the week, using the locale's weekday names; either the abbreviated or full name may be specified.                                                                                        |
| 44377 |    |                                                                                                                                                                                                     |
| 44378 | %A | Equivalent to %a.                                                                                                                                                                                   |
| 44379 | %b | The month, using the locale's month names; either the abbreviated or full name may be specified.                                                                                                    |
| 44380 |    |                                                                                                                                                                                                     |
| 44381 | %B | Equivalent to %b.                                                                                                                                                                                   |
| 44382 | %c | Replaced by the locale's appropriate date and time representation.                                                                                                                                  |
| 44383 | %C | The century number [00,99]; leading zeros are permitted but not required.                                                                                                                           |
| 44384 | %d | The day of the month [01,31]; leading zeros are permitted but not required.                                                                                                                         |
| 44385 | %D | The date as %m/%d/%y.                                                                                                                                                                               |
| 44386 | %e | Equivalent to %d.                                                                                                                                                                                   |
| 44387 | %h | Equivalent to %b.                                                                                                                                                                                   |
| 44388 | %H | The hour (24-hour clock) [00,23]; leading zeros are permitted but not required.                                                                                                                     |
| 44389 | %I | The hour (12-hour clock) [01,12]; leading zeros are permitted but not required.                                                                                                                     |
| 44390 | %j | The day number of the year [001,366]; leading zeros are permitted but not required.                                                                                                                 |
| 44391 | %m | The month number [01,12]; leading zeros are permitted but not required.                                                                                                                             |
| 44392 | %M | The minute [00,59]; leading zeros are permitted but not required.                                                                                                                                   |
| 44393 | %n | Any white space.                                                                                                                                                                                    |
| 44394 | %p | The locale's equivalent of a.m or p.m.                                                                                                                                                              |
| 44395 | %r | 12-hour clock time using the AM/PM notation if <b>t_fmt_ampm</b> is not an empty string in the LC_TIME portion of the current locale; in the POSIX locale, this shall be equivalent to %I:%M:%S %p. |
| 44396 |    |                                                                                                                                                                                                     |
| 44397 |    |                                                                                                                                                                                                     |
| 44398 | %R | The time as %H:%M.                                                                                                                                                                                  |

|       |              |                                                                                                                                                                                                                                                                                       |
|-------|--------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 44399 | %S           | The seconds [00,60]; leading zeros are permitted but not required.                                                                                                                                                                                                                    |
| 44400 | %t           | Any white space.                                                                                                                                                                                                                                                                      |
| 44401 | %T           | The time as %H:%M:%S.                                                                                                                                                                                                                                                                 |
| 44402 | %U           | The week number of the year (Sunday as the first day of the week) as a decimal number [00,53]; leading zeros are permitted but not required.                                                                                                                                          |

| 44453 |                          |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| 44454 |                          | Any other conversion specification is executed by scanning characters until a character matching the next directive is scanned, or until no more characters can be scanned. These characters, except the one matching the next directive, are then compared to the locale values associated with the conversion specifier. If a match is found, values for the appropriate <b>tm</b> structure members are set to values corresponding to the locale information. Case is ignored when matching items in <i>buf</i> such as month or weekday names. If no match is found, <i>strptime()</i> fails and no more characters are scanned. |

| 44469 |                          | Several "equivalent to" formats and the special processing of white-space characters are provided in order to ease the use of identical <i>format</i> strings for <i>strftime()</i> and <i>strptime()</i> .                                                                                                                                                                                                                                                                                                                                                                                                                           |
| 44470 |                          |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| 44471 |                          | Applications should use %Y (4-digit years) in preference to %y (2-digit years).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| 44472 |                          | It is unspecified whether multiple calls to <i>strptime()</i> using the same <b>tm</b> structure will update the current contents of the structure or overwrite all contents of the structure. Conforming applications should make a single call to <i>strptime()</i> with a format and all data needed to completely specify the date and time being converted.                                                                                                                                                                                                                                                                      |
| 44473 |                          |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| 44474 |                          |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| 44475 |                          |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| 44476 | <b>RATIONALE</b>         |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| 44477 |                          | None.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

44478 **FUTURE DIRECTIONS**

44479           The *strptime()* function is expected to be mandatory in the next version of this volume of  
44480           IEEE Std 1003.1-2001.

44481 **SEE ALSO**

44482           *scanf()*, *strptime()*, *time()*, the Base Definitions volume of IEEE Std 1003.1-2001, <**time.h**>

44483 **CHANGE HISTORY**

44484           First released in Issue 4.

44485 **Issue 5**

44486           Moved from ENHANCED I18N to BASE.

44487           The [ENOSYS] error is removed.

44488           The exact meaning of the %y and %Oy specifiers is clarified in the DESCRIPTION.

44489 **Issue 6**

44490           The Open Group Corrigendum U033/5 is applied. The %r specifier description is reworded.

44491           The DESCRIPTION is updated to avoid use of the term “must” for application requirements.

44492           The **restrict** keyword is added to the *strptime()* prototype for alignment with the  
44493           ISO/IEC 9899:1999 standard.

44494           The Open Group Corrigendum U047/2 is applied.

44495           The DESCRIPTION is updated to use the terms “conversion specifier” and “conversion  
44496           specification” for consistency with *strptime()*.

44497 **NAME**

44498           strchr — string scanning operation

44499 **SYNOPSIS**

44500           #include &lt;string.h&gt;

44501           char \*strchr(const char \*s, int c);

44502 **DESCRIPTION**

44503 cx       The functionality described on this reference page is aligned with the ISO C standard. Any  
44504       conflict between the requirements described here and the ISO C standard is unintentional. This  
44505       volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

44506       The *strchr()* function shall locate the last occurrence of *c* (converted to a **char**) in the string  
44507       pointed to by *s*. The terminating null byte is considered to be part of the string.

44508 **RETURN VALUE**

44509       Upon successful completion, *strchr()* shall return a pointer to the byte or a null pointer if *c* does  
44510       not occur in the string.

44511 **ERRORS**

44512       No errors are defined.

44513 **EXAMPLES**44514           **Finding the Base Name of a File**

44515       The following example uses *strchr()* to get a pointer to the base name of a file. The *strchr()*  
44516       function searches backwards through the name of the file to find the last '/' character in *name*.  
44517       This pointer (plus one) will point to the base name of the file.

```
44518       #include <string.h>
44519       ...
44520       const char *name;
44521       char *basename;
44522       ...
44523       basename = strchr(name, '/') + 1;
44524       ...
```

44525 **APPLICATION USAGE**

44526       None.

44527 **RATIONALE**

44528       None.

44529 **FUTURE DIRECTIONS**

44530       None.

44531 **SEE ALSO**44532       *strchr()*, the Base Definitions volume of IEEE Std 1003.1-2001, <string.h>44533 **CHANGE HISTORY**

44534       First released in Issue 1. Derived from Issue 1 of the SVID.

44535 **NAME**

44536 strspn — get length of a substring

44537 **SYNOPSIS**

44538 #include &lt;string.h&gt;

44539 size\_t strspn(const char \*s1, const char \*s2);

44540 **DESCRIPTION**

44541 cx The functionality described on this reference page is aligned with the ISO C standard. Any  
44542 conflict between the requirements described here and the ISO C standard is unintentional. This  
44543 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

44544 The *strspn()* function shall compute the length (in bytes) of the maximum initial segment of the  
44545 string pointed to by *s1* which consists entirely of bytes from the string pointed to by *s2*.

44546 **RETURN VALUE**

44547 The *strspn()* function shall return the length of *s1*; no return value is reserved to indicate an  
44548 error.

44549 **ERRORS**

44550 No errors are defined.

44551 **EXAMPLES**

44552 None.

44553 **APPLICATION USAGE**

44554 None.

44555 **RATIONALE**

44556 None.

44557 **FUTURE DIRECTIONS**

44558 None.

44559 **SEE ALSO**44560 *strcspn()*, the Base Definitions volume of IEEE Std 1003.1-2001, <string.h>44561 **CHANGE HISTORY**

44562 First released in Issue 1. Derived from Issue 1 of the SVID.

44563 **Issue 5**

44564 The RETURN VALUE section is updated to indicate that *strspn()* returns the length of *s*, and not  
44565 *s* itself as was previously stated.

44566 **NAME**44567        **strstr** — find a substring44568 **SYNOPSIS**

44569        #include &lt;string.h&gt;

44570        char \*strstr(const char \*s1, const char \*s2);

44571 **DESCRIPTION**

44572 **CX**        The functionality described on this reference page is aligned with the ISO C standard. Any  
44573 conflict between the requirements described here and the ISO C standard is unintentional. This  
44574 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

44575        The *strstr()* function shall locate the first occurrence in the string pointed to by *s1* of the  
44576 sequence of bytes (excluding the terminating null byte) in the string pointed to by *s2*.

44577 **RETURN VALUE**

44578        Upon successful completion, *strstr()* shall return a pointer to the located string or a null pointer  
44579 if the string is not found.

44580        If *s2* points to a string with zero length, the function shall return *s1*.

44581 **ERRORS**

44582        No errors are defined.

44583 **EXAMPLES**

44584        None.

44585 **APPLICATION USAGE**

44586        None.

44587 **RATIONALE**

44588        None.

44589 **FUTURE DIRECTIONS**

44590        None.

44591 **SEE ALSO**44592        *strchr()*, the Base Definitions volume of IEEE Std 1003.1-2001, <**string.h**>44593 **CHANGE HISTORY**

44594        First released in Issue 3. Included for alignment with the ANSI C standard.

44595 **NAME**

44596 strtod, strtodf, strtold — convert a string to a double-precision number

44597 **SYNOPSIS**

44598 #include &lt;stdlib.h&gt;

44599 double strtod(const char \*restrict *nptr*, char \*\*restrict *endp*);44600 float strtodf(const char \*restrict *nptr*, char \*\*restrict *endp*);44601 long double strtold(const char \*restrict *nptr*, char \*\*restrict *endp*);44602 **DESCRIPTION**

44603 **CX** The functionality described on this reference page is aligned with the ISO C standard. Any  
 44604 conflict between the requirements described here and the ISO C standard is unintentional. This  
 44605 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

44606 These functions shall convert the initial portion of the string pointed to by *nptr* to **double**, **float**,  
 44607 and **long double** representation, respectively. First, they decompose the input string into three  
 44608 parts:

- 44609 1. An initial, possibly empty, sequence of white-space characters (as specified by *isspace()*)
- 44610 2. A subject sequence interpreted as a floating-point constant or representing infinity or NaN
- 44611 3. A final string of one or more unrecognized characters, including the terminating null byte  
 44612 of the input string

44613 Then they shall attempt to convert the subject sequence to a floating-point number, and return  
 44614 the result.

44615 The expected form of the subject sequence is an optional plus or minus sign, then one of the  
 44616 following:

- 44617 • A non-empty sequence of decimal digits optionally containing a radix character, then an  
 44618 optional exponent part
- 44619 • A 0x or 0X, then a non-empty sequence of hexadecimal digits optionally containing a radix  
 44620 character, then an optional binary exponent part
- 44621 • One of INF or INFINITY, ignoring case
- 44622 • One of NAN or NAN(*n-char-sequence<sub>opt</sub>*), ignoring case in the NAN part, where:

```

44623 n-char-sequence:
44624     digit
44625     nondigit
44626     n-char-sequence digit
44627     n-char-sequence nondigit
  
```

44628 The subject sequence is defined as the longest initial subsequence of the input string, starting  
 44629 with the first non-white-space character, that is of the expected form. The subject sequence  
 44630 contains no characters if the input string is not of the expected form.

44631 If the subject sequence has the expected form for a floating-point number, the sequence of  
 44632 characters starting with the first digit or the decimal-point character (whichever occurs first)  
 44633 shall be interpreted as a floating constant of the C language, except that the radix character shall  
 44634 be used in place of a period, and that if neither an exponent part nor a radix character appears in  
 44635 a decimal floating-point number, or if a binary exponent part does not appear in a hexadecimal  
 44636 floating-point number, an exponent part of the appropriate type with value zero is assumed to  
 44637 follow the last digit in the string. If the subject sequence begins with a minus sign, the sequence  
 44638 shall be interpreted as negated. A character sequence INF or INFINITY shall be interpreted as an

44639 infinity, if representable in the return type, else as if it were a floating constant that is too large  
 44640 for the range of the return type. A character sequence NAN or NAN(*n-char-sequence<sub>opt</sub>*) shall be  
 44641 interpreted as a quiet NaN, if supported in the return type, else as if it were a subject sequence  
 44642 part that does not have the expected form; the meaning of the *n-char* sequences is  
 44643 implementation-defined. A pointer to the final string is stored in the object pointed to by *endptr*,  
 44644 provided that *endptr* is not a null pointer.

44645 If the subject sequence has the hexadecimal form and FLT\_RADIX is a power of 2, the value  
 44646 resulting from the conversion is correctly rounded.

44647 CX The radix character is defined in the program's locale (category *LC\_NUMERIC*). In the POSIX  
 44648 locale, or in a locale where the radix character is not defined, the radix character shall default to a  
 44649 period ('.').

44650 CX In other than the C or POSIX locales, other implementation-defined subject sequences may be  
 44651 accepted.

44652 If the subject sequence is empty or does not have the expected form, no conversion shall be  
 44653 performed; the value of *str* is stored in the object pointed to by *endptr*, provided that *endptr* is not  
 44654 a null pointer.

44655 CX The *strtod()* function shall not change the setting of *errno* if successful.

44656 Since 0 is returned on error and is also a valid return on success, an application wishing to check  
 44657 for error situations should set *errno* to 0, then call *strtod()*, *strtof()*, or *strtold()*, then check *errno*.

#### 44658 RETURN VALUE

44659 Upon successful completion, these functions shall return the converted value. If no conversion  
 44660 could be performed, 0 shall be returned, and *errno* may be set to [EINVAL].

44661 If the correct value is outside the range of representable values, HUGE\_VAL, HUGE\_VALF, or  
 44662 HUGE\_VALL shall be returned (according to the sign of the value), and *errno* shall be set to  
 44663 [ERANGE].

44664 If the correct value would cause an underflow, a value whose magnitude is no greater than the  
 44665 smallest normalized positive number in the return type shall be returned and *errno* set to  
 44666 [ERANGE].

#### 44667 ERRORS

44668 These functions shall fail if:

44669 CX [ERANGE] The value to be returned would cause overflow or underflow.

44670 These functions may fail if:

44671 CX [EINVAL] No conversion could be performed.

#### 44672 EXAMPLES

44673 None.

#### 44674 APPLICATION USAGE

44675 If the subject sequence has the hexadecimal form and FLT\_RADIX is not a power of 2, and the  
 44676 result is not exactly representable, the result should be one of the two numbers in the  
 44677 appropriate internal format that are adjacent to the hexadecimal floating source value, with the  
 44678 extra stipulation that the error should have a correct sign for the current rounding direction.

44679 If the subject sequence has the decimal form and at most DECIMAL\_DIG (defined in <float.h>)  
 44680 significant digits, the result should be correctly rounded. If the subject sequence *D* has the  
 44681 decimal form and more than DECIMAL\_DIG significant digits, consider the two bounding,  
 44682 adjacent decimal strings *L* and *U*, both having DECIMAL\_DIG significant digits, such that the

44683 values of  $L$ ,  $D$ , and  $U$  satisfy  $L \leq D \leq U$ . The result should be one of the (equal or adjacent)  
 44684 values that would be obtained by correctly rounding  $L$  and  $U$  according to the current rounding  
 44685 direction, with the extra stipulation that the error with respect to  $D$  should have a correct sign  
 44686 for the current rounding direction.

44687 The changes to `strtod()` introduced by the ISO/IEC 9899:1999 standard can alter the behavior of  
 44688 well-formed applications complying with the ISO/IEC 9899:1990 standard and thus earlier  
 44689 versions of the base documents. One such example would be:

```

44690 int
44691 what_kind_of_number (char *s)
44692 {
44693     char *endp;
44694     double d;
44695     long l;

44696     d = strtod(s, &endp);
44697     if (s != endp && *endp == '\0')
44698         printf("It's a float with value %g\n", d);
44699     else
44700     {
44701         l = strtol(s, &endp, 0);
44702         if (s != endp && *endp == '\0')
44703             printf("It's an integer with value %ld\n", l);
44704         else
44705             return 1;
44706     }
44707     return 0;
44708 }
```

44709 If the function is called with:

```
44710 what_kind_of_number ("0x10")
```

44711 an ISO/IEC 9899:1990 standard-compliant library will result in the function printing:

```
44712 It's an integer with value 16
```

44713 With the ISO/IEC 9899:1999 standard, the result is:

```
44714 It's a float with value 16
```

44715 The change in behavior is due to the inclusion of floating-point numbers in hexadecimal  
 44716 notation without requiring that either a decimal point or the binary exponent be present.

#### 44717 RATIONALE

44718 None.

#### 44724 CHANGE HISTORY

44725 First released in Issue 1. Derived from Issue 1 of the SVID.

44726 **Issue 5**

44727 The DESCRIPTION is updated to indicate that *errno* is not changed if the function is successful.

44728 **Issue 6**

44729 Extensions beyond the ISO C standard are marked.

44730 The following new requirements on POSIX implementations derive from alignment with the  
44731 Single UNIX Specification:

- 44732 • In the RETURN VALUE and ERRORS sections, the [EINVAL] optional error condition is  
44733 added if no conversion could be performed.

44734 The following changes are made for alignment with the ISO/IEC 9899:1999 standard:

- 44735 • The *strtod()* function is updated.
- 44736 • The *strtof()* and *strtold()* functions are added.
- 44737 • The DESCRIPTION is extensively revised.

44738 ISO/IEC 9899:1999 standard, Technical Corrigendum No. 1 is incorporated.

44739 **NAME**

44740 strtoimax, strtoumax — convert string to integer type

44741 **SYNOPSIS**

44742 #include <inttypes.h>

44743 intmax\_t strtoimax(const char \*restrict *nptr*, char \*\*restrict *endptr*,  
44744 int *base*);

44745 uintmax\_t strtoumax(const char \*restrict *nptr*, char \*\*restrict *endptr*,  
44746 int *base*);

44747 **DESCRIPTION**

44748 **CX** The functionality described on this reference page is aligned with the ISO C standard. Any  
44749 conflict between the requirements described here and the ISO C standard is unintentional. This  
44750 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

44751 These functions shall be equivalent to the *strtol()*, *strtoll()*, *strtoul()*, and *strtoull()* functions,  
44752 except that the initial portion of the string shall be converted to **intmax\_t** and **uintmax\_t**  
44753 representation, respectively.

44754 **RETURN VALUE**

44755 These functions shall return the converted value, if any.

44756 If no conversion could be performed, zero shall be returned.

44757 If the correct value is outside the range of representable values, {INTMAX\_MAX},  
44758 {INTMAX\_MIN}, or {UINTMAX\_MAX} shall be returned (according to the return type and sign  
44759 of the value, if any), and *errno* shall be set to [ERANGE].

44760 **ERRORS**

44761 These functions shall fail if:

44762 [ERANGE] The value to be returned is not representable.

44763 These functions may fail if:

44764 [EINVAL] The value of *base* is not supported.

44765 **EXAMPLES**

44766 None.

44767 **APPLICATION USAGE**

44768 None.

44769 **RATIONALE**

44770 None.

44774 *strtol()*, *strtoul()*, the Base Definitions volume of IEEE Std 1003.1-2001, <inttypes.h>

44775 **CHANGE HISTORY**

44776 First released in Issue 6. Derived from the ISO/IEC 9899:1999 standard.

## 44777 NAME

44778        strtok, strtok\_r — split string into tokens

## 44779 SYNOPSIS

44780        #include &lt;string.h&gt;

44781        char \*strtok(char \*restrict s1, const char \*restrict s2);

44782 TSF     char \*strtok\_r(char \*restrict s, const char \*restrict sep,

44783        char \*\*restrict lasts);

44784

## 44785 DESCRIPTION

44786 CX     For *strtok()*: The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

44789        A sequence of calls to *strtok()* breaks the string pointed to by *s1* into a sequence of tokens, each of which is delimited by a byte from the string pointed to by *s2*. The first call in the sequence has *s1* as its first argument, and is followed by calls with a null pointer as their first argument. The separator string pointed to by *s2* may be different from call to call.

44793        The first call in the sequence searches the string pointed to by *s1* for the first byte that is *not* contained in the current separator string pointed to by *s2*. If no such byte is found, then there are no tokens in the string pointed to by *s1* and *strtok()* shall return a null pointer. If such a byte is found, it is the start of the first token.

44797        The *strtok()* function then searches from there for a byte that *is* contained in the current separator string. If no such byte is found, the current token extends to the end of the string pointed to by *s1*, and subsequent searches for a token shall return a null pointer. If such a byte is found, it is overwritten by a null byte, which terminates the current token. The *strtok()* function saves a pointer to the following byte, from which the next search for a token shall start.

44802        Each subsequent call, with a null pointer as the value of the first argument, starts searching from the saved pointer and behaves as described above.

44804        The implementation shall behave as if no function defined in this volume of IEEE Std 1003.1-2001 calls *strtok()*.

44806 CX     The *strtok()* function need not be reentrant. A function that is not required to be reentrant is not required to be thread-safe.

44808 TSF     The *strtok\_r()* function considers the null-terminated string *s* as a sequence of zero or more text tokens separated by spans of one or more characters from the separator string *sep*. The argument *lasts* points to a user-provided pointer which points to stored information necessary for *strtok\_r()* to continue scanning the same string.

44812        In the first call to *strtok\_r()*, *s* points to a null-terminated string, *sep* to a null-terminated string of separator characters, and the value pointed to by *lasts* is ignored. The *strtok\_r()* function shall return a pointer to the first character of the first token, write a null character into *s* immediately following the returned token, and update the pointer to which *lasts* points.

44816        In subsequent calls, *s* is a NULL pointer and *lasts* shall be unchanged from the previous call so that subsequent calls shall move through the string *s*, returning successive tokens until no tokens remain. The separator string *sep* may be different from call to call. When no token remains in *s*, a NULL pointer shall be returned.

44820 **RETURN VALUE**

44821 Upon successful completion, *strtok()* shall return a pointer to the first byte of a token. Otherwise,  
44822 if there is no token, *strtok()* shall return a null pointer.

44823 TSF The *strtok\_r()* function shall return a pointer to the token found, or a NULL pointer when no  
44824 token is found.

44825 **ERRORS**

44826 No errors are defined.

44827 **EXAMPLES**44828 **Searching for Word Separators**

44829 The following example searches for tokens separated by <space>s.

```
44830 #include <string.h>
44831 ...
44832 char *token;
44833 char *line = "LINE TO BE SEPARATED";
44834 char *search = " ";

44835 /* Token will point to "LINE". */
44836 token = strtok(line, search);

44837 /* Token will point to "TO". */
44838 token = strtok(NULL, search);
```

44839 **Breaking a Line**

44840 The following example uses *strtok()* to break a line into two character strings separated by any  
44841 combination of <space>s, <tab>s, or <newline>s.

```
44842 #include <string.h>
44843 ...
44844 struct element {
44845     char *key;
44846     char *data;
44847 };
44848 ...
44849 char line[LINE_MAX];
44850 char *key, *data;
44851 ...
44852 key = strtok(line, " \n");
44853 data = strtok(NULL, " \n");
44854 ...
```

44855 **APPLICATION USAGE**

44856 The *strtok\_r()* function is thread-safe and stores its state in a user-supplied buffer instead of  
44857 possibly using a static data area that may be overwritten by an unrelated call from another  
44858 thread.

44859 **RATIONALE**

44860 The *strtok()* function searches for a separator string within a larger string. It returns a pointer to  
44861 the last substring between separator strings. This function uses static storage to keep track of  
44862 the current string position between calls. The new function, *strtok\_r()*, takes an additional  
44863 argument, *lasts*, to keep track of the current position in the string.

44864 **FUTURE DIRECTIONS**

44865 None.

44866 **SEE ALSO**44867 The Base Definitions volume of IEEE Std 1003.1-2001, <**string.h**>44868 **CHANGE HISTORY**

44869 First released in Issue 1. Derived from Issue 1 of the SVID.

44870 **Issue 5**44871 The *strtok\_r()* function is included for alignment with the POSIX Threads Extension.44872 A note indicating that the *strtok()* function need not be reentrant is added to the DESCRIPTION.44873 **Issue 6**

44874 Extensions beyond the ISO C standard are marked.

44875 The *strtok\_r()* function is marked as part of the Thread-Safe Functions option.

44876 In the DESCRIPTION, the note about reentrancy is expanded to cover thread-safety.

44877 The APPLICATION USAGE section is updated to include a note on the thread-safe function and

44878 its avoidance of possibly using a static data area.

44879 The **restrict** keyword is added to the *strtok()* and *strtok\_r()* prototypes for alignment with the

44880 ISO/IEC 9899:1999 standard.

## 44881 NAME

44882        strtol, strtoll — convert a string to a long integer

## 44883 SYNOPSIS

44884        #include &lt;stdlib.h&gt;

44885        long strtol(const char \*restrict *str*, char \*\*restrict *endptr*, int *base*);44886        long long strtoll(const char \*restrict *str*, char \*\*restrict *endptr*,44887           int *base*)

## 44888 DESCRIPTION

44889 cx     The functionality described on this reference page is aligned with the ISO C standard. Any  
 44890     conflict between the requirements described here and the ISO C standard is unintentional. This  
 44891     volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

44892     These functions shall convert the initial portion of the string pointed to by *str* to a type **long** and  
 44893     **long long** representation, respectively. First, they decompose the input string into three parts:

- 44894        1. An initial, possibly empty, sequence of white-space characters (as specified by *isspace()*)
- 44895        2. A subject sequence interpreted as an integer represented in some radix determined by the  
 44896         value of *base*
- 44897        3. A final string of one or more unrecognized characters, including the terminating null byte  
 44898         of the input string.

44899     Then they shall attempt to convert the subject sequence to an integer, and return the result.

44900     If the value of *base* is 0, the expected form of the subject sequence is that of a decimal constant,  
 44901     octal constant, or hexadecimal constant, any of which may be preceded by a '+' or '-' sign. A  
 44902     decimal constant begins with a non-zero digit, and consists of a sequence of decimal digits. An  
 44903     octal constant consists of the prefix '0' optionally followed by a sequence of the digits '0' to  
 44904     '7' only. A hexadecimal constant consists of the prefix 0x or 0X followed by a sequence of the  
 44905     decimal digits and letters 'a' (or 'A') to 'f' (or 'F') with values 10 to 15 respectively.

44906     If the value of *base* is between 2 and 36, the expected form of the subject sequence is a sequence  
 44907     of letters and digits representing an integer with the radix specified by *base*, optionally preceded  
 44908     by a '+' or '-' sign. The letters from 'a' (or 'A') to 'z' (or 'Z') inclusive are ascribed the  
 44909     values 10 to 35; only letters whose ascribed values are less than that of *base* are permitted. If the  
 44910     value of *base* is 16, the characters 0x or 0X may optionally precede the sequence of letters and  
 44911     digits, following the sign if present.

44912     The subject sequence is defined as the longest initial subsequence of the input string, starting  
 44913     with the first non-white-space character that is of the expected form. The subject sequence shall  
 44914     contain no characters if the input string is empty or consists entirely of white-space characters,  
 44915     or if the first non-white-space character is other than a sign or a permissible letter or digit.

44916     If the subject sequence has the expected form and the value of *base* is 0, the sequence of  
 44917     characters starting with the first digit shall be interpreted as an integer constant. If the subject  
 44918     sequence has the expected form and the value of *base* is between 2 and 36, it shall be used as the  
 44919     base for conversion, ascribing to each letter its value as given above. If the subject sequence  
 44920     begins with a minus sign, the value resulting from the conversion shall be negated. A pointer to  
 44921     the final string shall be stored in the object pointed to by *endptr*, provided that *endptr* is not a null  
 44922     pointer.

44923 cx     In other than the C or POSIX locales, other implementation-defined subject sequences may be  
 44924     accepted.

44925 If the subject sequence is empty or does not have the expected form, no conversion is performed;  
 44926 the value of *str* is stored in the object pointed to by *endptr*, provided that *endptr* is not a null  
 44927 pointer.

44928 CX The *strtol()* function shall not change the setting of *errno* if successful.

44929 Since 0, {LONG\_MIN} or {LLONG\_MIN}, and {LONG\_MAX} or {LLONG\_MAX} are returned on  
 44930 error and are also valid returns on success, an application wishing to check for error situations  
 44931 should set *errno* to 0, then call *strtol()* or *strtoll()*, then check *errno*.

#### 44932 RETURN VALUE

44933 Upon successful completion, these functions shall return the converted value, if any. If no  
 44934 CX conversion could be performed, 0 shall be returned and *errno* may be set to [EINVAL].

44935 If the correct value is outside the range of representable values, {LONG\_MIN}, {LONG\_MAX},  
 44936 {LLONG\_MIN}, or {LLONG\_MAX} shall be returned (according to the sign of the value), and  
 44937 *errno* set to [ERANGE].

#### 44938 ERRORS

44939 These functions shall fail if:

44940 [ERANGE] The value to be returned is not representable.

44941 These functions may fail if:

44942 CX [EINVAL] The value of *base* is not supported.

#### 44943 EXAMPLES

44944 None.

#### 44945 APPLICATION USAGE

44946 None.

#### 44947 RATIONALE

44948 None.

#### 44949 FUTURE DIRECTIONS

44950 None.

#### 44951 SEE ALSO

44952 *isalpha()*, *scanf()*, *strtod()*, the Base Definitions volume of IEEE Std 1003.1-2001, <stdlib.h>

#### 44953 CHANGE HISTORY

44954 First released in Issue 1. Derived from Issue 1 of the SVID.

#### 44955 Issue 5

44956 The DESCRIPTION is updated to indicate that *errno* is not changed if the function is successful.

#### 44957 Issue 6

44958 Extensions beyond the ISO C standard are marked.

44959 The following new requirements on POSIX implementations derive from alignment with the  
 44960 Single UNIX Specification:

44961 • In the RETURN VALUE and ERRORS sections, the [EINVAL] optional error condition is  
 44962 added if no conversion could be performed.

44963 The following changes are made for alignment with the ISO/IEC 9899:1999 standard:

44964 • The *strtol()* prototype is updated.

44965 • The *strtoll()* function is added.

44966 **NAME**44967        **strtold** — convert a string to a double-precision number44968 **SYNOPSIS**

44969        #include &lt;stdlib.h&gt;

44970        long double strtold(const char \*restrict *nptr*, char \*\*restrict *endptr*);44971 **DESCRIPTION**44972        Refer to *strtod()*.

44973 **NAME**44974            **strtoll** — convert a string to a long integer44975 **SYNOPSIS**

44976            #include &lt;stdlib.h&gt;

44977            long long strtoll(const char \*restrict *str*, char \*\*restrict *endptr*,  
44978                               int *base*);44979 **DESCRIPTION**44980            Refer to *strtol()*.

## 44981 NAME

44982 strtoul, strtoull — convert a string to an unsigned long

## 44983 SYNOPSIS

44984 #include &lt;stdlib.h&gt;

44985 unsigned long strtoul(const char \*restrict str,  
44986 char \*\*restrict endptr, int base);44987 unsigned long long strtoull(const char \*restrict str,  
44988 char \*\*restrict endptr, int base);

## 44989 DESCRIPTION

44990 cx The functionality described on this reference page is aligned with the ISO C standard. Any  
44991 conflict between the requirements described here and the ISO C standard is unintentional. This  
44992 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.44993 These functions shall convert the initial portion of the string pointed to by *str* to a type **unsigned**  
44994 **long** and **unsigned long long** representation, respectively. First, they decompose the input  
44995 string into three parts:

- 44996 1. An initial, possibly empty, sequence of white-space characters (as specified by *isspace()*)
- 44997 2. A subject sequence interpreted as an integer represented in some radix determined by the  
44998 value of *base*
- 44999 3. A final string of one or more unrecognized characters, including the terminating null byte  
45000 of the input string

45001 Then they shall attempt to convert the subject sequence to an unsigned integer, and return the  
45002 result.45003 If the value of *base* is 0, the expected form of the subject sequence is that of a decimal constant,  
45004 octal constant, or hexadecimal constant, any of which may be preceded by a '+' or '-' sign. A  
45005 decimal constant begins with a non-zero digit, and consists of a sequence of decimal digits. An  
45006 octal constant consists of the prefix '0' optionally followed by a sequence of the digits '0' to  
45007 '7' only. A hexadecimal constant consists of the prefix 0x or 0X followed by a sequence of the  
45008 decimal digits and letters 'a' (or 'A') to 'f' (or 'F') with values 10 to 15 respectively.45009 If the value of *base* is between 2 and 36, the expected form of the subject sequence is a sequence  
45010 of letters and digits representing an integer with the radix specified by *base*, optionally preceded  
45011 by a '+' or '-' sign. The letters from 'a' (or 'A') to 'z' (or 'Z') inclusive are ascribed the  
45012 values 10 to 35; only letters whose ascribed values are less than that of *base* are permitted. If the  
45013 value of *base* is 16, the characters 0x or 0X may optionally precede the sequence of letters and  
45014 digits, following the sign if present.45015 The subject sequence is defined as the longest initial subsequence of the input string, starting  
45016 with the first non-white-space character that is of the expected form. The subject sequence shall  
45017 contain no characters if the input string is empty or consists entirely of white-space characters,  
45018 or if the first non-white-space character is other than a sign or a permissible letter or digit.45019 If the subject sequence has the expected form and the value of *base* is 0, the sequence of  
45020 characters starting with the first digit shall be interpreted as an integer constant. If the subject  
45021 sequence has the expected form and the value of *base* is between 2 and 36, it shall be used as the  
45022 base for conversion, ascribing to each letter its value as given above. If the subject sequence  
45023 begins with a minus sign, the value resulting from the conversion shall be negated. A pointer to  
45024 the final string shall be stored in the object pointed to by *endptr*, provided that *endptr* is not a null  
45025 pointer.

45026 CX In other than the C or POSIX locales, other implementation-defined subject sequences may be  
45027 accepted.

45028 If the subject sequence is empty or does not have the expected form, no conversion shall be  
45029 performed; the value of *str* shall be stored in the object pointed to by *endptr*, provided that *endptr*  
45030 is not a null pointer.

45031 CX The *strtol()* function shall not change the setting of *errno* if successful.

45032 Since 0, {ULONG\_MAX}, and {ULLONG\_MAX} are returned on error and are also valid returns  
45033 on success, an application wishing to check for error situations should set *errno* to 0, then call  
45034 *strtol()* or *strtoll()*, then check *errno*.

#### 45035 RETURN VALUE

45036 Upon successful completion, these functions shall return the converted value, if any. If no  
45037 CX conversion could be performed, 0 shall be returned and *errno* may be set to [EINVAL]. If the  
45038 correct value is outside the range of representable values, {ULONG\_MAX} or {ULLONG\_MAX}  
45039 shall be returned and *errno* set to [ERANGE].

#### 45040 ERRORS

45041 These functions shall fail if:

45042 CX [EINVAL] The value of *base* is not supported.

45043 [ERANGE] The value to be returned is not representable.

45044 These functions may fail if:

45045 CX [EINVAL] No conversion could be performed.

#### 45046 EXAMPLES

45047 None.

#### 45048 APPLICATION USAGE

45049 None.

#### 45050 RATIONALE

45051 None.

#### 45052 FUTURE DIRECTIONS

45053 None.

#### 45054 SEE ALSO

45055 *isalpha()*, *scanf()*, *strtod()*, *strtol()*, the Base Definitions volume of IEEE Std 1003.1-2001,  
45056 <stdlib.h>

#### 45057 CHANGE HISTORY

45058 First released in Issue 4. Derived from the ANSI C standard.

#### 45059 Issue 5

45060 The DESCRIPTION is updated to indicate that *errno* is not changed if the function is successful.

#### 45061 Issue 6

45062 Extensions beyond the ISO C standard are marked.

45063 The following new requirements on POSIX implementations derive from alignment with the  
45064 Single UNIX Specification:

- 45065 • The [EINVAL] error condition is added for when the value of *base* is not supported.

45066 In the RETURN VALUE and ERRORS sections, the [EINVAL] optional error condition is  
45067 added if no conversion could be performed.

- 45068        The following changes are made for alignment with the ISO/IEC 9899:1999 standard:
- 45069        • The *strtoul()* prototype is updated.
- 45070        • The *strtoull()* function is added.

45071 **NAME**

45072        **strtoumax** — convert a string to an integer type

45073 **SYNOPSIS**

45074        #include <inttypes.h>

45075        uintmax\_t strtoumax(const char \*restrict *nptr*, char \*\*restrict *endptr*,  
45076                            int *base*);

45077 **DESCRIPTION**

45078        Refer to *strtoimax()*.

45079 **NAME**

45080 strxfrm — string transformation

45081 **SYNOPSIS**

45082 #include &lt;string.h&gt;

45083 size\_t strxfrm(char \*restrict *s1*, const char \*restrict *s2*, size\_t *n*);45084 **DESCRIPTION**

45085 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
45086 conflict between the requirements described here and the ISO C standard is unintentional. This  
45087 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

45088 The *strxfrm()* function shall transform the string pointed to by *s2* and place the resulting string  
45089 into the array pointed to by *s1*. The transformation is such that if *strcmp()* is applied to two  
45090 transformed strings, it shall return a value greater than, equal to, or less than 0, corresponding to  
45091 the result of *strcoll()* applied to the same two original strings. No more than *n* bytes are placed  
45092 into the resulting array pointed to by *s1*, including the terminating null byte. If *n* is 0, *s1*  
45093 is permitted to be a null pointer. If copying takes place between objects that overlap, the behavior  
45094 is undefined.

45095 CX The *strxfrm()* function shall not change the setting of *errno* if successful.

45096 Since no return value is reserved to indicate an error, an application wishing to check for error  
45097 situations should set *errno* to 0, then call *strxfrm()*, then check *errno*.

45098 **RETURN VALUE**

45099 Upon successful completion, *strxfrm()* shall return the length of the transformed string (not  
45100 including the terminating null byte). If the value returned is *n* or more, the contents of the array  
45101 pointed to by *s1* are unspecified.

45102 CX On error, *strxfrm()* may set *errno* but no return value is reserved to indicate an error.

45103 **ERRORS**

45104 The *strxfrm()* function may fail if:

45105 CX [EINVAL] The string pointed to by the *s2* argument contains characters outside the  
45106 domain of the collating sequence.

45107 **EXAMPLES**

45108 None.

45109 **APPLICATION USAGE**

45110 The transformation function is such that two transformed strings can be ordered by *strcmp()* as  
45111 appropriate to collating sequence information in the program's locale (category *LC\_COLLATE*).

45112 The fact that when *n* is 0 *s1* is permitted to be a null pointer is useful to determine the size of the  
45113 *s1* array prior to making the transformation.

45114 **RATIONALE**

45115 None.

45116 **FUTURE DIRECTIONS**

45117 None.

45118 **SEE ALSO**

45119 *strcmp()*, *strcoll()*, the Base Definitions volume of IEEE Std 1003.1-2001, <string.h>

45120 **CHANGE HISTORY**

45121 First released in Issue 3. Included for alignment with the ISO C standard.

45122 **Issue 5**

45123 The DESCRIPTION is updated to indicate that *errno* does not change if the function is  
45124 successful.

45125 **Issue 6**

45126 Extensions beyond the ISO C standard are marked.

45127 The following new requirements on POSIX implementations derive from alignment with the  
45128 Single UNIX Specification:

- 45129 • In the RETURN VALUE and ERRORS sections, the [EINVAL] optional error condition is  
45130 added if no conversion could be performed.

45131 The *strxfrm()* prototype is updated for alignment with the ISO/IEC 9899:1999 standard.

45132 **NAME**

45133 swab — swap bytes

45134 **SYNOPSIS**45135 XSI 

```
#include <unistd.h>
```

45136 

```
void swab(const void *restrict src, void *restrict dest,  
45137         ssize_t nbytes);
```

45138

45139 **DESCRIPTION**

45140 The *swab()* function shall copy *nbytes* bytes, which are pointed to by *src*, to the object pointed to  
45141 by *dest*, exchanging adjacent bytes. The *nbytes* argument should be even. If *nbytes* is odd, *swab()*  
45142 copies and exchanges *nbytes*–1 bytes and the disposition of the last byte is unspecified. If  
45143 copying takes place between objects that overlap, the behavior is undefined. If *nbytes* is  
45144 negative, *swab()* does nothing.

45145 **RETURN VALUE**

45146 None.

45147 **ERRORS**

45148 No errors are defined.

45149 **EXAMPLES**

45150 None.

45151 **APPLICATION USAGE**

45152 None.

45153 **RATIONALE**

45154 None.

45155 **FUTURE DIRECTIONS**

45156 None.

45157 **SEE ALSO**45158 The Base Definitions volume of IEEE Std 1003.1-2001, <**unistd.h**>45159 **CHANGE HISTORY**

45160 First released in Issue 1. Derived from Issue 1 of the SVID.

45161 **Issue 6**

45162 The **restrict** keyword is added to the *swab()* prototype for alignment with the  
45163 ISO/IEC 9899:1999 standard.

45164 **NAME**

45165        swapcontext — swap user context

45166 **SYNOPSIS**

45167 XSI        `#include <ucontext.h>`

```
45168        int swapcontext(ucontext_t *restrict oucp,  
45169                      const ucontext_t *restrict ucp);
```

45170

45171 **DESCRIPTION**

45172        Refer to *makecontext()*.

45173 **NAME**

45174 swprintf — print formatted wide-character output

45175 **SYNOPSIS**

45176 #include &lt;stdio.h&gt;

45177 #include &lt;wchar.h&gt;

45178 int swprintf(wchar\_t \*restrict *ws*, size\_t *n*,45179 const wchar\_t \*restrict *format*, ...);45180 **DESCRIPTION**45181 Refer to *fwprintf()*.

45182 **NAME**

45183       swscanf — convert formatted wide-character input

45184 **SYNOPSIS**

45185       #include &lt;stdio.h&gt;

45186       #include &lt;wchar.h&gt;

45187       int swscanf(const wchar\_t \*restrict *ws*,45188                 const wchar\_t \*restrict *format*, ... );45189 **DESCRIPTION**45190       Refer to *fwscanf()*.

45191 **NAME**

45192            symlink — make a symbolic link to a file

45193 **SYNOPSIS**

45194            #include &lt;unistd.h&gt;

45195            int symlink(const char \*path1, const char \*path2);

45196 **DESCRIPTION**45197            The *symlink()* function shall create a symbolic link called *path2* that contains the string pointed  
45198            to by *path1* (*path2* is the name of the symbolic link created, *path1* is the string contained in the  
45199            symbolic link).45200            The string pointed to by *path1* shall be treated only as a character string and shall not be  
45201            validated as a pathname.45202            If the *symlink()* function fails for any reason other than [EIO], any file named by *path2* shall be  
45203            unaffected.45204 **RETURN VALUE**45205            Upon successful completion, *symlink()* shall return 0; otherwise, it shall return -1 and set *errno* to  
45206            indicate the error.45207 **ERRORS**45208            The *symlink()* function shall fail if:45209            [EACCES]            Write permission is denied in the directory where the symbolic link is being  
45210            created, or search permission is denied for a component of the path prefix of  
45211            *path2*.45212            [EEXIST]            The *path2* argument names an existing file or symbolic link.

45213            [EIO]                An I/O error occurs while reading from or writing to the file system.

45214            [ELOOP]            A loop exists in symbolic links encountered during resolution of the *path2*  
45215            argument.45216            [ENAMETOOLONG]      The length of the *path2* argument exceeds {PATH\_MAX} or a pathname  
45217            component is longer than {NAME\_MAX} or the length of the *path1* argument  
45218            is longer than {SYMLINK\_MAX}.  
4521945220            [ENOENT]            A component of *path2* does not name an existing file or *path2* is an empty  
45221            string.45222            [ENOSPC]            The directory in which the entry for the new symbolic link is being placed  
45223            cannot be extended because no space is left on the file system containing the  
45224            directory, or the new symbolic link cannot be created because no space is left  
45225            on the file system which shall contain the link, or the file system is out of file-  
45226            allocation resources.45227            [ENOTDIR]           A component of the path prefix of *path2* is not a directory.

45228            [EROFS]             The new symbolic link would reside on a read-only file system.

45229            The *symlink()* function may fail if:45230            [ELOOP]             More than {SYMLOOP\_MAX} symbolic links were encountered during  
45231            resolution of the *path2* argument.45232            [ENAMETOOLONG]      As a result of encountering a symbolic link in resolution of the *path2*  
45233

45234 argument, the length of the substituted pathname string exceeded  
45235 {PATH\_MAX} bytes (including the terminating null byte), or the length of the  
45236 string pointed to by *path1* exceeded {SYMLINK\_MAX}.

**45237 EXAMPLES**

45238 None.

**45239 APPLICATION USAGE**

45240 Like a hard link, a symbolic link allows a file to have multiple logical names. The presence of a  
45241 hard link guarantees the existence of a file, even after the original name has been removed. A  
45242 symbolic link provides no such assurance; in fact, the file named by the *path1* argument need not  
45243 exist when the link is created. A symbolic link can cross file system boundaries.

45244 Normal permission checks are made on each component of the symbolic link pathname during  
45245 its resolution.

**45246 RATIONALE**

45247 Since IEEE Std 1003.1-2001 does not require any association of file times with symbolic links,  
45248 there is no requirement that file times be updated by *symlink()*.

**45249 FUTURE DIRECTIONS**

45250 None.

**45251 SEE ALSO**

**45254 CHANGE HISTORY**

45255 First released in Issue 4, Version 2.

**45256 Issue 5**

45257 Moved from X/OPEN UNIX extension to BASE.

**45258 Issue 6**

45259 The following changes were made to align with the IEEE P1003.1a draft standard:

- 45260 • The DESCRIPTION text is updated.
- 45261 • The [ELOOP] optional error condition is added.

45262 **NAME**

45263 sync — schedule file system updates

45264 **SYNOPSIS**

45265 XSI #include &lt;unistd.h&gt;

45266 void sync(void);

45267

45268 **DESCRIPTION**45269 The *sync()* function shall cause all information in memory that updates file systems to be  
45270 scheduled for writing out to all file systems.45271 The writing, although scheduled, is not necessarily complete upon return from *sync()*.45272 **RETURN VALUE**45273 The *sync()* function shall not return a value.45274 **ERRORS**

45275 No errors are defined.

45276 **EXAMPLES**

45277 None.

45278 **APPLICATION USAGE**

45279 None.

45280 **RATIONALE**

45281 None.

45282 **FUTURE DIRECTIONS**

45283 None.

45284 **SEE ALSO**45285 *fsync()*, the Base Definitions volume of IEEE Std 1003.1-2001, <unistd.h>45286 **CHANGE HISTORY**

45287 First released in Issue 4, Version 2.

45288 **Issue 5**

45289 Moved from X/OPEN UNIX extension to BASE.

45290 **NAME**

45291 sysconf — get configurable system variables

45292 **SYNOPSIS**

45293 #include <unistd.h>

45294 long sysconf(int name);

45295 **DESCRIPTION**

45296 The *sysconf()* function provides a method for the application to determine the current value of a configurable system limit or option (*variable*). Support for some system variables is dependent on implementation options (as indicated by the margin codes in the following table). Where an implementation option is not supported, the variable need not be supported.

45300 The *name* argument represents the system variable to be queried. The following table lists the minimal set of system variables from <limits.h> or <unistd.h> that can be returned by *sysconf()*, and the symbolic constants defined in <unistd.h> that are the corresponding values used for *name*. Support for some configuration variables is dependent on implementation options (see shading and margin codes in the table below). Where an implementation option is not supported, the variable need not be supported.

45435 **RETURN VALUE**

45436

45437

45438

If *name* is an invalid value, `sysconf()` shall return `-1` and set *errno* to indicate the error. If the variable corresponding to *name* has no limit, `sysconf()` shall return `-1` without changing the value of *errno*. Note that indefinite limits do not imply infinite limits; see `<limits.h>`.

45439

45440

45441

45442

Otherwise, `sysconf()` shall return the current variable value on the system. The value returned shall not be more restrictive than the corresponding value described to the application when it was compiled with the implementation's `<limits.h>` or `<unistd.h>`. The value shall not change during the lifetime of the calling process.

45443 **ERRORS**

45444

The `sysconf()` function shall fail if:

45445

[EINVAL] The value of the *name* argument is invalid.

45446 **EXAMPLES**

45447

None.

45448 **APPLICATION USAGE**

45449

45450

45451

As `-1` is a permissible return value in a successful situation, an application wishing to check for error situations should set *errno* to 0, then call `sysconf()`, and, if it returns `-1`, check to see if *errno* is non-zero.

45452

45453

45454

45455

45456

45457

45458

45459

If the value of `sysconf(_SC_2_VERSION)` is not equal to the value of the `_POSIX2_VERSION` symbolic constant, the utilities available via `system()` or `popen()` might not behave as described in the Shell and Utilities volume of IEEE Std 1003.1-2001. This would mean that the application is not running in an environment that conforms to the Shell and Utilities volume of IEEE Std 1003.1-2001. Some applications might be able to deal with this, others might not. However, the functions defined in this volume of IEEE Std 1003.1-2001 continue to operate as specified, even if `sysconf(_SC_2_VERSION)` reports that the utilities no longer perform as specified.

45460 **RATIONALE**

45461

45462

45463

This functionality was added in response to requirements of application developers and of system vendors who deal with many international system configurations. It is closely related to `pathconf()` and `fpathconf()`.

45464

45465

45466

45467

45468

Although a conforming application can run on all systems by never demanding more resources than the minimum values published in this volume of IEEE Std 1003.1-2001, it is useful for that application to be able to use the actual value for the quantity of a resource available on any given system. To do this, the application makes use of the value of a symbolic constant in `<limits.h>` or `<unistd.h>`.

45469

45470

45471

However, once compiled, the application must still be able to cope if the amount of resource available is increased. To that end, an application may need a means of determining the quantity of a resource, or the presence of an option, at execution time.

45472 Two examples are offered:

- 45473 1. Applications may wish to act differently on systems with or without job control.  
 45474 Applications vendors who wish to distribute only a single binary package to all instances  
 45475 of a computer architecture would be forced to assume job control is never available if it  
 45476 were to rely solely on the `<unistd.h>` value published in this volume of  
 45477 IEEE Std 1003.1-2001.
- 45478 2. International applications vendors occasionally require knowledge of the number of clock  
 45479 ticks per second. Without these facilities, they would be required to either distribute their  
 45480 applications partially in source form or to have 50 Hz and 60 Hz versions for the various  
 45481 countries in which they operate.

45482 It is the knowledge that many applications are actually distributed widely in executable form  
 45483 that leads to this facility. If limited to the most restrictive values in the headers, such  
 45484 applications would have to be prepared to accept the most limited environments offered by the  
 45485 smallest microcomputers. Although this is entirely portable, there was a consensus that they  
 45486 should be able to take advantage of the facilities offered by large systems, without the  
 45487 restrictions associated with source and object distributions.

45488 During the discussions of this feature, it was pointed out that it is almost always possible for an  
 45489 application to discern what a value might be at runtime by suitably testing the various functions  
 45490 themselves. And, in any event, it could always be written to adequately deal with error returns  
 45491 from the various functions. In the end, it was felt that this imposed an unreasonable level of  
 45492 complication and sophistication on the application writer.

45493 This runtime facility is not meant to provide ever-changing values that applications have to  
 45494 check multiple times. The values are seen as changing no more frequently than once per system  
 45495 initialization, such as by a system administrator or operator with an automatic configuration  
 45496 program. This volume of IEEE Std 1003.1-2001 specifies that they shall not change within the  
 45497 lifetime of the process.

45498 Some values apply to the system overall and others vary at the file system or directory level. The  
 45499 latter are described in *pathconf()*.

45500 Note that all values returned must be expressible as integers. String values were considered, but  
 45501 the additional flexibility of this approach was rejected due to its added complexity of  
 45502 implementation and use.

45503 Some values, such as `{PATH_MAX}`, are sometimes so large that they must not be used to, say,  
 45504 allocate arrays. The *sysconf()* function returns a negative value to show that this symbolic  
 45505 constant is not even defined in this case.

45506 Similar to *pathconf()*, this permits the implementation not to have a limit. When one resource is  
 45507 infinite, returning an error indicating that some other resource limit has been reached is  
 45508 conforming behavior.

#### 45509 FUTURE DIRECTIONS

45510 None.

#### 45511 SEE ALSO

45512 *confstr()*, *pathconf()*, the Base Definitions volume of IEEE Std 1003.1-2001, `<limits.h>`,  
 45513 `<unistd.h>`, the Shell and Utilities volume of IEEE Std 1003.1-2001, *getconf*

#### 45514 CHANGE HISTORY

45515 First released in Issue 3. Included for alignment with the POSIX.1-1988 standard.

45516 **Issue 5**

45517 The DESCRIPTION is updated for alignment with the POSIX Realtime Extension and the POSIX  
45518 Threads Extension.

45519 The `_XBS_` variables and name values are added to the table of system variables in the  
45520 DESCRIPTION. These are all marked EX.

45521 **Issue 6**

45522 The symbol `CLK_TCK` is obsolescent and removed. It is replaced with the phrase “clock ticks  
45523 per second”.

45524 The symbol `{PASS_MAX}` is removed.

45525 The following changes were made to align with the IEEE P1003.1a draft standard:

- 45526 • Table entries are added for the following variables: `_SC_REGEXP`, `_SC_SHELL`,
- 45527 `_SC_REGEX_VERSION`, `_SC_SYMLINK_MAX`.

45528 The following `sysconf()` variables and their associated names are added for alignment with  
45529 IEEE Std 1003.1d-1999:

```
45530     _POSIX_ADVISORY_INFO
45531     _POSIX_CPUTIME
45532     _POSIX_SPAWN
45533     _POSIX_SPORADIC_SERVER
45534     _POSIX_THREAD_CPUTIME
45535     _POSIX_THREAD_SPORADIC_SERVER
45536     _POSIX_TIMEOUTS
```

45537 The following changes are made to the DESCRIPTION for alignment with IEEE Std 1003.1j-2000:

- 45538 • A statement expressing the dependency of support for some system variables on  
45539 implementation options is added.
- 45540 • The following system variables are added:

```
45541     _POSIX_BARRIERS
45542     _POSIX_CLOCK_SELECTION
45543     _POSIX_MONOTONIC_CLOCK
45544     _POSIX_READER_WRITER_LOCKS
45545     _POSIX_SPIN_LOCKS
45546     _POSIX_TYPED_MEMORY_OBJECTS
```

45547 The following system variables are added for alignment with IEEE Std 1003.2d-1994:

```
45548     _POSIX2_PBS
45549     _POSIX2_PBS_ACCOUNTING
45550     _POSIX2_PBS_LOCATE
45551     _POSIX2_PBS_MESSAGE
45552     _POSIX2_PBS_TRACK
```

45553 The following `sysconf()` variables and their associated names are added for alignment with  
45554 IEEE Std 1003.1q-2000:

```
45555     _POSIX_TRACE
45556     _POSIX_TRACE_EVENT_FILTER
45557     _POSIX_TRACE_INHERIT
45558     _POSIX_TRACE_LOG
```

45559  
45560

The macros associated with the *c89* programming models are marked **LEGACY**, and new equivalent macros associated with *c99* are introduced.

45561 **NAME**

45562        syslog — log a message

45563 **SYNOPSIS**

45564 XSI        #include &lt;syslog.h&gt;

45565        void syslog(int *priority*, const char \**message*, ... /\* *argument* \*/);

45566

45567 **DESCRIPTION**45568        Refer to *closelog*().

45569 **NAME**

45570 system — issue a command

45571 **SYNOPSIS**

45572 #include &lt;stdlib.h&gt;

45573 int system(const char \**command*);45574 **DESCRIPTION**

45575 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
 45576 conflict between the requirements described here and the ISO C standard is unintentional. This  
 45577 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

45578 If *command* is a null pointer, the *system()* function shall determine whether the host environment  
 45579 has a command processor. If *command* is not a null pointer, the *system()* function shall pass the  
 45580 string pointed to by *command* to that command processor to be executed in an implementation-  
 45581 defined manner; this might then cause the program calling *system()* to behave in a non-  
 45582 conforming manner or to terminate.

45583 CX The environment of the executed command shall be as if a child process were created using  
 45584 *fork()*, and the child process invoked the *sh* utility using *execl()* as follows:

```
45585 execl(<shell path>, "sh", "-c", command, (char *)0);
```

45586 where <shell path> is an unspecified pathname for the *sh* utility.

45587 The *system()* function shall ignore the SIGINT and SIGQUIT signals, and shall block the  
 45588 SIGCHLD signal, while waiting for the command to terminate. If this might cause the  
 45589 application to miss a signal that would have killed it, then the application should examine the  
 45590 return value from *system()* and take whatever action is appropriate to the application if the  
 45591 command terminated due to receipt of a signal.

45592 The *system()* function shall not affect the termination status of any child of the calling processes  
 45593 other than the process or processes it itself creates.

45594 The *system()* function shall not return until the child process has terminated.

45595 **RETURN VALUE**

45596 If *command* is a null pointer, *system()* shall return non-zero to indicate that a command processor  
 45597 CX is available, or zero if none is available. The *system()* function shall always return non-zero when  
 45598 *command* is NULL.

45599 CX If *command* is not a null pointer, *system()* shall return the termination status of the command  
 45600 language interpreter in the format specified by *waitpid()*. The termination status shall be as  
 45601 defined for the *sh* utility; otherwise, the termination status is unspecified. If some error prevents  
 45602 the command language interpreter from executing after the child process is created, the return  
 45603 value from *system()* shall be as if the command language interpreter had terminated using  
 45604 *exit(127)* or *\_exit(127)*. If a child process cannot be created, or if the termination status for the  
 45605 command language interpreter cannot be obtained, *system()* shall return -1 and set *errno* to  
 45606 indicate the error.

45607 **ERRORS**

45608 CX The *system()* function may set *errno* values as described by *fork()*.

45609 In addition, *system()* may fail if:

45610 CX [ECHILD] The status of the child process created by *system()* is no longer available.

45611 **EXAMPLES**

45612       None.

45613 **APPLICATION USAGE**

45614       If the return value of *system()* is not  $-1$ , its value can be decoded through the use of the macros  
45615       described in `<sys/wait.h>`. For convenience, these macros are also provided in `<stdlib.h>`.

45616       Note that, while *system()* must ignore SIGINT and SIGQUIT and block SIGCHLD while waiting  
45617       for the child to terminate, the handling of signals in the executed command is as specified by  
45618       *fork()* and *exec*. For example, if SIGINT is being caught or is set to SIG\_DFL when *system()* is  
45619       called, then the child is started with SIGINT handling set to SIG\_DFL.

45620       Ignoring SIGINT and SIGQUIT in the parent process prevents coordination problems (two  
45621       processes reading from the same terminal, for example) when the executed command ignores or  
45622       catches one of the signals. It is also usually the correct action when the user has given a  
45623       command to the application to be executed synchronously (as in the '!' command in many  
45624       interactive applications). In either case, the signal should be delivered only to the child process,  
45625       not to the application itself. There is one situation where ignoring the signals might have less  
45626       than the desired effect. This is when the application uses *system()* to perform some task invisible  
45627       to the user. If the user typed the interrupt character ("^C", for example) while *system()* is being  
45628       used in this way, one would expect the application to be killed, but only the executed command  
45629       is killed. Applications that use *system()* in this way should carefully check the return status from  
45630       *system()* to see if the executed command was successful, and should take appropriate action  
45631       when the command fails.

45632       Blocking SIGCHLD while waiting for the child to terminate prevents the application from  
45633       catching the signal and obtaining status from *system()*'s child process before *system()* can get the  
45634       status itself.

45635       The context in which the utility is ultimately executed may differ from that in which *system()*  
45636       was called. For example, file descriptors that have the FD\_CLOEXEC flag set are closed, and the  
45637       process ID and parent process ID are different. Also, if the executed utility changes its  
45638       environment variables or its current working directory, that change is not reflected in the caller's  
45639       context.

45640       There is no defined way for an application to find the specific path for the shell. However,  
45641       *confstr()* can provide a value for *PATH* that is guaranteed to find the *sh* utility.

45642 **RATIONALE**

45643       The *system()* function should not be used by programs that have set user (or group) ID  
45644       privileges. The *fork()* and *exec* family of functions (except *execlp()* and *execvp()*), should be used  
45645       instead. This prevents any unforeseen manipulation of the environment of the user that could  
45646       cause execution of commands not anticipated by the calling program.

45647       There are three levels of specification for the *system()* function. The ISO C standard gives the  
45648       most basic. It requires that the function exists, and defines a way for an application to query  
45649       whether a command language interpreter exists. It says nothing about the command language or  
45650       the environment in which the command is interpreted.

45651       IEEE Std 1003.1-2001 places additional restrictions on *system()*. It requires that if there is a  
45652       command language interpreter, the environment must be as specified by *fork()* and *exec*. This  
45653       ensures, for example, that close-on-exec works, that file locks are not inherited, and that the  
45654       process ID is different. It also specifies the return value from *system()* when the command line  
45655       can be run, thus giving the application some information about the command's completion  
45656       status.

45657 Finally, IEEE Std 1003.1-2001 requires the command to be interpreted as in the shell command  
45658 language defined in the Shell and Utilities volume of IEEE Std 1003.1-2001.

45659 Note that, *system*(NULL) is required to return non-zero, indicating that there is a command  
45660 language interpreter. At first glance, this would seem to conflict with the ISO C standard which  
45661 allows *system*(NULL) to return zero. There is no conflict, however. A system must have a  
45662 command language interpreter, and is non-conforming if none is present. It is therefore  
45663 permissible for the *system*() function on such a system to implement the behavior specified by  
45664 the ISO C standard as long as it is understood that the implementation does not conform to  
45665 IEEE Std 1003.1-2001 if *system*(NULL) returns zero.

45666 It was explicitly decided that when *command* is NULL, *system*() should not be required to check  
45667 to make sure that the command language interpreter actually exists with the correct mode, that  
45668 there are enough processes to execute it, and so on. The call *system*(NULL) could, theoretically,  
45669 check for such problems as too many existing child processes, and return zero. However, it  
45670 would be inappropriate to return zero due to such a (presumably) transient condition. If some  
45671 condition exists that is not under the control of this application and that would cause any  
45672 *system*() call to fail, that system has been rendered non-conforming.

45673 Early drafts required, or allowed, *system*() to return with *errno* set to [EINTR] if it was  
45674 interrupted with a signal. This error return was removed, and a requirement that *system*() not  
45675 return until the child has terminated was added. This means that if a *waitpid*() call in *system*()  
45676 exits with *errno* set to [EINTR], *system*() must reissue the *waitpid*(). This change was made for  
45677 two reasons:

- 45678 1. There is no way for an application to clean up if *system*() returns [EINTR], short of calling  
45679 *wait*(), and that could have the undesirable effect of returning the status of children other  
45680 than the one started by *system*()).
- 45681 2. While it might require a change in some historical implementations, those  
45682 implementations already have to be changed because they use *wait*() instead of *waitpid*()).

45683 Note that if the application is catching SIGCHLD signals, it will receive such a signal before a  
45684 successful *system*() call returns.

45685 To conform to IEEE Std 1003.1-2001, *system*() must use *waitpid*(), or some similar function,  
45686 instead of *wait*()).

45687 The following code sample illustrates how *system*() might be implemented on an  
45688 implementation conforming to IEEE Std 1003.1-2001.

```
45689 #include <signal.h>
45690 int system(const char *cmd)
45691 {
45692     int stat;
45693     pid_t pid;
45694     struct sigaction sa, savintr, savequit;
45695     sigset_t saveblock;
45696     if (cmd == NULL)
45697         return(1);
45698     sa.sa_handler = SIG_IGN;
45699     sigemptyset(&sa.sa_mask);
45700     sa.sa_flags = 0;
45701     sigemptyset(&savintr.sa_mask);
45702     sigemptyset(&savequit.sa_mask);
45703     sigaction(SIGINT, &sa, &savintr);
45704     sigaction(SIGQUIT, &sa, &savequit);
```

```

45705     sigaddset(&sa.sa_mask, SIGCHLD);
45706     sigprocmask(SIG_BLOCK, &sa.sa_mask, &saveblock);
45707     if ((pid = fork()) == 0) {
45708         sigaction(SIGINT, &saveintr, (struct sigaction *)0);
45709         sigaction(SIGQUIT, &savequit, (struct sigaction *)0);
45710         sigprocmask(SIG_SETMASK, &saveblock, (sigset_t *)0);
45711         execl("/bin/sh", "sh", "-c", cmd, (char *)0);
45712         _exit(127);
45713     }
45714     if (pid == -1) {
45715         stat = -1; /* errno comes from fork() */
45716     } else {
45717         while (waitpid(pid, &stat, 0) == -1) {
45718             if (errno != EINTR){
45719                 stat = -1;
45720                 break;
45721             }
45722         }
45723     }
45724     sigaction(SIGINT, &saveintr, (struct sigaction *)0);
45725     sigaction(SIGQUIT, &savequit, (struct sigaction *)0);
45726     sigprocmask(SIG_SETMASK, &saveblock, (sigset_t *)0);
45727     return(stat);
45728 }

```

45729 Note that, while a particular implementation of *system()* (such as the one above) can assume a  
45730 particular path for the shell, such a path is not necessarily valid on another system. The above  
45731 example is not portable, and is not intended to be.

45732 One reviewer suggested that an implementation of *system()* might want to use an environment  
45733 variable such as *SHELL* to determine which command interpreter to use. The supposed  
45734 implementation would use the default command interpreter if the one specified by the  
45735 environment variable was not available. This would allow a user, when using an application  
45736 that prompts for command lines to be processed using *system()*, to specify a different command  
45737 interpreter. Such an implementation is discouraged. If the alternate command interpreter did not  
45738 follow the command line syntax specified in the Shell and Utilities volume of  
45739 IEEE Std 1003.1-2001, then changing *SHELL* would render *system()* non-conforming. This would  
45740 affect applications that expected the specified behavior from *system()*, and since the Shell and  
45741 Utilities volume of IEEE Std 1003.1-2001 does not mention that *SHELL* affects *system()*, the  
45742 application would not know that it needed to unset *SHELL*.

#### 45748 CHANGE HISTORY

45749 First released in Issue 1. Derived from Issue 1 of the SVID.

#### 45750 Issue 6

45751 Extensions beyond the ISO C standard are marked.

45752 **NAME**

45753 tan, tanf, tanl — tangent function

45754 **SYNOPSIS**

45755 #include &lt;math.h&gt;

45756 double tan(double x);

45757 float tanf(float x);

45758 long double tanl(long double x);

45759 **DESCRIPTION**

45760 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
 45761 conflict between the requirements described here and the ISO C standard is unintentional. This  
 45762 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

45763 These functions shall compute the tangent of their argument *x*, measured in radians.

45764 An application wishing to check for error situations should set *errno* to zero and call  
 45765 *feclearexcept*(FE\_ALL\_EXCEPT) before calling these functions. On return, if *errno* is non-zero or  
 45766 *fetestexcept*(FE\_INVALID | FE\_DIVBYZERO | FE\_OVERFLOW | FE\_UNDERFLOW) is non-  
 45767 zero, an error has occurred.

45768 **RETURN VALUE**45769 Upon successful completion, these functions shall return the tangent of *x*.

45770 If the correct value would cause underflow, and is not representable, a range error may occur,  
 45771 MX and either 0.0 (if supported), or an implementation-defined value shall be returned.

45772 MX If *x* is NaN, a NaN shall be returned.45773 If *x* is  $\pm 0$ , *x* shall be returned.45774 If *x* is subnormal, a range error may occur and *x* should be returned.

45775 If *x* is  $\pm\text{Inf}$ , a domain error shall occur, and either a NaN (if supported), or an implementation-  
 45776 defined value shall be returned.

45777 If the correct value would cause underflow, and is representable, a range error may occur and  
 45778 the correct value shall be returned.

45779 XSI If the correct value would cause overflow, a range error shall occur and *tan()*, *tanf()*, and *tanl()*  
 45780 shall return the value of the macro HUGE\_VAL, HUGE\_VALF, and HUGE\_VALL, respectively.

45781 **ERRORS**

45782 These functions shall fail if:

45783 MX **Domain Error** The value of *x* is  $\pm\text{Inf}$ .

45784 If the integer expression (math\_errhandling & MATH\_ERRNO) is non-zero,  
 45785 then *errno* shall be set to [EDOM]. If the integer expression (math\_errhandling  
 45786 & MATH\_ERREXCEPT) is non-zero, then the invalid floating-point exception  
 45787 shall be raised.

45788 XSI **Range Error** The result overflows

45789 If the integer expression (math\_errhandling & MATH\_ERRNO) is non-zero,  
 45790 then *errno* shall be set to [ERANGE]. If the integer expression  
 45791 (math\_errhandling & MATH\_ERREXCEPT) is non-zero, then the overflow  
 45792 floating-point exception shall be raised.

45793 These functions may fail if:

45794 MX Range Error The result underflows, or the value of  $x$  is subnormal.

45795 If the integer expression (`math_errhandling` & `MATH_ERRNO`) is non-zero,  
 45796 then *errno* shall be set to `[ERANGE]`. If the integer expression  
 45797 (`math_errhandling` & `MATH_ERREXCEPT`) is non-zero, then the underflow  
 45798 floating-point exception shall be raised.

#### 45799 EXAMPLES

##### 45800 Taking the Tangent of a 45-Degree Angle

```
45801 #include <math.h>
45802 ...
45803 double radians = 45.0 * M_PI / 180;
45804 double result;
45805 ...
45806 result = tan (radians);
```

#### 45807 APPLICATION USAGE

45808 There are no known floating-point representations such that for a normal argument, *tan*( $x$ ) is  
 45809 either overflow or underflow.

45810 These functions may lose accuracy when their argument is near a multiple of  $\pi/2$  or is far from  
 45811 0.0.

45812 On error, the expressions (`math_errhandling` & `MATH_ERRNO`) and (`math_errhandling` &  
 45813 `MATH_ERREXCEPT`) are independent of each other, but at least one of them must be non-zero.

#### 45814 RATIONALE

#### 45821 CHANGE HISTORY

45822 First released in Issue 1. Derived from Issue 1 of the SVID.

#### 45823 Issue 5

45824 The last two paragraphs of the DESCRIPTION were included as APPLICATION USAGE notes  
 45825 in previous issues.

#### 45826 Issue 6

45827 The *tanf()* and *tanl()* functions are added for alignment with the ISO/IEC 9899:1999 standard.

45828 The DESCRIPTION, RETURN VALUE, ERRORS, and APPLICATION USAGE sections are  
 45829 revised to align with the ISO/IEC 9899:1999 standard.

45830 IEC 60559:1989 standard floating-point extensions over the ISO/IEC 9899:1999 standard are  
 45831 marked.

45832 **NAME**

45833 tanh, tanhf, tanhl — hyperbolic tangent functions

45834 **SYNOPSIS**

45835 #include &lt;math.h&gt;

45836 double tanh(double x);

45837 float tanhf(float x);

45838 long double tanhl(long double x);

45839 **DESCRIPTION**

45840 **CX** The functionality described on this reference page is aligned with the ISO C standard. Any  
 45841 conflict between the requirements described here and the ISO C standard is unintentional. This  
 45842 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

45843 These functions shall compute the hyperbolic tangent of their argument *x*.

45844 An application wishing to check for error situations should set *errno* to zero and call  
 45845 *feclearexcept*(FE\_ALL\_EXCEPT) before calling these functions. On return, if *errno* is non-zero or  
 45846 *fetestexcept*(FE\_INVALID | FE\_DIVBYZERO | FE\_OVERFLOW | FE\_UNDERFLOW) is non-  
 45847 zero, an error has occurred.

45848 **RETURN VALUE**45849 Upon successful completion, these functions shall return the hyperbolic tangent of *x*.45850 **MX** If *x* is NaN, a NaN shall be returned.45851 If *x* is  $\pm 0$ , *x* shall be returned.45852 If *x* is  $\pm\text{Inf}$ ,  $\pm 1$  shall be returned.45853 If *x* is subnormal, a range error may occur and *x* should be returned.45854 **ERRORS**

45855 These functions may fail if:

45856 **MX** **Range Error** The value of *x* is subnormal.

45857 If the integer expression (math\_errhandling & MATH\_ERRNO) is non-zero,  
 45858 then *errno* shall be set to [ERANGE]. If the integer expression  
 45859 (math\_errhandling & MATH\_ERREXCEPT) is non-zero, then the underflow  
 45860 floating-point exception shall be raised.

45861 **EXAMPLES**

45862 None.

45863 **APPLICATION USAGE**

45864 On error, the expressions (math\_errhandling & MATH\_ERRNO) and (math\_errhandling &  
 45865 MATH\_ERREXCEPT) are independent of each other, but at least one of them must be non-zero.

45866 **RATIONALE**

45867 None.

45868 **FUTURE DIRECTIONS**

45869 None.

45870 **SEE ALSO**

45871 *atanh()*, *feclearexcept()*, *fetestexcept()*, *isnan()*, *tan()*, the Base Definitions volume of

45874 **CHANGE HISTORY**

45875 First released in Issue 1. Derived from Issue 1 of the SVID.

45876 **Issue 5**

45877 The DESCRIPTION is updated to indicate how an application should check for an error. This  
45878 text was previously published in the APPLICATION USAGE section.

45879 **Issue 6**

45880 The *tanhf()* and *tanhl()* functions are added for alignment with the ISO/IEC 9899:1999 standard.

45881 The DESCRIPTION, RETURN VALUE, ERRORS, and APPLICATION USAGE sections are  
45882 revised to align with the ISO/IEC 9899:1999 standard.

45883 IEC 60559:1989 standard floating-point extensions over the ISO/IEC 9899:1999 standard are  
45884 marked.

45885 **NAME**

45886           tanl — tangent function

45887 **SYNOPSIS**

45888           #include &lt;math.h&gt;

45889           long double tanl(long double x);

45890 **DESCRIPTION**45891           Refer to *tan()*.

45892 **NAME**

45893 tcdrain — wait for transmission of output

45894 **SYNOPSIS**

45895 #include &lt;termios.h&gt;

45896 int tcdrain(int *fildev*);45897 **DESCRIPTION**45898 The *tcdrain()* function shall block until all output written to the object referred to by *fildev* is transmitted. The *fildev* argument is an open file descriptor associated with a terminal.45900 Any attempts to use *tcdrain()* from a process which is a member of a background process group on a *fildev* associated with its controlling terminal, shall cause the process group to be sent a SIGTTOU signal. If the calling process is blocking or ignoring SIGTTOU signals, the process shall be allowed to perform the operation, and no signal is sent.45904 **RETURN VALUE**45905 Upon successful completion, 0 shall be returned. Otherwise, -1 shall be returned and *errno* set to indicate the error.45907 **ERRORS**45908 The *tcdrain()* function shall fail if:45909 [EBADF] The *fildev* argument is not a valid file descriptor.45910 [EINTR] A signal interrupted *tcdrain()*.45911 [ENOTTY] The file associated with *fildev* is not a terminal.45912 The *tcdrain()* function may fail if:

45913 [EIO] The process group of the writing process is orphaned, and the writing process is not ignoring or blocking SIGTTOU.

45915 **EXAMPLES**

45916 None.

45917 **APPLICATION USAGE**

45918 None.

45919 **RATIONALE**

45920 None.

45921 **FUTURE DIRECTIONS**

45922 None.

45927 First released in Issue 3. Included for alignment with the POSIX.1-1988 standard.

45928 **Issue 6**

45929 The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:

- 45931 • In the DESCRIPTION, the final paragraph is no longer conditional on
- 
- 45932
- `_POSIX_JOB_CONTROL`
- . This is a FIPS requirement.

45933

- The [EIO] error is added.

45934 **NAME**

45935 tcflow — suspend or restart the transmission or reception of data

45936 **SYNOPSIS**

45937 #include &lt;termios.h&gt;

45938 int tcflow(int *fildev*, int *action*);45939 **DESCRIPTION**45940 The *tcflow()* function shall suspend or restart transmission or reception of data on the object referred to by *fildev*, depending on the value of *action*. The *fildev* argument is an open file descriptor associated with a terminal.

- 45943 • If *action* is TCOFF, output shall be suspended.
- 45944 • If *action* is TCOON, suspended output shall be restarted.
- 45945 • If *action* is TCIOFF, the system shall transmit a STOP character, which is intended to cause the terminal device to stop transmitting data to the system.
- 45946
- 45947 • If *action* is TCION, the system shall transmit a START character, which is intended to cause the terminal device to start transmitting data to the system.
- 45948

45949 The default on the opening of a terminal file is that neither its input nor its output are suspended.

45950  
45951 Attempts to use *tcflow()* from a process which is a member of a background process group on a *fildev* associated with its controlling terminal, shall cause the process group to be sent a SIGTTOU signal. If the calling process is blocking or ignoring SIGTTOU signals, the process shall be allowed to perform the operation, and no signal is sent.45955 **RETURN VALUE**45956 Upon successful completion, 0 shall be returned. Otherwise, -1 shall be returned and *errno* set to indicate the error.45958 **ERRORS**45959 The *tcflow()* function shall fail if:

- 45960 [EBADF] The *fildev* argument is not a valid file descriptor.
- 45961 [EINVAL] The *action* argument is not a supported value.
- 45962 [ENOTTY] The file associated with *fildev* is not a terminal.

45963 The *tcflow()* function may fail if:

- 45964 [EIO] The process group of the writing process is orphaned, and the writing process is not ignoring or blocking SIGTTOU.
- 45965

45966 **EXAMPLES**

45967 None.

45968 **APPLICATION USAGE**

45969 None.

45970 **RATIONALE**

45971 None.

45972 **FUTURE DIRECTIONS**

45973 None.

45974 **SEE ALSO**

45975            *tcsendbreak()*, the Base Definitions volume of IEEE Std 1003.1-2001, Chapter 11, General Terminal Interface, <**termios.h**>, <**unistd.h**>

45977 **CHANGE HISTORY**

45978            First released in Issue 3. Included for alignment with the POSIX.1-1988 standard.

45979 **Issue 6**

45980            The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:

- 45982            • The [EIO] error is added.

45983 **NAME**

45984 tcflush — flush non-transmitted output data, non-read input data, or both

45985 **SYNOPSIS**

45986 #include <termios.h>

45987 int tcflush(int *fildev*, int *queue\_selector*);

45988 **DESCRIPTION**

45989 Upon successful completion, *tcflush()* shall discard data written to the object referred to by *fildev*  
45990 (an open file descriptor associated with a terminal) but not transmitted, or data received but not  
45991 read, depending on the value of *queue\_selector*:

- 45992 • If *queue\_selector* is TCIFLUSH, it shall flush data received but not read.
- 45993 • If *queue\_selector* is TCOFLUSH, it shall flush data written but not transmitted.
- 45994 • If *queue\_selector* is TCIOFLUSH, it shall flush both data received but not read and data  
45995 written but not transmitted.

45996 Attempts to use *tcflush()* from a process which is a member of a background process group on a  
45997 *fildev* associated with its controlling terminal shall cause the process group to be sent a SIGTTOU  
45998 signal. If the calling process is blocking or ignoring SIGTTOU signals, the process shall be  
45999 allowed to perform the operation, and no signal is sent.

46000 **RETURN VALUE**

46001 Upon successful completion, 0 shall be returned. Otherwise, -1 shall be returned and *errno* set to  
46002 indicate the error.

46003 **ERRORS**

46004 The *tcflush()* function shall fail if:

- 46005 [EBADF] The *fildev* argument is not a valid file descriptor.
- 46006 [EINVAL] The *queue\_selector* argument is not a supported value.
- 46007 [ENOTTY] The file associated with *fildev* is not a terminal.

46008 The *tcflush()* function may fail if:

- 46009 [EIO] The process group of the writing process is orphaned, and the writing process  
46010 is not ignoring or blocking SIGTTOU.

46011 **EXAMPLES**

46012 None.

46013 **APPLICATION USAGE**

46014 None.

46015 **RATIONALE**

46016 None.

46017 **FUTURE DIRECTIONS**

46018 None.

46019 **SEE ALSO**

46021 Interface, <termios.h>, <unistd.h>

46022 **CHANGE HISTORY**

46023 First released in Issue 3. Included for alignment with the POSIX.1-1988 standard.

46024 **Issue 6**

46025 The Open Group Corrigendum U035/1 is applied. In the ERRORS and APPLICATION USAGE  
46026 sections, references to *tcfow()* are replaced with *tcflush()*.

46027 The following new requirements on POSIX implementations derive from alignment with the  
46028 Single UNIX Specification:

- 46029 • In the DESCRIPTION, the final paragraph is no longer conditional on  
46030 `_POSIX_JOB_CONTROL`. This is a FIPS requirement.
- 46031 • The [EIO] error is added.

46032 **NAME**

46033 tcgetattr — get the parameters associated with the terminal

46034 **SYNOPSIS**

46035 #include <termios.h>

46036 int tcgetattr(int *fildev*, struct termios \**termios\_p*);

46037 **DESCRIPTION**

46038 The *tcgetattr()* function shall get the parameters associated with the terminal referred to by *fildev*  
46039 and store them in the **termios** structure referenced by *termios\_p*. The *fildev* argument is an open  
46040 file descriptor associated with a terminal.

46041 The *termios\_p* argument is a pointer to a **termios** structure.

46042 The *tcgetattr()* operation is allowed from any process.

46043 If the terminal device supports different input and output baud rates, the baud rates stored in  
46044 the **termios** structure returned by *tcgetattr()* shall reflect the actual baud rates, even if they are  
46045 equal. If differing baud rates are not supported, the rate returned as the output baud rate shall be  
46046 the actual baud rate. If the terminal device does not support split baud rates, the input baud rate  
46047 stored in the **termios** structure shall be the output rate (as one of the symbolic values).

46048 **RETURN VALUE**

46049 Upon successful completion, 0 shall be returned. Otherwise, -1 shall be returned and *errno* set to  
46050 indicate the error.

46051 **ERRORS**

46052 The *tcgetattr()* function shall fail if:

46053 [EBADF] The *fildev* argument is not a valid file descriptor.

46054 [ENOTTY] The file associated with *fildev* is not a terminal.

46055 **EXAMPLES**

46056 None.

46057 **APPLICATION USAGE**

46058 None.

46059 **RATIONALE**

46060 Care must be taken when changing the terminal attributes. Applications should always do a  
46061 *tcgetattr()*, save the **termios** structure values returned, and then do a *tcsetattr()*, changing only  
46062 the necessary fields. The application should use the values saved from the *tcgetattr()* to reset the  
46063 terminal state whenever it is done with the terminal. This is necessary because terminal  
46064 attributes apply to the underlying port and not to each individual open instance; that is, all  
46065 processes that have used the terminal see the latest attribute changes.

46066 A program that uses these functions should be written to catch all signals and take other  
46067 appropriate actions to ensure that when the program terminates, whether planned or not, the  
46068 terminal device's state is restored to its original state.

46069 Existing practice dealing with error returns when only part of a request can be honored is based  
46070 on calls to the *ioctl()* function. In historical BSD and System V implementations, the  
46071 corresponding *ioctl()* returns zero if the requested actions were semantically correct, even if  
46072 some of the requested changes could not be made. Many existing applications assume this  
46073 behavior and would no longer work correctly if the return value were changed from zero to -1  
46074 in this case.

46075 Note that either specification has a problem. When zero is returned, it implies everything  
46076 succeeded even if some of the changes were not made. When -1 is returned, it implies  
46077 everything failed even though some of the changes were made.

46078 Applications that need all of the requested changes made to work properly should follow  
46079 *tcsetattr()* with a call to *tcgetattr()* and compare the appropriate field values.

46080 **FUTURE DIRECTIONS**

46081 None.

46082 **SEE ALSO**

46083 *tcsetattr()*, the Base Definitions volume of IEEE Std 1003.1-2001, Chapter 11, General Terminal  
46084 Interface, <termios.h>

46085 **CHANGE HISTORY**

46086 First released in Issue 3. Included for alignment with the POSIX.1-1988 standard.

46087 **Issue 6**

46088 In the DESCRIPTION, the rate returned as the input baud rate shall be the output rate.  
46089 Previously, the number zero was also allowed but was obsolescent.

46090 **NAME**

46091 tcgetpgrp — get the foreground process group ID

46092 **SYNOPSIS**

46093 #include &lt;unistd.h&gt;

46094 pid\_t tcgetpgrp(int *fildev*);46095 **DESCRIPTION**46096 The *tcgetpgrp()* function shall return the value of the process group ID of the foreground process  
46097 group associated with the terminal.46098 If there is no foreground process group, *tcgetpgrp()* shall return a value greater than 1 that does  
46099 not match the process group ID of any existing process group.46100 The *tcgetpgrp()* function is allowed from a process that is a member of a background process  
46101 group; however, the information may be subsequently changed by a process that is a member of  
46102 a foreground process group.46103 **RETURN VALUE**46104 Upon successful completion, *tcgetpgrp()* shall return the value of the process group ID of the  
46105 foreground process associated with the terminal. Otherwise, -1 shall be returned and *errno* set to  
46106 indicate the error.46107 **ERRORS**46108 The *tcgetpgrp()* function shall fail if:46109 [EBADF] The *fildev* argument is not a valid file descriptor.46110 [ENOTTY] The calling process does not have a controlling terminal, or the file is not the  
46111 controlling terminal.46112 **EXAMPLES**

46113 None.

46114 **APPLICATION USAGE**

46115 None.

46116 **RATIONALE**

46117 None.

46118 **FUTURE DIRECTIONS**

46119 None.

46120 **SEE ALSO**46121 *setsid()*, *setpgid()*, *tcsetpgrp()*, the Base Definitions volume of IEEE Std 1003.1-2001,  
46122 <sys/types.h>, <unistd.h>46123 **CHANGE HISTORY**

46124 First released in Issue 3. Included for alignment with the POSIX.1-1988 standard.

46125 **Issue 6**

46126 In the SYNOPSIS, the optional include of the &lt;sys/types.h&gt; header is removed.

46127 The following new requirements on POSIX implementations derive from alignment with the  
46128 Single UNIX Specification:

- 46129
- The requirement to include <sys/types.h> has been removed. Although <sys/types.h> was  
46130 required for conforming implementations of previous POSIX specifications, it was not  
46131 required for UNIX applications.

46132  
46133

- In the DESCRIPTION, text previously conditional on support for `_POSIX_JOB_CONTROL` is now mandatory. This is a FIPS requirement.

46134 **NAME**

46135 tcgetsid — get the process group ID for the session leader for the controlling terminal

46136 **SYNOPSIS**

46137 XSI #include <termios.h>

46138 pid\_t tcgetsid(int *fildes*);

46139

46140 **DESCRIPTION**

46141 The *tcgetsid()* function shall obtain the process group ID of the session for which the terminal  
46142 specified by *fildes* is the controlling terminal.

46143 **RETURN VALUE**

46144 Upon successful completion, *tcgetsid()* shall return the process group ID associated with the  
46145 terminal. Otherwise, a value of (**pid\_t**)-1 shall be returned and *errno* set to indicate the error.

46146 **ERRORS**

46147 The *tcgetsid()* function shall fail if:

46148 [EBADF] The *fildes* argument is not a valid file descriptor.

46149 [ENOTTY] The calling process does not have a controlling terminal, or the file is not the  
46150 controlling terminal.

46151 **EXAMPLES**

46152 None.

46153 **APPLICATION USAGE**

46154 None.

46155 **RATIONALE**

46156 None.

46157 **FUTURE DIRECTIONS**

46158 None.

46159 **SEE ALSO**

46160 The Base Definitions volume of IEEE Std 1003.1-2001, <**termios.h**>

46161 **CHANGE HISTORY**

46162 First released in Issue 4, Version 2.

46163 **Issue 5**

46164 Moved from X/OPEN UNIX extension to BASE.

46165 The [EACCES] error has been removed from the list of mandatory errors, and the description of  
46166 [ENOTTY] has been reworded.

46167 **NAME**

46168 tcsendbreak — send a break for a specific duration

46169 **SYNOPSIS**

46170 #include &lt;termios.h&gt;

46171 int tcsendbreak(int *fildev*, int *duration*);46172 **DESCRIPTION**

46173 If the terminal is using asynchronous serial data transmission, *tcsendbreak()* shall cause  
46174 transmission of a continuous stream of zero-valued bits for a specific duration. If *duration* is 0, it  
46175 shall cause transmission of zero-valued bits for at least 0.25 seconds, and not more than 0.5  
46176 seconds. If *duration* is not 0, it shall send zero-valued bits for an implementation-defined period  
46177 of time.

46178 The *fildev* argument is an open file descriptor associated with a terminal.

46179 If the terminal is not using asynchronous serial data transmission, it is implementation-defined  
46180 whether *tcsendbreak()* sends data to generate a break condition or returns without taking any  
46181 action.

46182 Attempts to use *tcsendbreak()* from a process which is a member of a background process group  
46183 on a *fildev* associated with its controlling terminal shall cause the process group to be sent a  
46184 SIGTTOU signal. If the calling process is blocking or ignoring SIGTTOU signals, the process  
46185 shall be allowed to perform the operation, and no signal is sent.

46186 **RETURN VALUE**

46187 Upon successful completion, 0 shall be returned. Otherwise, -1 shall be returned and *errno* set to  
46188 indicate the error.

46189 **ERRORS**

46190 The *tcsendbreak()* function shall fail if:

46191 [EBADF] The *fildev* argument is not a valid file descriptor.

46192 [ENOTTY] The file associated with *fildev* is not a terminal.

46193 The *tcsendbreak()* function may fail if:

46194 [EIO] The process group of the writing process is orphaned, and the writing process  
46195 is not ignoring or blocking SIGTTOU.

46196 **EXAMPLES**

46197 None.

46198 **APPLICATION USAGE**

46199 None.

46200 **RATIONALE**

46201 None.

46202 **FUTURE DIRECTIONS**

46203 None.

46204 **SEE ALSO**

46205 The Base Definitions volume of IEEE Std 1003.1-2001, Chapter 11, General Terminal Interface,  
46206 <termios.h>, <unistd.h>

46207 **CHANGE HISTORY**

46208 First released in Issue 3. Included for alignment with the POSIX.1-1988 standard.

46209 **Issue 6**

46210 The following new requirements on POSIX implementations derive from alignment with the  
46211 Single UNIX Specification:

- 46212 • In the DESCRIPTION, text previously conditional on `_POSIX_JOB_CONTROL` is now
- 46213 mandated. This is a FIPS requirement.
- 46214 • The [EIO] error is added.

## 46215 NAME

46216 tcsetattr — set the parameters associated with the terminal

## 46217 SYNOPSIS

46218 #include <termios.h>

```
46219 int tcsetattr(int fildev, int optional_actions,
46220               const struct termios *termios_p);
```

## 46221 DESCRIPTION

46222 The *tcsetattr()* function shall set the parameters associated with the terminal referred to by the  
 46223 open file descriptor *fildev* (an open file descriptor associated with a terminal) from the **termios**  
 46224 structure referenced by *termios\_p* as follows:

- 46225 • If *optional\_actions* is TCSANOW, the change shall occur immediately.
- 46226 • If *optional\_actions* is TCSADRAIN, the change shall occur after all output written to *fildev* is  
 46227 transmitted. This function should be used when changing parameters that affect output.
- 46228 • If *optional\_actions* is TCSAFLUSH, the change shall occur after all output written to *fildev* is  
 46229 transmitted, and all input so far received but not read shall be discarded before the change is  
 46230 made.

46231 If the output baud rate stored in the **termios** structure pointed to by *termios\_p* is the zero baud  
 46232 rate, B0, the modem control lines shall no longer be asserted. Normally, this shall disconnect the  
 46233 line.

46234 If the input baud rate stored in the **termios** structure pointed to by *termios\_p* is 0, the input baud  
 46235 rate given to the hardware is the same as the output baud rate stored in the **termios** structure.

46236 The *tcsetattr()* function shall return successfully if it was able to perform any of the requested  
 46237 actions, even if some of the requested actions could not be performed. It shall set all the  
 46238 attributes that the implementation supports as requested and leave all the attributes not  
 46239 supported by the implementation unchanged. If no part of the request can be honored, it shall  
 46240 return  $-1$  and set *errno* to [EINVAL]. If the input and output baud rates differ and are a  
 46241 combination that is not supported, neither baud rate shall be changed. A subsequent call to  
 46242 *tcgetattr()* shall return the actual state of the terminal device (reflecting both the changes made  
 46243 and not made in the previous *tcsetattr()* call). The *tcsetattr()* function shall not change the values  
 46244 found in the **termios** structure under any circumstances.

46245 The effect of *tcsetattr()* is undefined if the value of the **termios** structure pointed to by *termios\_p*  
 46246 was not derived from the result of a call to *tcgetattr()* on *fildev*; an application should modify  
 46247 only fields and flags defined by this volume of IEEE Std 1003.1-2001 between the call to  
 46248 *tcgetattr()* and *tcsetattr()*, leaving all other fields and flags unmodified.

46249 No actions defined by this volume of IEEE Std 1003.1-2001, other than a call to *tcsetattr()* or a  
 46250 close of the last file descriptor in the system associated with this terminal device, shall cause any  
 46251 of the terminal attributes defined by this volume of IEEE Std 1003.1-2001 to change.

46252 If *tcsetattr()* is called from a process which is a member of a background process group on a  
 46253 *fildev* associated with its controlling terminal:

- 46254 • If the calling process is blocking or ignoring SIGTTOU signals, the operation completes  
 46255 normally and no signal is sent.
- 46256 • Otherwise, a SIGTTOU signal shall be sent to the process group.

46257 **RETURN VALUE**

46258           Upon successful completion, 0 shall be returned. Otherwise, -1 shall be returned and *errno* set to  
46259           indicate the error.

46260 **ERRORS**

46261           The *tcsetattr()* function shall fail if:

46262           [EBADF]           The *fildev* argument is not a valid file descriptor.

46263           [EINTR]           A signal interrupted *tcsetattr()*.

46264           [EINVAL]          The *optional\_actions* argument is not a supported value, or an attempt was  
46265           made to change an attribute represented in the **termios** structure to an  
46266           unsupported value.

46267           [ENOTTY]          The file associated with *fildev* is not a terminal.

46268           The *tcsetattr()* function may fail if:

46269           [EIO]            The process group of the writing process is orphaned, and the writing process  
46270           is not ignoring or blocking SIGTTOU.

46271 **EXAMPLES**

46272           None.

46273 **APPLICATION USAGE**

46274           If trying to change baud rates, applications should call *tcsetattr()* then call *tcgetattr()* in order to  
46275           determine what baud rates were actually selected.

46276 **RATIONALE**

46277           The *tcsetattr()* function can be interrupted in the following situations:

- 46278           • It is interrupted while waiting for output to drain.
- 46279           • It is called from a process in a background process group and SIGTTOU is caught.

46280           See also the RATIONALE section in *tcgetattr()*.

46281 **FUTURE DIRECTIONS**

46282           Using an input baud rate of 0 to set the input rate equal to the output rate may not necessarily be  
46283           supported in a future version of this volume of IEEE Std 1003.1-2001.

46284 **SEE ALSO**

46285           *cfgetispeed()*, *tcgetattr()*, the Base Definitions volume of IEEE Std 1003.1-2001, Chapter 11,  
46286           General Terminal Interface, <**termios.h**>, <**unistd.h**>

46287 **CHANGE HISTORY**

46288           First released in Issue 3. Included for alignment with the POSIX.1-1988 standard.

46289 **Issue 6**

46290           The following new requirements on POSIX implementations derive from alignment with the  
46291           Single UNIX Specification:

- 46292           • In the DESCRIPTION, text previously conditional on `_POSIX_JOB_CONTROL` is now  
46293           mandated. This is a FIPS requirement.
- 46294           • The [EIO] error is added.

46295  
46296

In the DESCRIPTION, the text describing use of *tcsetattr()* from a process which is a member of a background process group is clarified.

46297 **NAME**

46298 tcsetpgrp — set the foreground process group ID

46299 **SYNOPSIS**

46300 #include &lt;unistd.h&gt;

46301 int tcsetpgrp(int *fildev*, pid\_t *pgid\_id*);46302 **DESCRIPTION**

46303 If the process has a controlling terminal, *tcsetpgrp()* shall set the foreground process group ID  
46304 associated with the terminal to *pgid\_id*. The application shall ensure that the file associated with  
46305 *fildev* is the controlling terminal of the calling process and the controlling terminal is currently  
46306 associated with the session of the calling process. The application shall ensure that the value of  
46307 *pgid\_id* matches a process group ID of a process in the same session as the calling process.

46308 Attempts to use *tcsetpgrp()* from a process which is a member of a background process group on  
46309 a *fildev* associated with its controlling terminal shall cause the process group to be sent a  
46310 SIGTTOU signal. If the calling process is blocking or ignoring SIGTTOU signals, the process  
46311 shall be allowed to perform the operation, and no signal is sent.

46312 **RETURN VALUE**

46313 Upon successful completion, 0 shall be returned. Otherwise, -1 shall be returned and *errno* set to  
46314 indicate the error.

46315 **ERRORS**46316 The *tcsetpgrp()* function shall fail if:46317 [EBADF] The *fildev* argument is not a valid file descriptor.46318 [EINVAL] This implementation does not support the value in the *pgid\_id* argument.

46319 [ENOTTY] The calling process does not have a controlling terminal, or the file is not the  
46320 controlling terminal, or the controlling terminal is no longer associated with  
46321 the session of the calling process.

46322 [EPERM] The value of *pgid\_id* is a value supported by the implementation, but does not  
46323 match the process group ID of a process in the same session as the calling  
46324 process.

46325 **EXAMPLES**

46326 None.

46327 **APPLICATION USAGE**

46328 None.

46329 **RATIONALE**

46330 None.

46331 **FUTURE DIRECTIONS**

46332 None.

46333 **SEE ALSO**46334 *tcgetpgrp()*, the Base Definitions volume of IEEE Std 1003.1-2001, <sys/types.h>, <unistd.h>46335 **CHANGE HISTORY**

46336 First released in Issue 3. Included for alignment with the POSIX.1-1988 standard.

46337 **Issue 6**

46338 In the SYNOPSIS, the inclusion of `<sys/types.h>` is no longer required.

46339 The following new requirements on POSIX implementations derive from alignment with the  
46340 Single UNIX Specification:

46341 • The requirement to include `<sys/types.h>` has been removed. Although `<sys/types.h>` was  
46342 required for conforming implementations of previous POSIX specifications, it was not  
46343 required for UNIX applications.

46344 • In the DESCRIPTION and ERRORS sections, text previously conditional on  
46345 `_POSIX_JOB_CONTROL` is now mandated. This is a FIPS requirement.

46346 The DESCRIPTION is updated to avoid use of the term “must” for application requirements.

46347 The Open Group Corrigendum U047/4 is applied.

46348 **NAME**

46349 tdelete, tfind, tsearch, twalk — manage a binary search tree

46350 **SYNOPSIS**

```

46351 xsi #include <search.h>
46352 void *tdelete(const void *restrict key, void **restrict rootp,
46353             int(*compar)(const void *, const void *));
46354 void *tfind(const void *key, void *const *rootp,
46355            int(*compar)(const void *, const void *));
46356 void *tsearch(const void *key, void **rootp,
46357              int (*compar)(const void *, const void *));
46358 void twalk(const void *root,
46359           void (*action)(const void *, VISIT, int));
46360

```

46361 **DESCRIPTION**

46362 The *tdelete()*, *tfind()*, *tsearch()*, and *twalk()* functions manipulate binary search trees.  
 46363 Comparisons are made with a user-supplied routine, the address of which is passed as the  
 46364 *compar* argument. This routine is called with two arguments, which are the pointers to the  
 46365 elements being compared. The application shall ensure that the user-supplied routine returns an  
 46366 integer less than, equal to, or greater than 0, according to whether the first argument is to be  
 46367 considered less than, equal to, or greater than the second argument. The comparison function  
 46368 need not compare every byte, so arbitrary data may be contained in the elements in addition to  
 46369 the values being compared.

46370 The *tsearch()* function shall build and access the tree. The *key* argument is a pointer to an element  
 46371 to be accessed or stored. If there is a node in the tree whose element is equal to the value pointed  
 46372 to by *key*, a pointer to this found node shall be returned. Otherwise, the value pointed to by *key*  
 46373 shall be inserted (that is, a new node is created and the value of *key* is copied to this node), and a  
 46374 pointer to this node returned. Only pointers are copied, so the application shall ensure that the  
 46375 calling routine stores the data. The *rootp* argument points to a variable that points to the root  
 46376 node of the tree. A null pointer value for the variable pointed to by *rootp* denotes an empty tree;  
 46377 in this case, the variable shall be set to point to the node which shall be at the root of the new  
 46378 tree.

46379 Like *tsearch()*, *tfind()* shall search for a node in the tree, returning a pointer to it if found.  
 46380 However, if it is not found, *tfind()* shall return a null pointer. The arguments for *tfind()* are the  
 46381 same as for *tsearch()*.

46382 The *tdelete()* function shall delete a node from a binary search tree. The arguments are the same  
 46383 as for *tsearch()*. The variable pointed to by *rootp* shall be changed if the deleted node was the  
 46384 root of the tree. The *tdelete()* function shall return a pointer to the parent of the deleted node, or a  
 46385 null pointer if the node is not found.

46386 The *twalk()* function shall traverse a binary search tree. The *root* argument is a pointer to the root  
 46387 node of the tree to be traversed. (Any node in a tree may be used as the root for a walk below  
 46388 that node.) The argument *action* is the name of a routine to be invoked at each node. This routine  
 46389 is, in turn, called with three arguments. The first argument shall be the address of the node being  
 46390 visited. The structure pointed to by this argument is unspecified and shall not be modified by  
 46391 the application, but it shall be possible to cast a pointer-to-node into a pointer-to-pointer-to-  
 46392 element to access the element stored in the node. The second argument shall be a value from an  
 46393 enumeration data type:

```

46394 typedef enum { preorder, postorder, endorder, leaf } VISIT;

```

46395 (defined in `<search.h>`), depending on whether this is the first, second, or third time that the  
 46396 node is visited (during a depth-first, left-to-right traversal of the tree), or whether the node is a  
 46397 leaf. The third argument shall be the level of the node in the tree, with the root being level 0.

46398 If the calling function alters the pointer to the root, the result is undefined.

#### 46399 RETURN VALUE

46400 If the node is found, both `tsearch()` and `tfind()` shall return a pointer to it. If not, `tfind()` shall  
 46401 return a null pointer, and `tsearch()` shall return a pointer to the inserted item.

46402 A null pointer shall be returned by `tsearch()` if there is not enough space available to create a new  
 46403 node.

46404 A null pointer shall be returned by `tdelete()`, `tfind()`, and `tsearch()` if `rootp` is a null pointer on  
 46405 entry.

46406 The `tdelete()` function shall return a pointer to the parent of the deleted node, or a null pointer if  
 46407 the node is not found.

46408 The `twalk()` function shall not return a value.

#### 46409 ERRORS

46410 No errors are defined.

#### 46411 EXAMPLES

46412 The following code reads in strings and stores structures containing a pointer to each string and  
 46413 a count of its length. It then walks the tree, printing out the stored strings and their lengths in  
 46414 alphabetical order.

```
46415 #include <search.h>
46416 #include <string.h>
46417 #include <stdio.h>

46418 #define STRSZ    10000
46419 #define NODSZ    500

46420 struct node {          /* Pointers to these are stored in the tree. */
46421     char    *string;
46422     int     length;
46423 };

46424 char    string_space[STRSZ]; /* Space to store strings. */
46425 struct node nodes[NODSZ];   /* Nodes to store. */
46426 void    *root = NULL;      /* This points to the root. */

46427 int main(int argc, char *argv[])
46428 {
46429     char    *strptr = string_space;
46430     struct node *nodeptr = nodes;
46431     void    print_node(const void *, VISIT, int);
46432     int     i = 0, node_compare(const void *, const void *);

46433     while (gets(strptr) != NULL && i++ < NODSZ) {
46434         /* Set node. */
46435         nodeptr->string = strptr;
46436         nodeptr->length = strlen(strptr);
46437         /* Put node into the tree. */
46438         (void) tsearch((void *)nodeptr, (void **)&root,
46439             node_compare);
```

```

46440         /* Adjust pointers, so we do not overwrite tree. */
46441         strptr += nodeptr->length + 1;
46442         nodeptr++;
46443     }
46444     twalk(root, print_node);
46445     return 0;
46446 }
46447 /*
46448  * This routine compares two nodes, based on an
46449  * alphabetical ordering of the string field.
46450  */
46451 int
46452 node_compare(const void *node1, const void *node2)
46453 {
46454     return strcmp(((const struct node *) node1)->string,
46455                 ((const struct node *) node2)->string);
46456 }
46457 /*
46458  * This routine prints out a node, the second time
46459  * twalk encounters it or if it is a leaf.
46460  */
46461 void
46462 print_node(const void *ptr, VISIT order, int level)
46463 {
46464     const struct node *p = *(const struct node **) ptr;
46465     if (order == postorder || order == leaf) {
46466         (void) printf("string = %s, length = %d\n",
46467                     p->string, p->length);
46468     }
46469 }

```

#### 46470 APPLICATION USAGE

46471 The *root* argument to *twalk()* is one level of indirection less than the *rootp* arguments to *tdelete()*  
 46472 and *tsearch()*.

46473 There are two nomenclatures used to refer to the order in which tree nodes are visited. The  
 46474 *tsearch()* function uses **preorder**, **postorder**, and **endorder** to refer respectively to visiting a node  
 46475 before any of its children, after its left child and before its right, and after both its children. The  
 46476 alternative nomenclature uses **preorder**, **inorder**, and **postorder** to refer to the same visits, which  
 46477 could result in some confusion over the meaning of **postorder**.

#### 46478 RATIONALE

46479 None.

#### 46480 FUTURE DIRECTIONS

46481 None.

46484 **CHANGE HISTORY**

46485 First released in Issue 1. Derived from Issue 1 of the SVID.

46486 **Issue 5**

46487 The last paragraph of the DESCRIPTION was included as an APPLICATION USAGE note in  
46488 previous issues.

46489 **Issue 6**

46490 The DESCRIPTION is updated to avoid use of the term “must” for application requirements.

46491 The **restrict** keyword is added to the *tdelete()* prototype for alignment with the  
46492 ISO/IEC 9899:1999 standard.

46493 **NAME**

46494 telldir — current location of a named directory stream

46495 **SYNOPSIS**

46496 XSI #include <dirent.h>

46497 long telldir(DIR \*dirp);

46498

46499 **DESCRIPTION**

46500 The *telldir()* function shall obtain the current location associated with the directory stream  
46501 specified by *dirp*.

46502 If the most recent operation on the directory stream was a *seekdir()*, the directory position  
46503 returned from the *telldir()* shall be the same as that supplied as a *loc* argument for *seekdir()*.

46504 **RETURN VALUE**

46505 Upon successful completion, *telldir()* shall return the current location of the specified directory  
46506 stream.

46507 **ERRORS**

46508 No errors are defined.

46509 **EXAMPLES**

46510 None.

46511 **APPLICATION USAGE**

46512 None.

46513 **RATIONALE**

46514 None.

46515 **FUTURE DIRECTIONS**

46516 None.

46517 **SEE ALSO**

46518 *opendir()*, *readdir()*, *seekdir()*, the Base Definitions volume of IEEE Std 1003.1-2001, <*dirent.h*>

46519 **CHANGE HISTORY**

46520 First released in Issue 2.

46521 **NAME**

46522 tempnam — create a name for a temporary file

46523 **SYNOPSIS**46524 XSI 

```
#include <stdio.h>
```

46525 

```
char *tempnam(const char *dir, const char *pfx);
```

46526

46527 **DESCRIPTION**46528 The *tempnam()* function shall generate a pathname that may be used for a temporary file.

46529 The *tempnam()* function allows the user to control the choice of a directory. The *dir* argument  
 46530 points to the name of the directory in which the file is to be created. If *dir* is a null pointer or  
 46531 points to a string which is not a name for an appropriate directory, the path prefix defined as  
 46532 P\_tmpdir in the <stdio.h> header shall be used. If that directory is not accessible, an  
 46533 implementation-defined directory may be used.

46534 Many applications prefer their temporary files to have certain initial letter sequences in their  
 46535 names. The *pfx* argument should be used for this. This argument may be a null pointer or point  
 46536 to a string of up to five bytes to be used as the beginning of the filename.

46537 Some implementations of *tempnam()* may use *tmpnam()* internally. On such implementations, if  
 46538 called more than {TMP\_MAX} times in a single process, the behavior is implementation-defined.

46539 **RETURN VALUE**

46540 Upon successful completion, *tempnam()* shall allocate space for a string, put the generated  
 46541 pathname in that space, and return a pointer to it. The pointer shall be suitable for use in a  
 46542 subsequent call to *free()*. Otherwise, it shall return a null pointer and set *errno* to indicate the  
 46543 error.

46544 **ERRORS**46545 The *tempnam()* function shall fail if:

46546 [ENOMEM] Insufficient storage space is available.

46547 **EXAMPLES**46548 **Generating a Pathname**

46549 The following example generates a pathname for a temporary file in directory **/tmp**, with the  
 46550 prefix *file*. After the filename has been created, the call to *free()* deallocates the space used to  
 46551 store the filename.

```
46552 #include <stdio.h>
46553 #include <stdlib.h>
46554 ...
46555 char *directory = "/tmp";
46556 char *fileprefix = "file";
46557 char *file;

46558 file = tempnam(directory, fileprefix);
46559 free(file);
```

46560 **APPLICATION USAGE**

46561 This function only creates pathnames. It is the application's responsibility to create and remove  
 46562 the files. Between the time a pathname is created and the file is opened, it is possible for some  
 46563 other process to create a file with the same name. Applications may find *tmpfile()* more useful.

46564 **RATIONALE**

46565           None.

46566 **FUTURE DIRECTIONS**

46567           None.

46568 **SEE ALSO**46569           *fopen()*, *free()*, *open()*, *tmpfile()*, *tmpnam()*, *unlink()*, the Base Definitions volume of  
46570           IEEE Std 1003.1-2001, <stdio.h>46571 **CHANGE HISTORY**

46572           First released in Issue 1. Derived from Issue 1 of the SVID.

46573 **Issue 5**46574           The last paragraph of the DESCRIPTION was included as an APPLICATION USAGE note in  
46575           previous issues.

46576 **NAME**

46577           tfind — search binary search tree

46578 **SYNOPSIS**

46579 XSI       #include <search.h>

```
46580       void *tfind(const void *key, void *const *rootp,  
46581                   int (*compar)(const void *, const void *));
```

46582

46583 **DESCRIPTION**

46584       Refer to *tdelete()*.

46585 **NAME**

46586 tgamma, tgammaf, tgammal — compute gamma() function

46587 **SYNOPSIS**

46588 #include &lt;math.h&gt;

46589 double tgamma(double x);

46590 float tgammaf(float x);

46591 long double tgammal(long double x);

46592 **DESCRIPTION**

46593 **CX** The functionality described on this reference page is aligned with the ISO C standard. Any  
 46594 conflict between the requirements described here and the ISO C standard is unintentional. This  
 46595 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

46596 These functions shall compute the *gamma()* function of *x*.

46597 An application wishing to check for error situations should set *errno* to zero and call  
 46598 *feclearexcept*(FE\_ALL\_EXCEPT) before calling these functions. On return, if *errno* is non-zero or  
 46599 *fetestexcept*(FE\_INVALID | FE\_DIVBYZERO | FE\_OVERFLOW | FE\_UNDERFLOW) is non-  
 46600 zero, an error has occurred.

46601 **RETURN VALUE**46602 Upon successful completion, these functions shall return *Gamma(x)*.

46603 If *x* is a negative integer, a domain error shall occur, and either a NaN (if supported), or an  
 46604 implementation-defined value shall be returned.

46605 If the correct value would cause overflow, a range error shall occur and *tgamma()*, *tgammaf()*,  
 46606 and *tgammal()* shall return the value of the macro HUGE\_VAL, HUGE\_VALF, or HUGE\_VALL,  
 46607 respectively.

46608 **MX** If *x* is NaN, a NaN shall be returned.46609 If *x* is +Inf, *x* shall be returned.

46610 If *x* is ±0, a pole error shall occur, and *tgamma()*, *tgammaf()*, and *tgammal()* shall return  
 46611 ±HUGE\_VAL, ±HUGE\_VALF, and ±HUGE\_VALL, respectively.

46612 If *x* is −Inf, a domain error shall occur, and either a NaN (if supported), or an implementation-  
 46613 defined value shall be returned.

46614 **ERRORS**

46615 These functions shall fail if:

46616 **MX** Domain Error The value of *x* is a negative integer, or *x* is −Inf.

46617 If the integer expression (math\_errhandling & MATH\_ERRNO) is non-zero,  
 46618 then *errno* shall be set to [EDOM]. If the integer expression (math\_errhandling  
 46619 & MATH\_ERREXCEPT) is non-zero, then the invalid floating-point exception  
 46620 shall be raised.

46621 **MX** Pole Error The value of *x* is zero.

46622 If the integer expression (math\_errhandling & MATH\_ERRNO) is non-zero,  
 46623 then *errno* shall be set to [ERANGE]. If the integer expression  
 46624 (math\_errhandling & MATH\_ERREXCEPT) is non-zero, then the divide-by-  
 46625 zero floating-point exception shall be raised.

- 46626           Range Error       The value overflows.
- 46627                            If the integer expression (math\_errhandling & MATH\_ERRNO) is non-zero,  
46628                            then *errno* shall be set to [ERANGE]. If the integer expression  
46629                            (math\_errhandling & MATH\_ERREXCEPT) is non-zero, then the overflow  
46630                            floating-point exception shall be raised.
- 46631 **EXAMPLES**
- 46632           None.
- 46633 **APPLICATION USAGE**
- 46634           For IEEE Std 754-1985 **double**, overflow happens when  $0 < x < 1/\text{DBL\_MAX}$ , and  $171.7 < x$ .
- 46635           On error, the expressions (math\_errhandling & MATH\_ERRNO) and (math\_errhandling &  
46636           MATH\_ERREXCEPT) are independent of each other, but at least one of them must be non-zero.
- 46637 **RATIONALE**
- 46638           This function is named *tgamma()* in order to avoid conflicts with the historical *gamma()* and  
46639           *lgamma()* functions.
- 46640 **FUTURE DIRECTIONS**
- 46641           It is possible that the error response for a negative integer argument may be changed to a pole  
46642           error and a return value of  $\pm\text{Inf}$ .
- 46643 **SEE ALSO**
- 46644           *feclearexcept()*, *fetestexcept()*, *lgamma()*, the Base Definitions volume of IEEE Std 1003.1-2001,  
46645           Section 4.18, Treatment of Error Conditions for Mathematical Functions, <math.h>
- 46646 **CHANGE HISTORY**
- 46647           First released in Issue 6. Derived from the ISO/IEC 9899:1999 standard.

46648 **NAME**

46649           time — get time

46650 **SYNOPSIS**

46651           #include &lt;time.h&gt;

46652           time\_t time(time\_t \*tloc);

46653 **DESCRIPTION**

46654 CX       The functionality described on this reference page is aligned with the ISO C standard. Any  
46655       conflict between the requirements described here and the ISO C standard is unintentional. This  
46656       volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

46657 CX       The *time()* function shall return the value of time in seconds since the Epoch.

46658       The *tloc* argument points to an area where the return value is also stored. If *tloc* is a null pointer,  
46659       no value is stored.

46660 **RETURN VALUE**

46661       Upon successful completion, *time()* shall return the value of time. Otherwise, (**time\_t**)−1 shall be  
46662       returned.

46663 **ERRORS**

46664       No errors are defined.

46665 **EXAMPLES**46666       **Getting the Current Time**

46667       The following example uses the *time()* function to calculate the time elapsed, in seconds, since  
46668       the Epoch, *localtime()* to convert that value to a broken-down time, and *asctime()* to convert the  
46669       broken-down time values into a printable string.

```
46670       #include <stdio.h>
46671       #include <time.h>
46672       int main(void)
46673       {
46674       time_t result;
46675       
46676       result = time(NULL);
46677       printf("%s%ju secs since the Epoch\n",
46678              asctime(localtime(&result)),
46679              (uintmax_t)result);
46680       return(0);
46681       }
```

46681       This example writes the current time to *stdout* in a form like this:

```
46682       Wed Jun 26 10:32:15 1996
46683       835810335 secs since the Epoch
```

46684 **Timing an Event**

46685 The following example gets the current time, prints it out in the user's format, and prints the  
46686 number of minutes to an event being timed.

```
46687 #include <time.h>
46688 #include <stdio.h>
46689 ...
46690 time_t now;
46691 int minutes_to_event;
46692 ...
46693 time(&now);
46694 minutes_to_event = ...;
46695 printf("The time is ");
46696 puts(asctime(localtime(&now)));
46697 printf("There are %d minutes to the event.\n",
46698         minutes_to_event);
46699 ...
```

46700 **APPLICATION USAGE**

46701 None.

46702 **RATIONALE**

46703 The *time()* function returns a value in seconds (type **time\_t**) while *times()* returns a set of values  
46704 in clock ticks (type **clock\_t**). Some historical implementations, such as 4.3 BSD, have  
46705 mechanisms capable of returning more precise times (see below). A generalized timing scheme  
46706 to unify these various timing mechanisms has been proposed but not adopted.

46707 Implementations in which **time\_t** is a 32-bit signed integer (many historical implementations)  
46708 fail in the year 2038. IEEE Std 1003.1-2001 does not address this problem. However, the use of  
46709 the **time\_t** type is mandated in order to ease the eventual fix.

46710 The use of the **<time.h>** header instead of **<sys/types.h>** allows compatibility with the ISO C  
46711 standard.

46712 Many historical implementations (including Version 7) and the 1984 /usr/group standard use  
46713 **long** instead of **time\_t**. This volume of IEEE Std 1003.1-2001 uses the latter type in order to agree  
46714 with the ISO C standard.

46715 4.3 BSD includes *time()* only as an alternate function to the more flexible *gettimeofday()* function.

46716 **FUTURE DIRECTIONS**

46717 In a future version of this volume of IEEE Std 1003.1-2001, **time\_t** is likely to be required to be  
46718 capable of representing times far in the future. Whether this will be mandated as a 64-bit type or  
46719 a requirement that a specific date in the future be representable (for example, 10000 AD) is not  
46720 yet determined. Systems purchased after the approval of this volume of IEEE Std 1003.1-2001  
46721 should be evaluated to determine whether their lifetime will extend past 2038.

46725 **CHANGE HISTORY**

46726 First released in Issue 1. Derived from Issue 1 of the SVID.

46727 **Issue 6**

46728 Extensions beyond the ISO C standard are marked.

46729 The EXAMPLES, RATIONALE, and FUTURE DIRECTIONS sections are added.

## 46730 NAME

46731 timer\_create — create a per-process timer (**REALTIME**)

## 46732 SYNOPSIS

46733 TMR #include &lt;signal.h&gt;

46734 #include &lt;time.h&gt;

46735 int timer\_create(clockid\_t *clockid*, struct sigevent \*restrict *evp*,46736 timer\_t \*restrict *timerid*);

46737

## 46738 DESCRIPTION

46739 The *timer\_create()* function shall create a per-process timer using the specified clock, *clock\_id*, as  
 46740 the timing base. The *timer\_create()* function shall return, in the location referenced by *timerid*, a  
 46741 timer ID of type **timer\_t** used to identify the timer in timer requests. This timer ID shall be  
 46742 unique within the calling process until the timer is deleted. The particular clock, *clock\_id*, is  
 46743 defined in <**time.h**>. The timer whose ID is returned shall be in a disarmed state upon return  
 46744 from *timer\_create()*.

46745 The *evp* argument, if non-NULL, points to a **sigevent** structure. This structure, allocated by the  
 46746 application, defines the asynchronous notification to occur as specified in Section 2.4.1 (on page  
 46747 28) when the timer expires. If the *evp* argument is NULL, the effect is as if the *evp* argument  
 46748 pointed to a **sigevent** structure with the *sigev\_notify* member having the value SIGEV\_SIGNAL,  
 46749 the *sigev\_signo* having a default signal number, and the *sigev\_value* member having the value of  
 46750 the timer ID.

46751 Each implementation shall define a set of clocks that can be used as timing bases for per-process  
 46752 MON timers. All implementations shall support a *clock\_id* of CLOCK\_REALTIME. If the Monotonic  
 46753 Clock option is supported, implementations shall support a *clock\_id* of CLOCK\_MONOTONIC.

46754 Per-process timers shall not be inherited by a child process across a *fork()* and shall be disarmed  
 46755 and deleted by an *exec*.

46756 CPT If \_POSIX\_CPUTIME is defined, implementations shall support *clock\_id* values representing the  
 46757 CPU-time clock of the calling process.

46758 TCT If \_POSIX\_THREAD\_CPUTIME is defined, implementations shall support *clock\_id* values  
 46759 representing the CPU-time clock of the calling thread.

46760 CPT|TCT It is implementation-defined whether a *timer\_create()* function will succeed if the value defined  
 46761 by *clock\_id* corresponds to the CPU-time clock of a process or thread different from the process  
 46762 or thread invoking the function.

## 46763 RETURN VALUE

46764 If the call succeeds, *timer\_create()* shall return zero and update the location referenced by *timerid*  
 46765 to a **timer\_t**, which can be passed to the per-process timer calls. If an error occurs, the function  
 46766 shall return a value of -1 and set *errno* to indicate the error. The value of *timerid* is undefined if  
 46767 an error occurs.

## 46768 ERRORS

46769 The *timer\_create()* function shall fail if:

46770 [EAGAIN] The system lacks sufficient signal queuing resources to honor the request.

46771 [EAGAIN] The calling process has already created all of the timers it is allowed by this  
46772 implementation.

46773 [EINVAL] The specified clock ID is not defined.

46774 CPT|TCT [ENOTSUP] The implementation does not support the creation of a timer attached to the  
 46775 CPU-time clock that is specified by *clock\_id* and associated with a process or  
 46776 thread different from the process or thread invoking *timer\_create()*.

#### 46777 EXAMPLES

46778 None.

#### 46779 APPLICATION USAGE

46780 None.

#### 46781 RATIONALE

##### 46782 **Periodic Timer Overrun and Resource Allocation**

46783 The specified timer facilities may deliver realtime signals (that is, queued signals) on  
 46784 implementations that support this option. Since realtime applications cannot afford to lose  
 46785 notifications of asynchronous events, like timer expirations or asynchronous I/O completions, it  
 46786 must be possible to ensure that sufficient resources exist to deliver the signal when the event  
 46787 occurs. In general, this is not a difficulty because there is a one-to-one correspondence between a  
 46788 request and a subsequent signal generation. If the request cannot allocate the signal delivery  
 46789 resources, it can fail the call with an [EAGAIN] error.

46790 Periodic timers are a special case. A single request can generate an unspecified number of  
 46791 signals. This is not a problem if the requesting process can service the signals as fast as they are  
 46792 generated, thus making the signal delivery resources available for delivery of subsequent  
 46793 periodic timer expiration signals. But, in general, this cannot be assured—processing of periodic  
 46794 timer signals may “overrun”; that is, subsequent periodic timer expirations may occur before the  
 46795 currently pending signal has been delivered.

46796 Also, for signals, according to the POSIX.1-1990 standard, if subsequent occurrences of a  
 46797 pending signal are generated, it is implementation-defined whether a signal is delivered for each  
 46798 occurrence. This is not adequate for some realtime applications. So a mechanism is required to  
 46799 allow applications to detect how many timer expirations were delayed without requiring an  
 46800 indefinite amount of system resources to store the delayed expirations.

46801 The specified facilities provide for an overrun count. The overrun count is defined as the number  
 46802 of extra timer expirations that occurred between the time a timer expiration signal is generated  
 46803 and the time the signal is delivered. The signal-catching function, if it is concerned with  
 46804 overruns, can retrieve this count on entry. With this method, a periodic timer only needs one  
 46805 “signal queuing resource” that can be allocated at the time of the *timer\_create()* function call.

46806 A function is defined to retrieve the overrun count so that an application need not allocate static  
 46807 storage to contain the count, and an implementation need not update this storage  
 46808 asynchronously on timer expirations. But, for some high-frequency periodic applications, the  
 46809 overhead of an additional system call on each timer expiration may be prohibitive. The  
 46810 functions, as defined, permit an implementation to maintain the overrun count in user space,  
 46811 associated with the *timerid*. The *timer\_getoverrun()* function can then be implemented as a macro  
 46812 that uses the *timerid* argument (which may just be a pointer to a user space structure containing  
 46813 the counter) to locate the overrun count with no system call overhead. Other implementations,  
 46814 less concerned with this class of applications, can avoid the asynchronous update of user space  
 46815 by maintaining the count in a system structure at the cost of the extra system call to obtain it.

46816 **Timer Expiration Signal Parameters**

46817 The Realtime Signals Extension option supports an application-specific datum that is delivered  
46818 to the extended signal handler. This value is explicitly specified by the application, along with  
46819 the signal number to be delivered, in a **sigevent** structure. The type of the application-defined  
46820 value can be either an integer constant or a pointer. This explicit specification of the value, as  
46821 opposed to always sending the timer ID, was selected based on existing practice.

46822 It is common practice for realtime applications (on non-POSIX systems or realtime extended  
46823 POSIX systems) to use the parameters of event handlers as the case label of a switch statement  
46824 or as a pointer to an application-defined data structure. Since *timer\_ids* are dynamically allocated  
46825 by the *timer\_create()* function, they can be used for neither of these functions without additional  
46826 application overhead in the signal handler; for example, to search an array of saved timer IDs to  
46827 associate the ID with a constant or application data structure.

46828 **FUTURE DIRECTIONS**

46829 None.

46831 *clock\_getres()*, *timer\_delete()*, *timer\_getoverrun()*, the Base Definitions volume of  
46832 IEEE Std 1003.1-2001, <**time.h**>

46833 **CHANGE HISTORY**

46834 First released in Issue 5. Included for alignment with the POSIX Realtime Extension.

46835 **Issue 6**

46836 The *timer\_create()* function is marked as part of the Timers option.

46837 The [ENOSYS] error condition has been removed as stubs need not be provided if an  
46838 implementation does not support the Timers option.

46839 CPU-time clocks are added for alignment with IEEE Std 1003.1d-1999.

46840 The DESCRIPTION is updated for alignment with IEEE Std 1003.1j-2000 by adding the  
46841 requirement for the CLOCK\_MONOTONIC clock under the Monotonic Clock option.

46842 The **restrict** keyword is added to the *timer\_create()* prototype for alignment with the  
46843 ISO/IEC 9899:1999 standard.

46844 **NAME**

46845 timer\_delete — delete a per-process timer (**REALTIME**)

46846 **SYNOPSIS**

```
46847 TMR #include <time.h>
```

```
46848 int timer_delete(timer_t timerid);
```

46849

46850 **DESCRIPTION**

46851 The *timer\_delete()* function deletes the specified timer, *timerid*, previously created by the  
46852 *timer\_create()* function. If the timer is armed when *timer\_delete()* is called, the behavior shall be  
46853 as if the timer is automatically disarmed before removal. The disposition of pending signals for  
46854 the deleted timer is unspecified.

46855 **RETURN VALUE**

46856 If successful, the *timer\_delete()* function shall return a value of zero. Otherwise, the function shall  
46857 return a value of  $-1$  and set *errno* to indicate the error.

46858 **ERRORS**

46859 The *timer\_delete()* function shall fail if:

46860 [EINVAL] The timer ID specified by *timerid* is not a valid timer ID.

46861 **EXAMPLES**

46862 None.

46863 **APPLICATION USAGE**

46864 None.

46865 **RATIONALE**

46866 None.

46867 **FUTURE DIRECTIONS**

46868 None.

46869 **SEE ALSO**

46870 *timer\_create()*, the Base Definitions volume of IEEE Std 1003.1-2001, <**time.h**>

46871 **CHANGE HISTORY**

46872 First released in Issue 5. Included for alignment with the POSIX Realtime Extension.

46873 **Issue 6**

46874 The *timer\_delete()* function is marked as part of the Timers option.

46875 The [ENOSYS] error condition has been removed as stubs need not be provided if an  
46876 implementation does not support the Timers option.

## 46877 NAME

46878 timer\_getoverrun, timer\_gettime, timer\_settime — per-process timers (**REALTIME**)

## 46879 SYNOPSIS

```
46880 TMR    #include <time.h>
46881
46881     int timer_getoverrun(timer_t timerid);
46882     int timer_gettime(timer_t timerid, struct itimerspec *value);
46883     int timer_settime(timer_t timerid, int flags,
46884                     const struct itimerspec *restrict value,
46885                     struct itimerspec *restrict ovalue);
46886
```

## 46887 DESCRIPTION

46888 The *timer\_gettime()* function shall store the amount of time until the specified timer, *timerid*, expires and the reload value of the timer into the space pointed to by the *value* argument. The *it\_value* member of this structure shall contain the amount of time before the timer expires, or zero if the timer is disarmed. This value is returned as the interval until timer expiration, even if the timer was armed with absolute time. The *it\_interval* member of *value* shall contain the reload value last set by *timer\_settime()*.

46894 The *timer\_settime()* function shall set the time until the next expiration of the timer specified by *timerid* from the *it\_value* member of the *value* argument and arm the timer if the *it\_value* member of *value* is non-zero. If the specified timer was already armed when *timer\_settime()* is called, this call shall reset the time until next expiration to the *value* specified. If the *it\_value* member of *value* is zero, the timer shall be disarmed. The effect of disarming or resetting a timer with pending expiration notifications is unspecified.

46900 If the flag **TIMER\_ABSTIME** is not set in the argument *flags*, *timer\_settime()* shall behave as if the time until next expiration is set to be equal to the interval specified by the *it\_value* member of *value*. That is, the timer shall expire in *it\_value* nanoseconds from when the call is made. If the flag **TIMER\_ABSTIME** is set in the argument *flags*, *timer\_settime()* shall behave as if the time until next expiration is set to be equal to the difference between the absolute time specified by the *it\_value* member of *value* and the current value of the clock associated with *timerid*. That is, the timer shall expire when the clock reaches the value specified by the *it\_value* member of *value*. If the specified time has already passed, the function shall succeed and the expiration notification shall be made.

46909 The reload value of the timer shall be set to the value specified by the *it\_interval* member of *value*. When a timer is armed with a non-zero *it\_interval*, a periodic (or repetitive) timer is specified.

46912 Time values that are between two consecutive non-negative integer multiples of the resolution of the specified timer shall be rounded up to the larger multiple of the resolution. Quantization error shall not cause the timer to expire earlier than the rounded time value.

46915 If the argument *ovalue* is not NULL, the *timer\_settime()* function shall store, in the location referenced by *ovalue*, a value representing the previous amount of time before the timer would have expired, or zero if the timer was disarmed, together with the previous timer reload value. Timers shall not expire before their scheduled time.

46919 Only a single signal shall be queued to the process for a given timer at any point in time. When a timer for which a signal is still pending expires, no signal shall be queued, and a timer overrun shall occur. When a timer expiration signal is delivered to or accepted by a process, if the implementation supports the Realtime Signals Extension, the *timer\_getoverrun()* function shall return the timer expiration overrun count for the specified timer. The overrun count returned contains the number of extra timer expirations that occurred between the time the signal was

46925 generated (queued) and when it was delivered or accepted, up to but not including an  
 46926 implementation-defined maximum of {DELAYTIMER\_MAX}. If the number of such extra  
 46927 expirations is greater than or equal to {DELAYTIMER\_MAX}, then the overrun count shall be set  
 46928 to {DELAYTIMER\_MAX}. The value returned by *timer\_getoverrun()* shall apply to the most  
 46929 recent expiration signal delivery or acceptance for the timer. If no expiration signal has been  
 46930 delivered for the timer, or if the Realtime Signals Extension is not supported, the return value of  
 46931 *timer\_getoverrun()* is unspecified.

#### 46932 RETURN VALUE

46933 If the *timer\_getoverrun()* function succeeds, it shall return the timer expiration overrun count as  
 46934 explained above.

46935 If the *timer\_gettime()* or *timer\_settime()* functions succeed, a value of 0 shall be returned.

46936 If an error occurs for any of these functions, the value -1 shall be returned, and *errno* set to  
 46937 indicate the error.

#### 46938 ERRORS

46939 The *timer\_getoverrun()*, *timer\_gettime()*, and *timer\_settime()* functions shall fail if:

46940 [EINVAL] The *timerid* argument does not correspond to an ID returned by *timer\_create()*  
 46941 but not yet deleted by *timer\_delete()*.

46942 The *timer\_settime()* function shall fail if:

46943 [EINVAL] A *value* structure specified a nanosecond value less than zero or greater than  
 46944 or equal to 1 000 million, and the *it\_value* member of that structure did not  
 46945 specify zero seconds and nanoseconds.

#### 46946 EXAMPLES

46947 None.

#### 46948 APPLICATION USAGE

46949 None.

#### 46950 RATIONALE

46951 Practical clocks tick at a finite rate, with rates of 100 hertz and 1 000 hertz being common. The  
 46952 inverse of this tick rate is the clock resolution, also called the clock granularity, which in either  
 46953 case is expressed as a time duration, being 10 milliseconds and 1 millisecond respectively for  
 46954 these common rates. The granularity of practical clocks implies that if one reads a given clock  
 46955 twice in rapid succession, one may get the same time value twice; and that timers must wait for  
 46956 the next clock tick after the theoretical expiration time, to ensure that a timer never returns too  
 46957 soon. Note also that the granularity of the clock may be significantly coarser than the resolution  
 46958 of the data format used to set and get time and interval values. Also note that some  
 46959 implementations may choose to adjust time and/or interval values to exactly match the ticks of  
 46960 the underlying clock.

46961 This volume of IEEE Std 1003.1-2001 defines functions that allow an application to determine the  
 46962 implementation-supported resolution for the clocks and requires an implementation to  
 46963 document the resolution supported for timers and *nanosleep()* if they differ from the supported  
 46964 clock resolution. This is more of a procurement issue than a runtime application issue.

#### 46965 FUTURE DIRECTIONS

46966 None.

46967 **SEE ALSO**

46968 *clock\_getres()*, *timer\_create()*, the Base Definitions volume of IEEE Std 1003.1-2001, <time.h>

46969 **CHANGE HISTORY**

46970 First released in Issue 5. Included for alignment with the POSIX Realtime Extension.

46971 **Issue 6**

46972 The *timer\_getoverrun()*, *timer\_gettime()*, and *timer\_settime()* functions are marked as part of the  
46973 Timers option.

46974 The [ENOSYS] error condition has been removed as stubs need not be provided if an  
46975 implementation does not support the Timers option.

46976 The [EINVAL] error condition is updated to include the following: “and the *it\_value* member of  
46977 that structure did not specify zero seconds and nanoseconds.” This change is for IEEE PASC  
46978 Interpretation 1003.1 #89.

46979 The DESCRIPTION for *timer\_getoverrun()* is updated to clarify that “If no expiration signal has  
46980 been delivered for the timer, or if the Realtime Signals Extension is not supported, the return  
46981 value of *timer\_getoverrun()* is unspecified”.

46982 The **restrict** keyword is added to the *timer\_settime()* prototype for alignment with the  
46983 ISO/IEC 9899:1999 standard.

46984 **NAME**46985 `times` — get process and waited-for child process times46986 **SYNOPSIS**46987 `#include <sys/times.h>`46988 `clock_t times(struct tms *buffer);`46989 **DESCRIPTION**46990 The `times()` function shall fill the `tms` structure pointed to by `buffer` with time-accounting  
46991 information. The `tms` structure is defined in `<sys/times.h>`.

46992 All times are measured in terms of the number of clock ticks used.

46993 The times of a terminated child process shall be included in the `tms_cutime` and `tms_cstime`  
46994 elements of the parent when `wait()` or `waitpid()` returns the process ID of this terminated child. If  
46995 a child process has not waited for its children, their times shall not be included in its times.46996 • The `tms_utime` structure member is the CPU time charged for the execution of user  
46997 instructions of the calling process.46998 • The `tms_stime` structure member is the CPU time charged for execution by the system on  
46999 behalf of the calling process.47000 • The `tms_cutime` structure member is the sum of the `tms_utime` and `tms_cutime` times of the  
47001 child processes.47002 • The `tms_cstime` structure member is the sum of the `tms_stime` and `tms_cstime` times of the child  
47003 processes.47004 **RETURN VALUE**47005 Upon successful completion, `times()` shall return the elapsed real time, in clock ticks, since an  
47006 arbitrary point in the past (for example, system start-up time). This point does not change from  
47007 one invocation of `times()` within the process to another. The return value may overflow the  
47008 possible range of type `clock_t`. If `times()` fails, `(clock_t)-1` shall be returned and `errno` set to  
47009 indicate the error.47010 **ERRORS**

47011 No errors are defined.

47012 **EXAMPLES**47013 **Timing a Database Lookup**47014 The following example defines two functions, `start_clock()` and `end_clock()`, that are used to time  
47015 a lookup. It also defines variables of type `clock_t` and `tms` to measure the duration of  
47016 transactions. The `start_clock()` function saves the beginning times given by the `times()` function.  
47017 The `end_clock()` function gets the ending times and prints the difference between the two times.47018 `#include <sys/times.h>`  
47019 `#include <stdio.h>`  
47020 `...`  
47021 `void start_clock(void);`  
47022 `void end_clock(char *msg);`  
47023 `...`  
47024 `static clock_t st_time;`  
47025 `static clock_t en_time;`  
47026 `static struct tms st_cpu;`  
47027 `static struct tms en_cpu;`

```

47028     ...
47029     void
47030     start_clock()
47031     {
47032         st_time = times(&st_cpu);
47033     }

47034     /* This example assumes that the result of each subtraction
47035        is within the range of values that can be represented in
47036        an integer type. */
47037     void
47038     end_clock(char *msg)
47039     {
47040         en_time = times(&en_cpu);

47041         fputs(msg, stdout);
47042         printf("Real Time: %jd, User Time %jd, System Time %jd\n",
47043             (intmax_t)(en_time - st_time),
47044             (intmax_t)(en_cpu.tms_utime - st_cpu.tms_utime),
47045             (intmax_t)(en_cpu.tms_stime - st_cpu.tms_stime));
47046     }

```

**47047 APPLICATION USAGE**

47048 Applications should use `sysconf(_SC_CLK_TCK)` to determine the number of clock ticks per  
47049 second as it may vary from system to system.

**47050 RATIONALE**

47051 The accuracy of the times reported is intentionally left unspecified to allow implementations  
47052 flexibility in design, from uniprocessor to multi-processor networks.

47053 The inclusion of times of child processes is recursive, so that a parent process may collect the  
47054 total times of all of its descendants. But the times of a child are only added to those of its parent  
47055 when its parent successfully waits on the child. Thus, it is not guaranteed that a parent process  
47056 can always see the total times of all its descendants; see also the discussion of the term  
47057 “realtime” in `alarm()`.

47058 If the type `clock_t` is defined to be a signed 32-bit integer, it overflows in somewhat more than a  
47059 year if there are 60 clock ticks per second, or less than a year if there are 100. There are individual  
47060 systems that run continuously for longer than that. This volume of IEEE Std 1003.1-2001 permits  
47061 an implementation to make the reference point for the returned value be the start-up time of the  
47062 process, rather than system start-up time.

47063 The term “charge” in this context has nothing to do with billing for services. The operating  
47064 system accounts for time used in this way. That information must be correct, regardless of how  
47065 that information is used.

**47066 FUTURE DIRECTIONS**

47067 None.

**47068 SEE ALSO**

47069 `alarm()`, `exec`, `fork()`, `sysconf()`, `time()`, `wait()`, the Base Definitions volume of  
47070 IEEE Std 1003.1-2001, <`sys/times.h`>

**47071 CHANGE HISTORY**

47072 First released in Issue 1. Derived from Issue 1 of the SVID.

47073 **NAME**

47074            timezone — difference from UTC and local standard time

47075 **SYNOPSIS**

47076 xSI        #include &lt;time.h&gt;

47077            extern long timezone;

47078

47079 **DESCRIPTION**47080            Refer to *tzset()*.

47081 **NAME**

47082 tmpfile — create a temporary file

47083 **SYNOPSIS**

47084 #include &lt;stdio.h&gt;

47085 FILE \*tmpfile(void);

47086 **DESCRIPTION**

47087 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
 47088 conflict between the requirements described here and the ISO C standard is unintentional. This  
 47089 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

47090 The *tmpfile()* function shall create a temporary file and open a corresponding stream. The file  
 47091 shall be automatically deleted when all references to the file are closed. The file is opened as in  
 47092 *fopen()* for update (*w+*).

47093 CX In some implementations, a permanent file may be left behind if the process calling *tmpfile()* is  
 47094 killed while it is processing a call to *tmpfile()*.

47095 An error message may be written to standard error if the stream cannot be opened.

47096 **RETURN VALUE**

47097 Upon successful completion, *tmpfile()* shall return a pointer to the stream of the file that is  
 47098 CX created. Otherwise, it shall return a null pointer and set *errno* to indicate the error.

47099 **ERRORS**47100 The *tmpfile()* function shall fail if:47101 CX [EINTR] A signal was caught during *tmpfile()*.

47102 CX [EMFILE] {OPEN\_MAX} file descriptors are currently open in the calling process.

47103 CX [ENFILE] The maximum allowable number of files is currently open in the system.

47104 CX [ENOSPC] The directory or file system which would contain the new file cannot be  
 47105 expanded.

47106 CX [EOVERFLOW] The file is a regular file and the size of the file cannot be represented correctly  
 47107 in an object of type *off\_t*.

47108 The *tmpfile()* function may fail if:

47109 CX [EMFILE] {FOPEN\_MAX} streams are currently open in the calling process.

47110 CX [ENOMEM] Insufficient storage space is available.

47111 **EXAMPLES**47112 **Creating a Temporary File**

47113 The following example creates a temporary file for update, and returns a pointer to a stream for  
 47114 the created file in the *fp* variable.

47115 #include &lt;stdio.h&gt;

47116 ...

47117 FILE \*fp;

47118 fp = tmpfile ();

**47119 APPLICATION USAGE**

47120 It should be possible to open at least {TMP\_MAX} temporary files during the lifetime of the  
47121 program (this limit may be shared with *tmpnam()*) and there should be no limit on the number  
47122 simultaneously open other than this limit and any limit on the number of open files  
47123 ({FOPEN\_MAX}).

**47124 RATIONALE**

47125 None.

**47126 FUTURE DIRECTIONS**

47127 None.

**47128 SEE ALSO**

47129 *fopen()*, *tmpnam()*, *unlink()*, the Base Definitions volume of IEEE Std 1003.1-2001, <stdio.h>

**47130 CHANGE HISTORY**

47131 First released in Issue 1. Derived from Issue 1 of the SVID.

**47132 Issue 5**

47133 Large File Summit extensions are added.

47134 The last two paragraphs of the DESCRIPTION were included as APPLICATION USAGE notes  
47135 in previous issues.

**47136 Issue 6**

47137 Extensions beyond the ISO C standard are marked.

47138 The following new requirements on POSIX implementations derive from alignment with the  
47139 Single UNIX Specification:

- 47140 • In the ERRORS section, the [Eoverflow] condition is added. This change is to support  
47141 large files.
- 47142 • The [EMFILE] optional error condition is added.

47143 The APPLICATION USAGE section is added for alignment with the ISO/IEC 9899:1999  
47144 standard.

47145 **NAME**

47146 tmpnam — create a name for a temporary file

47147 **SYNOPSIS**

47148 #include &lt;stdio.h&gt;

47149 char \*tmpnam(char \*s);

47150 **DESCRIPTION**

47151 cx The functionality described on this reference page is aligned with the ISO C standard. Any  
 47152 conflict between the requirements described here and the ISO C standard is unintentional. This  
 47153 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

47154 The *tmpnam()* function shall generate a string that is a valid filename and that is not the same as  
 47155 the name of an existing file. The function is potentially capable of generating {TMP\_MAX}  
 47156 different strings, but any or all of them may already be in use by existing files and thus not be  
 47157 suitable return values.

47158 The *tmpnam()* function generates a different string each time it is called from the same process,  
 47159 up to {TMP\_MAX} times. If it is called more than {TMP\_MAX} times, the behavior is  
 47160 implementation-defined.

47161 The implementation shall behave as if no function defined in this volume of  
 47162 IEEE Std 1003.1-2001 calls *tmpnam()*.

47163 cx If the application uses any of the functions guaranteed to be available if either  
 47164 `_POSIX_THREAD_SAFE_FUNCTIONS` or `_POSIX_THREADS` is defined, the application shall  
 47165 ensure that the *tmpnam()* function is called with a non-NULL parameter.

47166 **RETURN VALUE**

47167 Upon successful completion, *tmpnam()* shall return a pointer to a string. If no suitable string can  
 47168 be generated, the *tmpnam()* function shall return a null pointer.

47169 If the argument *s* is a null pointer, *tmpnam()* shall leave its result in an internal static object and  
 47170 return a pointer to that object. Subsequent calls to *tmpnam()* may modify the same object. If the  
 47171 argument *s* is not a null pointer, it is presumed to point to an array of at least `L_tmpnam` **chars**;  
 47172 *tmpnam()* shall write its result in that array and shall return the argument as its value.

47173 **ERRORS**

47174 No errors are defined.

47175 **EXAMPLES**47176 **Generating a Filename**47177 The following example generates a unique filename and stores it in the array pointed to by *ptr*.

```
47178 #include <stdio.h>
47179 ...
47180 char filename[L_tmpnam+1];
47181 char *ptr;

47182 ptr = tmpnam(filename);
```

47183 **APPLICATION USAGE**

47184 This function only creates filenames. It is the application's responsibility to create and remove  
 47185 the files.

47186 Between the time a pathname is created and the file is opened, it is possible for some other  
 47187 process to create a file with the same name. Applications may find *tmpfile()* more useful.

47188 **RATIONALE**

47189 None.

47190 **FUTURE DIRECTIONS**

47191 None.

47192 **SEE ALSO**47193 *fopen()*, *open()*, *tmpnam()*, *tmpfile()*, *unlink()*, the Base Definitions volume of  
47194 IEEE Std 1003.1-2001, <stdio.h>47195 **CHANGE HISTORY**

47196 First released in Issue 1. Derived from Issue 1 of the SVID.

47197 **Issue 5**

47198 The DESCRIPTION is updated for alignment with the POSIX Threads Extension.

47199 **Issue 6**

47200 Extensions beyond the ISO C standard are marked.

47201 The DESCRIPTION is updated to avoid use of the term “must” for application requirements.

47202 The DESCRIPTION is expanded for alignment with the ISO/IEC 9899:1999 standard.

47203 **NAME**

47204           toascii — translate an integer to a 7-bit ASCII character

47205 **SYNOPSIS**

47206 XSI        #include &lt;ctype.h&gt;

47207            int toascii(int c);

47208

47209 **DESCRIPTION**47210           The *toascii()* function shall convert its argument into a 7-bit ASCII character.47211 **RETURN VALUE**47212           The *toascii()* function shall return the value (*c* & 0x7f).47213 **ERRORS**

47214           No errors are returned.

47215 **EXAMPLES**

47216           None.

47217 **APPLICATION USAGE**

47218           None.

47219 **RATIONALE**

47220           None.

47221 **FUTURE DIRECTIONS**

47222           None.

47223 **SEE ALSO**47224           *isascii()*, the Base Definitions volume of IEEE Std 1003.1-2001, <ctype.h>47225 **CHANGE HISTORY**

47226           First released in Issue 1. Derived from Issue 1 of the SVID.

47227 **NAME**

47228           tolower — transliterate uppercase characters to lowercase

47229 **SYNOPSIS**

47230           #include &lt;ctype.h&gt;

47231           int tolower(int c);

47232 **DESCRIPTION**

47233 CX       The functionality described on this reference page is aligned with the ISO C standard. Any  
47234       conflict between the requirements described here and the ISO C standard is unintentional. This  
47235       volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

47236       The *tolower()* function has as a domain a type **int**, the value of which is representable as an  
47237       **unsigned char** or the value of EOF. If the argument has any other value, the behavior is  
47238       undefined. If the argument of *tolower()* represents an uppercase letter, and there exists a  
47239 CX       corresponding lowercase letter (as defined by character type information in the program locale  
47240       category *LC\_CTYPE*), the result shall be the corresponding lowercase letter. All other arguments  
47241       in the domain are returned unchanged.

47242 **RETURN VALUE**

47243       Upon successful completion, *tolower()* shall return the lowercase letter corresponding to the  
47244       argument passed; otherwise, it shall return the argument unchanged.

47245 **ERRORS**

47246       No errors are defined.

47247 **EXAMPLES**

47248       None.

47249 **APPLICATION USAGE**

47250       None.

47251 **RATIONALE**

47252       None.

47253 **FUTURE DIRECTIONS**

47254       None.

47255 **SEE ALSO**47256       *setlocale()*, the Base Definitions volume of IEEE Std 1003.1-2001, Chapter 7, Locale, <ctype.h>47257 **CHANGE HISTORY**

47258       First released in Issue 1. Derived from Issue 1 of the SVID.

47259 **Issue 6**

47260       Extensions beyond the ISO C standard are marked.

47261 **NAME**

47262           toupper — transliterate lowercase characters to uppercase

47263 **SYNOPSIS**

47264           #include &lt;ctype.h&gt;

47265           int toupper(int c);

47266 **DESCRIPTION**47267 **CX**       The functionality described on this reference page is aligned with the ISO C standard. Any  
47268 conflict between the requirements described here and the ISO C standard is unintentional. This  
47269 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.47270       The *toupper()* function has as a domain a type **int**, the value of which is representable as an  
47271 **unsigned char** or the value of EOF. If the argument has any other value, the behavior is  
47272 undefined. If the argument of *toupper()* represents a lowercase letter, and there exists a  
47273 **CX**       corresponding uppercase letter (as defined by character type information in the program locale  
47274 category *LC\_CTYPE*), the result shall be the corresponding uppercase letter. All other arguments  
47275 in the domain are returned unchanged.47276 **RETURN VALUE**47277       Upon successful completion, *toupper()* shall return the uppercase letter corresponding to the  
47278 argument passed.47279 **ERRORS**

47280       No errors are defined.

47281 **EXAMPLES**

47282       None.

47283 **APPLICATION USAGE**

47284       None.

47285 **RATIONALE**

47286       None.

47287 **FUTURE DIRECTIONS**

47288       None.

47289 **SEE ALSO**47290       *setlocale()*, the Base Definitions volume of IEEE Std 1003.1-2001, Chapter 7, Locale, <ctype.h>47291 **CHANGE HISTORY**

47292       First released in Issue 1. Derived from Issue 1 of the SVID.

47293 **Issue 6**

47294       Extensions beyond the ISO C standard are marked.

47295 **NAME**

47296 towctrans — wide-character transliteration

47297 **SYNOPSIS**

47298 #include &lt;wctype.h&gt;

47299 wint\_t towctrans(wint\_t *wc*, wctrans\_t *desc*);47300 **DESCRIPTION**

47301 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
 47302 conflict between the requirements described here and the ISO C standard is unintentional. This  
 47303 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

47304 The *towctrans()* function shall transliterate the wide-character code *wc* using the mapping  
 47305 described by *desc*. The current setting of the *LC\_CTYPE* category should be the same as during  
 47306 CX the call to *wctrans()* that returned the value *desc*. If the value of *desc* is invalid (that is, not  
 47307 obtained by a call to *wctrans()* or *desc* is invalidated by a subsequent call to *setlocale()* that has  
 47308 affected category *LC\_CTYPE*), the result is unspecified.

47309 An application wishing to check for error situations should set *errno* to 0 before calling  
 47310 *towctrans()*. If *errno* is non-zero on return, an error has occurred.

47311 **RETURN VALUE**

47312 If successful, the *towctrans()* function shall return the mapped value of *wc* using the mapping  
 47313 described by *desc*. Otherwise, it shall return *wc* unchanged.

47314 **ERRORS**47315 The *towctrans()* function may fail if:47316 CX [EINVAL] *desc* contains an invalid transliteration descriptor.47317 **EXAMPLES**

47318 None.

47319 **APPLICATION USAGE**

47320 The strings "tolower" and "toupper" are reserved for the standard mapping names. In the  
 47321 table below, the functions in the left column are equivalent to the functions in the right column.

47322 tolower(*wc*) towctrans(*wc*, wctrans("tolower"))47323 toupper(*wc*) towctrans(*wc*, wctrans("toupper"))47324 **RATIONALE**

47325 None.

47326 **FUTURE DIRECTIONS**

47327 None.

47328 **SEE ALSO**

47329 *tolower()*, *toupper()*, *wctrans()*, the Base Definitions volume of IEEE Std 1003.1-2001,  
 47330 <wctype.h>

47331 **CHANGE HISTORY**

47332 First released in Issue 5. Derived from ISO/IEC 9899:1990/Amendment 1:1995 (E).

47333 **Issue 6**

47334 Extensions beyond the ISO C standard are marked.

47335 **NAME**

47336 towlower — transliterate uppercase wide-character code to lowercase

47337 **SYNOPSIS**

47338 #include <wctype.h>

47339 wint\_t towlower(wint\_t wc);

47340 **DESCRIPTION**

47341 cx The functionality described on this reference page is aligned with the ISO C standard. Any  
47342 conflict between the requirements described here and the ISO C standard is unintentional. This  
47343 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

47344 The *towlower()* function has as a domain a type **wint\_t**, the value of which the application shall  
47345 ensure is a character representable as a **wchar\_t**, and a wide-character code corresponding to a  
47346 valid character in the current locale or the value of WEOF. If the argument has any other value,  
47347 the behavior is undefined. If the argument of *towlower()* represents an uppercase wide-character  
47348 code, and there exists a corresponding lowercase wide-character code (as defined by character  
47349 type information in the program locale category *LC\_CTYPE*), the result shall be the  
47350 corresponding lowercase wide-character code. All other arguments in the domain are returned  
47351 unchanged.

47352 **RETURN VALUE**

47353 Upon successful completion, *towlower()* shall return the lowercase letter corresponding to the  
47354 argument passed; otherwise, it shall return the argument unchanged.

47355 **ERRORS**

47356 No errors are defined.

47357 **EXAMPLES**

47358 None.

47359 **APPLICATION USAGE**

47360 None.

47361 **RATIONALE**

47362 None.

47363 **FUTURE DIRECTIONS**

47364 None.

47365 **SEE ALSO**

47366 *setlocale()*, the Base Definitions volume of IEEE Std 1003.1-2001, Chapter 7, Locale, <**wctype.h**>,  
47367 <**wchar.h**>

47368 **CHANGE HISTORY**

47369 First released in Issue 4.

47370 **Issue 5**

47371 The following change has been made in this issue for alignment with  
47372 ISO/IEC 9899:1990/Amendment 1:1995 (E):

- 47373 • The SYNOPSIS has been changed to indicate that this function and associated data types are  
47374 now made visible by inclusion of the <**wctype.h**> header rather than <**wchar.h**>.

47375 **Issue 6**

47376 The DESCRIPTION is updated to avoid use of the term “must” for application requirements.

47377 **NAME**

47378 towupper — transliterate lowercase wide-character code to uppercase

47379 **SYNOPSIS**

47380 #include <wctype.h>

47381 wint\_t towupper(wint\_t wc);

47382 **DESCRIPTION**

47383 cx The functionality described on this reference page is aligned with the ISO C standard. Any  
47384 conflict between the requirements described here and the ISO C standard is unintentional. This  
47385 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

47386 The *towupper()* function has as a domain a type **wint\_t**, the value of which the application shall  
47387 ensure is a character representable as a **wchar\_t**, and a wide-character code corresponding to a  
47388 valid character in the current locale or the value of WEOF. If the argument has any other value,  
47389 the behavior is undefined. If the argument of *towupper()* represents a lowercase wide-character  
47390 code, and there exists a corresponding uppercase wide-character code (as defined by character  
47391 type information in the program locale category *LC\_CTYPE*), the result shall be the  
47392 corresponding uppercase wide-character code. All other arguments in the domain are returned  
47393 unchanged.

47394 **RETURN VALUE**

47395 Upon successful completion, *towupper()* shall return the uppercase letter corresponding to the  
47396 argument passed. Otherwise, it shall return the argument unchanged.

47397 **ERRORS**

47398 No errors are defined.

47399 **EXAMPLES**

47400 None.

47401 **APPLICATION USAGE**

47402 None.

47403 **RATIONALE**

47404 None.

47405 **FUTURE DIRECTIONS**

47406 None.

47407 **SEE ALSO**

47408 *setlocale()*, the Base Definitions volume of IEEE Std 1003.1-2001, Chapter 7, Locale, <wctype.h>,  
47409 <wchar.h>

47410 **CHANGE HISTORY**

47411 First released in Issue 4.

47412 **Issue 5**

47413 The following change has been made in this issue for alignment with  
47414 ISO/IEC 9899:1990/Amendment 1:1995 (E):

- 47415 • The SYNOPSIS has been changed to indicate that this function and associated data types are  
47416 now made visible by inclusion of the <wctype.h> header rather than <wchar.h>.

47417 **Issue 6**

47418 The DESCRIPTION is updated to avoid use of the term “must” for application requirements.

47419 **NAME**

47420 trunc, truncf, trunc1 — round to truncated integer value

47421 **SYNOPSIS**

47422 #include <math.h>

47423 double trunc(double x);

47424 float truncf(float x);

47425 long double trunc1(long double x);

47426 **DESCRIPTION**

47427 **CX** The functionality described on this reference page is aligned with the ISO C standard. Any  
47428 conflict between the requirements described here and the ISO C standard is unintentional. This  
47429 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

47430 These functions shall round their argument to the integer value, in floating format, nearest to but  
47431 no larger in magnitude than the argument.

47432 **RETURN VALUE**

47433 Upon successful completion, these functions shall return the truncated integer value.

47434 **MX** If  $x$  is NaN, a NaN shall be returned.

47435 If  $x$  is  $\pm 0$  or  $\pm \text{Inf}$ ,  $x$  shall be returned.

47436 **ERRORS**

47437 No errors are defined.

47438 **EXAMPLES**

47439 None.

47440 **APPLICATION USAGE**

47441 None.

47442 **RATIONALE**

47443 None.

47444 **FUTURE DIRECTIONS**

47445 None.

47448 **CHANGE HISTORY**

47449 First released in Issue 6. Derived from the ISO/IEC 9899:1999 standard.

47450 **NAME**

47451 truncate — truncate a file to a specified length

47452 **SYNOPSIS**47453 XSI `#include <unistd.h>`47454 `int truncate(const char *path, off_t length);`

47455

47456 **DESCRIPTION**47457 The `truncate()` function shall cause the regular file named by *path* to have a size which shall be  
47458 equal to *length* bytes.47459 If the file previously was larger than *length*, the extra data is discarded. If the file was previously  
47460 shorter than *length*, its size is increased, and the extended area appears as if it were zero-filled.

47461 The application shall ensure that the process has write permission for the file.

47462 If the request would cause the file size to exceed the soft file size limit for the process, the  
47463 request shall fail and the implementation shall generate the SIGXFSZ signal for the process.47464 This function shall not modify the file offset for any open file descriptions associated with the  
47465 file. Upon successful completion, if the file size is changed, this function shall mark for update  
47466 the *st\_ctime* and *st\_mtime* fields of the file, and the S\_ISUID and S\_ISGID bits of the file mode  
47467 may be cleared.47468 **RETURN VALUE**47469 Upon successful completion, `truncate()` shall return 0. Otherwise, `-1` shall be returned, and *errno*  
47470 set to indicate the error.47471 **ERRORS**47472 The `truncate()` function shall fail if:

47473 [EINTR] A signal was caught during execution.

47474 [EINVAL] The *length* argument was less than 0.

47475 [EFBIG] or [EINVAL]

47476 The *length* argument was greater than the maximum file size.

47477 [EIO] An I/O error occurred while reading from or writing to a file system.

47478 [EACCES] A component of the path prefix denies search permission, or write permission  
47479 is denied on the file.

47480 [EISDIR] The named file is a directory.

47481 [ELOOP] A loop exists in symbolic links encountered during resolution of the *path*  
47482 argument.

47483 [ENAMETOOLONG]

47484 The length of the *path* argument exceeds {PATH\_MAX} or a pathname  
47485 component is longer than {NAME\_MAX}.47486 [ENOENT] A component of *path* does not name an existing file or *path* is an empty string.47487 [ENOTDIR] A component of the path prefix of *path* is not a directory.

47488 [EROFS] The named file resides on a read-only file system.

47489 The `truncate()` function may fail if:

47490 [ELOOP] More than {SYMLOOP\_MAX} symbolic links were encountered during  
47491 resolution of the *path* argument.

47492 [ENAMETOOLONG]  
47493 Pathname resolution of a symbolic link produced an intermediate result  
47494 whose length exceeds {PATH\_MAX}.

47495 **EXAMPLES**  
47496 None.

47497 **APPLICATION USAGE**  
47498 None.

47499 **RATIONALE**  
47500 None.

47501 **FUTURE DIRECTIONS**  
47502 None.

47503 **SEE ALSO**  
47504 *open()*, the Base Definitions volume of IEEE Std 1003.1-2001, <**unistd.h**>

47505 **CHANGE HISTORY**  
47506 First released in Issue 4, Version 2.

47507 **Issue 5**  
47508 Moved from X/OPEN UNIX extension to BASE.  
47509 Large File Summit extensions are added.

47510 **Issue 6**  
47511 This reference page is split out from the *ftruncate()* reference page.  
47512 The DESCRIPTION is updated to avoid use of the term “must” for application requirements.  
47513 The wording of the mandatory [ELOOP] error condition is updated, and a second optional  
47514 [ELOOP] error condition is added.

47515 **NAME**

47516           truncf, trunc1 — round to truncated integer value

47517 **SYNOPSIS**

47518           #include &lt;math.h&gt;

47519           float truncf(float x);

47520           long double trunc1(long double x);

47521 **DESCRIPTION**47522           Refer to *trunc()*.

47523 **NAME**

47524           tsearch — search a binary search tree

47525 **SYNOPSIS**

47526 XSI       #include <search.h>

```
47527       void *tsearch(const void *key, void **rootp,  
47528                    int (*compar)(const void *, const void *));
```

47529

47530 **DESCRIPTION**

47531       Refer to *tdelete()*.

47532 **NAME**

47533 `ttyname`, `ttyname_r` — find the pathname of a terminal

47534 **SYNOPSIS**

47535 `#include <unistd.h>`

47536 `char *ttyname(int fildev);`

47537 TSF `int ttyname_r(int fildev, char *name, size_t namesize);`

47538

47539 **DESCRIPTION**

47540 The `ttyname()` function shall return a pointer to a string containing a null-terminated pathname of the terminal associated with file descriptor *fildev*. The return value may point to static data whose content is overwritten by each call.

47543 The `ttyname()` function need not be reentrant. A function that is not required to be reentrant is not required to be thread-safe.

47545 TSF The `ttyname_r()` function shall store the null-terminated pathname of the terminal associated with the file descriptor *fildev* in the character array referenced by *name*. The array is *namesize* characters long and should have space for the name and the terminating null character. The maximum length of the terminal name shall be `{TTY_NAME_MAX}`.

47549 **RETURN VALUE**

47550 Upon successful completion, `ttyname()` shall return a pointer to a string. Otherwise, a null pointer shall be returned and `errno` set to indicate the error.

47552 TSF If successful, the `ttyname_r()` function shall return zero. Otherwise, an error number shall be returned to indicate the error.

47554 **ERRORS**

47555 The `ttyname()` function may fail if:

47556 [EBADF] The *fildev* argument is not a valid file descriptor.

47557 [ENOTTY] The *fildev* argument does not refer to a terminal.

47558 The `ttyname_r()` function may fail if:

47559 TSF [EBADF] The *fildev* argument is not a valid file descriptor.

47560 TSF [ENOTTY] The *fildev* argument does not refer to a terminal.

47561 TSF [ERANGE] The value of *namesize* is smaller than the length of the string to be returned including the terminating null character.

47563 **EXAMPLES**

47564 None.

47565 **APPLICATION USAGE**

47566 None.

47567 **RATIONALE**

47568 The term “terminal” is used instead of the historical term “terminal device” in order to avoid a reference to an undefined term.

47570 The thread-safe version places the terminal name in a user-supplied buffer and returns a non-zero value if it fails. The non-thread-safe version may return the name in a static data area that may be overwritten by each call.

47573 **FUTURE DIRECTIONS**

47574       None.

47575 **SEE ALSO**

47576       The Base Definitions volume of IEEE Std 1003.1-2001, <**unistd.h**>

47577 **CHANGE HISTORY**

47578       First released in Issue 1. Derived from Issue 1 of the SVID.

47579 **Issue 5**

47580       The *ttyname\_r()* function is included for alignment with the POSIX Threads Extension.

47581       A note indicating that the *ttyname()* function need not be reentrant is added to the  
47582       DESCRIPTION.

47583 **Issue 6**

47584       The *ttyname\_r()* function is marked as part of the Thread-Safe Functions option.

47585       The following new requirements on POSIX implementations derive from alignment with the  
47586       Single UNIX Specification:

- 47587
  - The statement that *errno* is set on error is added.
  - The [EBADF] and [ENOTTY] optional error conditions are added.
- 47588

47589 **NAME**

47590 twalk — traverse a binary search tree

47591 **SYNOPSIS**47592 XSI `#include <search.h>`47593 `void twalk(const void *root,`  
47594 `void (*action)(const void *, VISIT, int ));`

47595

47596 **DESCRIPTION**47597 Refer to *tdelete()*.

47598 **NAME**

47599 daylight, timezone, tzname, tzset — set timezone conversion information

47600 **SYNOPSIS**

47601 #include &lt;time.h&gt;

47602 XSI extern int daylight;

47603 extern long timezone;

47604 CX extern char \*tzname[2];

47605 void tzset(void);

47606

47607 **DESCRIPTION**

47608 The *tzset()* function shall use the value of the environment variable *TZ* to set time conversion information used by *ctime()*, *localtime()*, *mktime()*, and *strftime()*. If *TZ* is absent from the environment, implementation-defined default timezone information shall be used.

47611 The *tzset()* function shall set the external variable *tzname* as follows:

47612 tzname[0] = "std";

47613 tzname[1] = "dst";

47614 where *std* and *dst* are as described in the Base Definitions volume of IEEE Std 1003.1-2001, Chapter 8, Environment Variables.

47616 XSI The *tzset()* function also shall set the external variable *daylight* to 0 if Daylight Savings Time conversions should never be applied for the timezone in use; otherwise, non-zero. The external variable *timezone* shall be set to the difference, in seconds, between Coordinated Universal Time (UTC) and local standard time.

47620 **RETURN VALUE**47621 The *tzset()* function shall not return a value.47622 **ERRORS**

47623 No errors are defined.

47624 **EXAMPLES**47625 Example *TZ* variables and their timezone differences are given in the table below:

47626

|       | <i>TZ</i> | <i>timezone</i> |
|-------|-----------|-----------------|
| 47628 | EST5EDT   | 5*60*60         |
| 47629 | GMT0      | 0*60*60         |
| 47630 | JST-9     | -9*60*60        |
| 47631 | MET-1MEST | -1*60*60        |
| 47632 | MST7MDT   | 7*60*60         |
| 47633 | PST8PDT   | 8*60*60         |

47634 **APPLICATION USAGE**

47635 None.

47636 **RATIONALE**

47637 None.

47638 **FUTURE DIRECTIONS**

47639 None.

47640 **SEE ALSO**

47641 *ctime()*, *localtime()*, *mktime()*, *strftime()*, the Base Definitions volume of IEEE Std 1003.1-2001,  
47642 Chapter 8, Environment Variables, <**time.h**>

47643 **CHANGE HISTORY**

47644 First released in Issue 1. Derived from Issue 1 of the SVID.

47645 **Issue 6**

47646 The example is corrected.

47647 **NAME**

47648       ualarm — set the interval timer

47649 **SYNOPSIS**

47650 OB XSI   #include &lt;unistd.h&gt;

47651       useconds\_t ualarm(useconds\_t *useconds*, useconds\_t *interval*);

47652

47653 **DESCRIPTION**

47654       The *ualarm()* function shall cause the SIGALRM signal to be generated for the calling process  
 47655       after the number of realtime microseconds specified by the *useconds* argument has elapsed.  
 47656       When the *interval* argument is non-zero, repeated timeout notification occurs with a period in  
 47657       microseconds specified by the *interval* argument. If the notification signal, SIGALRM, is not  
 47658       caught or ignored, the calling process is terminated.

47659       Implementations may place limitations on the granularity of timer values. For each interval  
 47660       timer, if the requested timer value requires a finer granularity than the implementation supports,  
 47661       the actual timer value shall be rounded up to the next supported value.

47662       Interactions between *ualarm()* and any of the following are unspecified:

47663            *alarm()*  
 47664            *nanosleep()*  
 47665            *setitimer()*  
 47666            *timer\_create()*  
 47667            *timer\_delete()*  
 47668            *timer\_getoverrun()*  
 47669            *timer\_gettime()*  
 47670            *timer\_settime()*  
 47671            *sleep()*

47672 **RETURN VALUE**

47673       The *ualarm()* function shall return the number of microseconds remaining from the previous  
 47674       *ualarm()* call. If no timeouts are pending or if *ualarm()* has not previously been called, *ualarm()*  
 47675       shall return 0.

47676 **ERRORS**

47677       No errors are defined.

47678 **EXAMPLES**

47679       None.

47680 **APPLICATION USAGE**

47681       Applications are recommended to use *nanosleep()* if the Timers option is supported, or  
 47682       *setitimer()*, *timer\_create()*, *timer\_delete()*, *timer\_getoverrun()*, *timer\_gettime()*, or *timer\_settime()*  
 47683       instead of this function.

47684 **RATIONALE**

47685       None.

47686 **FUTURE DIRECTIONS**

47687       None.

47688 **SEE ALSO**

47689       *alarm()*, *nanosleep()*, *setitimer()*, *sleep()*, *timer\_create()*, *timer\_delete()*, *timer\_getoverrun()*, the Base  
 47690       Definitions volume of IEEE Std 1003.1-2001, <unistd.h>

47691 **CHANGE HISTORY**

47692 First released in Issue 4, Version 2.

47693 **Issue 5**

47694 Moved from X/OPEN UNIX extension to BASE.

47695 **Issue 6**

47696 This function is marked obsolescent.

47697 **NAME**

47698           ulimit — get and set process limits

47699 **SYNOPSIS**

47700 xSI       #include &lt;ulimit.h&gt;

47701           long ulimit(int *cmd*, ...);

47702

47703 **DESCRIPTION**

47704       The *ulimit()* function shall control process limits. The process limits that can be controlled by  
 47705       this function include the maximum size of a single file that can be written (this is equivalent to  
 47706       using *setrlimit()* with `RLIMIT_FSIZE`). The *cmd* values, defined in <ulimit.h>, include:

47707       **UL\_GETFSIZE**   Return the file size limit (`RLIMIT_FSIZE`) of the process. The limit shall be in  
 47708       units of 512-byte blocks and shall be inherited by child processes. Files of any  
 47709       size can be read. The return value shall be the integer part of the soft file size  
 47710       limit divided by 512. If the result cannot be represented as a **long**, the result is  
 47711       unspecified.

47712       **UL\_SETFSIZE**   Set the file size limit for output operations of the process to the value of the  
 47713       second argument, taken as a **long**, multiplied by 512. If the result would  
 47714       overflow an **rlim\_t**, the actual value set is unspecified. Any process may  
 47715       decrease its own limit, but only a process with appropriate privileges may  
 47716       increase the limit. The return value shall be the integer part of the new file size  
 47717       limit divided by 512.

47718       The *ulimit()* function shall not change the setting of *errno* if successful.

47719       As all return values are permissible in a successful situation, an application wishing to check for  
 47720       error situations should set *errno* to 0, then call *ulimit()*, and, if it returns `-1`, check to see if *errno* is  
 47721       non-zero.

47722 **RETURN VALUE**

47723       Upon successful completion, *ulimit()* shall return the value of the requested limit. Otherwise, `-1`  
 47724       shall be returned and *errno* set to indicate the error.

47725 **ERRORS**

47726       The *ulimit()* function shall fail and the limit shall be unchanged if:

47727       [EINVAL]       The *cmd* argument is not valid.

47728       [EPERM]       A process not having appropriate privileges attempts to increase its file size  
 47729       limit.

47730 **EXAMPLES**

47731       None.

47732 **APPLICATION USAGE**

47733       None.

47734 **RATIONALE**

47735       None.

47736 **FUTURE DIRECTIONS**

47737       None.

47738 **SEE ALSO**

47739 *getrlimit()*, *setrlimit()*, *write()*, the Base Definitions volume of IEEE Std 1003.1-2001, <ulimit.h>

47740 **CHANGE HISTORY**

47741 First released in Issue 1. Derived from Issue 1 of the SVID.

47742 **Issue 5**

47743 In the description of UL\_SETFSIZE, the text is corrected to refer to **rlim\_t** rather than the spurious **rlimit\_t**.

47745 The DESCRIPTION is updated to indicate that *errno* is not changed if the function is successful.

47746 **NAME**

47747 umask — set and get the file mode creation mask

47748 **SYNOPSIS**

47749 #include <sys/stat.h>

47750 mode\_t umask(mode\_t *cmask*);

47751 **DESCRIPTION**

47752 The *umask()* function shall set the process' file mode creation mask to *cmask* and return the  
47753 previous value of the mask. Only the file permission bits of *cmask* (see <sys/stat.h>) are used; the  
47754 meaning of the other bits is implementation-defined.

47755 The process' file mode creation mask is used during *open()*, *creat()*, *mkdir()*, and *mkfifo()* to turn  
47756 off permission bits in the *mode* argument supplied. Bit positions that are set in *cmask* are cleared  
47757 in the mode of the created file.

47758 **RETURN VALUE**

47759 The file permission bits in the value returned by *umask()* shall be the previous value of the file  
47760 mode creation mask. The state of any other bits in that value is unspecified, except that a  
47761 subsequent call to *umask()* with the returned value as *cmask* shall leave the state of the mask the  
47762 same as its state before the first call, including any unspecified use of those bits.

47763 **ERRORS**

47764 No errors are defined.

47765 **EXAMPLES**

47766 None.

47767 **APPLICATION USAGE**

47768 None.

47769 **RATIONALE**

47770 Unsigned argument and return types for *umask()* were proposed. The return type and the  
47771 argument were both changed to **mode\_t**.

47772 Historical implementations have made use of additional bits in *cmask* for their implementation-  
47773 defined purposes. The addition of the text that the meaning of other bits of the field is  
47774 implementation-defined permits these implementations to conform to this volume of  
47775 IEEE Std 1003.1-2001.

47776 **FUTURE DIRECTIONS**

47777 None.

47778 **SEE ALSO**

47779 *creat()*, *mkdir()*, *mkfifo()*, *open()*, the Base Definitions volume of IEEE Std 1003.1-2001,  
47780 <sys/stat.h>, <sys/types.h>

47781 **CHANGE HISTORY**

47782 First released in Issue 1. Derived from Issue 1 of the SVID.

47783 **Issue 6**

47784 In the SYNOPSIS, the optional include of the <sys/types.h> header is removed.

47785 The following new requirements on POSIX implementations derive from alignment with the  
47786 Single UNIX Specification:

- 47787 • The requirement to include `<sys/types.h>` has been removed. Although `<sys/types.h>` was  
47788 required for conforming implementations of previous POSIX specifications, it was not  
47789 required for UNIX applications.

47790 **NAME**

47791            **uname** — get the name of the current system

47792 **SYNOPSIS**

47793            #include <sys/utsname.h>

47794            int uname(struct utsname \*name);

47795 **DESCRIPTION**

47796            The *uname()* function shall store information identifying the current system in the structure pointed to by *name*.

47798            The *uname()* function uses the **utsname** structure defined in <sys/utsname.h>.

47799            The *uname()* function shall return a string naming the current system in the character array *sysname*. Similarly, *nodename* shall contain the name of this node within an implementation-defined communications network. The arrays *release* and *version* shall further identify the operating system. The array *machine* shall contain a name that identifies the hardware that the system is running on.

47804            The format of each member is implementation-defined.

47805 **RETURN VALUE**

47806            Upon successful completion, a non-negative value shall be returned. Otherwise, -1 shall be returned and *errno* set to indicate the error.

47808 **ERRORS**

47809            No errors are defined.

47810 **EXAMPLES**

47811            None.

47812 **APPLICATION USAGE**

47813            The inclusion of the *nodename* member in this structure does not imply that it is sufficient information for interfacing to communications networks.

47815 **RATIONALE**

47816            The values of the structure members are not constrained to have any relation to the version of this volume of IEEE Std 1003.1-2001 implemented in the operating system. An application should instead depend on `_POSIX_VERSION` and related constants defined in <unistd.h>.

47819            This volume of IEEE Std 1003.1-2001 does not define the sizes of the members of the structure and permits them to be of different sizes, although most implementations define them all to be the same size: eight bytes plus one byte for the string terminator. That size for *nodename* is not enough for use with many networks.

47823            The *uname()* function originated in System III, System V, and related implementations, and it does not exist in Version 7 or 4.3 BSD. The values it returns are set at system compile time in those historical implementations.

47826            4.3 BSD has *gethostname()* and *gethostid()*, which return a symbolic name and a numeric value, respectively. There are related *sethostname()* and *sethostid()* functions that are used to set the values the other two functions return. The former functions are included in this specification, the latter are not.

47830 **FUTURE DIRECTIONS**

47831            None.

47832 **SEE ALSO**

47833           The Base Definitions volume of IEEE Std 1003.1-2001, <sys/utsname.h>

47834 **CHANGE HISTORY**

47835           First released in Issue 1. Derived from Issue 1 of the SVID.

47836 **NAME**

47837 ungetc — push byte back into input stream

47838 **SYNOPSIS**

47839 #include &lt;stdio.h&gt;

47840 int ungetc(int *c*, FILE \**stream*);47841 **DESCRIPTION**

47842 **CX** The functionality described on this reference page is aligned with the ISO C standard. Any  
47843 conflict between the requirements described here and the ISO C standard is unintentional. This  
47844 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

47845 The *ungetc()* function shall push the byte specified by *c* (converted to an **unsigned char**) back  
47846 onto the input stream pointed to by *stream*. The pushed-back bytes shall be returned by  
47847 subsequent reads on that stream in the reverse order of their pushing. A successful intervening  
47848 call (with the stream pointed to by *stream*) to a file-positioning function (*fseek()*, *fsetpos()*, or  
47849 *rewind()*) shall discard any pushed-back bytes for the stream. The external storage  
47850 corresponding to the stream shall be unchanged.

47851 One byte of push-back shall be provided. If *ungetc()* is called too many times on the same stream  
47852 without an intervening read or file-positioning operation on that stream, the operation may fail.

47853 If the value of *c* equals that of the macro EOF, the operation shall fail and the input stream shall  
47854 be left unchanged.

47855 A successful call to *ungetc()* shall clear the end-of-file indicator for the stream. The value of the  
47856 file-position indicator for the stream after reading or discarding all pushed-back bytes shall be  
47857 the same as it was before the bytes were pushed back. The file-position indicator is decremented  
47858 by each successful call to *ungetc()*; if its value was 0 before a call, its value is unspecified after  
47859 the call.

47860 **RETURN VALUE**

47861 Upon successful completion, *ungetc()* shall return the byte pushed back after conversion.  
47862 Otherwise, it shall return EOF.

47863 **ERRORS**

47864 No errors are defined.

47865 **EXAMPLES**

47866 None.

47867 **APPLICATION USAGE**

47868 None.

47869 **RATIONALE**

47870 None.

47875 IEEE Std 1003.1-2001, <stdio.h>

47876 **CHANGE HISTORY**

47877 First released in Issue 1. Derived from Issue 1 of the SVID.

47878 **NAME**

47879 ungetwc — push wide-character code back into the input stream

47880 **SYNOPSIS**

47881 #include &lt;stdio.h&gt;

47882 #include &lt;wchar.h&gt;

47883 wint\_t ungetwc(wint\_t *wc*, FILE \**stream*);47884 **DESCRIPTION**

47885 **CX** The functionality described on this reference page is aligned with the ISO C standard. Any  
 47886 conflict between the requirements described here and the ISO C standard is unintentional. This  
 47887 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

47888 The *ungetwc()* function shall push the character corresponding to the wide-character code  
 47889 specified by *wc* back onto the input stream pointed to by *stream*. The pushed-back characters  
 47890 shall be returned by subsequent reads on that stream in the reverse order of their pushing. A  
 47891 successful intervening call (with the stream pointed to by *stream*) to a file-positioning function  
 47892 (*fseek()*, *fsetpos()*, or *rewind()*) discards any pushed-back characters for the stream. The external  
 47893 storage corresponding to the stream is unchanged.

47894 At least one character of push-back shall be provided. If *ungetwc()* is called too many times on  
 47895 the same stream without an intervening read or file-positioning operation on that stream, the  
 47896 operation may fail.

47897 If the value of *wc* equals that of the macro WEOF, the operation shall fail and the input stream  
 47898 shall be left unchanged.

47899 A successful call to *ungetwc()* shall clear the end-of-file indicator for the stream. The value of the  
 47900 file-position indicator for the stream after reading or discarding all pushed-back characters shall  
 47901 be the same as it was before the characters were pushed back. The file-position indicator is  
 47902 decremented (by one or more) by each successful call to *ungetwc()*; if its value was 0 before a  
 47903 call, its value is unspecified after the call.

47904 **RETURN VALUE**

47905 Upon successful completion, *ungetwc()* shall return the wide-character code corresponding to  
 47906 the pushed-back character. Otherwise, it shall return WEOF.

47907 **ERRORS**47908 The *ungetwc()* function may fail if:

47909 **CX** [EILSEQ] An invalid character sequence is detected, or a wide-character code does not  
 47910 correspond to a valid character.

47911 **EXAMPLES**

47912 None.

47913 **APPLICATION USAGE**

47914 None.

47915 **RATIONALE**

47916 None.

47917 **FUTURE DIRECTIONS**

47918 None.

47919 **SEE ALSO**

47920 *fseek()*, *fsetpos()*, *read()*, *rewind()*, *setbuf()*, the Base Definitions volume of IEEE Std 1003.1-2001,  
47921 `<stdio.h>`, `<wchar.h>`

47922 **CHANGE HISTORY**

47923 First released in Issue 4. Derived from the MSE working draft.

47924 **Issue 5**

47925 The Optional Header (OH) marking is removed from `<stdio.h>`.

47926 **Issue 6**

47927 The [EILSEQ] optional error condition is marked CX.

47928 **NAME**

47929 unlink — remove a directory entry

47930 **SYNOPSIS**

47931 #include &lt;unistd.h&gt;

47932 int unlink(const char \*path);

47933 **DESCRIPTION**

47934 The *unlink()* function shall remove a link to a file. If *path* names a symbolic link, *unlink()* shall  
 47935 remove the symbolic link named by *path* and shall not affect any file or directory named by the  
 47936 contents of the symbolic link. Otherwise, *unlink()* shall remove the link named by the pathname  
 47937 pointed to by *path* and shall decrement the link count of the file referenced by the link.

47938 When the file's link count becomes 0 and no process has the file open, the space occupied by the  
 47939 file shall be freed and the file shall no longer be accessible. If one or more processes have the file  
 47940 open when the last link is removed, the link shall be removed before *unlink()* returns, but the  
 47941 removal of the file contents shall be postponed until all references to the file are closed.

47942 The *path* argument shall not name a directory unless the process has appropriate privileges and  
 47943 the implementation supports using *unlink()* on directories.

47944 Upon successful completion, *unlink()* shall mark for update the *st\_ctime* and *st\_mtime* fields of  
 47945 the parent directory. Also, if the file's link count is not 0, the *st\_ctime* field of the file shall be  
 47946 marked for update.

47947 **RETURN VALUE**

47948 Upon successful completion, 0 shall be returned. Otherwise, -1 shall be returned and *errno* set to  
 47949 indicate the error. If -1 is returned, the named file shall not be changed.

47950 **ERRORS**47951 The *unlink()* function shall fail and shall not unlink the file if:

47952 [EACCES] Search permission is denied for a component of the path prefix, or write  
 47953 permission is denied on the directory containing the directory entry to be  
 47954 removed.

47955 [EBUSY] The file named by the *path* argument cannot be unlinked because it is being  
 47956 used by the system or another process and the implementation considers this  
 47957 an error.

47958 [ELOOP] A loop exists in symbolic links encountered during resolution of the *path*  
 47959 argument.

47960 [ENAMETOOLONG] The length of the *path* argument exceeds {PATH\_MAX} or a pathname  
 47961 component is longer than {NAME\_MAX}.  
 47962

47963 [ENOENT] A component of *path* does not name an existing file or *path* is an empty string.

47964 [ENOTDIR] A component of the path prefix is not a directory.

47965 [EPERM] The file named by *path* is a directory, and either the calling process does not  
 47966 have appropriate privileges, or the implementation prohibits using *unlink()*  
 47967 on directories.

47968 XSI [EPERM] or [EACCES]

47969 The S\_ISVTX flag is set on the directory containing the file referred to by the  
 47970 *path* argument and the caller is not the file owner, nor is the caller the  
 47971 directory owner, nor does the caller have appropriate privileges.

- 47972 [EROFS] The directory entry to be unlinked is part of a read-only file system.
- 47973 The *unlink()* function may fail and not unlink the file if:
- 47974 XSI [EBUSY] The file named by *path* is a named STREAM.
- 47975 [ELOOP] More than {SYMLOOP\_MAX} symbolic links were encountered during
- 47976 resolution of the *path* argument.
- 47977 [ENAMETOOLONG]
- 47978 As a result of encountering a symbolic link in resolution of the *path* argument,
- 47979 the length of the substituted pathname string exceeded {PATH\_MAX}.
- 47980 [ETXTBSY] The entry to be unlinked is the last directory entry to a pure procedure (shared
- 47981 text) file that is being executed.

## 47982 EXAMPLES

### 47983 Removing a Link to a File

47984 The following example shows how to remove a link to a file named `/home/cnd/mod1` by

47985 removing the entry named `/modules/pass1`.

```
47986 #include <unistd.h>
47987 char *path = "/modules/pass1";
47988 int status;
47989 ...
47990 status = unlink(path);
```

### 47991 Checking for an Error

47992 The following example fragment creates a temporary password lock file named **LOCKFILE**,

47993 which is defined as `/etc/ptmp`, and gets a file descriptor for it. If the file cannot be opened for

47994 writing, *unlink()* is used to remove the link between the file descriptor and **LOCKFILE**.

```
47995 #include <sys/types.h>
47996 #include <stdio.h>
47997 #include <fcntl.h>
47998 #include <errno.h>
47999 #include <unistd.h>
48000 #include <sys/stat.h>
48001 #define LOCKFILE "/etc/ptmp"
48002 int pfd; /* Integer for file descriptor returned by open call. */
48003 FILE *fpfd; /* File pointer for use in putpwent(). */
48004 ...
48005 /* Open password Lock file. If it exists, this is an error. */
48006 if ((pfd = open(LOCKFILE, O_WRONLY | O_CREAT | O_EXCL, S_IRUSR
48007 | S_IWUSR | S_IRGRP | S_IROTH)) == -1) {
48008     fprintf(stderr, "Cannot open /etc/ptmp. Try again later.\n");
48009     exit(1);
48010 }
48011 /* Lock file created; proceed with fdopen of lock file so that
48012 putpwent() can be used.
48013 */
48014 if ((fpfd = fdopen(pfd, "w")) == NULL) {
```

```

48015         close(pfd);
48016         unlink(LOCKFILE);
48017         exit(1);
48018     }

```

### 48019 **Replacing Files**

48020 The following example fragment uses *unlink()* to discard links to files, so that they can be  
48021 replaced with new versions of the files. The first call removes the link to **LOCKFILE** if an error  
48022 occurs. Successive calls remove the links to **SAVEFILE** and **PASSWDFILE** so that new links can  
48023 be created, then removes the link to **LOCKFILE** when it is no longer needed.

```

48024     #include <sys/types.h>
48025     #include <stdio.h>
48026     #include <fcntl.h>
48027     #include <errno.h>
48028     #include <unistd.h>
48029     #include <sys/stat.h>

48030     #define LOCKFILE "/etc/ptmp"
48031     #define PASSWDFILE "/etc/passwd"
48032     #define SAVEFILE "/etc/opasswd"
48033     ...
48034     /* If no change was made, assume error and leave passwd unchanged. */
48035     if (!valid_change) {
48036         fprintf(stderr, "Could not change password for user %s\n", user);
48037         unlink(LOCKFILE);
48038         exit(1);
48039     }

48040     /* Change permissions on new password file. */
48041     chmod(LOCKFILE, S_IRUSR | S_IRGRP | S_IROTH);

48042     /* Remove saved password file. */
48043     unlink(SAVEFILE);

48044     /* Save current password file. */
48045     link(PASSWDFILE, SAVEFILE);

48046     /* Remove current password file. */
48047     unlink(PASSWDFILE);

48048     /* Save new password file as current password file. */
48049     link(LOCKFILE, PASSWDFILE);

48050     /* Remove lock file. */
48051     unlink(LOCKFILE);

48052     exit(0);

```

### 48053 **APPLICATION USAGE**

48054 Applications should use *rmdir()* to remove a directory.

### 48055 **RATIONALE**

48056 Unlinking a directory is restricted to the superuser in many historical implementations for  
48057 reasons given in *link()* (see also *rename()*).

48058 The meaning of [EBUSY] in historical implementations is “mount point busy”. Since this volume  
 48059 of IEEE Std 1003.1-2001 does not cover the system administration concepts of mounting and  
 48060 unmounting, the description of the error was changed to “resource busy”. (This meaning is used  
 48061 by some device drivers when a second process tries to open an exclusive use device.) The  
 48062 wording is also intended to allow implementations to refuse to remove a directory if it is the  
 48063 root or current working directory of any process.

48064 **FUTURE DIRECTIONS**

48065 None.

48066 **SEE ALSO**

48067 *close()*, *link()*, *remove()*, *rmdir()*, the Base Definitions volume of IEEE Std 1003.1-2001, <**unistd.h**>

48068 **CHANGE HISTORY**

48069 First released in Issue 1. Derived from Issue 1 of the SVID.

48070 **Issue 5**

48071 The [EBUSY] error is added to the “may fail” part of the ERRORS section.

48072 **Issue 6**

48073 The following new requirements on POSIX implementations derive from alignment with the  
 48074 Single UNIX Specification:

- 48075 • In the DESCRIPTION, the effect is specified if *path* specifies a symbolic link.
- 48076 • The [ELOOP] mandatory error condition is added.
- 48077 • A second [ENAMETOOLONG] is added as an optional error condition.
- 48078 • The [ETXTBSY] optional error condition is added.

48079 The following changes were made to align with the IEEE P1003.1a draft standard:

- 48080 • The [ELOOP] optional error condition is added.

48081 The DESCRIPTION is updated to avoid use of the term “must” for application requirements.

48082 **NAME**

48083 unlockpt — unlock a pseudo-terminal master/slave pair

48084 **SYNOPSIS**

48085 XSI #include &lt;stdlib.h&gt;

48086 int unlockpt(int *fildev*);

48087

48088 **DESCRIPTION**48089 The *unlockpt()* function shall unlock the slave pseudo-terminal device associated with the  
48090 master to which *fildev* refers.48091 Conforming applications shall ensure that they call *unlockpt()* before opening the slave side of a  
48092 pseudo-terminal device.48093 **RETURN VALUE**48094 Upon successful completion, *unlockpt()* shall return 0. Otherwise, it shall return -1 and set *errno*  
48095 to indicate the error.48096 **ERRORS**48097 The *unlockpt()* function may fail if:48098 [EBADF] The *fildev* argument is not a file descriptor open for writing.48099 [EINVAL] The *fildev* argument is not associated with a master pseudo-terminal device.48100 **EXAMPLES**

48101 None.

48102 **APPLICATION USAGE**

48103 None.

48104 **RATIONALE**

48105 None.

48106 **FUTURE DIRECTIONS**

48107 None.

48108 **SEE ALSO**48109 *grantpt()*, *open()*, *ptsname()*, the Base Definitions volume of IEEE Std 1003.1-2001, <stdlib.h>48110 **CHANGE HISTORY**

48111 First released in Issue 4, Version 2.

48112 **Issue 5**

48113 Moved from X/OPEN UNIX extension to BASE.

48114 **Issue 6**

48115 The DESCRIPTION is updated to avoid use of the term “must” for application requirements.

48116 **NAME**

48117           unsetenv — remove an environment variable

48118 **SYNOPSIS**48119 **cx**       #include <stdlib.h>

48120           int unsetenv(const char \*name);

48121

48122 **DESCRIPTION**

48123       The *unsetenv()* function shall remove an environment variable from the environment of the  
48124       calling process. The *name* argument points to a string, which is the name of the variable to be  
48125       removed. The named argument shall not contain an '=' character. If the named variable does  
48126       not exist in the current environment, the environment shall be unchanged and the function is  
48127       considered to have completed successfully.

48128       If the application modifies *environ* or the pointers to which it points, the behavior of *unsetenv()* is  
48129       undefined. The *unsetenv()* function shall update the list of pointers to which *environ* points.

48130       The *unsetenv()* function need not be reentrant. A function that is not required to be reentrant is  
48131       not required to be thread-safe.

48132 **RETURN VALUE**

48133       Upon successful completion, zero shall be returned. Otherwise, -1 shall be returned, *errno* set to  
48134       indicate the error, and the environment shall be unchanged.

48135 **ERRORS**48136       The *unsetenv()* function shall fail if:

48137       [EINVAL]       The *name* argument is a null pointer, points to an empty string, or points to a  
48138       string containing an '=' character.

48139 **EXAMPLES**

48140       None.

48141 **APPLICATION USAGE**

48142       None.

48143 **RATIONALE**48144       Refer to the RATIONALE section in *setenv()*.48145 **FUTURE DIRECTIONS**

48146       None.

48147 **SEE ALSO**

48148       *getenv()*, *setenv()*, the Base Definitions volume of IEEE Std 1003.1-2001, <stdlib.h>,  
48149       <sys/types.h>, <unistd.h>

48150 **CHANGE HISTORY**

48151       First released in Issue 6. Derived from the IEEE P1003.1a draft standard.

48152 **NAME**

48153            usleep — suspend execution for an interval

48154 **SYNOPSIS**

48155 OB XSI    #include &lt;unistd.h&gt;

48156            int usleep(useconds\_t useconds);

48157

48158 **DESCRIPTION**

48159            The *usleep()* function shall cause the calling thread to be suspended from execution until either  
 48160            the number of realtime microseconds specified by the argument *useconds* has elapsed or a signal  
 48161            is delivered to the calling thread and its action is to invoke a signal-catching function or to  
 48162            terminate the process. The suspension time may be longer than requested due to the scheduling  
 48163            of other activity by the system.

48164            The *useconds* argument shall be less than one million. If the value of *useconds* is 0, then the call  
 48165            has no effect.

48166            If a SIGALRM signal is generated for the calling process during execution of *usleep()* and if the  
 48167            SIGALRM signal is being ignored or blocked from delivery, it is unspecified whether *usleep()*  
 48168            returns when the SIGALRM signal is scheduled. If the signal is being blocked, it is also  
 48169            unspecified whether it remains pending after *usleep()* returns or it is discarded.

48170            If a SIGALRM signal is generated for the calling process during execution of *usleep()*, except as a  
 48171            result of a prior call to *alarm()*, and if the SIGALRM signal is not being ignored or blocked from  
 48172            delivery, it is unspecified whether that signal has any effect other than causing *usleep()* to return.

48173            If a signal-catching function interrupts *usleep()* and examines or changes either the time a  
 48174            SIGALRM is scheduled to be generated, the action associated with the SIGALRM signal, or  
 48175            whether the SIGALRM signal is blocked from delivery, the results are unspecified.

48176            If a signal-catching function interrupts *usleep()* and calls *siglongjmp()* or *longjmp()* to restore an  
 48177            environment saved prior to the *usleep()* call, the action associated with the SIGALRM signal and  
 48178            the time at which a SIGALRM signal is scheduled to be generated are unspecified. It is also  
 48179            unspecified whether the SIGALRM signal is blocked, unless the process' signal mask is restored  
 48180            as part of the environment.

48181            Implementations may place limitations on the granularity of timer values. For each interval  
 48182            timer, if the requested timer value requires a finer granularity than the implementation supports,  
 48183            the actual timer value shall be rounded up to the next supported value.

48184            Interactions between *usleep()* and any of the following are unspecified:

48185            *nanosleep()*48186            *setitimer()*48187            *timer\_create()*48188            *timer\_delete()*48189            *timer\_getoverrun()*48190            *timer\_gettime()*48191            *timer\_settime()*48192            *ualarm()*48193            *sleep()*

## 48194 RETURN VALUE

48195       Upon successful completion, *usleep()* shall return 0; otherwise, it shall return -1 and set *errno* to  
48196       indicate the error.

## 48197 ERRORS

48198       The *usleep()* function may fail if:

48199       [EINVAL]       The time interval specified one million or more microseconds.

## 48200 EXAMPLES

48201       None.

## 48202 APPLICATION USAGE

48203       Applications are recommended to use *nanosleep()* if the Timers option is supported, or  
48204       *setitimer()*, *timer\_create()*, *timer\_delete()*, *timer\_getoverrun()*, *timer\_gettime()*, or *timer\_settime()*  
48205       instead of this function.

## 48206 RATIONALE

48207       None.

## 48208 FUTURE DIRECTIONS

48209       None.

## 48210 SEE ALSO

48211       *alarm()*, *getitimer()*, *nanosleep()*, *sigaction()*, *sleep()*, *timer\_create()*, *timer\_delete()*,  
48212       *timer\_getoverrun()*, the Base Definitions volume of IEEE Std 1003.1-2001, <**unistd.h**>

## 48213 CHANGE HISTORY

48214       First released in Issue 4, Version 2.

### 48215 Issue 5

48216       Moved from X/OPEN UNIX extension to BASE.

48217       The DESCRIPTION is changed to indicate that timers are now thread-based rather than  
48218       process-based.

### 48219 Issue 6

48220       The DESCRIPTION is updated to avoid use of the term “must” for application requirements.

48221       This function is marked obsolescent.

48222 **NAME**

48223 utime — set file access and modification times

48224 **SYNOPSIS**

48225 #include &lt;utime.h&gt;

48226 int utime(const char \*path, const struct utimbuf \*times);

48227 **DESCRIPTION**48228 The *utime()* function shall set the access and modification times of the file named by the *path*  
48229 argument.48230 If *times* is a null pointer, the access and modification times of the file shall be set to the current  
48231 time. The effective user ID of the process shall match the owner of the file, or the process has  
48232 write permission to the file or has appropriate privileges, to use *utime()* in this manner.48233 If *times* is not a null pointer, *times* shall be interpreted as a pointer to a **utimbuf** structure and the  
48234 access and modification times shall be set to the values contained in the designated structure.  
48235 Only a process with the effective user ID equal to the user ID of the file or a process with  
48236 appropriate privileges may use *utime()* this way.48237 The **utimbuf** structure is defined in the <**utime.h**> header. The times in the structure **utimbuf**  
48238 are measured in seconds since the Epoch.48239 Upon successful completion, *utime()* shall mark the time of the last file status change, *st\_ctime*,  
48240 to be updated; see <**sys/stat.h**>.48241 **RETURN VALUE**48242 Upon successful completion, 0 shall be returned. Otherwise, -1 shall be returned and *errno* shall  
48243 be set to indicate the error, and the file times shall not be affected.48244 **ERRORS**48245 The *utime()* function shall fail if:48246 [EACCES] Search permission is denied by a component of the path prefix; or the *times*  
48247 argument is a null pointer and the effective user ID of the process does not  
48248 match the owner of the file, the process does not have write permission for the  
48249 file, and the process does not have appropriate privileges.48250 [ELOOP] A loop exists in symbolic links encountered during resolution of the *path*  
48251 argument.48252 [ENAMETOOLONG]  
48253 The length of the *path* argument exceeds {PATH\_MAX} or a pathname  
48254 component is longer than {NAME\_MAX}.48255 [ENOENT] A component of *path* does not name an existing file or *path* is an empty string.

48256 [ENOTDIR] A component of the path prefix is not a directory.

48257 [EPERM] The *times* argument is not a null pointer and the calling process' effective user  
48258 ID does not match the owner of the file and the calling process does not have  
48259 the appropriate privileges.

48260 [EROFS] The file system containing the file is read-only.

48261 The *utime()* function may fail if:48262 [ELOOP] More than {SYMLOOP\_MAX} symbolic links were encountered during  
48263 resolution of the *path* argument.

48264 [ENAMETOOLONG]

48265 As a result of encountering a symbolic link in resolution of the *path* argument,  
48266 the length of the substituted pathname string exceeded {PATH\_MAX}.

48267 **EXAMPLES**

48268 None.

48269 **APPLICATION USAGE**

48270 None.

48271 **RATIONALE**

48272 The *actime* structure member must be present so that an application may set it, even though an  
48273 implementation may ignore it and not change the access time on the file. If an application  
48274 intends to leave one of the times of a file unchanged while changing the other, it should use  
48275 *stat()* to retrieve the file's *st\_atime* and *st\_mtime* parameters, set *actime* and *modtime* in the buffer,  
48276 and change one of them before making the *utime()* call.

48277 **FUTURE DIRECTIONS**

48278 None.

48279 **SEE ALSO**

48280 The Base Definitions volume of IEEE Std 1003.1-2001, <sys/stat.h>, <utime.h>

48281 **CHANGE HISTORY**

48282 First released in Issue 1. Derived from Issue 1 of the SVID.

48283 **Issue 6**

48284 The following new requirements on POSIX implementations derive from alignment with the  
48285 Single UNIX Specification:

- 48286 • The requirement to include <sys/types.h> has been removed. Although <sys/types.h> was  
48287 required for conforming implementations of previous POSIX specifications, it was not  
48288 required for UNIX applications.
- 48289 • The [ELOOP] mandatory error condition is added.
- 48290 • A second [ENAMETOOLONG] is added as an optional error condition.

48291 The following changes were made to align with the IEEE P1003.1a draft standard:

- 48292 • The [ELOOP] optional error condition is added.

48293 The DESCRIPTION is updated to avoid use of the term “must” for application requirements.

48294 **NAME**48295 utimes — set file access and modification times (**LEGACY**)48296 **SYNOPSIS**48297 XSI `#include <sys/time.h>`48298 `int utimes(const char *path, const struct timeval times[2]);`

48299

48300 **DESCRIPTION**

48301 The *utimes()* function shall set the access and modification times of the file pointed to by the *path*  
 48302 argument to the value of the *times* argument. The *utimes()* function allows time specifications  
 48303 accurate to the microsecond.

48304 For *utimes()*, the *times* argument is an array of **timeval** structures. The first array member  
 48305 represents the date and time of last access, and the second member represents the date and time  
 48306 of last modification. The times in the **timeval** structure are measured in seconds and  
 48307 microseconds since the Epoch, although rounding toward the nearest second may occur.

48308 If the *times* argument is a null pointer, the access and modification times of the file shall be set to  
 48309 the current time. The effective user ID of the process shall match the owner of the file, or has  
 48310 write access to the file or appropriate privileges to use this call in this manner. Upon completion,  
 48311 *utimes()* shall mark the time of the last file status change, *st\_ctime*, for update.

48312 **RETURN VALUE**

48313 Upon successful completion, 0 shall be returned. Otherwise, -1 shall be returned and *errno* shall  
 48314 be set to indicate the error, and the file times shall not be affected.

48315 **ERRORS**48316 The *utimes()* function shall fail if:

48317 [EACCES] Search permission is denied by a component of the path prefix; or the *times*  
 48318 argument is a null pointer and the effective user ID of the process does not  
 48319 match the owner of the file and write access is denied.

48320 [ELOOP] A loop exists in symbolic links encountered during resolution of the *path*  
 48321 argument.

48322 [ENAMETOOLONG]  
 48323 The length of the *path* argument exceeds {PATH\_MAX} or a pathname  
 48324 component is longer than {NAME\_MAX}.

48325 [ENOENT] A component of *path* does not name an existing file or *path* is an empty string.

48326 [ENOTDIR] A component of the path prefix is not a directory.

48327 [EPERM] The *times* argument is not a null pointer and the calling process' effective user  
 48328 ID has write access to the file but does not match the owner of the file and the  
 48329 calling process does not have the appropriate privileges.

48330 [EROFS] The file system containing the file is read-only.

48331 The *utimes()* function may fail if:

48332 [ELOOP] More than {SYMLOOP\_MAX} symbolic links were encountered during  
 48333 resolution of the *path* argument.

48334 [ENAMETOOLONG]  
 48335 Pathname resolution of a symbolic link produced an intermediate result  
 48336 whose length exceeds {PATH\_MAX}.

48337 **EXAMPLES**

48338 None.

48339 **APPLICATION USAGE**

48340 For applications portability, the *utime()* function should be used to set file access and  
48341 modification times instead of *utimes()*.

48342 **RATIONALE**

48343 None.

48344 **FUTURE DIRECTIONS**

48345 This function may be withdrawn in a future version.

48346 **SEE ALSO**48347 *utime()*, the Base Definitions volume of IEEE Std 1003.1-2001, <sys/time.h>48348 **CHANGE HISTORY**

48349 First released in Issue 4, Version 2.

48350 **Issue 5**

48351 Moved from X/OPEN UNIX extension to BASE.

48352 **Issue 6**

48353 This function is marked LEGACY.

48354 The DESCRIPTION is updated to avoid use of the term “must” for application requirements.

48355 The wording of the mandatory [ELOOP] error condition is updated, and a second optional  
48356 [ELOOP] error condition is added.

48357 **NAME**

48358       va\_arg, va\_copy, va\_end, va\_start — handle variable argument list

48359 **SYNOPSIS**

48360       #include &lt;stdarg.h&gt;

48361       type va\_arg(va\_list ap, type);

48362       void va\_copy(va\_list dest, va\_list src);

48363       void va\_end(va\_list ap);

48364       void va\_start(va\_list ap, argN);

48365 **DESCRIPTION**

48366       Refer to the Base Definitions volume of IEEE Std 1003.1-2001, &lt;stdarg.h&gt;.

48367 **NAME**

48368 vfork — create a new process; share virtual memory

48369 **SYNOPSIS**

48370 OB XSI #include &lt;unistd.h&gt;

48371 pid\_t vfork(void);

48372

48373 **DESCRIPTION**

48374 The *vfork()* function shall be equivalent to *fork()*, except that the behavior is undefined if the  
 48375 process created by *vfork()* either modifies any data other than a variable of type **pid\_t** used to  
 48376 store the return value from *vfork()*, or returns from the function in which *vfork()* was called, or  
 48377 calls any other function before successfully calling *\_exit()* or one of the *exec* family of functions.

48378 **RETURN VALUE**

48379 Upon successful completion, *vfork()* shall return 0 to the child process and return the process ID  
 48380 of the child process to the parent process. Otherwise, -1 shall be returned to the parent, no child  
 48381 process shall be created, and *errno* shall be set to indicate the error.

48382 **ERRORS**48383 The *vfork()* function shall fail if:

48384 [EAGAIN] The system-wide limit on the total number of processes under execution  
 48385 would be exceeded, or the system-imposed limit on the total number of  
 48386 processes under execution by a single user would be exceeded.

48387 [ENOMEM] There is insufficient swap space for the new process.

48388 **EXAMPLES**

48389 None.

48390 **APPLICATION USAGE**

48391 Conforming applications are recommended not to depend on *vfork()*, but to use *fork()* instead.  
 48392 The *vfork()* function may be withdrawn in a future version.

48393 On some implementations, *vfork()* is equivalent to *fork()*.

48394 The *vfork()* function differs from *fork()* only in that the child process can share code and data  
 48395 with the calling process (parent process). This speeds cloning activity significantly at a risk to  
 48396 the integrity of the parent process if *vfork()* is misused.

48397 The use of *vfork()* for any purpose except as a prelude to an immediate call to a function from  
 48398 the *exec* family, or to *\_exit()*, is not advised.

48399 The *vfork()* function can be used to create new processes without fully copying the address  
 48400 space of the old process. If a forked process is simply going to call *exec*, the data space copied  
 48401 from the parent to the child by *fork()* is not used. This is particularly inefficient in a paged  
 48402 environment, making *vfork()* particularly useful. Depending upon the size of the parent's data  
 48403 space, *vfork()* can give a significant performance improvement over *fork()*.

48404 The *vfork()* function can normally be used just like *fork()*. It does not work, however, to return  
 48405 while running in the child's context from the caller of *vfork()* since the eventual return from  
 48406 *vfork()* would then return to a no longer existent stack frame. Care should be taken, also, to call  
 48407 *\_exit()* rather than *exit()* if *exec* cannot be used, since *exit()* flushes and closes standard I/O  
 48408 channels, thereby damaging the parent process' standard I/O data structures. (Even with *fork()*,  
 48409 it is wrong to call *exit()*, since buffered data would then be flushed twice.)

48410 If signal handlers are invoked in the child process after *vfork()*, they must follow the same rules  
 48411 as other code in the child process.

48412 **RATIONALE**

48413           None.

48414 **FUTURE DIRECTIONS**

48415           This function may be withdrawn in a future version.

48416 **SEE ALSO**48417           *exec*, *exit()*, *fork()*, *wait()*, the Base Definitions volume of IEEE Std 1003.1-2001, <**unistd.h**>48418 **CHANGE HISTORY**

48419           First released in Issue 4, Version 2.

48420 **Issue 5**

48421           Moved from X/OPEN UNIX extension to BASE.

48422 **Issue 6**

48423           This function is marked obsolescent.

48424 **NAME**

48425 vfprintf, vprintf, vsnprintf, vsprintf — format output of a stdarg argument list

48426 **SYNOPSIS**

48427 #include <stdarg.h>

48428 #include <stdio.h>

48429 int vfprintf(FILE \*restrict *stream*, const char \*restrict *format*,  
48430 va\_list *ap*);

48431 int vprintf(const char \*restrict *format*, va\_list *ap*);

48432 int vsnprintf(char \*restrict *s*, size\_t *n*, const char \*restrict *format*,  
48433 va\_list *ap*);

48434 int vsprintf(char \*restrict *s*, const char \*restrict *format*, va\_list *ap*);

48435 **DESCRIPTION**

48436 **CX** The functionality described on this reference page is aligned with the ISO C standard. Any  
48437 conflict between the requirements described here and the ISO C standard is unintentional. This  
48438 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

48439 The *vprintf()*, *vfprintf()*, *vsnprintf()*, and *vsprintf()* functions shall be equivalent to *printf()*,  
48440 *fprintf()*, *snprintf()*, and *sprintf()* respectively, except that instead of being called with a variable  
48441 number of arguments, they are called with an argument list as defined by <stdarg.h>.

48442 These functions shall not invoke the *va\_end* macro. As these functions invoke the *va\_arg* macro,  
48443 the value of *ap* after the return is unspecified.

48444 **RETURN VALUE**

48445 Refer to *fprintf()*.

48446 **ERRORS**

48447 Refer to *fprintf()*.

48448 **EXAMPLES**

48449 None.

48450 **APPLICATION USAGE**

48451 Applications using these functions should call *va\_end(ap)* afterwards to clean up.

48452 **RATIONALE**

48453 None.

48454 **FUTURE DIRECTIONS**

48455 None.

48456 **SEE ALSO**

48457 *fprintf()*, the Base Definitions volume of IEEE Std 1003.1-2001, <stdarg.h>, <stdio.h>

48458 **CHANGE HISTORY**

48459 First released in Issue 1. Derived from Issue 1 of the SVID.

48460 **Issue 5**

48461 The *vsnprintf()* function is added.

48462 **Issue 6**

48463 The *vfprintf()*, *vprintf()*, *vsnprintf()*, and *vsprintf()* functions are updated for alignment with the  
48464 ISO/IEC 9899:1999 standard.

48465 **NAME**48466 `vfscanf`, `vscanf`, `vsscanf` — format input of a `stdarg` argument list48467 **SYNOPSIS**48468 `#include <stdarg.h>`48469 `#include <stdio.h>`48470 `int vfscanf(FILE *restrict stream, const char *restrict format,`  
48471 `va_list arg);`48472 `int vscanf(const char *restrict format, va_list arg);`48473 `int vsscanf(const char *restrict s, const char *restrict format,`  
48474 `va_list arg);`48475 **DESCRIPTION**48476 **CX** The functionality described on this reference page is aligned with the ISO C standard. Any  
48477 conflict between the requirements described here and the ISO C standard is unintentional. This  
48478 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.48479 The `vscanf()`, `vfscanf()`, and `vsscanf()` functions shall be equivalent to the `scanf()`, `fscanf()`, and  
48480 `sscanf()` functions, respectively, except that instead of being called with a variable number of  
48481 arguments, they are called with an argument list as defined in the `<stdarg.h>` header. These  
48482 functions shall not invoke the `va_end` macro. As these functions invoke the `va_arg` macro, the  
48483 value of `ap` after the return is unspecified.48484 **RETURN VALUE**48485 Refer to `fscanf()`.48486 **ERRORS**48487 Refer to `fscanf()`.48488 **EXAMPLES**

48489 None.

48629 #include &lt;wchar.h&gt;

48630 int vswscanf(const wchar\_t \*restrict ws, const wchar\_t \*restrict format,  
48631 va\_list arg);48632 **DESCRIPTION**48633 Refer to *vfwscanf()*.

48634 **NAME**

48635       vwprintf — wide-character formatted output of a stdarg argument list

48636 **SYNOPSIS**

48637       #include <stdarg.h>

48638       #include <stdio.h>

48639       #include <wchar.h>

48640       int vwprintf(const wchar\_t \*restrict *format*, va\_list *arg*);

48641 **DESCRIPTION**

48642       Refer to *vfwprintf()*.

48643 **NAME**

48644       vwscanf — wide-character formatted input of a stdarg argument list

48645 **SYNOPSIS**

48646       #include &lt;stdarg.h&gt;

48647       #include &lt;stdio.h&gt;

48648       #include &lt;wchar.h&gt;

48649       int vwscanf(const wchar\_t \*restrict *format*, va\_list *arg*);48650 **DESCRIPTION**48651       Refer to *vfwscanf()*.

## 48652 NAME

48653 wait, waitpid — wait for a child process to stop or terminate

## 48654 SYNOPSIS

48655 #include &lt;sys/wait.h&gt;

48656 pid\_t wait(int \*stat\_loc);

48657 pid\_t waitpid(pid\_t pid, int \*stat\_loc, int options);

## 48658 DESCRIPTION

48659 The *wait()* and *waitpid()* functions shall obtain status information pertaining to one of the  
 48660 caller's child processes. Various options permit status information to be obtained for child  
 48661 processes that have terminated or stopped. If status information is available for two or more  
 48662 child processes, the order in which their status is reported is unspecified.

48663 The *wait()* function shall suspend execution of the calling thread until status information for one  
 48664 of the terminated child processes of the calling process is available, or until delivery of a signal  
 48665 whose action is either to execute a signal-catching function or to terminate the process. If more  
 48666 than one thread is suspended in *wait()* or *waitpid()* awaiting termination of the same process,  
 48667 exactly one thread shall return the process status at the time of the target process termination. If  
 48668 status information is available prior to the call to *wait()*, return shall be immediate.

48669 The *waitpid()* function shall be equivalent to *wait()* if the *pid* argument is (**pid\_t**)−1 and the  
 48670 *options* argument is 0. Otherwise, its behavior shall be modified by the values of the *pid* and  
 48671 *options* arguments.

48672 The *pid* argument specifies a set of child processes for which *status* is requested. The *waitpid()*  
 48673 function shall only return the status of a child process from this set:

- 48674 • If *pid* is equal to (**pid\_t**)−1, *status* is requested for any child process. In this respect, *waitpid()*  
 48675 is then equivalent to *wait()*.
- 48676 • If *pid* is greater than 0, it specifies the process ID of a single child process for which *status* is  
 48677 requested.
- 48678 • If *pid* is 0, *status* is requested for any child process whose process group ID is equal to that of  
 48679 the calling process.
- 48680 • If *pid* is less than (**pid\_t**)−1, *status* is requested for any child process whose process group ID  
 48681 is equal to the absolute value of *pid*.

48682 The *options* argument is constructed from the bitwise-inclusive OR of zero or more of the  
 48683 following flags, defined in the <sys/wait.h> header:

48684 XSI WCONTINUED The *waitpid()* function shall report the status of any continued child process  
 48685 specified by *pid* whose status has not been reported since it continued from a  
 48686 job control stop.

48687 WNOHANG The *waitpid()* function shall not suspend execution of the calling thread if  
 48688 *status* is not immediately available for one of the child processes specified by  
 48689 *pid*.

48690 WUNTRACED The status of any child processes specified by *pid* that are stopped, and whose  
 48691 status has not yet been reported since they stopped, shall also be reported to  
 48692 the requesting process.

48693 XSI If the calling process has SA\_NOCLDWAIT set or has SIGCHLD set to SIG\_IGN, and the  
 48694 process has no unwaited-for children that were transformed into zombie processes, the calling  
 48695 thread shall block until all of the children of the process containing the calling thread terminate,  
 48696 and *wait()* and *waitpid()* shall fail and set *errno* to [ECHILD].

48697 If *wait()* or *waitpid()* return because the status of a child process is available, these functions  
 48698 shall return a value equal to the process ID of the child process. In this case, if the value of the  
 48699 argument *stat\_loc* is not a null pointer, information shall be stored in the location pointed to by  
 48700 *stat\_loc*. The value stored at the location pointed to by *stat\_loc* shall be 0 if and only if the status  
 48701 returned is from a terminated child process that terminated by one of the following means:

- 48702 1. The process returned 0 from *main()*.
- 48703 2. The process called *\_exit()* or *exit()* with a *status* argument of 0.
- 48704 3. The process was terminated because the last thread in the process terminated.

48705 Regardless of its value, this information may be interpreted using the following macros, which  
 48706 are defined in `<sys/wait.h>` and evaluate to integral expressions; the *stat\_val* argument is the  
 48707 integer value pointed to by *stat\_loc*.

48708 **WIFEXITED(*stat\_val*)**

48709 Evaluates to a non-zero value if *status* was returned for a child process that terminated  
 48710 normally.

48711 **WEXITSTATUS(*stat\_val*)**

48712 If the value of **WIFEXITED(*stat\_val*)** is non-zero, this macro evaluates to the low-order 8 bits  
 48713 of the *status* argument that the child process passed to *\_exit()* or *exit()*, or the value the child  
 48714 process returned from *main()*.

48715 **WIFSIGNALED(*stat\_val*)**

48716 Evaluates to a non-zero value if *status* was returned for a child process that terminated due  
 48717 to the receipt of a signal that was not caught (see `<signal.h>`).

48718 **WTERMSIG(*stat\_val*)**

48719 If the value of **WIFSIGNALED(*stat\_val*)** is non-zero, this macro evaluates to the number of  
 48720 the signal that caused the termination of the child process.

48721 **WIFSTOPPED(*stat\_val*)**

48722 Evaluates to a non-zero value if *status* was returned for a child process that is currently  
 48723 stopped.

48724 **WSTOPSIG(*stat\_val*)**

48725 If the value of **WIFSTOPPED(*stat\_val*)** is non-zero, this macro evaluates to the number of the  
 48726 signal that caused the child process to stop.

48727 XSI **WIFCONTINUED(*stat\_val*)**

48728 Evaluates to a non-zero value if *status* was returned for a child process that has continued  
 48729 from a job control stop.

48730 SPN It is unspecified whether the *status* value returned by calls to *wait()* or *waitpid()* for processes  
 48731 created by *posix\_spawn()* or *posix\_spawnnp()* can indicate a **WIFSTOPPED(*stat\_val*)** before  
 48732 subsequent calls to *wait()* or *waitpid()* indicate **WIFEXITED(*stat\_val*)** as the result of an error  
 48733 detected before the new process image starts executing.

48734 It is unspecified whether the *status* value returned by calls to *wait()* or *waitpid()* for processes  
 48735 created by *posix\_spawn()* or *posix\_spawnnp()* can indicate a **WIFSIGNALED(*stat\_val*)** if a signal is  
 48736 sent to the parent's process group after *posix\_spawn()* or *posix\_spawnnp()* is called.

48737 If the information pointed to by *stat\_loc* was stored by a call to *waitpid()* that specified the  
 48738 XSI **WUNTRACED** flag and did not specify the **WCONTINUED** flag, exactly one of the macros  
 48739 **WIFEXITED(\**stat\_loc*)**, **WIFSIGNALED(\**stat\_loc*)**, and **WIFSTOPPED(\**stat\_loc*)** shall evaluate to  
 48740 a non-zero value.

48741 If the information pointed to by *stat\_loc* was stored by a call to *waitpid()* that specified the  
 48742 XSI WUNTRACED and WCONTINUED flags, exactly one of the macros WIFEXITED(\**stat\_loc*),  
 48743 XSI WIFSIGNALED(\**stat\_loc*), WIFSTOPPED(\**stat\_loc*), and WIFCONTINUED(\**stat\_loc*) shall  
 48744 evaluate to a non-zero value.

48745 If the information pointed to by *stat\_loc* was stored by a call to *waitpid()* that did not specify the  
 48746 XSI WUNTRACED or WCONTINUED flags, or by a call to the *wait()* function, exactly one of the  
 48747 macros WIFEXITED(\**stat\_loc*) and WIFSIGNALED(\**stat\_loc*) shall evaluate to a non-zero value.

48748 If the information pointed to by *stat\_loc* was stored by a call to *waitpid()* that did not specify the  
 48749 XSI WUNTRACED flag and specified the WCONTINUED flag, or by a call to the *wait()* function,  
 48750 XSI exactly one of the macros WIFEXITED(\**stat\_loc*), WIFSIGNALED(\**stat\_loc*), and  
 48751 WIFCONTINUED(\**stat\_loc*) shall evaluate to a non-zero value.

48752 If `_POSIX_REALTIME_SIGNALS` is defined, and the implementation queues the SIGCHLD  
 48753 signal, then if *wait()* or *waitpid()* returns because the status of a child process is available, any  
 48754 pending SIGCHLD signal associated with the process ID of the child process shall be discarded.  
 48755 Any other pending SIGCHLD signals shall remain pending.

48756 Otherwise, if SIGCHLD is blocked, if *wait()* or *waitpid()* return because the status of a child  
 48757 process is available, any pending SIGCHLD signal shall be cleared unless the status of another  
 48758 child process is available.

48759 For all other conditions, it is unspecified whether child *status* will be available when a SIGCHLD  
 48760 signal is delivered.

48761 There may be additional implementation-defined circumstances under which *wait()* or *waitpid()*  
 48762 report *status*. This shall not occur unless the calling process or one of its child processes explicitly  
 48763 makes use of a non-standard extension. In these cases the interpretation of the reported *status* is  
 48764 implementation-defined.

48765 XSI If a parent process terminates without waiting for all of its child processes to terminate, the  
 48766 remaining child processes shall be assigned a new parent process ID corresponding to an  
 48767 implementation-defined system process.

#### 48768 RETURN VALUE

48769 If *wait()* or *waitpid()* returns because the status of a child process is available, these functions  
 48770 shall return a value equal to the process ID of the child process for which *status* is reported. If  
 48771 *wait()* or *waitpid()* returns due to the delivery of a signal to the calling process, `-1` shall be  
 48772 returned and *errno* set to `[EINTR]`. If *waitpid()* was invoked with `WNOHANG` set in *options*, it  
 48773 has at least one child process specified by *pid* for which *status* is not available, and *status* is not  
 48774 available for any process specified by *pid*, `0` is returned. Otherwise, `(pid_t)-1` shall be returned,  
 48775 and *errno* set to indicate the error.

#### 48776 ERRORS

48777 The *wait()* function shall fail if:

48778 `[ECHILD]` The calling process has no existing unwaited-for child processes.

48779 `[EINTR]` The function was interrupted by a signal. The value of the location pointed to  
 48780 by *stat\_loc* is undefined.

48781 The *waitpid()* function shall fail if:

48782 `[ECHILD]` The process specified by *pid* does not exist or is not a child of the calling  
 48783 process, or the process group specified by *pid* does not exist or does not have  
 48784 any member process that is a child of the calling process.

48785 [EINTR] The function was interrupted by a signal. The value of the location pointed to  
48786 by *stat\_loc* is undefined.

48787 [EINVAL] The *options* argument is not valid.

#### 48788 EXAMPLES

48789 None.

#### 48790 APPLICATION USAGE

48791 None.

#### 48792 RATIONALE

48793 A call to the *wait()* or *waitpid()* function only returns *status* on an immediate child process of the  
48794 calling process; that is, a child that was produced by a single *fork()* call (perhaps followed by an  
48795 *exec* or other function calls) from the parent. If a child produces grandchildren by further use of  
48796 *fork()*, none of those grandchildren nor any of their descendants affect the behavior of a *wait()*  
48797 from the original parent process. Nothing in this volume of IEEE Std 1003.1-2001 prevents an  
48798 implementation from providing extensions that permit a process to get *status* from a grandchild  
48799 or any other process, but a process that does not use such extensions must be guaranteed to see  
48800 *status* from only its direct children.

48801 The *waitpid()* function is provided for three reasons:

- 48802 1. To support job control
- 48803 2. To permit a non-blocking version of the *wait()* function
- 48804 3. To permit a library routine, such as *system()* or *pclose()*, to wait for its children without  
48805 interfering with other terminated children for which the process has not waited

48806 The first two of these facilities are based on the *wait3()* function provided by 4.3 BSD. The  
48807 function uses the *options* argument, which is equivalent to an argument to *wait3()*. The  
48808 WUNTRACED flag is used only in conjunction with job control on systems supporting job  
48809 control. Its name comes from 4.3 BSD and refers to the fact that there are two types of stopped  
48810 processes in that implementation: processes being traced via the *ptrace()* debugging facility and  
48811 (untraced) processes stopped by job control signals. Since *ptrace()* is not part of this volume of  
48812 IEEE Std 1003.1-2001, only the second type is relevant. The name WUNTRACED was retained  
48813 because its usage is the same, even though the name is not intuitively meaningful in this context.

48814 The third reason for the *waitpid()* function is to permit independent sections of a process to  
48815 spawn and wait for children without interfering with each other. For example, the following  
48816 problem occurs in developing a portable shell, or command interpreter:

```
48817 stream = popen("/bin/true");
48818 (void) system("sleep 100");
48819 (void) pclose(stream);
```

48820 On all historical implementations, the final *pclose()* fails to reap the *wait()* *status* of the *popen()*.

48821 The status values are retrieved by macros, rather than given as specific bit encodings as they are  
48822 in most historical implementations (and thus expected by existing programs). This was  
48823 necessary to eliminate a limitation on the number of signals an implementation can support that  
48824 was inherent in the traditional encodings. This volume of IEEE Std 1003.1-2001 does require that  
48825 a *status* value of zero corresponds to a process calling *\_exit(0)*, as this is the most common  
48826 encoding expected by existing programs. Some of the macro names were adopted from 4.3 BSD.

48827 These macros syntactically operate on an arbitrary integer value. The behavior is undefined  
48828 unless that value is one stored by a successful call to *wait()* or *waitpid()* in the location pointed  
48829 to by the *stat\_loc* argument. An early proposal attempted to make this clearer by specifying each

48830 argument as *\*stat\_loc* rather than *stat\_val*. However, that did not follow the conventions of other  
 48831 specifications in this volume of IEEE Std 1003.1-2001 or traditional usage. It also could have  
 48832 implied that the argument to the macro must literally be *\*stat\_loc*; in fact, that value can be  
 48833 stored or passed as an argument to other functions before being interpreted by these macros.

48834 The extension that affects *wait()* and *waitpid()* and is common in historical implementations is  
 48835 the *ptrace()* function. It is called by a child process and causes that child to stop and return a  
 48836 *status* that appears identical to the *status* indicated by WIFSTOPPED. The *status* of *ptrace()*  
 48837 children is traditionally returned regardless of the WUNTRACED flag (or by the *wait()*  
 48838 function). Most applications do not need to concern themselves with such extensions because  
 48839 they have control over what extensions they or their children use. However, applications, such  
 48840 as command interpreters, that invoke arbitrary processes may see this behavior when those  
 48841 arbitrary processes misuse such extensions.

48842 Implementations that support **core** file creation or other implementation-defined actions on  
 48843 termination of some processes traditionally provide a bit in the *status* returned by *wait()* to  
 48844 indicate that such actions have occurred.

48845 Allowing the *wait()* family of functions to discard a pending SIGCHLD signal that is associated  
 48846 with a successfully waited-for child process puts them into the *sigwait()* and *sigwaitinfo()*  
 48847 category with respect to SIGCHLD.

48848 This definition allows implementations to treat a pending SIGCHLD signal as accepted by the  
 48849 process in *wait()*, with the same meaning of “accepted” as when that word is applied to the  
 48850 *sigwait()* family of functions.

48851 Allowing the *wait()* family of functions to behave this way permits an implementation to be able  
 48852 to deal precisely with SIGCHLD signals.

48853 In particular, an implementation that does accept (discard) the SIGCHLD signal can make the  
 48854 following guarantees regardless of the queuing depth of signals in general (the list of waitable  
 48855 children can hold the SIGCHLD queue):

- 48856 1. If a SIGCHLD signal handler is established via *sigaction()* without the SA\_RESETHAND  
 48857 flag, SIGCHLD signals can be accurately counted; that is, exactly one SIGCHLD signal will  
 48858 be delivered to or accepted by the process for every child process that terminates.
- 48859 2. A single *wait()* issued from a SIGCHLD signal handler can be guaranteed to return  
 48860 immediately with status information for a child process.
- 48861 3. When SA\_SIGINFO is requested, the SIGCHLD signal handler can be guaranteed to  
 48862 receive a non-NULL pointer to a **siginfo\_t** structure that describes a child process for  
 48863 which a wait via *waitpid()* or *waitid()* will not block or fail.
- 48864 4. The *system()* function will not cause a process' SIGCHLD handler to be called as a result of  
 48865 the *fork()/exec* executed within *system()* because *system()* will accept the SIGCHLD signal  
 48866 when it performs a *waitpid()* for its child process. This is a desirable behavior of *system()*  
 48867 so that it can be used in a library without causing side effects to the application linked with  
 48868 the library.

48869 An implementation that does not permit the *wait()* family of functions to accept (discard) a  
 48870 pending SIGCHLD signal associated with a successfully waited-for child, cannot make the  
 48871 guarantees described above for the following reasons:

#### 48872 Guarantee #1

48873 Although it might be assumed that reliable queuing of all SIGCHLD signals generated by  
 48874 the system can make this guarantee, the counter-example is the case of a process that blocks  
 48875 SIGCHLD and performs an indefinite loop of *fork()/wait()* operations. If the

48876 implementation supports queued signals, then eventually the system will run out of  
48877 memory for the queue. The guarantee cannot be made because there must be some limit to  
48878 the depth of queuing.

48879 Guarantees #2 and #3

48880 These cannot be guaranteed unless the *wait()* family of functions accepts the SIGCHLD  
48881 signal. Otherwise, a *fork()/wait()* executed while SIGCHLD is blocked (as in the *system()*  
48882 function) will result in an invocation of the handler when SIGCHLD is unblocked, after the  
48883 process has disappeared.

48884 Guarantee #4

48885 Although possible to make this guarantee, *system()* would have to set the SIGCHLD  
48886 handler to SIG\_DFL so that the SIGCHLD signal generated by its *fork()* would be discarded  
48887 (the SIGCHLD default action is to be ignored), then restore it to its previous setting. This  
48888 would have the undesirable side effect of discarding all SIGCHLD signals pending to the  
48889 process.

#### 48890 FUTURE DIRECTIONS

48891 None.

#### 48892 SEE ALSO

48893 *exec*, *exit()*, *fork()*, *waitid()*, the Base Definitions volume of IEEE Std 1003.1-2001, <signal.h>,  
48894 <sys/wait.h>

#### 48895 CHANGE HISTORY

48896 First released in Issue 1. Derived from Issue 1 of the SVID.

#### 48897 Issue 5

48898 The DESCRIPTION is updated for alignment with the POSIX Threads Extension.

#### 48899 Issue 6

48900 The following new requirements on POSIX implementations derive from alignment with the  
48901 Single UNIX Specification:

48902 • The requirement to include <sys/types.h> has been removed. Although <sys/types.h> was  
48903 required for conforming implementations of previous POSIX specifications, it was not  
48904 required for UNIX applications.

48905 The following changes were made to align with the IEEE P1003.1a draft standard:

48906 • The processing of the SIGCHLD signal and the [ECHILD] error is clarified.

48907 The semantics of WIFSTOPPED(*stat\_val*), WIFEXITED(*stat\_val*), and WIFSIGNALED(*stat\_val*)  
48908 are defined with respect to *posix\_spawn()* or *posix\_spawnnp()* for alignment with  
48909 IEEE Std 1003.1d-1999.

48910 The DESCRIPTION is updated for alignment with the ISO/IEC 9899:1999 standard.

## 48911 NAME

48912 waitid — wait for a child process to change state

## 48913 SYNOPSIS

48914 XSI #include &lt;sys/wait.h&gt;

48915 int waitid(idtype\_t idtype, id\_t id, siginfo\_t \*infop, int options);

48916

## 48917 DESCRIPTION

48918 The *waitid()* function shall suspend the calling thread until one child of the process containing  
 48919 the calling thread changes state. It records the current state of a child in the structure pointed to  
 48920 by *infop*. If a child process changed state prior to the call to *waitid()*, *waitid()* shall return  
 48921 immediately. If more than one thread is suspended in *wait()* or *waitpid()* waiting for termination  
 48922 of the same process, exactly one thread shall return the process status at the time of the target  
 48923 process termination.

48924 The *idtype* and *id* arguments are used to specify which children *waitid()* waits for.

48925 If *idtype* is P\_PID, *waitid()* shall wait for the child with a process ID equal to (**pid\_t**)*id*.

48926 If *idtype* is P\_PGID, *waitid()* shall wait for any child with a process group ID equal to (**pid\_t**)*id*.

48927 If *idtype* is P\_ALL, *waitid()* shall wait for any children and *id* is ignored.

48928 The *options* argument is used to specify which state changes *waitid()* shall wait for. It is formed  
 48929 by OR'ing together one or more of the following flags:

48930 WEXITED Wait for processes that have exited.

48931 WSTOPPED Status shall be returned for any child that has stopped upon receipt of a signal.

48932 WCONTINUED Status shall be returned for any child that was stopped and has been  
 48933 continued.

48934 WNOHANG Return immediately if there are no children to wait for.

48935 WNOWAIT Keep the process whose status is returned in *infop* in a waitable state. This  
 48936 shall not affect the state of the process; the process may be waited for again  
 48937 after this call completes.

48938 The application shall ensure that the *infop* argument points to a **siginfo\_t** structure. If *waitid()*  
 48939 returns because a child process was found that satisfied the conditions indicated by the  
 48940 arguments *idtype* and *options*, then the structure pointed to by *infop* shall be filled in by the  
 48941 system with the status of the process. The *si\_signo* member shall always be equal to SIGCHLD.

## 48942 RETURN VALUE

48943 If WNOHANG was specified and there are no children to wait for, 0 shall be returned. If *waitid()*  
 48944 returns due to the change of state of one of its children, 0 shall be returned. Otherwise, -1 shall  
 48945 be returned and *errno* set to indicate the error.

## 48946 ERRORS

48947 The *waitid()* function shall fail if:

48948 [ECHILD] The calling process has no existing unwaited-for child processes.

48949 [EINTR] The *waitid()* function was interrupted by a signal.

48950 [EINVAL] An invalid value was specified for *options*, or *idtype* and *id* specify an invalid  
 48951 set of processes.

48952 **EXAMPLES**

48953 None.

48954 **APPLICATION USAGE**

48955 None.

48956 **RATIONALE**

48958 **FUTURE DIRECTIONS**

48959 None.

48960 **SEE ALSO**48961 *exec*, *exit()*, *wait()*, the Base Definitions volume of IEEE Std 1003.1-2001, <sys/wait.h>48962 **CHANGE HISTORY**

48963 First released in Issue 4, Version 2.

48964 **Issue 5**

48965 Moved from X/OPEN UNIX extension to BASE.

48966 The DESCRIPTION is updated for alignment with the POSIX Threads Extension.

48967 **Issue 6**

48968 The DESCRIPTION is updated to avoid use of the term “must” for application requirements.

48969 **NAME**

48970           waitpid — wait for a child process to stop or terminate

48971 **SYNOPSIS**

48972           #include <sys/wait.h>

48973           pid\_t waitpid(pid\_t *pid*, int *\*stat\_loc*, int *options*);

48974 **DESCRIPTION**

48975           Refer to *wait()*.

48976 **NAME**48977 `wrtomb` — convert a wide-character code to a character (restartable)48978 **SYNOPSIS**48979 `#include <stdio.h>`48980 `size_t wrtomb(char *restrict s, wchar_t wc, mbstate_t *restrict ps);`48981 **DESCRIPTION**

48982 **CX** The functionality described on this reference page is aligned with the ISO C standard. Any  
 48983 conflict between the requirements described here and the ISO C standard is unintentional. This  
 48984 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

48985 If *s* is a null pointer, the `wrtomb()` function shall be equivalent to the call:48986 `wrtomb(buf, L'\0', ps)`48987 where *buf* is an internal buffer.

48988 If *s* is not a null pointer, the `wrtomb()` function shall determine the number of bytes needed to  
 48989 represent the character that corresponds to the wide character given by *wc* (including any shift  
 48990 sequences), and store the resulting bytes in the array whose first element is pointed to by *s*. At  
 48991 most {`MB_CUR_MAX`} bytes are stored. If *wc* is a null wide character, a null byte shall be stored,  
 48992 preceded by any shift sequence needed to restore the initial shift state. The resulting state  
 48993 described shall be the initial conversion state.

48994 If *ps* is a null pointer, the `wrtomb()` function shall use its own internal `mbstate_t` object, which is  
 48995 initialized at program start-up to the initial conversion state. Otherwise, the `mbstate_t` object  
 48996 pointed to by *ps* shall be used to completely describe the current conversion state of the  
 48997 associated character sequence. The implementation shall behave as if no function defined in this  
 48998 volume of IEEE Std 1003.1-2001 calls `wrtomb()`.

48999 **CX** If the application uses any of the `_POSIX_THREAD_SAFE_FUNCTIONS` or `_POSIX_THREADS`  
 49000 functions, the application shall ensure that the `wrtomb()` function is called with a non-NULL *ps*  
 49001 argument.

49002 The behavior of this function shall be affected by the `LC_CTYPE` category of the current locale.49003 **RETURN VALUE**

49004 The `wrtomb()` function shall return the number of bytes stored in the array object (including any  
 49005 shift sequences). When *wc* is not a valid wide character, an encoding error shall occur. In this  
 49006 case, the function shall store the value of the macro `[EILSEQ]` in *errno* and shall return `(size_t)-1`;  
 49007 the conversion state shall be undefined.

49008 **ERRORS**49009 The `wrtomb()` function may fail if:49010 **CX** `[EINVAL]` *ps* points to an object that contains an invalid conversion state.49011 `[EILSEQ]` Invalid wide-character code is detected.

49012 **EXAMPLES**

49013 None.

49014 **APPLICATION USAGE**

49015 None.

49016 **RATIONALE**

49017 None.

49018 **FUTURE DIRECTIONS**

49019 None.

49020 **SEE ALSO**49021 *mbstinit()*, the Base Definitions volume of IEEE Std 1003.1-2001, <**wchar.h**>49022 **CHANGE HISTORY**49023 First released in Issue 5. Included for alignment with ISO/IEC 9899:1990/Amendment 1:1995  
49024 (E).49025 **Issue 6**

49026 In the DESCRIPTION, a note on using this function in a threaded application is added.

49027 Extensions beyond the ISO C standard are marked.

49028 The DESCRIPTION is updated to avoid use of the term “must” for application requirements.

49029 The *wcrtomb()* prototype is updated for alignment with the ISO/IEC 9899:1999 standard.

49030 **NAME**49031 `wscat` — concatenate two wide-character strings49032 **SYNOPSIS**49033 `#include <wchar.h>`49034 `wchar_t *wscat(wchar_t *restrict ws1, const wchar_t *restrict ws2);`49035 **DESCRIPTION**

49036 **CX** The functionality described on this reference page is aligned with the ISO C standard. Any  
49037 conflict between the requirements described here and the ISO C standard is unintentional. This  
49038 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

49039 The `wscat()` function shall append a copy of the wide-character string pointed to by `ws2`  
49040 (including the terminating null wide-character code) to the end of the wide-character string  
49041 pointed to by `ws1`. The initial wide-character code of `ws2` shall overwrite the null wide-character  
49042 code at the end of `ws1`. If copying takes place between objects that overlap, the behavior is  
49043 undefined.

49044 **RETURN VALUE**49045 The `wscat()` function shall return `ws1`; no return value is reserved to indicate an error.49046 **ERRORS**

49047 No errors are defined.

49048 **EXAMPLES**

49049 None.

49050 **APPLICATION USAGE**

49051 None.

49052 **RATIONALE**

49053 None.

49054 **FUTURE DIRECTIONS**

49055 None.

49056 **SEE ALSO**49057 `wscncat()`, the Base Definitions volume of IEEE Std 1003.1-2001, `<wchar.h>`49058 **CHANGE HISTORY**

49059 First released in Issue 4. Derived from the MSE working draft.

49060 **Issue 6**49061 The Open Group Corrigendum U040/2 is applied. In the RETURN VALUE section, `s1` is changed  
49062 to `ws1`.49063 The `wscat()` prototype is updated for alignment with the ISO/IEC 9899:1999 standard.

49064 **NAME**

49065           wcschr — wide-character string scanning operation

49066 **SYNOPSIS**

49067           #include &lt;wchar.h&gt;

49068           wchar\_t \*wcschr(const wchar\_t \*ws, wchar\_t wc);

49069 **DESCRIPTION**

49070 cx       The functionality described on this reference page is aligned with the ISO C standard. Any  
49071       conflict between the requirements described here and the ISO C standard is unintentional. This  
49072       volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

49073       The *wcschr()* function shall locate the first occurrence of *wc* in the wide-character string pointed  
49074       to by *ws*. The application shall ensure that the value of *wc* is a character representable as a type  
49075       **wchar\_t** and a wide-character code corresponding to a valid character in the current locale. The  
49076       terminating null wide-character code is considered to be part of the wide-character string.

49077 **RETURN VALUE**

49078       Upon completion, *wcschr()* shall return a pointer to the wide-character code, or a null pointer if  
49079       the wide-character code is not found.

49080 **ERRORS**

49081       No errors are defined.

49082 **EXAMPLES**

49083       None.

49084 **APPLICATION USAGE**

49085       None.

49086 **RATIONALE**

49087       None.

49088 **FUTURE DIRECTIONS**

49089       None.

49090 **SEE ALSO**49091       *wcsrchr()*, the Base Definitions volume of IEEE Std 1003.1-2001, <**wchar.h**>49092 **CHANGE HISTORY**

49093       First released in Issue 4. Derived from the MSE working draft.

49094 **Issue 6**

49095       The DESCRIPTION is updated to avoid use of the term “must” for application requirements.

49096 **NAME**

49097       wcsncmp — compare two wide-character strings

49098 **SYNOPSIS**

49099       #include &lt;wchar.h&gt;

49100       int wcsncmp(const wchar\_t \*ws1, const wchar\_t \*ws2);

49101 **DESCRIPTION**

49102 cx     The functionality described on this reference page is aligned with the ISO C standard. Any  
49103     conflict between the requirements described here and the ISO C standard is unintentional. This  
49104     volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

49105     The *wcsncmp()* function shall compare the wide-character string pointed to by *ws1* to the wide-  
49106     character string pointed to by *ws2*.

49107     The sign of a non-zero return value shall be determined by the sign of the difference between the  
49108     values of the first pair of wide-character codes that differ in the objects being compared.

49109 **RETURN VALUE**

49110     Upon completion, *wcsncmp()* shall return an integer greater than, equal to, or less than 0, if the  
49111     wide-character string pointed to by *ws1* is greater than, equal to, or less than the wide-character  
49112     string pointed to by *ws2*, respectively.

49113 **ERRORS**

49114       No errors are defined.

49115 **EXAMPLES**

49116       None.

49117 **APPLICATION USAGE**

49118       None.

49119 **RATIONALE**

49120       None.

49121 **FUTURE DIRECTIONS**

49122       None.

49123 **SEE ALSO**49124       *wcsncmp()*, the Base Definitions volume of IEEE Std 1003.1-2001, <wchar.h>49125 **CHANGE HISTORY**

49126       First released in Issue 4. Derived from the MSE working draft.

49127 **NAME**

49128 wscoll — wide-character string comparison using collating information

49129 **SYNOPSIS**

49130 #include &lt;wchar.h&gt;

49131 int wscoll(const wchar\_t \*ws1, const wchar\_t \*ws2);

49132 **DESCRIPTION**49133 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
49134 conflict between the requirements described here and the ISO C standard is unintentional. This  
49135 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.49136 The *wscoll()* function shall compare the wide-character string pointed to by *ws1* to the wide-  
49137 character string pointed to by *ws2*, both interpreted as appropriate to the *LC\_COLLATE* category  
49138 of the current locale.49139 CX The *wscoll()* function shall not change the setting of *errno* if successful.49140 An application wishing to check for error situations should set *errno* to 0 before calling *wscoll()*.  
49141 If *errno* is non-zero on return, an error has occurred.49142 **RETURN VALUE**49143 Upon successful completion, *wscoll()* shall return an integer greater than, equal to, or less than  
49144 0, according to whether the wide-character string pointed to by *ws1* is greater than, equal to, or  
49145 less than the wide-character string pointed to by *ws2*, when both are interpreted as appropriate  
49146 CX to the current locale. On error, *wscoll()* shall set *errno*, but no return value is reserved to  
49147 indicate an error.49148 **ERRORS**49149 The *wscoll()* function may fail if:49150 CX [EINVAL] The *ws1* or *ws2* arguments contain wide-character codes outside the domain of  
49151 the collating sequence.49152 **EXAMPLES**

49153 None.

49154 **APPLICATION USAGE**49155 The *wcsxfrm()* and *wscmp()* functions should be used for sorting large lists.49156 **RATIONALE**

49157 None.

49158 **FUTURE DIRECTIONS**

49159 None.

49160 **SEE ALSO**49161 *wscmp()*, *wcsxfrm()*, the Base Definitions volume of IEEE Std 1003.1-2001, <wchar.h>49162 **CHANGE HISTORY**

49163 First released in Issue 4. Derived from the MSE working draft.

49164 **Issue 5**

49165 Moved from ENHANCED I18N to BASE and the [ENOSYS] error is removed.

49166 The DESCRIPTION is updated to indicate that *errno* is not changed if the function is successful.

49167 **NAME**

49168           wcscpy — copy a wide-character string

49169 **SYNOPSIS**

49170           #include &lt;wchar.h&gt;

49171           wchar\_t \*wcscpy(wchar\_t \*restrict ws1, const wchar\_t \*restrict ws2);

49172 **DESCRIPTION**

49173 cx       The functionality described on this reference page is aligned with the ISO C standard. Any  
49174       conflict between the requirements described here and the ISO C standard is unintentional. This  
49175       volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

49176       The *wcscpy()* function shall copy the wide-character string pointed to by *ws2* (including the  
49177       terminating null wide-character code) into the array pointed to by *ws1*. If copying takes place  
49178       between objects that overlap, the behavior is undefined.

49179 **RETURN VALUE**49180       The *wcscpy()* function shall return *ws1*; no return value is reserved to indicate an error.49181 **ERRORS**

49182       No errors are defined.

49183 **EXAMPLES**

49184       None.

49185 **APPLICATION USAGE**

49186       None.

49187 **RATIONALE**

49188       None.

49189 **FUTURE DIRECTIONS**

49190       None.

49191 **SEE ALSO**49192       *wscncpy()*, the Base Definitions volume of IEEE Std 1003.1-2001, <**wchar.h**>49193 **CHANGE HISTORY**

49194       First released in Issue 4. Derived from the MSE working draft.

49195 **Issue 6**49196       The *wcscpy()* prototype is updated for alignment with the ISO/IEC 9899:1999 standard.

49197 **NAME**

49198           wscspn — get the length of a complementary wide substring

49199 **SYNOPSIS**

49200           #include <wchar.h>

49201           size\_t wscspn(const wchar\_t \*ws1, const wchar\_t \*ws2);

49202 **DESCRIPTION**

49203 **CX**       The functionality described on this reference page is aligned with the ISO C standard. Any  
49204 conflict between the requirements described here and the ISO C standard is unintentional. This  
49205 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

49206       The *wscspn()* function shall compute the length (in wide characters) of the maximum initial  
49207 segment of the wide-character string pointed to by *ws1* which consists entirely of wide-character  
49208 codes *not* from the wide-character string pointed to by *ws2*.

49209 **RETURN VALUE**

49210       The *wscspn()* function shall return the length of the initial substring of *ws1*; no return value is  
49211 reserved to indicate an error.

49212 **ERRORS**

49213       No errors are defined.

49214 **EXAMPLES**

49215       None.

49216 **APPLICATION USAGE**

49217       None.

49218 **RATIONALE**

49219       None.

49220 **FUTURE DIRECTIONS**

49221       None.

49222 **SEE ALSO**

49223       *wcspn()*, the Base Definitions volume of IEEE Std 1003.1-2001, <wchar.h>

49224 **CHANGE HISTORY**

49225       First released in Issue 4. Derived from the MSE working draft.

49226 **Issue 5**

49227       The RETURN VALUE section is updated to indicate that *wscspn()* returns the length of *ws1*,  
49228 rather than *ws1* itself.

49229 **NAME**49230 `wcsftime` — convert date and time to a wide-character string49231 **SYNOPSIS**49232 `#include <wchar.h>`49233 `size_t wcsftime(wchar_t *restrict wcs, size_t maxsize,`  
49234 `const wchar_t *restrict format, const struct tm *restrict timeptr);`49235 **DESCRIPTION**49236 **CX** The functionality described on this reference page is aligned with the ISO C standard. Any  
49237 conflict between the requirements described here and the ISO C standard is unintentional. This  
49238 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.49239 The `wcsftime()` function shall be equivalent to the `strftime()` function, except that:

- 49240 • The argument `wcs` points to the initial element of an array of wide characters into which the  
49241 generated output is to be placed.
- 49242 • The argument `maxsize` indicates the maximum number of wide characters to be placed in the  
49243 output array.
- 49244 • The argument `format` is a wide-character string and the conversion specifications are replaced  
49245 by corresponding sequences of wide characters.
- 49246 • The return value indicates the number of wide characters placed in the output array.

49247 If copying takes place between objects that overlap, the behavior is undefined.

49248 **RETURN VALUE**49249 If the total number of resulting wide-character codes including the terminating null wide-  
49250 character code is no more than `maxsize`, `wcsftime()` shall return the number of wide-character  
49251 codes placed into the array pointed to by `wcs`, not including the terminating null wide-character  
49252 code. Otherwise, zero is returned and the contents of the array are unspecified.49253 **ERRORS**

49254 No errors are defined.

49255 **EXAMPLES**

49256 None.

49257 **APPLICATION USAGE**

49258 None.

49259 **RATIONALE**

49260 None.

49261 **FUTURE DIRECTIONS**

49262 None.

49263 **SEE ALSO**49264 `strftime()`, the Base Definitions volume of IEEE Std 1003.1-2001, `<wchar.h>`49265 **CHANGE HISTORY**

49266 First released in Issue 4.

49267 **Issue 5**

49268 Moved from ENHANCED I18N to BASE and the [ENOSYS] error is removed.

49269 Aligned with ISO/IEC 9899:1990/Amendment 1:1995 (E). Specifically, the type of the `format`  
49270 argument is changed from `const char *` to `const wchar_t *`.

49271 **Issue 6**

49272

The *wcsftime()* prototype is updated for alignment with the ISO/IEC 9899:1999 standard.

49273 **NAME**

49274           wcslen — get wide-character string length

49275 **SYNOPSIS**

49276           #include &lt;wchar.h&gt;

49277           size\_t wcslen(const wchar\_t \*ws);

49278 **DESCRIPTION**

49279 cx       The functionality described on this reference page is aligned with the ISO C standard. Any  
49280       conflict between the requirements described here and the ISO C standard is unintentional. This  
49281       volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

49282       The *wcslen()* function shall compute the number of wide-character codes in the wide-character  
49283       string to which *ws* points, not including the terminating null wide-character code.

49284 **RETURN VALUE**

49285       The *wcslen()* function shall return the length of *ws*; no return value is reserved to indicate an  
49286       error.

49287 **ERRORS**

49288       No errors are defined.

49289 **EXAMPLES**

49290       None.

49291 **APPLICATION USAGE**

49292       None.

49293 **RATIONALE**

49294       None.

49295 **FUTURE DIRECTIONS**

49296       None.

49297 **SEE ALSO**49298       The Base Definitions volume of IEEE Std 1003.1-2001, <**wchar.h**>49299 **CHANGE HISTORY**

49300       First released in Issue 4. Derived from the MSE working draft.

49301 **NAME**

49302        `wcsncat` — concatenate a wide-character string with part of another

49303 **SYNOPSIS**

49304        `#include <wchar.h>`

49305        `wchar_t *wcsncat(wchar_t *restrict ws1, const wchar_t *restrict ws2,`  
49306            `size_t n);`

49307 **DESCRIPTION**

49308 **CX**        The functionality described on this reference page is aligned with the ISO C standard. Any  
49309        conflict between the requirements described here and the ISO C standard is unintentional. This  
49310        volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

49311        The `wcsncat()` function shall append not more than *n* wide-character codes (a null wide-  
49312        character code and wide-character codes that follow it are not appended) from the array pointed  
49313        to by *ws2* to the end of the wide-character string pointed to by *ws1*. The initial wide-character  
49314        code of *ws2* shall overwrite the null wide-character code at the end of *ws1*. A terminating null  
49315        wide-character code shall always be appended to the result. If copying takes place between  
49316        objects that overlap, the behavior is undefined.

49317 **RETURN VALUE**

49318        The `wcsncat()` function shall return *ws1*; no return value is reserved to indicate an error.

49319 **ERRORS**

49320        No errors are defined.

49321 **EXAMPLES**

49322        None.

49323 **APPLICATION USAGE**

49324        None.

49325 **RATIONALE**

49326        None.

49327 **FUTURE DIRECTIONS**

49328        None.

49329 **SEE ALSO**

49330        `wscat()`, the Base Definitions volume of IEEE Std 1003.1-2001, `<wchar.h>`

49331 **CHANGE HISTORY**

49332        First released in Issue 4. Derived from the MSE working draft.

49333 **Issue 6**

49334        The `wcsncat()` prototype is updated for alignment with the ISO/IEC 9899:1999 standard.

49335 **NAME**

49336           wcsncmp — compare part of two wide-character strings

49337 **SYNOPSIS**

49338           #include &lt;wchar.h&gt;

49339           int wcsncmp(const wchar\_t \*ws1, const wchar\_t \*ws2, size\_t n);

49340 **DESCRIPTION**

49341 cx       The functionality described on this reference page is aligned with the ISO C standard. Any  
49342       conflict between the requirements described here and the ISO C standard is unintentional. This  
49343       volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

49344       The *wcsncmp()* function shall compare not more than *n* wide-character codes (wide-character  
49345       codes that follow a null wide-character code are not compared) from the array pointed to by *ws1*  
49346       to the array pointed to by *ws2*.

49347       The sign of a non-zero return value shall be determined by the sign of the difference between the  
49348       values of the first pair of wide-character codes that differ in the objects being compared.

49349 **RETURN VALUE**

49350       Upon successful completion, *wcsncmp()* shall return an integer greater than, equal to, or less  
49351       than 0, if the possibly null-terminated array pointed to by *ws1* is greater than, equal to, or less  
49352       than the possibly null-terminated array pointed to by *ws2*, respectively.

49353 **ERRORS**

49354       No errors are defined.

49355 **EXAMPLES**

49356       None.

49357 **APPLICATION USAGE**

49358       None.

49359 **RATIONALE**

49360       None.

49361 **FUTURE DIRECTIONS**

49362       None.

49363 **SEE ALSO**49364       *wscmp()*, the Base Definitions volume of IEEE Std 1003.1-2001, <wchar.h>49365 **CHANGE HISTORY**

49366       First released in Issue 4. Derived from the MSE working draft.

49367 **NAME**

49368       wcsncpy — copy part of a wide-character string

49369 **SYNOPSIS**

49370       #include &lt;wchar.h&gt;

49371       wchar\_t \*wcsncpy(wchar\_t \*restrict ws1, const wchar\_t \*restrict ws2,  
49372                       size\_t n);49373 **DESCRIPTION**49374 **CX**       The functionality described on this reference page is aligned with the ISO C standard. Any  
49375       conflict between the requirements described here and the ISO C standard is unintentional. This  
49376       volume of IEEE Std 1003.1-2001 defers to the ISO C standard.49377       The *wcsncpy()* function shall copy not more than *n* wide-character codes (wide-character codes  
49378       that follow a null wide-character code are not copied) from the array pointed to by *ws2* to the  
49379       array pointed to by *ws1*. If copying takes place between objects that overlap, the behavior is  
49380       undefined.49381       If the array pointed to by *ws2* is a wide-character string that is shorter than *n* wide-character  
49382       codes, null wide-character codes shall be appended to the copy in the array pointed to by *ws1*,  
49383       until *n* wide-character codes in all are written.49384 **RETURN VALUE**49385       The *wcsncpy()* function shall return *ws1*; no return value is reserved to indicate an error.49386 **ERRORS**

49387       No errors are defined.

49388 **EXAMPLES**

49389       None.

49390 **APPLICATION USAGE**49391       If there is no null wide-character code in the first *n* wide-character codes of the array pointed to  
49392       by *ws2*, the result is not null-terminated.49393 **RATIONALE**

49394       None.

49395 **FUTURE DIRECTIONS**

49396       None.

49397 **SEE ALSO**49398       *wscpy()*, the Base Definitions volume of IEEE Std 1003.1-2001, <wchar.h>49399 **CHANGE HISTORY**

49400       First released in Issue 4. Derived from the MSE working draft.

49401 **Issue 6**49402       The *wcsncpy()* prototype is updated for alignment with the ISO/IEC 9899:1999 standard.

49403 **NAME**

49404 `wcsprk` — scan a wide-character string for a wide-character code

49405 **SYNOPSIS**

49406 `#include <wchar.h>`

49407 `wchar_t *wcsprk(const wchar_t *ws1, const wchar_t *ws2);`

49408 **DESCRIPTION**

49409 **CX** The functionality described on this reference page is aligned with the ISO C standard. Any  
49410 conflict between the requirements described here and the ISO C standard is unintentional. This  
49411 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

49412 The `wcsprk()` function shall locate the first occurrence in the wide-character string pointed to by  
49413 `ws1` of any wide-character code from the wide-character string pointed to by `ws2`.

49414 **RETURN VALUE**

49415 Upon successful completion, `wcsprk()` shall return a pointer to the wide-character code or a null  
49416 pointer if no wide-character code from `ws2` occurs in `ws1`.

49417 **ERRORS**

49418 No errors are defined.

49419 **EXAMPLES**

49420 None.

49421 **APPLICATION USAGE**

49422 None.

49423 **RATIONALE**

49424 None.

49429 **CHANGE HISTORY**

49430 First released in Issue 4. Derived from the MSE working draft.

49431 **NAME**

49432       wcsrchr — wide-character string scanning operation

49433 **SYNOPSIS**

49434       #include &lt;wchar.h&gt;

49435       wchar\_t \*wcsrchr(const wchar\_t \*ws, wchar\_t wc);

49436 **DESCRIPTION**

49437 cx     The functionality described on this reference page is aligned with the ISO C standard. Any  
49438     conflict between the requirements described here and the ISO C standard is unintentional. This  
49439     volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

49440     The *wcsrchr()* function shall locate the last occurrence of *wc* in the wide-character string pointed  
49441     to by *ws*. The application shall ensure that the value of *wc* is a character representable as a type  
49442     **wchar\_t** and a wide-character code corresponding to a valid character in the current locale. The  
49443     terminating null wide-character code shall be considered to be part of the wide-character string.

49444 **RETURN VALUE**

49445     Upon successful completion, *wcsrchr()* shall return a pointer to the wide-character code or a null  
49446     pointer if *wc* does not occur in the wide-character string.

49447 **ERRORS**

49448     No errors are defined.

49449 **EXAMPLES**

49450     None.

49451 **APPLICATION USAGE**

49452     None.

49453 **RATIONALE**

49454     None.

49455 **FUTURE DIRECTIONS**

49456     None.

49457 **SEE ALSO**49458     *wchr()*, the Base Definitions volume of IEEE Std 1003.1-2001, <**wchar.h**>49459 **CHANGE HISTORY**

49460     First released in Issue 4. Derived from the MSE working draft.

49461 **Issue 6**

49462     The DESCRIPTION is updated to avoid use of the term “must” for application requirements.

## 49463 NAME

49464       wcsrtoombs — convert a wide-character string to a character string (restartable)

## 49465 SYNOPSIS

49466       #include &lt;wchar.h&gt;

49467       size\_t wcsrtoombs(char \*restrict dst, const wchar\_t \*\*restrict src,  
49468                   size\_t len, mbstate\_t \*restrict ps);

## 49469 DESCRIPTION

49470 cx       The functionality described on this reference page is aligned with the ISO C standard. Any  
49471       conflict between the requirements described here and the ISO C standard is unintentional. This  
49472       volume of IEEE Std 1003.1-2001 defers to the ISO C standard.49473       The *wcsrtoombs()* function shall convert a sequence of wide characters from the array indirectly  
49474       pointed to by *src* into a sequence of corresponding characters, beginning in the conversion state  
49475       described by the object pointed to by *ps*. If *dst* is not a null pointer, the converted characters  
49476       shall then be stored into the array pointed to by *dst*. Conversion continues up to and including a  
49477       terminating null wide character, which shall also be stored. Conversion shall stop earlier in the  
49478       following cases:

- 49479
- When a code is reached that does not correspond to a valid character
  - When the next character would exceed the limit of *len* total bytes to be stored in the array  
49480       pointed to by *dst* (and *dst* is not a null pointer)
- 49481

49482       Each conversion shall take place as if by a call to the *wcrtomb()* function.49483       If *dst* is not a null pointer, the pointer object pointed to by *src* shall be assigned either a null  
49484       pointer (if conversion stopped due to reaching a terminating null wide character) or the address  
49485       just past the last wide character converted (if any). If conversion stopped due to reaching a  
49486       terminating null wide character, the resulting state described shall be the initial conversion state.49487       If *ps* is a null pointer, the *wcsrtoombs()* function shall use its own internal **mbstate\_t** object, which  
49488       is initialized at program start-up to the initial conversion state. Otherwise, the **mbstate\_t** object  
49489       pointed to by *ps* shall be used to completely describe the current conversion state of the  
49490       associated character sequence. The implementation shall behave as if no function defined in this  
49491       volume of IEEE Std 1003.1-2001 calls *wcsrtoombs()*.49492 cx       If the application uses any of the `_POSIX_THREAD_SAFE_FUNCTIONS` or `_POSIX_THREADS`  
49493       functions, the application shall ensure that the *wcsrtoombs()* function is called with a non-NULL  
49494       *ps* argument.49495       The behavior of this function shall be affected by the *LC\_CTYPE* category of the current locale.

## 49496 RETURN VALUE

49497       If conversion stops because a code is reached that does not correspond to a valid character, an  
49498       encoding error occurs. In this case, the *wcsrtoombs()* function shall store the value of the macro  
49499       [EILSEQ] in *errno* and return (**size\_t**)-1; the conversion state is undefined. Otherwise, it shall  
49500       return the number of bytes in the resulting character sequence, not including the terminating  
49501       null (if any).

## 49502 ERRORS

49503       The *wcsrtoombs()* function may fail if:

- 49504 cx       [EINVAL]
- ps*
- points to an object that contains an invalid conversion state.
- 
- 49505       [EILSEQ]       A wide-character code does not correspond to a valid character.

49506 **EXAMPLES**

49507 None.

49508 **APPLICATION USAGE**

49509 None.

49510 **RATIONALE**

49511 None.

49512 **FUTURE DIRECTIONS**

49513 None.

49514 **SEE ALSO**49515 *mbsinit()*, *wcrtomb()*, the Base Definitions volume of IEEE Std 1003.1-2001, <**wchar.h**>49516 **CHANGE HISTORY**49517 First released in Issue 5. Included for alignment with ISO/IEC 9899:1990/Amendment 1:1995  
49518 (E).49519 **Issue 6**

49520 In the DESCRIPTION, a note on using this function in a threaded application is added.

49521 Extensions beyond the ISO C standard are marked.

49522 The DESCRIPTION is updated to avoid use of the term “must” for application requirements.

49523 The *wcsrombs()* prototype is updated for alignment with the ISO/IEC 9899:1999 standard.

49524 **NAME**49525 `wcsspnp` — get the length of a wide substring49526 **SYNOPSIS**49527 `#include <wchar.h>`49528 `size_t wcsspnp(const wchar_t *ws1, const wchar_t *ws2);`49529 **DESCRIPTION**

49530 **CX** The functionality described on this reference page is aligned with the ISO C standard. Any  
49531 conflict between the requirements described here and the ISO C standard is unintentional. This  
49532 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

49533 The `wcsspnp()` function shall compute the length (in wide characters) of the maximum initial  
49534 segment of the wide-character string pointed to by `ws1` which consists entirely of wide-character  
49535 codes from the wide-character string pointed to by `ws2`.

49536 **RETURN VALUE**

49537 The `wcsspnp()` function shall return the length of the initial substring of `ws1`; no return value is  
49538 reserved to indicate an error.

49539 **ERRORS**

49540 No errors are defined.

49541 **EXAMPLES**

49542 None.

49543 **APPLICATION USAGE**

49544 None.

49545 **RATIONALE**

49546 None.

49547 **FUTURE DIRECTIONS**

49548 None.

49549 **SEE ALSO**49550 `wcscspnp()`, the Base Definitions volume of IEEE Std 1003.1-2001, `<wchar.h>`49551 **CHANGE HISTORY**

49552 First released in Issue 4. Derived from the MSE working draft.

49553 **Issue 5**

49554 The RETURN VALUE section is updated to indicate that `wcsspnp()` returns the length of `ws1`  
49555 rather than `ws1` itself.

49556 **NAME**49557 `wcsstr` — find a wide-character substring49558 **SYNOPSIS**49559 `#include <wchar.h>`49560 `wchar_t *wcsstr(const wchar_t *restrict ws1,`  
49561 `const wchar_t *restrict ws2);`49562 **DESCRIPTION**49563 **CX** The functionality described on this reference page is aligned with the ISO C standard. Any  
49564 conflict between the requirements described here and the ISO C standard is unintentional. This  
49565 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.49566 The `wcsstr()` function shall locate the first occurrence in the wide-character string pointed to by  
49567 `ws1` of the sequence of wide characters (excluding the terminating null wide character) in the  
49568 wide-character string pointed to by `ws2`.49569 **RETURN VALUE**49570 Upon successful completion, `wcsstr()` shall return a pointer to the located wide-character string,  
49571 or a null pointer if the wide-character string is not found.49572 If `ws2` points to a wide-character string with zero length, the function shall return `ws1`.49573 **ERRORS**

49574 No errors are defined.

49575 **EXAMPLES**

49576 None.

49577 **APPLICATION USAGE**

49578 None.

49579 **RATIONALE**

49580 None.

49581 **FUTURE DIRECTIONS**

49582 None.

49583 **SEE ALSO**49584 `wcschr()`, the Base Definitions volume of IEEE Std 1003.1-2001, `<wchar.h>`49585 **CHANGE HISTORY**49586 First released in Issue 5. Included for alignment with ISO/IEC 9899:1990/Amendment 1:1995  
49587 (E).49588 **Issue 6**49589 The `wcsstr()` prototype is updated for alignment with the ISO/IEC 9899:1999 standard.

## 49590 NAME

49591 `wcstod`, `wcstof`, `wcstold` — convert a wide-character string to a double-precision number

## 49592 SYNOPSIS

49593 `#include <wchar.h>`

49594 `double wcstod(const wchar_t *restrict nptr, wchar_t **restrict endpnr);`

49595 `float wcstof(const wchar_t *restrict nptr, wchar_t **restrict endpnr);`

49596 `long double wcstold(const wchar_t *restrict nptr,`

49597 `wchar_t **restrict endpnr);`

## 49598 DESCRIPTION

49599 cx The functionality described on this reference page is aligned with the ISO C standard. Any  
49600 conflict between the requirements described here and the ISO C standard is unintentional. This  
49601 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

49602 These functions shall convert the initial portion of the wide-character string pointed to by *nptr* to  
49603 **double**, **float**, and **long double** representation, respectively. First, they shall decompose the  
49604 input wide-character string into three parts:

- 49605 1. An initial, possibly empty, sequence of white-space wide-character codes (as specified by  
49606 `iswspace()`)
- 49607 2. A subject sequence interpreted as a floating-point constant or representing infinity or NaN
- 49608 3. A final wide-character string of one or more unrecognized wide-character codes, including  
49609 the terminating null wide-character code of the input wide-character string

49610 Then they shall attempt to convert the subject sequence to a floating-point number, and return  
49611 the result.

49612 The expected form of the subject sequence is an optional plus or minus sign, then one of the  
49613 following:

- 49614 • A non-empty sequence of decimal digits optionally containing a radix character, then an  
49615 optional exponent part
- 49616 • A 0x or 0X, then a non-empty sequence of hexadecimal digits optionally containing a radix  
49617 character, then an optional binary exponent part
- 49618 • One of INF or INFINITY, or any other wide string equivalent except for case
- 49619 • One of NAN or NAN(*n-wchar-sequence<sub>opt</sub>*), or any other wide string ignoring case in the NAN  
49620 part, where:

49621 `n-wchar-sequence:`

49622 `digit`

49623 `nondigit`

49624 `n-wchar-sequence digit`

49625 `n-wchar-sequence nondigit`

49626 The subject sequence is defined as the longest initial subsequence of the input wide string,  
49627 starting with the first non-white-space wide character, that is of the expected form. The subject  
49628 sequence contains no wide characters if the input wide string is not of the expected form.

49629 If the subject sequence has the expected form for a floating-point number, the sequence of wide  
49630 characters starting with the first digit or the radix character (whichever occurs first) shall be  
49631 interpreted as a floating constant according to the rules of the C language, except that the radix  
49632 character shall be used in place of a period, and that if neither an exponent part nor a radix  
49633 character appears in a decimal floating-point number, or if a binary exponent part does not

- 49634 appear in a hexadecimal floating-point number, an exponent part of the appropriate type with  
 49635 value zero shall be assumed to follow the last digit in the string. If the subject sequence begins  
 49636 with a minus sign, the sequence shall be interpreted as negated. A wide-character sequence INF  
 49637 or INFINITY shall be interpreted as an infinity, if representable in the return type, else as if it  
 49638 were a floating constant that is too large for the range of the return type. A wide-character  
 49639 sequence NAN or NAN(*n-wchar-sequence<sub>opt</sub>*) shall be interpreted as a quiet NaN, if supported in  
 49640 the return type, else as if it were a subject sequence part that does not have the expected form;  
 49641 the meaning of the *n-wchar* sequences is implementation-defined. A pointer to the final wide  
 49642 string shall be stored in the object pointed to by *endptr*, provided that *endptr* is not a null pointer.
- 49643 If the subject sequence has the hexadecimal form and FLT\_RADIX is a power of 2, the  
 49644 conversion shall be rounded in an implementation-defined manner.
- 49645 CX The radix character shall be as defined in the program's locale (category *LC\_NUMERIC*). In the  
 49646 POSIX locale, or in a locale where the radix character is not defined, the radix character shall  
 49647 default to a period ( ' . ' ).
- 49648 CX In other than the C or POSIX locales, other implementation-defined subject sequences may be  
 49649 accepted.
- 49650 If the subject sequence is empty or does not have the expected form, no conversion shall be  
 49651 performed; the value of *nptr* shall be stored in the object pointed to by *endptr*, provided that  
 49652 *endptr* is not a null pointer.
- 49653 CX The *wcstod()* function shall not change the setting of *errno* if successful.
- 49654 Since 0 is returned on error and is also a valid return on success, an application wishing to check  
 49655 for error situations should set *errno* to 0, then call *wcstod()*, *wcstof()*, or *wcstold()*, then check  
 49656 *errno*.
- 49657 **RETURN VALUE**
- 49658 Upon successful completion, these functions shall return the converted value. If no conversion  
 49659 CX could be performed, 0 shall be returned and *errno* may be set to [EINVAL].
- 49660 If the correct value is outside the range of representable values, plus or minus HUGE\_VAL,  
 49661 HUGE\_VALF, or HUGE\_VALL shall be returned (according to the sign of the value), and *errno*  
 49662 shall be set to [ERANGE].
- 49663 If the correct value would cause underflow, a value whose magnitude is no greater than the  
 49664 smallest normalized positive number in the return type shall be returned and *errno* set to  
 49665 [ERANGE].
- 49666 **ERRORS**
- 49667 The *wcstod()* function shall fail if:
- 49668 [ERANGE] The value to be returned would cause overflow or underflow.
- 49669 The *wcstod()* function may fail if:
- 49670 CX [EINVAL] No conversion could be performed.

49671 **EXAMPLES**

49672 None.

49673 **APPLICATION USAGE**

49674 If the subject sequence has the hexadecimal form and FLT\_RADIX is not a power of 2, and the  
 49675 result is not exactly representable, the result should be one of the two numbers in the  
 49676 appropriate internal format that are adjacent to the hexadecimal floating source value, with the  
 49677 extra stipulation that the error should have a correct sign for the current rounding direction.

49678 If the subject sequence has the decimal form and at most DECIMAL\_DIG (defined in <float.h>)  
 49679 significant digits, the result should be correctly rounded. If the subject sequence *D* has the  
 49680 decimal form and more than DECIMAL\_DIG significant digits, consider the two bounding,  
 49681 adjacent decimal strings *L* and *U*, both having DECIMAL\_DIG significant digits, such that the  
 49682 values of *L*, *D*, and *U* satisfy " $L \leq D \leq U$ ". The result should be one of the (equal or  
 49683 adjacent) values that would be obtained by correctly rounding *L* and *U* according to the current  
 49684 rounding direction, with the extra stipulation that the error with respect to *D* should have a  
 49685 correct sign for the current rounding direction.

49686 **RATIONALE**

49687 None.

49688 **FUTURE DIRECTIONS**

49689 None.

49690 **SEE ALSO**

49691 *iswspace()*, *localeconv()*, *scanf()*, *setlocale()*, *wcstol()*, the Base Definitions volume of  
 49692 IEEE Std 1003.1-2001, Chapter 7, Locale, <float.h>, <wchar.h>

49693 **CHANGE HISTORY**

49694 First released in Issue 4. Derived from the MSE working draft.

49695 **Issue 5**49696 The DESCRIPTION is updated to indicate that *errno* is not changed if the function is successful.49697 **Issue 6**

49698 Extensions beyond the ISO C standard are marked.

49699 The following new requirements on POSIX implementations derive from alignment with the  
 49700 Single UNIX Specification:

49701 • In the RETURN VALUE and ERRORS sections, the [EINVAL] optional error condition is  
 49702 added if no conversion could be performed.

49703 The following changes are made for alignment with the ISO/IEC 9899:1999 standard:

49704 • The *wcstod()* prototype is updated.49705 • The *wcstof()* and *wcstold()* functions are added.

49706 • If the correct value for *wcstod()* would cause underflow, the return value changed from 0 (as  
 49707 specified in Issue 5) to the smallest normalized positive number.

49708 • The DESCRIPTION, RETURN VALUE, and APPLICATION USAGE sections are extensively  
 49709 updated.

49710 ISO/IEC 9899:1999 standard, Technical Corrigendum No. 1 is incorporated.

49711 **NAME**

49712 `wcstoimax`, `wcstoumax` — convert a wide-character string to an integer type

49713 **SYNOPSIS**

49714 `#include <stddef.h>`

49715 `#include <inttypes.h>`

49716 `intmax_t wcstoimax(const wchar_t *restrict nptr,`

49717 `wchar_t **restrict endptr, int base);`

49718 `uintmax_t wcstoumax(const wchar_t *restrict nptr,`

49719 `wchar_t **restrict endptr, int base);`

49720 **DESCRIPTION**

49721 **CX** The functionality described on this reference page is aligned with the ISO C standard. Any  
 49722 conflict between the requirements described here and the ISO C standard is unintentional. This  
 49723 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

49724 These functions shall be equivalent to the `wcstol()`, `wcstoll()`, `wcstoul()`, and `wcstoull()` functions,  
 49725 respectively, except that the initial portion of the wide string shall be converted to `intmax_t` and  
 49726 `uintmax_t` representation, respectively.

49727 **RETURN VALUE**

49728 These functions shall return the converted value, if any.

49729 If no conversion could be performed, zero shall be returned. If the correct value is outside the  
 49730 range of representable values, `{INTMAX_MAX}`, `{INTMAX_MIN}`, or `{UINTMAX_MAX}` shall  
 49731 be returned (according to the return type and sign of the value, if any), and `errno` shall be set to  
 49732 `[ERANGE]`.

49733 **ERRORS**

49734 These functions shall fail if:

49735 `[EINVAL]` The value of `base` is not supported.

49736 `[ERANGE]` The value to be returned is not representable.

49737 These functions may fail if:

49738 `[EINVAL]` No conversion could be performed.

49739 **EXAMPLES**

49740 None.

49741 **APPLICATION USAGE**

49742 None.

49743 **RATIONALE**

49744 None.

49745 **FUTURE DIRECTIONS**

49746 None.

49750 **CHANGE HISTORY**

49751 First released in Issue 6. Derived from the ISO/IEC 9899:1999 standard.

49752 **NAME**

49753 wcstok — split a wide-character string into tokens

49754 **SYNOPSIS**

49755 #include &lt;wchar.h&gt;

49756 wchar\_t \*wcstok(wchar\_t \*restrict ws1, const wchar\_t \*restrict ws2,  
49757 wchar\_t \*\*restrict ptr);49758 **DESCRIPTION**49759 **CX** The functionality described on this reference page is aligned with the ISO C standard. Any  
49760 conflict between the requirements described here and the ISO C standard is unintentional. This  
49761 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.49762 A sequence of calls to *wcstok()* shall break the wide-character string pointed to by *ws1* into a  
49763 sequence of tokens, each of which shall be delimited by a wide-character code from the wide-  
49764 character string pointed to by *ws2*. The *ptr* argument points to a caller-provided **wchar\_t** pointer  
49765 into which the *wcstok()* function shall store information necessary for it to continue scanning the  
49766 same wide-character string.49767 The first call in the sequence has *ws1* as its first argument, and is followed by calls with a null  
49768 pointer as their first argument. The separator string pointed to by *ws2* may be different from call  
49769 to call.49770 The first call in the sequence shall search the wide-character string pointed to by *ws1* for the first  
49771 wide-character code that is *not* contained in the current separator string pointed to by *ws2*. If no  
49772 such wide-character code is found, then there are no tokens in the wide-character string pointed  
49773 to by *ws1* and *wcstok()* shall return a null pointer. If such a wide-character code is found, it shall  
49774 be the start of the first token.49775 The *wcstok()* function shall then search from there for a wide-character code that *is* contained in  
49776 the current separator string. If no such wide-character code is found, the current token extends  
49777 to the end of the wide-character string pointed to by *ws1*, and subsequent searches for a token  
49778 shall return a null pointer. If such a wide-character code is found, it shall be overwritten by a  
49779 null wide character, which terminates the current token. The *wcstok()* function shall save a  
49780 pointer to the following wide-character code, from which the next search for a token shall start.49781 Each subsequent call, with a null pointer as the value of the first argument, shall start searching  
49782 from the saved pointer and behave as described above.49783 The implementation shall behave as if no function calls *wcstok()*.49784 **RETURN VALUE**49785 Upon successful completion, the *wcstok()* function shall return a pointer to the first wide-  
49786 character code of a token. Otherwise, if there is no token, *wcstok()* shall return a null pointer.49787 **ERRORS**

49788 No errors are defined.

49789 **EXAMPLES**

49790 None.

49791 **APPLICATION USAGE**

49792 None.

49793 **RATIONALE**

49794 None.

49795 **FUTURE DIRECTIONS**

49796 None.

49797 **SEE ALSO**49798 The Base Definitions volume of IEEE Std 1003.1-2001, <**wchar.h**>49799 **CHANGE HISTORY**

49800 First released in Issue 4.

49801 **Issue 5**49802 Aligned with ISO/IEC 9899:1990/Amendment 1:1995 (E). Specifically, a third argument is  
49803 added to the definition of *wcstok()* in the SYNOPSIS.49804 **Issue 6**49805 The *wcstok()* prototype is updated for alignment with the ISO/IEC 9899:1999 standard.

## 49806 NAME

49807 wcstol, wcstoll — convert a wide-character string to a long integer

## 49808 SYNOPSIS

49809 #include &lt;wchar.h&gt;

49810 long wcstol(const wchar\_t \*restrict *nptr*, wchar\_t \*\*restrict *endptr*,  
49811 int *base*);49812 long long wcstoll(const wchar\_t \*restrict *nptr*,  
49813 wchar\_t \*\*restrict *endptr*, int *base*);

## 49814 DESCRIPTION

49815 cx The functionality described on this reference page is aligned with the ISO C standard. Any  
49816 conflict between the requirements described here and the ISO C standard is unintentional. This  
49817 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.49818 These functions shall convert the initial portion of the wide-character string pointed to by *nptr* to  
49819 **long**, **long long**, **unsigned long**, and **unsigned long long** representation, respectively. First, they  
49820 shall decompose the input string into three parts:

- 49821 1. An initial, possibly empty, sequence of white-space wide-character codes (as specified by  
49822 *iswspace()*)
- 49823 2. A subject sequence interpreted as an integer represented in some radix determined by the  
49824 value of *base*
- 49825 3. A final wide-character string of one or more unrecognized wide-character codes, including  
49826 the terminating null wide-character code of the input wide-character string

49827 Then they shall attempt to convert the subject sequence to an integer, and return the result.

49828 If *base* is 0, the expected form of the subject sequence is that of a decimal constant, octal constant,  
49829 or hexadecimal constant, any of which may be preceded by a '+' or '-' sign. A decimal  
49830 constant begins with a non-zero digit, and consists of a sequence of decimal digits. An octal  
49831 constant consists of the prefix '0' optionally followed by a sequence of the digits '0' to '7'  
49832 only. A hexadecimal constant consists of the prefix 0x or 0X followed by a sequence of the  
49833 decimal digits and letters 'a' (or 'A') to 'f' (or 'F') with values 10 to 15 respectively.49834 If the value of *base* is between 2 and 36, the expected form of the subject sequence is a sequence  
49835 of letters and digits representing an integer with the radix specified by *base*, optionally preceded  
49836 by a '+' or '-' sign, but not including an integer suffix. The letters from 'a' (or 'A') to 'z'  
49837 (or 'Z') inclusive are ascribed the values 10 to 35; only letters whose ascribed values are less  
49838 than that of *base* shall be permitted. If the value of *base* is 16, the wide-character code  
49839 representations of 0x or 0X may optionally precede the sequence of letters and digits, following  
49840 the sign if present.49841 The subject sequence is defined as the longest initial subsequence of the input wide-character  
49842 string, starting with the first non-white-space wide-character code that is of the expected form.  
49843 The subject sequence contains no wide-character codes if the input wide-character string is  
49844 empty or consists entirely of white-space wide-character code, or if the first non-white-space  
49845 wide-character code is other than a sign or a permissible letter or digit.49846 If the subject sequence has the expected form and *base* is 0, the sequence of wide-character codes  
49847 starting with the first digit shall be interpreted as an integer constant. If the subject sequence has  
49848 the expected form and the value of *base* is between 2 and 36, it shall be used as the base for  
49849 conversion, ascribing to each letter its value as given above. If the subject sequence begins with a  
49850 minus sign, the value resulting from the conversion shall be negated. A pointer to the final  
49851 wide-character string shall be stored in the object pointed to by *endptr*, provided that *endptr* is

- 49852 not a null pointer.
- 49853 CX In other than the C or POSIX locales, other implementation-defined subject sequences may be  
49854 accepted.
- 49855 If the subject sequence is empty or does not have the expected form, no conversion shall be  
49856 performed; the value of *nptr* shall be stored in the object pointed to by *endptr*, provided that  
49857 *endptr* is not a null pointer.
- 49858 CX These functions shall not change the setting of *errno* if successful.
- 49859 Since 0, {LONG\_MIN} or {LLONG\_MIN} and {LONG\_MAX} or {LLONG\_MAX} are returned on  
49860 error and are also valid returns on success, an application wishing to check for error situations  
49861 should set *errno* to 0, then call *wcstol()* or *wcstoll()*, then check *errno*.
- 49862 **RETURN VALUE**
- 49863 Upon successful completion, these functions shall return the converted value, if any. If no  
49864 CX conversion could be performed, 0 shall be returned and *errno* may be set to indicate the error. If  
49865 the correct value is outside the range of representable values, {LONG\_MIN}, {LONG\_MAX},  
49866 {LLONG\_MIN}, or {LLONG\_MAX} shall be returned (according to the sign of the value), and  
49867 *errno* set to [ERANGE].
- 49868 **ERRORS**
- 49869 These functions shall fail if:
- 49870 CX [EINVAL] The value of *base* is not supported.
- 49871 [ERANGE] The value to be returned is not representable.
- 49872 These functions may fail if:
- 49873 CX [EINVAL] No conversion could be performed.
- 49874 **EXAMPLES**
- 49875 None.
- 49876 **APPLICATION USAGE**
- 49877 None.
- 49878 **RATIONALE**
- 49879 None.
- 49880 **FUTURE DIRECTIONS**
- 49881 None.
- 49882 **SEE ALSO**
- 49883 *iswalpha()*, *scanf()*, *wcstod()*, the Base Definitions volume of IEEE Std 1003.1-2001, <**wchar.h**>
- 49884 **CHANGE HISTORY**
- 49885 First released in Issue 4. Derived from the MSE working draft.
- 49886 **Issue 5**
- 49887 The DESCRIPTION is updated to indicate that *errno* is not changed if the function is successful.
- 49888 **Issue 6**
- 49889 Extensions beyond the ISO C standard are marked.
- 49890 The following new requirements on POSIX implementations derive from alignment with the  
49891 Single UNIX Specification:
- 49892 • In the RETURN VALUE and ERRORS sections, the [EINVAL] optional error condition is  
49893 added if no conversion could be performed.

- 49894      The following changes are made for alignment with the ISO/IEC 9899:1999 standard:
- 49895      • The *wcstol()* prototype is updated.
- 49896      • The *wcstoll()* function is added.

49897 **NAME**

49898           wcstold — convert a wide-character string to a double-precision number

49899 **SYNOPSIS**

49900           #include <wchar.h>

49901           long double wcstold(const wchar\_t \*restrict *nptr*,

49902                    wchar\_t \*\*restrict *endptr*);

49903 **DESCRIPTION**

49904           Refer to *wcstod()*.

49905 **NAME**

49906           wcstoll — convert a wide-character string to a long integer

49907 **SYNOPSIS**

49908           #include <wchar.h>

49909           long long wcstoll(const wchar\_t \*restrict *nptr*,  
49910                            wchar\_t \*\*restrict *endptr*, int *base*);

49911 **DESCRIPTION**

49912           Refer to *wcstol*().

49913 **NAME**

49914 wcstombs — convert a wide-character string to a character string

49915 **SYNOPSIS**

49916 #include &lt;stdlib.h&gt;

49917 size\_t wcstombs(char \*restrict s, const wchar\_t \*restrict pwcs,  
49918 size\_t n);49919 **DESCRIPTION**49920 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
49921 conflict between the requirements described here and the ISO C standard is unintentional. This  
49922 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.49923 The *wcstombs()* function shall convert the sequence of wide-character codes that are in the array  
49924 pointed to by *pwcs* into a sequence of characters that begins in the initial shift state and store  
49925 these characters into the array pointed to by *s*, stopping if a character would exceed the limit of *n*  
49926 total bytes or if a null byte is stored. Each wide-character code shall be converted as if by a call to  
49927 *wctomb()*, except that the shift state of *wctomb()* shall not be affected.49928 The behavior of this function shall be affected by the *LC\_CTYPE* category of the current locale.49929 No more than *n* bytes shall be modified in the array pointed to by *s*. If copying takes place  
49930 CX between objects that overlap, the behavior is undefined. If *s* is a null pointer, *wcstombs()* shall  
49931 return the length required to convert the entire array regardless of the value of *n*, but no values  
49932 are stored.49933 The *wcstombs()* function need not be reentrant. A function that is not required to be reentrant is  
49934 not required to be thread-safe.49935 **RETURN VALUE**49936 If a wide-character code is encountered that does not correspond to a valid character (of one or  
49937 more bytes each), *wcstombs()* shall return (**size\_t**)−1. Otherwise, *wcstombs()* shall return the  
49938 number of bytes stored in the character array, not including any terminating null byte. The array  
49939 shall not be null-terminated if the value returned is *n*.49940 **ERRORS**49941 The *wcstombs()* function may fail if:

49942 CX [EILSEQ] A wide-character code does not correspond to a valid character.

49943 **EXAMPLES**

49944 None.

49945 **APPLICATION USAGE**

49946 None.

49947 **RATIONALE**

49948 None.

49949 **FUTURE DIRECTIONS**

49950 None.

49951 **SEE ALSO**49952 *mblen()*, *mbtowc()*, *mbstowcs()*, *wctomb()*, the Base Definitions volume of IEEE Std 1003.1-2001,  
49953 <stdlib.h>

49954 **CHANGE HISTORY**

49955 First released in Issue 4. Derived from the ISO C standard.

49956 **Issue 6**

49957 The following new requirements on POSIX implementations derive from alignment with the  
49958 Single UNIX Specification:

- 49959 • The DESCRIPTION states the effect of when *s* is a null pointer.
- 49960 • The [EILSEQ] error condition is added.

49961 The *wcstombs()* prototype is updated for alignment with the ISO/IEC 9899:1999 standard.

## 49962 NAME

49963 wcstoul, wcstoull — convert a wide-character string to an unsigned long

## 49964 SYNOPSIS

49965 #include &lt;wchar.h&gt;

49966 unsigned long wcstoul(const wchar\_t \*restrict nptr,  
49967 wchar\_t \*\*restrict endptr, int base);49968 unsigned long long wcstoull(const wchar\_t \*restrict nptr,  
49969 wchar\_t \*\*restrict endptr, int base);

## 49970 DESCRIPTION

49971 cx The functionality described on this reference page is aligned with the ISO C standard. Any  
49972 conflict between the requirements described here and the ISO C standard is unintentional. This  
49973 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.49974 The *wcstoul()* and *wcstoull()* functions shall convert the initial portion of the wide-character  
49975 string pointed to by *nptr* to **unsigned long** and **unsigned long long** representation, respectively.  
49976 First, they shall decompose the input wide-character string into three parts:

- 49977 1. An initial, possibly empty, sequence of white-space wide-character codes (as specified by  
49978 *iswspace()*)
- 49979 2. A subject sequence interpreted as an integer represented in some radix determined by the  
49980 value of *base*
- 49981 3. A final wide-character string of one or more unrecognized wide-character codes, including  
49982 the terminating null wide-character code of the input wide-character string

49983 Then they shall attempt to convert the subject sequence to an unsigned integer, and return the  
49984 result.49985 If *base* is 0, the expected form of the subject sequence is that of a decimal constant, octal constant,  
49986 or hexadecimal constant, any of which may be preceded by a '+' or '-' sign. A decimal  
49987 constant begins with a non-zero digit, and consists of a sequence of decimal digits. An octal  
49988 constant consists of the prefix '0' optionally followed by a sequence of the digits '0' to '7'  
49989 only. A hexadecimal constant consists of the prefix 0x or 0X followed by a sequence of the  
49990 decimal digits and letters 'a' (or 'A') to 'f' (or 'F') with values 10 to 15 respectively.49991 If the value of *base* is between 2 and 36, the expected form of the subject sequence is a sequence  
49992 of letters and digits representing an integer with the radix specified by *base*, optionally preceded  
49993 by a '+' or '-' sign, but not including an integer suffix. The letters from 'a' (or 'A') to 'z'  
49994 (or 'Z') inclusive are ascribed the values 10 to 35; only letters whose ascribed values are less  
49995 than that of *base* shall be permitted. If the value of *base* is 16, the wide-character codes 0x or 0X  
49996 may optionally precede the sequence of letters and digits, following the sign if present.49997 The subject sequence is defined as the longest initial subsequence of the input wide-character  
49998 string, starting with the first wide-character code that is not white space and is of the expected  
49999 form. The subject sequence contains no wide-character codes if the input wide-character string is  
50000 empty or consists entirely of white-space wide-character codes, or if the first wide-character  
50001 code that is not white space is other than a sign or a permissible letter or digit.50002 If the subject sequence has the expected form and *base* is 0, the sequence of wide-character codes  
50003 starting with the first digit shall be interpreted as an integer constant. If the subject sequence has  
50004 the expected form and the value of *base* is between 2 and 36, it shall be used as the base for  
50005 conversion, ascribing to each letter its value as given above. If the subject sequence begins with a  
50006 minus sign, the value resulting from the conversion shall be negated. A pointer to the final  
50007 wide-character string shall be stored in the object pointed to by *endptr*, provided that *endptr* is

- 50008 not a null pointer.
- 50009 CX In other than the C or POSIX locales, other implementation-defined subject sequences may be  
50010 accepted.
- 50011 If the subject sequence is empty or does not have the expected form, no conversion shall be  
50012 performed; the value of *nptr* shall be stored in the object pointed to by *endptr*, provided that  
50013 *endptr* is not a null pointer.
- 50014 CX The *wcstoul()* function shall not change the setting of *errno* if successful.
- 50015 Since 0, {ULONG\_MAX}, and {ULLONG\_MAX} are returned on error and 0 is also a valid return  
50016 on success, an application wishing to check for error situations should set *errno* to 0, then call  
50017 *wcstoul()* or *wcstoull()*, then check *errno*.
- 50018 **RETURN VALUE**
- 50019 Upon successful completion, the *wcstoul()* and *wcstoull()* functions shall return the converted  
50020 CX value, if any. If no conversion could be performed, 0 shall be returned and *errno* may be set to  
50021 indicate the error. If the correct value is outside the range of representable values,  
50022 {ULONG\_MAX} or {ULLONG\_MAX} respectively shall be returned and *errno* set to [ERANGE].
- 50023 **ERRORS**
- 50024 These functions shall fail if:
- 50025 CX [EINVAL] The value of *base* is not supported.
- 50026 [ERANGE] The value to be returned is not representable.
- 50027 These functions may fail if:
- 50028 CX [EINVAL] No conversion could be performed.
- 50029 **EXAMPLES**
- 50030 None.
- 50031 **APPLICATION USAGE**
- 50032 None.
- 50033 **RATIONALE**
- 50034 None.
- 50035 **FUTURE DIRECTIONS**
- 50036 None.
- 50037 **SEE ALSO**
- 50038 *iswalpha()*, *scanf()*, *wcstod()*, *wcstol()*, the Base Definitions volume of IEEE Std 1003.1-2001,  
50039 <wchar.h>
- 50040 **CHANGE HISTORY**
- 50041 First released in Issue 4. Derived from the MSE working draft.
- 50042 **Issue 5**
- 50043 The DESCRIPTION is updated to indicate that *errno* is not changed if the function is successful.
- 50044 **Issue 6**
- 50045 Extensions beyond the ISO C standard are marked.
- 50046 The following new requirements on POSIX implementations derive from alignment with the  
50047 Single UNIX Specification:
- 50048
- The [EINVAL] error condition is added for when the value of *base* is not supported.

50049            In the RETURN VALUE and ERRORS sections, the [EINVAL] optional error condition is  
50050            added if no conversion could be performed.

50051            The following changes are made for alignment with the ISO/IEC 9899:1999 standard:

- 50052            • The *wcstoul()* prototype is updated.
- 50053            • The *wcstoull()* function is added.

50054 **NAME**

50055           wcstoumax — convert a wide-character string to an integer type

50056 **SYNOPSIS**

50057           #include <stddef.h>

50058           #include <inttypes.h>

50059           uintmax\_t wcstoumax(const wchar\_t \*restrict *nptr*,

50060                            wchar\_t \*\*restrict *endptr*, int *base*);

50061 **DESCRIPTION**

50062           Refer to *wcstoimax()*.

50063 **NAME**50064           wcswcs — find a wide substring (**LEGACY**)50065 **SYNOPSIS**

50066 XSI       #include &lt;wchar.h&gt;

50067           wchar\_t \*wcswcs(const wchar\_t \*ws1, const wchar\_t \*ws2);

50068

50069 **DESCRIPTION**

50070           The `wcswcs()` function shall locate the first occurrence in the wide-character string pointed to by  
50071           `ws1` of the sequence of wide-character codes (excluding the terminating null wide-character  
50072           code) in the wide-character string pointed to by `ws2`.

50073 **RETURN VALUE**

50074           Upon successful completion, `wcswcs()` shall return a pointer to the located wide-character string  
50075           or a null pointer if the wide-character string is not found.

50076           If `ws2` points to a wide-character string with zero length, the function shall return `ws1`.

50077 **ERRORS**

50078           No errors are defined.

50079 **EXAMPLES**

50080           None.

50081 **APPLICATION USAGE**

50082           This function was not included in the final ISO/IEC 9899:1990/Amendment 1:1995 (E).

50083           Application developers are strongly encouraged to use the `wcsstr()` function instead.50084 **RATIONALE**

50085           None.

50086 **FUTURE DIRECTIONS**

50087           This function may be withdrawn in a future version.

50088 **SEE ALSO**50089           `wcschr()`, `wcsstr()`, the Base Definitions volume of IEEE Std 1003.1-2001, <wchar.h>50090 **CHANGE HISTORY**

50091           First released in Issue 4. Derived from the MSE working draft.

50092 **Issue 5**

50093           Marked EX.

50094 **Issue 6**

50095           This function is marked LEGACY.

50096 **NAME**50097 `wcswidth` — number of column positions of a wide-character string50098 **SYNOPSIS**50099 `XSI` `#include <wchar.h>`50100 `int wcswidth(const wchar_t *pwcs, size_t n);`

50101

50102 **DESCRIPTION**

50103 The `wcswidth()` function shall determine the number of column positions required for  $n$  wide-  
50104 character codes (or fewer than  $n$  wide-character codes if a null wide-character code is  
50105 encountered before  $n$  wide-character codes are exhausted) in the string pointed to by `pwcs`.

50106 **RETURN VALUE**

50107 The `wcswidth()` function either shall return 0 (if `pwcs` points to a null wide-character code), or  
50108 return the number of column positions to be occupied by the wide-character string pointed to by  
50109 `pwcs`, or return -1 (if any of the first  $n$  wide-character codes in the wide-character string pointed  
50110 to by `pwcs` is not a printable wide-character code).

50111 **ERRORS**

50112 No errors are defined.

50113 **EXAMPLES**

50114 None.

50115 **APPLICATION USAGE**

50116 This function was removed from the final ISO/IEC 9899:1990/Amendment 1:1995 (E), and the  
50117 return value for a non-printable wide character is not specified.

50118 **RATIONALE**

50119 None.

50120 **FUTURE DIRECTIONS**

50121 None.

50122 **SEE ALSO**

50123 `wcwidth()`, the Base Definitions volume of IEEE Std 1003.1-2001, Section 3.103, Column Position,  
50124 `<wchar.h>`

50125 **CHANGE HISTORY**

50126 First released in Issue 4. Derived from the MSE working draft.

50127 **Issue 6**

50128 The Open Group Corrigendum U021/11 is applied. The function is marked as an extension.

50129 **NAME**

50130           wcsxfrm — wide-character string transformation

50131 **SYNOPSIS**

50132           #include &lt;wchar.h&gt;

50133           size\_t wcsxfrm(wchar\_t \*restrict ws1, const wchar\_t \*restrict ws2,  
50134                           size\_t n);50135 **DESCRIPTION**50136 **CX**       The functionality described on this reference page is aligned with the ISO C standard. Any  
50137 conflict between the requirements described here and the ISO C standard is unintentional. This  
50138 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.50139       The *wcsxfrm()* function shall transform the wide-character string pointed to by *ws2* and place the  
50140 resulting wide-character string into the array pointed to by *ws1*. The transformation shall be  
50141 such that if *wscmp()* is applied to two transformed wide strings, it shall return a value greater  
50142 than, equal to, or less than 0, corresponding to the result of *wscoll()* applied to the same two  
50143 original wide-character strings. No more than *n* wide-character codes shall be placed into the  
50144 resulting array pointed to by *ws1*, including the terminating null wide-character code. If *n* is 0,  
50145 *ws1* is permitted to be a null pointer. If copying takes place between objects that overlap, the  
50146 behavior is undefined.50147 **CX**       The *wcsxfrm()* function shall not change the setting of *errno* if successful.50148       Since no return value is reserved to indicate an error, an application wishing to check for error  
50149 situations should set *errno* to 0, then call *wcsxfrm()*, then check *errno*.50150 **RETURN VALUE**50151       The *wcsxfrm()* function shall return the length of the transformed wide-character string (not  
50152 including the terminating null wide-character code). If the value returned is *n* or more, the  
50153 contents of the array pointed to by *ws1* are unspecified.50154 **CX**       On error, the *wcsxfrm()* function may set *errno*, but no return value is reserved to indicate an  
50155 error.50156 **ERRORS**50157       The *wcsxfrm()* function may fail if:50158 **CX**       [EINVAL]       The wide-character string pointed to by *ws2* contains wide-character codes  
50159 outside the domain of the collating sequence.50160 **EXAMPLES**

50161       None.

50162 **APPLICATION USAGE**50163       The transformation function is such that two transformed wide-character strings can be ordered  
50164 by *wscmp()* as appropriate to collating sequence information in the program's locale (category  
50165 *LC\_COLLATE*).50166       The fact that when *n* is 0 *ws1* is permitted to be a null pointer is useful to determine the size of  
50167 the *ws1* array prior to making the transformation.50168 **RATIONALE**

50169       None.

50170 **FUTURE DIRECTIONS**

50171 None.

50172 **SEE ALSO**50173 `wscmp()`, `wscoll()`, the Base Definitions volume of IEEE Std 1003.1-2001, <**wchar.h**>50174 **CHANGE HISTORY**

50175 First released in Issue 4. Derived from the MSE working draft.

50176 **Issue 5**

50177 Moved from ENHANCED I18N to BASE and the [ENOSYS] error is removed.

50178 The DESCRIPTION is updated to indicate that *errno* is not changed if the function is successful.50179 **Issue 6**

50180 In previous versions, this function was required to return -1 on error.

50181 Extensions beyond the ISO C standard are marked.

50182 The following new requirements on POSIX implementations derive from alignment with the  
50183 Single UNIX Specification:

- 50184
- In the RETURN VALUE and ERRORS sections, the [EINVAL] optional error condition is  
50185 added if no conversion could be performed.

50186 The `wcsxfrm()` prototype is updated for alignment with the ISO/IEC 9899:1999 standard.

50187 **NAME**

50188 wctob — wide-character to single-byte conversion

50189 **SYNOPSIS**

50190 #include &lt;stdio.h&gt;

50191 #include &lt;wchar.h&gt;

50192 int wctob(wint\_t c);

50193 **DESCRIPTION**

50194 cx The functionality described on this reference page is aligned with the ISO C standard. Any  
50195 conflict between the requirements described here and the ISO C standard is unintentional. This  
50196 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

50197 The *wctob()* function shall determine whether *c* corresponds to a member of the extended  
50198 character set whose character representation is a single byte when in the initial shift state.

50199 The behavior of this function shall be affected by the *LC\_CTYPE* category of the current locale.

50200 **RETURN VALUE**

50201 The *wctob()* function shall return EOF if *c* does not correspond to a character with length one in  
50202 the initial shift state. Otherwise, it shall return the single-byte representation of that character as  
50203 an **unsigned char** converted to **int**.

50204 **ERRORS**

50205 No errors are defined.

50206 **EXAMPLES**

50207 None.

50208 **APPLICATION USAGE**

50209 None.

50210 **RATIONALE**

50211 None.

50212 **FUTURE DIRECTIONS**

50213 None.

50214 **SEE ALSO**50215 *btowc()*, the Base Definitions volume of IEEE Std 1003.1-2001, <**wchar.h**>50216 **CHANGE HISTORY**

50217 First released in Issue 5. Included for alignment with ISO/IEC 9899:1990/Amendment 1:1995  
50218 (E).

50219 **NAME**

50220 wctomb — convert a wide-character code to a character

50221 **SYNOPSIS**

50222 #include &lt;stdlib.h&gt;

50223 int wctomb(char \*s, wchar\_t wchar);

50224 **DESCRIPTION**

50225 cx The functionality described on this reference page is aligned with the ISO C standard. Any  
50226 conflict between the requirements described here and the ISO C standard is unintentional. This  
50227 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

50228 The *wctomb()* function shall determine the number of bytes needed to represent the character  
50229 corresponding to the wide-character code whose value is *wchar* (including any change in the  
50230 shift state). It shall store the character representation (possibly multiple bytes and any special  
50231 bytes to change shift state) in the array object pointed to by *s* (if *s* is not a null pointer). At most  
50232 {MB\_CUR\_MAX} bytes shall be stored. If *wchar* is 0, a null byte shall be stored, preceded by any  
50233 shift sequence needed to restore the initial shift state, and *wctomb()* shall be left in the initial shift  
50234 state.

50235 cx The behavior of this function is affected by the *LC\_CTYPE* category of the current locale. For a  
50236 state-dependent encoding, this function shall be placed into its initial state by a call for which its  
50237 character pointer argument, *s*, is a null pointer. Subsequent calls with *s* as other than a null  
50238 pointer shall cause the internal state of the function to be altered as necessary. A call with *s* as a  
50239 null pointer shall cause this function to return a non-zero value if encodings have state  
50240 dependency, and 0 otherwise. Changing the *LC\_CTYPE* category causes the shift state of this  
50241 function to be unspecified.

50242 The *wctomb()* function need not be reentrant. A function that is not required to be reentrant is  
50243 not required to be thread-safe.

50244 The implementation shall behave as if no function defined in this volume of  
50245 IEEE Std 1003.1-2001 calls *wctomb()*.

50246 **RETURN VALUE**

50247 If *s* is a null pointer, *wctomb()* shall return a non-zero or 0 value, if character encodings,  
50248 respectively, do or do not have state-dependent encodings. If *s* is not a null pointer, *wctomb()*  
50249 shall return -1 if the value of *wchar* does not correspond to a valid character, or return the  
50250 number of bytes that constitute the character corresponding to the value of *wchar*.

50251 In no case shall the value returned be greater than the value of the {MB\_CUR\_MAX} macro.

50252 **ERRORS**

50253 No errors are defined.

50254 **EXAMPLES**

50255 None.

50256 **APPLICATION USAGE**

50257 None.

50258 **RATIONALE**

50259 None.

50260 **FUTURE DIRECTIONS**

50261 None.

50262 **SEE ALSO**

50263            *mblen()*, *mbtowc()*, *mbstowcs()*, *wcstombs()*, the Base Definitions volume of IEEE Std 1003.1-2001,  
50264            <**stdlib.h**>

50265 **CHANGE HISTORY**

50266            First released in Issue 4. Derived from the ANSI C standard.

50267 **Issue 6**

50268            Extensions beyond the ISO C standard are marked.

50269            In the DESCRIPTION, a note about reentrancy and thread-safety is added.

50270 **NAME**

50271 wctrans — define character mapping

50272 **SYNOPSIS**

50273 #include &lt;wctype.h&gt;

50274 wctrans\_t wctrans(const char \*charclass);

50275 **DESCRIPTION**

50276 **CX** The functionality described on this reference page is aligned with the ISO C standard. Any  
 50277 conflict between the requirements described here and the ISO C standard is unintentional. This  
 50278 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

50279 The *wctrans()* function is defined for valid character mapping names identified in the current  
 50280 locale. The *charclass* is a string identifying a generic character mapping name for which codeset-  
 50281 specific information is required. The following character mapping names are defined in all  
 50282 locales: **tolower** and **toupper**.

50283 The function shall return a value of type **wctrans\_t**, which can be used as the second argument  
 50284 to subsequent calls of *towctrans()*. The *wctrans()* function shall determine values of **wctrans\_t**  
 50285 according to the rules of the coded character set defined by character mapping information in  
 50286 the program's locale (category *LC\_CTYPE*). The values returned by *wctrans()* shall be valid until  
 50287 a call to *setlocale()* that modifies the category *LC\_CTYPE*.

50288 **RETURN VALUE**

50289 **CX** The *wctrans()* function shall return 0 and may set *errno* to indicate the error if the given  
 50290 character mapping name is not valid for the current locale (category *LC\_CTYPE*); otherwise, it  
 50291 shall return a non-zero object of type **wctrans\_t** that can be used in calls to *towctrans()*.

50292 **ERRORS**50293 The *wctrans()* function may fail if:

50294 **CX** [EINVAL] The character mapping name pointed to by *charclass* is not valid in the current  
 50295 locale.

50296 **EXAMPLES**

50297 None.

50298 **APPLICATION USAGE**

50299 None.

50300 **RATIONALE**

50301 None.

50302 **FUTURE DIRECTIONS**

50303 None.

50304 **SEE ALSO**50305 *towctrans()*, the Base Definitions volume of IEEE Std 1003.1-2001, <**wctype.h**>50306 **CHANGE HISTORY**

50307 First released in Issue 5. Derived from ISO/IEC 9899:1990/Amendment 1:1995 (E).

50308 **NAME**

50309           wctype — define character class

50310 **SYNOPSIS**

50311           #include &lt;wctype.h&gt;

50312           wctype\_t wctype(const char \*property);

50313 **DESCRIPTION**

50314 cx       The functionality described on this reference page is aligned with the ISO C standard. Any  
 50315       conflict between the requirements described here and the ISO C standard is unintentional. This  
 50316       volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

50317       The *wctype()* function is defined for valid character class names as defined in the current locale.  
 50318       The *property* argument is a string identifying a generic character class for which codeset-specific  
 50319       type information is required. The following character class names shall be defined in all locales:

|       |              |              |               |
|-------|--------------|--------------|---------------|
| 50320 | <b>alnum</b> | <b>digit</b> | <b>punct</b>  |
| 50321 | <b>alpha</b> | <b>graph</b> | <b>space</b>  |
| 50322 | <b>blank</b> | <b>lower</b> | <b>upper</b>  |
| 50323 | <b>cntrl</b> | <b>print</b> | <b>xdigit</b> |

50324       Additional character class names defined in the locale definition file (category *LC\_CTYPE*) can  
 50325       also be specified.

50326       The function shall return a value of type **wctype\_t**, which can be used as the second argument to  
 50327       subsequent calls of *iswctype()*. The *wctype()* function shall determine values of **wctype\_t**  
 50328       according to the rules of the coded character set defined by character type information in the  
 50329       program's locale (category *LC\_CTYPE*). The values returned by *wctype()* shall be valid until a  
 50330       call to *setlocale()* that modifies the category *LC\_CTYPE*.

50331 **RETURN VALUE**

50332       The *wctype()* function shall return 0 if the given character class name is not valid for the current  
 50333       locale (category *LC\_CTYPE*); otherwise, it shall return an object of type **wctype\_t** that can be  
 50334       used in calls to *iswctype()*.

50335 **ERRORS**

50336       No errors are defined.

50337 **EXAMPLES**

50338       None.

50339 **APPLICATION USAGE**

50340       None.

50341 **RATIONALE**

50342       None.

50343 **FUTURE DIRECTIONS**

50344       None.

50345 **SEE ALSO**50346       *iswctype()*, the Base Definitions volume of IEEE Std 1003.1-2001, <**wctype.h**>50347 **CHANGE HISTORY**

50348       First released in Issue 4.

50349 **Issue 5**

50350 The following change has been made in this issue for alignment with  
50351 ISO/IEC 9899:1990/Amendment 1:1995 (E):

- 50352       • The SYNOPSIS has been changed to indicate that this function and associated data types are  
50353       now made visible by inclusion of the `<wctype.h>` header rather than `<wchar.h>`.

50354 **NAME**

50355 `wcwidth` — number of column positions of a wide-character code

50356 **SYNOPSIS**

```
50357 xsi #include <wchar.h>
```

```
50358 int wcwidth(wchar_t wc);
```

50359

50360 **DESCRIPTION**

50361 The `wcwidth()` function shall determine the number of column positions required for the wide  
50362 character `wc`. The application shall ensure that the value of `wc` is a character representable as a  
50363 **wchar\_t**, and is a wide-character code corresponding to a valid character in the current locale.

50364 **RETURN VALUE**

50365 The `wcwidth()` function shall either return 0 (if `wc` is a null wide-character code), or return the  
50366 number of column positions to be occupied by the wide-character code `wc`, or return -1 (if `wc`  
50367 does not correspond to a printable wide-character code).

50368 **ERRORS**

50369 No errors are defined.

50370 **EXAMPLES**

50371 None.

50372 **APPLICATION USAGE**

50373 This function was removed from the final ISO/IEC 9899:1990/Amendment 1:1995 (E), and the  
50374 return value for a non-printable wide character is not specified.

50375 **RATIONALE**

50376 None.

50377 **FUTURE DIRECTIONS**

50378 None.

50379 **SEE ALSO**

50380 `wcswidth()`, the Base Definitions volume of IEEE Std 1003.1-2001, `<wchar.h>`

50381 **CHANGE HISTORY**

50382 First released as a World-wide Portability Interface in Issue 4. Derived from the MSE working  
50383 draft.

50384 **Issue 6**

50385 The Open Group Corrigendum U021/12 is applied. This function is marked as an extension.

50386 The DESCRIPTION is updated to avoid use of the term “must” for application requirements.

50387 **NAME**

50388 wmemchr — find a wide character in memory

50389 **SYNOPSIS**

50390 #include &lt;wchar.h&gt;

50391 wchar\_t \*wmemchr(const wchar\_t \*ws, wchar\_t wc, size\_t n);

50392 **DESCRIPTION**

50393 cx The functionality described on this reference page is aligned with the ISO C standard. Any  
50394 conflict between the requirements described here and the ISO C standard is unintentional. This  
50395 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

50396 The *wmemchr()* function shall locate the first occurrence of *wc* in the initial *n* wide characters of  
50397 the object pointed to by *ws*. This function shall not be affected by locale and all **wchar\_t** values  
50398 shall be treated identically. The null wide character and **wchar\_t** values not corresponding to  
50399 valid characters shall not be treated specially.

50400 If *n* is zero, the application shall ensure that *ws* is a valid pointer and the function behaves as if  
50401 no valid occurrence of *wc* is found.

50402 **RETURN VALUE**

50403 The *wmemchr()* function shall return a pointer to the located wide character, or a null pointer if  
50404 the wide character does not occur in the object.

50405 **ERRORS**

50406 No errors are defined.

50407 **EXAMPLES**

50408 None.

50409 **APPLICATION USAGE**

50410 None.

50411 **RATIONALE**

50412 None.

50413 **FUTURE DIRECTIONS**

50414 None.

50415 **SEE ALSO**

50416 *wmemcmp()*, *wmemcpy()*, *wmemmove()*, *wmemset()*, the Base Definitions volume of  
50417 IEEE Std 1003.1-2001, <wchar.h>

50418 **CHANGE HISTORY**

50419 First released in Issue 5. Included for alignment with ISO/IEC 9899:1990/Amendment 1:1995  
50420 (E).

50421 **Issue 6**

50422 The DESCRIPTION is updated to avoid use of the term “must” for application requirements.

50423 **NAME**

50424 wmemcmp — compare wide characters in memory

50425 **SYNOPSIS**

50426 #include &lt;wchar.h&gt;

50427 int wmemcmp(const wchar\_t \*ws1, const wchar\_t \*ws2, size\_t n);

50428 **DESCRIPTION**

50429 cx The functionality described on this reference page is aligned with the ISO C standard. Any  
50430 conflict between the requirements described here and the ISO C standard is unintentional. This  
50431 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

50432 The *wmemcmp()* function shall compare the first *n* wide characters of the object pointed to by  
50433 *ws1* to the first *n* wide characters of the object pointed to by *ws2*. This function shall not be  
50434 affected by locale and all **wchar\_t** values shall be treated identically. The null wide character and  
50435 **wchar\_t** values not corresponding to valid characters shall not be treated specially.

50436 If *n* is zero, the application shall ensure that *ws1* and *ws2* are valid pointers, and the function  
50437 shall behave as if the two objects compare equal.

50438 **RETURN VALUE**

50439 The *wmemcmp()* function shall return an integer greater than, equal to, or less than zero,  
50440 respectively, as the object pointed to by *ws1* is greater than, equal to, or less than the object  
50441 pointed to by *ws2*.

50442 **ERRORS**

50443 No errors are defined.

50444 **EXAMPLES**

50445 None.

50446 **APPLICATION USAGE**

50447 None.

50448 **RATIONALE**

50449 None.

50450 **FUTURE DIRECTIONS**

50451 None.

50452 **SEE ALSO**

50453 *wmemchr()*, *wmemcpy()*, *wmemmove()*, *wmemset()*, the Base Definitions volume of  
50454 IEEE Std 1003.1-2001, <**wchar.h**>

50455 **CHANGE HISTORY**

50456 First released in Issue 5. Included for alignment with ISO/IEC 9899:1990/Amendment 1:1995  
50457 (E).

50458 **Issue 6**

50459 The DESCRIPTION is updated to avoid use of the term “must” for application requirements.

50460 **NAME**

50461 wmemcpy — copy wide characters in memory

50462 **SYNOPSIS**

50463 #include &lt;wchar.h&gt;

50464 wchar\_t \*wmemcpy(wchar\_t \*restrict ws1, const wchar\_t \*restrict ws2,  
50465 size\_t n);50466 **DESCRIPTION**50467 cx The functionality described on this reference page is aligned with the ISO C standard. Any  
50468 conflict between the requirements described here and the ISO C standard is unintentional. This  
50469 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.50470 The *wmemcpy()* function shall copy *n* wide characters from the object pointed to by *ws2* to the  
50471 object pointed to by *ws1*. This function shall not be affected by locale and all **wchar\_t** values  
50472 shall be treated identically. The null wide character and **wchar\_t** values not corresponding to  
50473 valid characters shall not be treated specially.50474 If *n* is zero, the application shall ensure that *ws1* and *ws2* are valid pointers, and the function  
50475 shall copy zero wide characters.50476 **RETURN VALUE**50477 The *wmemcpy()* function shall return the value of *ws1*.50478 **ERRORS**

50479 No errors are defined.

50480 **EXAMPLES**

50481 None.

50490 IEEE Std 1003.1-2001, <**wchar.h**>50491 **CHANGE HISTORY**50492 First released in Issue 5. Included for alignment with ISO/IEC 9899:1990/Amendment 1:1995  
50493 (E).50494 **Issue 6**

50495 The DESCRIPTION is updated to avoid use of the term “must” for application requirements.

50496 The *wmemcpy()* prototype is updated for alignment with the ISO/IEC 9899:1999 standard.

50497 **NAME**

50498 wmemmove — copy wide characters in memory with overlapping areas

50499 **SYNOPSIS**

50500 #include &lt;wchar.h&gt;

50501 wchar\_t \*wmemmove(wchar\_t \*ws1, const wchar\_t \*ws2, size\_t n);

50502 **DESCRIPTION**

50503 cx The functionality described on this reference page is aligned with the ISO C standard. Any  
50504 conflict between the requirements described here and the ISO C standard is unintentional. This  
50505 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

50506 The *wmemmove()* function shall copy *n* wide characters from the object pointed to by *ws2* to the  
50507 object pointed to by *ws1*. Copying shall take place as if the *n* wide characters from the object  
50508 pointed to by *ws2* are first copied into a temporary array of *n* wide characters that does not  
50509 overlap the objects pointed to by *ws1* or *ws2*, and then the *n* wide characters from the temporary  
50510 array are copied into the object pointed to by *ws1*.

50511 This function shall not be affected by locale and all **wchar\_t** values shall be treated identically.  
50512 The null wide character and **wchar\_t** values not corresponding to valid characters shall not be  
50513 treated specially.

50514 If *n* is zero, the application shall ensure that *ws1* and *ws2* are valid pointers, and the function  
50515 shall copy zero wide characters.

50516 **RETURN VALUE**50517 The *wmemmove()* function shall return the value of *ws1*.50518 **ERRORS**

50519 No errors are defined

50520 **EXAMPLES**

50521 None.

50522 **APPLICATION USAGE**

50523 None.

50569 **Issue 6**

50570 The DESCRIPTION is updated to avoid use of the term “must” for application requirements.

## 50571 NAME

50572 wordexp, wordfree — perform word expansions

## 50573 SYNOPSIS

50574 #include &lt;wordexp.h&gt;

50575 int wordexp(const char \*restrict words, wordexp\_t \*restrict pwordexp,  
50576 int flags);

50577 void wordfree(wordexp\_t \*pwordexp);

## 50578 DESCRIPTION

50579 The *wordexp()* function shall perform word expansions as described in the Shell and Utilities  
50580 volume of IEEE Std 1003.1-2001, Section 2.6, Word Expansions, subject to quoting as in the Shell  
50581 and Utilities volume of IEEE Std 1003.1-2001, Section 2.2, Quoting, and place the list of expanded  
50582 words into the structure pointed to by *pwordexp*.50583 The *words* argument is a pointer to a string containing one or more words to be expanded. The  
50584 expansions shall be the same as would be performed by the command line interpreter if *words*  
50585 were the part of a command line representing the arguments to a utility. Therefore, the  
50586 application shall ensure that *words* does not contain an unquoted <newline> or any of the  
50587 unquoted shell special characters ' | ', '&', ';', '<', '>' except in the context of command  
50588 substitution as specified in the Shell and Utilities volume of IEEE Std 1003.1-2001, Section 2.6.3,  
50589 Command Substitution. It also shall not contain unquoted parentheses or braces, except in the  
50590 context of command or variable substitution. The application shall ensure that every member of  
50591 *words* which it expects to have expanded by *wordexp()* does not contain an unquoted initial  
50592 comment character. The application shall also ensure that any words which it intends to be  
50593 ignored (because they begin or continue a comment) are deleted from *words*. If the argument  
50594 *words* contains an unquoted comment character (number sign) that is the beginning of a token,  
50595 *wordexp()* shall either treat the comment character as a regular character, or interpret it as a  
50596 comment indicator and ignore the remainder of *words*.50597 The structure type **wordexp\_t** is defined in the <**wordexp.h**> header and includes at least the  
50598 following members:

50599

50600

| Member Type | Member Name     | Description                                                         |
|-------------|-----------------|---------------------------------------------------------------------|
| size_t      | <i>we_wordc</i> | Count of words matched by <i>words</i> .                            |
| char **     | <i>we_wordv</i> | Pointer to list of expanded words.                                  |
| size_t      | <i>we_offs</i>  | Slots to reserve at the beginning of <i>pwordexp-&gt;we_wordv</i> . |

50601

50602

50603

50604 The *wordexp()* function shall store the number of generated words into *pwordexp->we\_wordc* and  
50605 a pointer to a list of pointers to words in *pwordexp->we\_wordv*. Each individual field created  
50606 during field splitting (see the Shell and Utilities volume of IEEE Std 1003.1-2001, Section 2.6.5,  
50607 Field Splitting) or pathname expansion (see the Shell and Utilities volume of  
50608 IEEE Std 1003.1-2001, Section 2.6.6, Pathname Expansion) shall be a separate word in the  
50609 *pwordexp->we\_wordv* list. The words shall be in order as described in the Shell and Utilities  
50610 volume of IEEE Std 1003.1-2001, Section 2.6, Word Expansions. The first pointer after the last  
50611 word pointer shall be a null pointer. The expansion of special parameters described in the Shell  
50612 and Utilities volume of IEEE Std 1003.1-2001, Section 2.5.2, Special Parameters is unspecified.50613 It is the caller's responsibility to allocate the storage pointed to by *pwordexp*. The *wordexp()*  
50614 function shall allocate other space as needed, including memory pointed to by  
50615 *pwordexp->we\_wordv*. The *wordfree()* function frees any memory associated with *pwordexp* from a  
50616 previous call to *wordexp()*.

50617 The *flags* argument is used to control the behavior of *wordexp()*. The value of *flags* is the  
50618 bitwise-inclusive OR of zero or more of the following constants, which are defined in  
50619 **<wordexp.h>**:

50620 **WRDE\_APPEND** Append words generated to the ones from a previous call to *wordexp()*.

50621 **WRDE\_DOOFFS** Make use of *pwordexp->we\_offs*. If this flag is set, *pwordexp->we\_offs* is used  
50622 to specify how many null pointers to add to the beginning of  
50623 *pwordexp->we\_wordv*. In other words, *pwordexp->we\_wordv* shall point to  
50624 *pwordexp->we\_offs* null pointers, followed by *pwordexp->we\_wordc* word  
50625 pointers, followed by a null pointer.

50626 **WRDE\_NOCMD** If the implementation supports the utilities defined in the Shell and  
50627 Utilities volume of IEEE Std 1003.1-2001, fail if command substitution, as  
50628 specified in the Shell and Utilities volume of IEEE Std 1003.1-2001, Section  
50629 2.6.3, Command Substitution, is requested.

50630 **WRDE\_REUSE** The *pwordexp* argument was passed to a previous successful call to  
50631 *wordexp()*, and has not been passed to *wordfree()*. The result shall be the  
50632 same as if the application had called *wordfree()* and then called *wordexp()*  
50633 without **WRDE\_REUSE**.

50634 **WRDE\_SHOWERR** Do not redirect *stderr* to **/dev/null**.

50635 **WRDE\_UNDEF** Report error on an attempt to expand an undefined shell variable.

50636 The **WRDE\_APPEND** flag can be used to append a new set of words to those generated by a  
50637 previous call to *wordexp()*. The following rules apply to applications when two or more calls to  
50638 *wordexp()* are made with the same value of *pwordexp* and without intervening calls to *wordfree()*:

- 50639 1. The first such call shall not set **WRDE\_APPEND**. All subsequent calls shall set it.
- 50640 2. All of the calls shall set **WRDE\_DOOFFS**, or all shall not set it.
- 50641 3. After the second and each subsequent call, *pwordexp->we\_wordv* shall point to a list  
50642 containing the following:
  - 50643 a. Zero or more null pointers, as specified by **WRDE\_DOOFFS** and *pwordexp->we\_offs*
  - 50644 b. Pointers to the words that were in the *pwordexp->we\_wordv* list before the call, in the  
50645 same order as before
  - 50646 c. Pointers to the new words generated by the latest call, in the specified order
- 50647 4. The count returned in *pwordexp->we\_wordc* shall be the total number of words from all of  
50648 the calls.
- 50649 5. The application can change any of the fields after a call to *wordexp()*, but if it does it shall  
50650 reset them to the original value before a subsequent call, using the same *pwordexp* value, to  
50651 *wordfree()* or *wordexp()* with the **WRDE\_APPEND** or **WRDE\_REUSE** flag.

50652 If the implementation supports the utilities defined in the Shell and Utilities volume of  
50653 IEEE Std 1003.1-2001, and *words* contains an unquoted character—<newline>, '|', '&', ';',  
50654 '<', '>', '(', ')', '{', '}'—in an inappropriate context, *wordexp()* shall fail, and the number  
50655 of expanded words shall be 0.

50656 Unless **WRDE\_SHOWERR** is set in *flags*, *wordexp()* shall redirect *stderr* to **/dev/null** for any  
50657 utilities executed as a result of command substitution while expanding *words*. If  
50658 **WRDE\_SHOWERR** is set, *wordexp()* may write messages to *stderr* if syntax errors are detected  
50659 while expanding *words*.

50660 The application shall ensure that if WRDE\_DOOFFS is set, then *pwordexp->we\_offs* has the same  
50661 value for each *wordexp()* call and *wordfree()* call using a given *pwordexp*.

50662 The following constants are defined as error return values:

50663 WRDE\_BADCHAR One of the unquoted characters—<newline>, '|', '&', ';', '<', '>',  
50664 '(', ')', '{', '}'—appears in *words* in an inappropriate context.

50665 WRDE\_BADVAL Reference to undefined shell variable when WRDE\_UNDEF is set in *flags*.

50666 WRDE\_CMDSUB Command substitution requested when WRDE\_NOCMD was set in *flags*.

50667 WRDE\_NOSPACE Attempt to allocate memory failed.

50668 WRDE\_SYNTAX Shell syntax error, such as unbalanced parentheses or unterminated  
50669 string.

#### 50670 RETURN VALUE

50671 Upon successful completion, *wordexp()* shall return 0. Otherwise, a non-zero value, as described  
50672 in <**wordexp.h**>, shall be returned to indicate an error. If *wordexp()* returns the value  
50673 WRDE\_NOSPACE, then *pwordexp->we\_wordc* and *pwordexp->we\_wordv* shall be updated to  
50674 reflect any words that were successfully expanded. In other cases, they shall not be modified.

50675 The *wordfree()* function shall not return a value.

#### 50676 ERRORS

50677 No errors are defined.

#### 50678 EXAMPLES

50679 None.

#### 50680 APPLICATION USAGE

50681 The *wordexp()* function is intended to be used by an application that wants to do all of the shell's  
50682 expansions on a word or words obtained from a user. For example, if the application prompts  
50683 for a filename (or list of filenames) and then uses *wordexp()* to process the input, the user could  
50684 respond with anything that would be valid as input to the shell.

50685 The WRDE\_NOCMD flag is provided for applications that, for security or other reasons, want to  
50686 prevent a user from executing shell commands. Disallowing unquoted shell special characters  
50687 also prevents unwanted side effects, such as executing a command or writing a file.

#### 50688 RATIONALE

50689 This function was included as an alternative to *glob()*. There had been continuing controversy  
50690 over exactly what features should be included in *glob()*. It is hoped that by providing *wordexp()*  
50691 (which provides all of the shell word expansions, but which may be slow to execute) and *glob()*  
50692 (which is faster, but which only performs pathname expansion, without tilde or parameter  
50693 expansion) this will satisfy the majority of applications.

50694 While *wordexp()* could be implemented entirely as a library routine, it is expected that most  
50695 implementations run a shell in a subprocess to do the expansion.

50696 Two different approaches have been proposed for how the required information might be  
50697 presented to the shell and the results returned. They are presented here as examples.

50698 One proposal is to extend the *echo* utility by adding a **-q** option. This option would cause *echo* to  
50699 add a backslash before each backslash and <blank> that occurs within an argument. The  
50700 *wordexp()* function could then invoke the shell as follows:

```
50701 (void) strcpy(buffer, "echo -q");
50702 (void) strcat(buffer, words);
50703 if ((flags & WRDE_SHOWERR) == 0)
```

```
50704     (void) strcat(buffer, "2>/dev/null");
50705     f = popen(buffer, "r");
```

50706 The *wordexp()* function would read the resulting output, remove unquoted backslashes, and  
 50707 break into words at unquoted <blank>s. If the WRDE\_NOCMD flag was set, *wordexp()* would  
 50708 have to scan *words* before starting the subshell to make sure that there would be no command  
 50709 substitution. In any case, it would have to scan *words* for unquoted special characters.

50710 Another proposal is to add the following options to *sh*:

50711 **-w wordlist**

50712 This option provides a wordlist expansion service to applications. The words in *wordlist*  
 50713 shall be expanded and the following written to standard output:

- 50714 1. The count of the number of words after expansion, in decimal, followed by a null byte
- 50715 2. The number of bytes needed to represent the expanded words (not including null  
 50716 separators), in decimal, followed by a null byte
- 50717 3. The expanded words, each terminated by a null byte

50718 If an error is encountered during word expansion, *sh* exits with a non-zero status after  
 50719 writing the former to report any words successfully expanded

50720 **-P** Run in “protected” mode. If specified with the **-w** option, no command substitution shall  
 50721 be performed.

50722 With these options, *wordexp()* could be implemented fairly simply by creating a subprocess  
 50723 using *fork()* and executing *sh* using the line:

```
50724 execl(<shell path>, "sh", "-P", "-w", words, (char *)0);
```

50725 after directing standard error to **/dev/null**.

50726 It seemed objectionable for a library routine to write messages to standard error, unless  
 50727 explicitly requested, so *wordexp()* is required to redirect standard error to **/dev/null** to ensure  
 50728 that no messages are generated, even for commands executed for command substitution. The  
 50729 WRDE\_SHOWERR flag can be specified to request that error messages be written.

50730 The WRDE\_REUSE flag allows the implementation to avoid the expense of freeing and  
 50731 reallocating memory, if that is possible. A minimal implementation can call *wordfree()* when  
 50732 WRDE\_REUSE is set.

#### 50733 FUTURE DIRECTIONS

50734 None.

#### 50735 SEE ALSO

50736 *fnmatch()*, *glob()*, the Base Definitions volume of IEEE Std 1003.1-2001, **<wordexp.h>**, the Shell  
 50737 and Utilities volume of IEEE Std 1003.1-2001, Chapter 2, Shell Command Language

#### 50738 CHANGE HISTORY

50739 First released in Issue 4. Derived from the ISO POSIX-2 standard.

#### 50740 Issue 5

50741 Moved from POSIX2 C-language Binding to BASE.

#### 50742 Issue 6

50743 The DESCRIPTION is updated to avoid use of the term “must” for application requirements.

50744 The **restrict** keyword is added to the *wordexp()* prototype for alignment with the  
 50745 ISO/IEC 9899:1999 standard.

**50746 NAME**

50747        `wprintf` — print formatted wide-character output

**50748 SYNOPSIS**

50749        `#include <stdio.h>`

50750        `#include <wchar.h>`

50751        `int wprintf(const wchar_t *restrict format, ...);`

**50752 DESCRIPTION**

50753        Refer to *fwprintf()*.

## 50754 NAME

50755 pwrite, write — write on a file

## 50756 SYNOPSIS

50757 #include &lt;unistd.h&gt;

50758 XSI ssize\_t pwrite(int *fildev*, const void \**buf*, size\_t *nbyte*,  
50759 off\_t *offset*);50760 ssize\_t write(int *fildev*, const void \**buf*, size\_t *nbyte*);

## 50761 DESCRIPTION

50762 The *write()* function shall attempt to write *nbyte* bytes from the buffer pointed to by *buf* to the  
50763 file associated with the open file descriptor, *fildev*.50764 Before any action described below is taken, and if *nbyte* is zero and the file is a regular file, the  
50765 *write()* function may detect and return errors as described below. In the absence of errors, or if  
50766 error detection is not performed, the *write()* function shall return zero and have no other results.  
50767 If *nbyte* is zero and the file is not a regular file, the results are unspecified.50768 On a regular file or other file capable of seeking, the actual writing of data shall proceed from the  
50769 position in the file indicated by the file offset associated with *fildev*. Before successful return  
50770 from *write()*, the file offset shall be incremented by the number of bytes actually written. On a  
50771 regular file, if this incremented file offset is greater than the length of the file, the length of the  
50772 file shall be set to this file offset.50773 On a file not capable of seeking, writing shall always take place starting at the current position.  
50774 The value of a file offset associated with such a device is undefined.50775 If the O\_APPEND flag of the file status flags is set, the file offset shall be set to the end of the file  
50776 prior to each write and no intervening file modification operation shall occur between changing  
50777 the file offset and the write operation.50778 XSI If a *write()* requests that more bytes be written than there is room for (for example, the process'  
50779 file size limit or the physical end of a medium), only as many bytes as there is room for shall be  
50780 written. For example, suppose there is space for 20 bytes more in a file before reaching a limit. A  
50781 write of 512 bytes will return 20. The next write of a non-zero number of bytes would give a  
50782 failure return (except as noted below).50783 XSI If the request would cause the file size to exceed the soft file size limit for the process and there  
50784 is no room for any bytes to be written, the request shall fail and the implementation shall  
50785 generate the SIGXFSZ signal for the thread.50786 If *write()* is interrupted by a signal before it writes any data, it shall return  $-1$  with *errno* set to  
50787 [EINTR].50788 If *write()* is interrupted by a signal after it successfully writes some data, it shall return the  
50789 number of bytes written.50790 If the value of *nbyte* is greater than {SSIZE\_MAX}, the result is implementation-defined.50791 After a *write()* to a regular file has successfully returned:

- 50792
- Any successful *read()* from each byte position in the file that was modified by that write shall  
50793 return the data specified by the *write()* for that position until such byte positions are again  
50794 modified.
  - Any subsequent successful *write()* to the same byte position in the file shall overwrite that  
50795 file data.  
50796

- 50797 Write requests to a pipe or FIFO shall be handled in the same way as a regular file with the  
50798 following exceptions:
- 50799 • There is no file offset associated with a pipe, hence each write request shall append to the  
50800 end of the pipe.
  - 50801 • Write requests of {PIPE\_BUF} bytes or less shall not be interleaved with data from other  
50802 processes doing writes on the same pipe. Writes of greater than {PIPE\_BUF} bytes may have  
50803 data interleaved, on arbitrary boundaries, with writes by other processes, whether or not the  
50804 O\_NONBLOCK flag of the file status flags is set.
  - 50805 • If the O\_NONBLOCK flag is clear, a write request may cause the thread to block, but on  
50806 normal completion it shall return *nbyte*.
  - 50807 • If the O\_NONBLOCK flag is set, *write()* requests shall be handled differently, in the  
50808 following ways:
    - 50809 — The *write()* function shall not block the thread.
    - 50810 — A write request for {PIPE\_BUF} or fewer bytes shall have the following effect: if there is  
50811 sufficient space available in the pipe, *write()* shall transfer all the data and return the  
50812 number of bytes requested. Otherwise, *write()* shall transfer no data and return  $-1$  with  
50813 *errno* set to [EAGAIN].
    - 50814 — A write request for more than {PIPE\_BUF} bytes shall cause one of the following:
      - 50815 — When at least one byte can be written, transfer what it can and return the number of  
50816 bytes written. When all data previously written to the pipe is read, it shall transfer at  
50817 least {PIPE\_BUF} bytes.
      - 50818 — When no data can be written, transfer no data, and return  $-1$  with *errno* set to  
50819 [EAGAIN].
- 50820 When attempting to write to a file descriptor (other than a pipe or FIFO) that supports non-  
50821 blocking writes and cannot accept the data immediately:
- 50822 • If the O\_NONBLOCK flag is clear, *write()* shall block the calling thread until the data can be  
50823 accepted.
  - 50824 • If the O\_NONBLOCK flag is set, *write()* shall not block the thread. If some data can be  
50825 written without blocking the thread, *write()* shall write what it can and return the number of  
50826 bytes written. Otherwise, it shall return  $-1$  and set *errno* to [EAGAIN].
- 50827 Upon successful completion, where *nbyte* is greater than 0, *write()* shall mark for update the  
50828 *st\_ctime* and *st\_mtime* fields of the file, and if the file is a regular file, the S\_ISUID and S\_ISGID  
50829 bits of the file mode may be cleared.
- 50830 For regular files, no data transfer shall occur past the offset maximum established in the open  
50831 file description associated with *fildes*.
- 50832 If *fildes* refers to a socket, *write()* shall be equivalent to *send()* with no flags set.
- 50833 SIO If the O\_DSYNC bit has been set, write I/O operations on the file descriptor shall complete as  
50834 defined by synchronized I/O data integrity completion.
- 50835 If the O\_SYNC bit has been set, write I/O operations on the file descriptor shall complete as  
50836 defined by synchronized I/O file integrity completion.
- 50837 SHM If *fildes* refers to a shared memory object, the result of the *write()* function is unspecified.
- 50838 TYM If *fildes* refers to a typed memory object, the result of the *write()* function is unspecified.

50839 XSR If *fildev* refers to a STREAM, the operation of *write()* shall be determined by the values of the  
 50840 minimum and maximum *nbyte* range (packet size) accepted by the STREAM. These values are  
 50841 determined by the topmost STREAM module. If *nbyte* falls within the packet size range, *nbyte*  
 50842 bytes shall be written. If *nbyte* does not fall within the range and the minimum packet size value  
 50843 is 0, *write()* shall break the buffer into maximum packet size segments prior to sending the data  
 50844 downstream (the last segment may contain less than the maximum packet size). If *nbyte* does not  
 50845 fall within the range and the minimum value is non-zero, *write()* shall fail with *errno* set to  
 50846 [ERANGE]. Writing a zero-length buffer (*nbyte* is 0) to a STREAMS device sends 0 bytes with 0  
 50847 returned. However, writing a zero-length buffer to a STREAMS-based pipe or FIFO sends no  
 50848 message and 0 is returned. The process may issue `I_SWROPT ioctl()` to enable zero-length  
 50849 messages to be sent across the pipe or FIFO.

50850 When writing to a STREAM, data messages are created with a priority band of 0. When writing  
 50851 to a STREAM that is not a pipe or FIFO:

- If O\_NONBLOCK is clear, and the STREAM cannot accept data (the STREAM write queue is full due to internal flow control conditions), *write()* shall block until data can be accepted.

- If O\_NONBLOCK is set and the STREAM cannot accept data, *write()* shall return -1 and set *errno* to [EAGAIN].

- If O\_NONBLOCK is set and part of the buffer has been written while a condition in which the STREAM cannot accept additional data occurs, *write()* shall terminate and return the number of bytes written.

50859 In addition, *write()* shall fail if the STREAM head has processed an asynchronous error before  
 50860 the call. In this case, the value of *errno* does not reflect the result of *write()*, but reflects the prior  
 50861 error.

50862 XSI The *pwrite()* function shall be equivalent to *write()*, except that it writes into a given position  
 50863 without changing the file pointer. The first three arguments to *pwrite()* are the same as *write()*  
 50864 with the addition of a fourth argument offset for the desired position inside the file.

#### 50865 RETURN VALUE

50866 XSI Upon successful completion, *write()* and *pwrite()* shall return the number of bytes actually  
 50867 written to the file associated with *fildev*. This number shall never be greater than *nbyte*.  
 50868 Otherwise, -1 shall be returned and *errno* set to indicate the error.

#### 50869 ERRORS

50870 XSI The *write()* and *pwrite()* functions shall fail if:

50871 [EAGAIN] The O\_NONBLOCK flag is set for the file descriptor and the thread would be  
 50872 delayed in the *write()* operation.

50873 [EBADF] The *fildev* argument is not a valid file descriptor open for writing.

50874 [EFBIG] An attempt was made to write a file that exceeds the implementation-defined  
 50875 XSI maximum file size or the process' file size limit, and there was no room for  
 50876 any bytes to be written.

50877 [EFBIG] The file is a regular file, *nbyte* is greater than 0, and the starting position is  
 50878 greater than or equal to the offset maximum established in the open file  
 50879 description associated with *fildev*.

50880 [EINTR] The write operation was terminated due to the receipt of a signal, and no data  
 50881 was transferred.

50882 [EIO] The process is a member of a background process group attempting to write  
 50883 to its controlling terminal, TOSTOP is set, the process is neither ignoring nor

| 50910     |                           | The <i>write()</i> function may fail if:                                                                                                                                                                      |
| 50911     | [EACCES]                  | A write was attempted on a socket and the calling process does not have appropriate privileges.                                                                                                               |
| 50912     |                           |                                                                                                                                                                                                               |
| 50913     | [ENETDOWN]                | A write was attempted on a socket and the local network interface used to reach the destination is down.                                                                                                      |
| 50914     |                           |                                                                                                                                                                                                               |
| 50915     | [ENETUNREACH]             |                                                                                                                                                                                                               |
| 50916     |                           | A write was attempted on a socket and no route to the network is present.                                                                                                                                     |
| 50917 XSI |                           | The <i>pwrite()</i> function shall fail and the file pointer remain unchanged if:                                                                                                                             |
| 50918 XSI | [EINVAL]                  | The <i>offset</i> argument is invalid. The value is negative.                                                                                                                                                 |
| 50919 XSI | [ESPIPE]                  | <i>fildev</i> is associated with a pipe or FIFO.                                                                                                                                                              |

50920 **EXAMPLES**50921 **Writing from a Buffer**

50922 The following example writes data from the buffer pointed to by *buf* to the file associated with  
50923 the file descriptor *fd*.

```
50924 #include <sys/types.h>
50925 #include <string.h>
50926 ...
50927 char buf[20];
50928 size_t nbytes;
50929 ssize_t bytes_written;
50930 int fd;
50931 ...
50932 strcpy(buf, "This is a test\n");
50933 nbytes = strlen(buf);
50934 bytes_written = write(fd, buf, nbytes);
50935 ...
```

50936 **APPLICATION USAGE**

50937 None.

50938 **RATIONALE**

50939 See also the RATIONALE section in *read()*.

50940 An attempt to write to a pipe or FIFO has several major characteristics:

- 50941 • *Atomic/non-atomic*: A write is atomic if the whole amount written in one operation is not  
50942 interleaved with data from any other process. This is useful when there are multiple writers  
50943 sending data to a single reader. Applications need to know how large a write request can be  
50944 expected to be performed atomically. This maximum is called {PIPE\_BUF}. This volume of  
50945 IEEE Std 1003.1-2001 does not say whether write requests for more than {PIPE\_BUF} bytes  
50946 are atomic, but requires that writes of {PIPE\_BUF} or fewer bytes shall be atomic.
- 50947 • *Blocking/immediate*: Blocking is only possible with O\_NONBLOCK clear. If there is enough  
50948 space for all the data requested to be written immediately, the implementation should do so.  
50949 Otherwise, the process may block; that is, pause until enough space is available for writing.  
50950 The effective size of a pipe or FIFO (the maximum amount that can be written in one  
50951 operation without blocking) may vary dynamically, depending on the implementation, so it  
50952 is not possible to specify a fixed value for it.

- 50953 • *Complete/partial/deferred*: A write request:

```
50954 int fildes;
50955 size_t nbyte;
50956 ssize_t ret;
50957 char *buf;
50958 ret = write(fildes, buf, nbyte);
```

50959 may return:

50960 Complete    *ret*=*nbyte*

50961 Partial      *ret*<*nbyte*

50962 This shall never happen if *nbyte*≤{PIPE\_BUF}. If it does happen (with  
50963 *nbyte*>{PIPE\_BUF}), this volume of IEEE Std 1003.1-2001 does not guarantee

50964 atomicity, even if  $ret \leq \{PIPE\_BUF\}$ , because atomicity is guaranteed according  
50965 to the amount *requested*, not the amount *written*.

50966 Deferred:  $ret = -1$ ,  $errno = [EAGAIN]$

50967 This error indicates that a later request may succeed. It does not indicate that it  
50968 *shall* succeed, even if  $nbyte \leq \{PIPE\_BUF\}$ , because if no process reads from the  
50969 pipe or FIFO, the write never succeeds. An application could usefully count the  
50970 number of times [EAGAIN] is caused by a particular value of  
50971  $nbyte > \{PIPE\_BUF\}$  and perhaps do later writes with a smaller value, on the  
50972 assumption that the effective size of the pipe may have decreased.

50973 Partial and deferred writes are only possible with O\_NONBLOCK set.

50974 The relations of these properties are shown in the following tables:

50975

50976

50977

50978

50979

50980

| Write to a Pipe or FIFO with O_NONBLOCK clear |                                 |                                 |                                  |
|-----------------------------------------------|---------------------------------|---------------------------------|----------------------------------|
| Immediately Writable:                         | None                            | Some                            | <i>nbyte</i>                     |
| $nbyte \leq \{PIPE\_BUF\}$                    | Atomic blocking<br><i>nbyte</i> | Atomic blocking<br><i>nbyte</i> | Atomic immediate<br><i>nbyte</i> |
| $nbyte > \{PIPE\_BUF\}$                       | Blocking <i>nbyte</i>           | Blocking <i>nbyte</i>           | Blocking <i>nbyte</i>            |

50981 If the O\_NONBLOCK flag is clear, a write request shall block if the amount writable  
50982 immediately is less than that requested. If the flag is set (by *fcntl()*), a write request shall never  
50983 block.

50984

50985

50986

50987

50988

50989

| Write to a Pipe or FIFO with O_NONBLOCK set |              |                                   |                                 |
|---------------------------------------------|--------------|-----------------------------------|---------------------------------|
| Immediately Writable:                       | None         | Some                              | <i>nbyte</i>                    |
| $nbyte \leq \{PIPE\_BUF\}$                  | -1, [EAGAIN] | -1, [EAGAIN]                      | Atomic <i>nbyte</i>             |
| $nbyte > \{PIPE\_BUF\}$                     | -1, [EAGAIN] | < <i>nbyte</i> or -1,<br>[EAGAIN] | $\leq nbyte$ or -1,<br>[EAGAIN] |

50990 There is no exception regarding partial writes when O\_NONBLOCK is set. With the exception  
50991 of writing to an empty pipe, this volume of IEEE Std 1003.1-2001 does not specify exactly when a  
50992 partial write is performed since that would require specifying internal details of the  
50993 implementation. Every application should be prepared to handle partial writes when  
50994 O\_NONBLOCK is set and the requested amount is greater than {PIPE\_BUF}, just as every  
50995 application should be prepared to handle partial writes on other kinds of file descriptors.

50996 The intent of forcing writing at least one byte if any can be written is to assure that each write  
50997 makes progress if there is any room in the pipe. If the pipe is empty, {PIPE\_BUF} bytes must be  
50998 written; if not, at least some progress must have been made.

50999 Where this volume of IEEE Std 1003.1-2001 requires -1 to be returned and *errno* set to  
51000 [EAGAIN], most historical implementations return zero (with the O\_NDELAY flag set, which is  
51001 the historical predecessor of O\_NONBLOCK, but is not itself in this volume of  
51002 IEEE Std 1003.1-2001). The error indications in this volume of IEEE Std 1003.1-2001 were chosen  
51003 so that an application can distinguish these cases from end-of-file. While *write()* cannot receive  
51004 an indication of end-of-file, *read()* can, and the two functions have similar return values. Also,  
51005 some existing systems (for example, Eighth Edition) permit a write of zero bytes to mean that  
51006 the reader should get an end-of-file indication; for those systems, a return value of zero from  
51007 *write()* indicates a successful write of an end-of-file indication.

- 51008 Implementations are allowed, but not required, to perform error checking for *write()* requests of  
51009 zero bytes.
- 51010 The concept of a {PIPE\_MAX} limit (indicating the maximum number of bytes that can be  
51011 written to a pipe in a single operation) was considered, but rejected, because this concept would  
51012 unnecessarily limit application writing.
- 51013 See also the discussion of O\_NONBLOCK in *read()*.
- 51014 Writes can be serialized with respect to other reads and writes. If a *read()* of file data can be  
51015 proven (by any means) to occur after a *write()* of the data, it must reflect that *write()*, even if the  
51016 calls are made by different processes. A similar requirement applies to multiple write operations  
51017 to the same file position. This is needed to guarantee the propagation of data from *write()* calls  
51018 to subsequent *read()* calls. This requirement is particularly significant for networked file  
51019 systems, where some caching schemes violate these semantics.
- 51020 Note that this is specified in terms of *read()* and *write()*. The XSI extensions *readv()* and *writv()*  
51021 also obey these semantics. A new “high-performance” write analog that did not follow these  
51022 serialization requirements would also be permitted by this wording. This volume of  
51023 IEEE Std 1003.1-2001 is also silent about any effects of application-level caching (such as that  
51024 done by *stdio*).
- 51025 This volume of IEEE Std 1003.1-2001 does not specify the value of the file offset after an error is  
51026 returned; there are too many cases. For programming errors, such as [EBADF], the concept is  
51027 meaningless since no file is involved. For errors that are detected immediately, such as  
51028 [EAGAIN], clearly the pointer should not change. After an interrupt or hardware error, however,  
51029 an updated value would be very useful and is the behavior of many implementations.
- 51030 This volume of IEEE Std 1003.1-2001 does not specify behavior of concurrent writes to a file from  
51031 multiple processes. Applications should use some form of concurrency control.
- 51032 **FUTURE DIRECTIONS**
- 51033 None.
- 51034 **SEE ALSO**
- 51035 *chmod()*, *creat()*, *dup()*, *fcntl()*, *getrlimit()*, *lseek()*, *open()*, *pipe()*, *ulimit()*, *writv()*, the Base

- 51037 **CHANGE HISTORY**
- 51038 First released in Issue 1. Derived from Issue 1 of the SVID.
- 51039 **Issue 5**
- 51040 The DESCRIPTION is updated for alignment with the POSIX Realtime Extension and the POSIX  
51041 Threads Extension.
- 51042 Large File Summit extensions are added.
- 51043 The *pwrite()* function is added.
- 51044 **Issue 6**
- 51045 The DESCRIPTION states that the *write()* function does not block the thread. Previously this  
51046 said “process” rather than “thread”.
- 51047 The DESCRIPTION and ERRORS sections are updated so that references to STREAMS are  
51048 marked as part of the XSI STREAMS Option Group.
- 51049 The following new requirements on POSIX implementations derive from alignment with the  
51050 Single UNIX Specification:

- 51051 • The DESCRIPTION now states that if *write()* is interrupted by a signal after it has  
51052 successfully written some data, it returns the number of bytes written. In the POSIX.1-1988  
51053 standard, it was optional whether *write()* returned the number of bytes written, or whether it  
51054 returned  $-1$  with *errno* set to [EINTR]. This is a FIPS requirement.
- 51055 • The following changes are made to support large files:
- 51056 — For regular files, no data transfer occurs past the offset maximum established in the open  
51057 file description associated with the *files*.
  - 51058 — A second [EFBIG] error condition is added.
- 51059 • The [EIO] error condition is added.
- 51060 • The [EPIPE] error condition is added for when a pipe has only one end open.
- 51061 • The [ENXIO] optional error condition is added.
- 51062 Text referring to sockets is added to the DESCRIPTION.
- 51063 The following changes were made to align with the IEEE P1003.1a draft standard:
- 51064 • The effect of reading zero bytes is clarified.
- 51065 The DESCRIPTION is updated for alignment with IEEE Std 1003.1j-2000 by specifying that  
51066 *write()* results are unspecified for typed memory objects.
- 51067 The following error conditions are added for operations on sockets: [EAGAIN],  
51068 [EWOULDBLOCK], [ECONNRESET], [ENOTCONN], and [EPIPE].
- 51069 The [EIO] error is changed to “may fail”.
- 51070 The [ENOBUFFS] error is added for sockets.
- 51071 The following error conditions are added for operations on sockets: [EACCES], [ENETDOWN],  
51072 and [ENETUNREACH].
- 51073 The *writetv()* function is split out into a separate reference page.

51074 **NAME**

51075 writev — write a vector

51076 **SYNOPSIS**51077 XSI 

```
#include <sys/uio.h>
```

51078 

```
ssize_t writev(int fildev, const struct iovec *iov, int iovcnt);
```

51079

51080 **DESCRIPTION**

51081 The *writev()* function shall be equivalent to *write()*, except as described below. The *writev()*  
 51082 function shall gather output data from the *iovcnt* buffers specified by the members of the *iov*  
 51083 array: *iov*[0], *iov*[1], ..., *iov*[*iovcnt*−1]. The *iovcnt* argument is valid if greater than 0 and less than  
 51084 or equal to {IOV\_MAX}, as defined in <limits.h>.

51085 Each *iovec* entry specifies the base address and length of an area in memory from which data  
 51086 should be written. The *writev()* function shall always write a complete area before proceeding to  
 51087 the next.

51088 If *fildev* refers to a regular file and all of the *iov\_len* members in the array pointed to by *iov* are 0,  
 51089 *writev()* shall return 0 and have no other effect. For other file types, the behavior is unspecified.

51090 If the sum of the *iov\_len* values is greater than {SSIZE\_MAX}, the operation shall fail and no data  
 51091 shall be transferred.

51092 **RETURN VALUE**

51093 Upon successful completion, *writev()* shall return the number of bytes actually written.  
 51094 Otherwise, it shall return a value of −1, the file-pointer shall remain unchanged, and *errno* shall  
 51095 be set to indicate an error.

51096 **ERRORS**51097 Refer to *write()*.51098 In addition, the *writev()* function shall fail if:51099 [EINVAL] The sum of the *iov\_len* values in the *iov* array would overflow an *ssize\_t*.51100 The *writev()* function may fail and set *errno* to:51101 [EINVAL] The *iovcnt* argument was less than or equal to 0, or greater than {IOV\_MAX}.51102 **EXAMPLES**51103 **Writing Data from an Array**

51104 The following example writes data from the buffers specified by members of the *iov* array to the  
 51105 file associated with the file descriptor *fd*.

```
51106 #include <sys/types.h>
51107 #include <sys/uio.h>
51108 #include <unistd.h>
51109 ...
51110 ssize_t bytes_written;
51111 int fd;
51112 char *buf0 = "short string\n";
51113 char *buf1 = "This is a longer string\n";
51114 char *buf2 = "This is the longest string in this example\n";
51115 int iovcnt;
51116 struct iovec iov[3];
```

```
51117     iov[0].iov_base = buf0;
51118     iov[0].iov_len = strlen(buf0);
51119     iov[1].iov_base = buf1;
51120     iov[1].iov_len = strlen(buf1);
51121     iov[2].iov_base = buf2;
51122     iov[2].iov_len = strlen(buf2);
51123     ...
51124     iovcnt = sizeof(iov) / sizeof(struct iovec);

51125     bytes_written = writev(fd, iov, iovcnt);
51126     ...
```

**51127 APPLICATION USAGE**

51128 None.

**51129 RATIONALE**

51130 Refer to *write()*.

**51131 FUTURE DIRECTIONS**

51132 None.

**51133 SEE ALSO**

51134 *readv()*, *write()*, the Base Definitions volume of IEEE Std 1003.1-2001, <**limits.h**>, <**sys/uio.h**>

**51135 CHANGE HISTORY**

51136 First released in Issue 4, Version 2.

**51137 Issue 6**

51138 Split out from the *write()* reference page.

51139 **NAME**

51140           wscanf — convert formatted wide-character input

51141 **SYNOPSIS**

51142           #include &lt;stdio.h&gt;

51143           #include &lt;wchar.h&gt;

51144           int wscanf(const wchar\_t \*restrict *format*, ... );51145 **DESCRIPTION**51146           Refer to *fwscanf()*.

51147 **NAME**

51148        y0, y1, yn — Bessel functions of the second kind

51149 **SYNOPSIS**

```
51150 xSI      #include <math.h>
51151          double y0(double x);
51152          double y1(double x);
51153          double yn(int n, double x);
51154
```

51155 **DESCRIPTION**

51156        The *y0()*, *y1()*, and *yn()* functions shall compute Bessel functions of *x* of the second kind of  
51157        orders 0, 1, and *n*, respectively.

51158        An application wishing to check for error situations should set *errno* to zero and call  
51159        *feclearexcept*(FE\_ALL\_EXCEPT) before calling these functions. On return, if *errno* is non-zero or  
51160        *fetestexcept*(FE\_INVALID | FE\_DIVBYZERO | FE\_OVERFLOW | FE\_UNDERFLOW) is non-  
51161        zero, an error has occurred.

51162 **RETURN VALUE**

51163        Upon successful completion, these functions shall return the relevant Bessel value of *x* of the  
51164        second kind.

51165        If *x* is NaN, NaN shall be returned.

51166        If the *x* argument to these functions is negative, *-HUGE\_VAL* or NaN shall be returned, and a  
51167        domain error may occur.

51168        If *x* is 0.0, *-HUGE\_VAL* shall be returned and a range error may occur.

51169        If the correct result would cause underflow, 0.0 shall be returned and a range error may occur.

51170        If the correct result would cause overflow, *-HUGE\_VAL* or 0.0 shall be returned and a range  
51171        error may occur.

51172 **ERRORS**

51173        These functions may fail if:

51174        Domain Error    The value of *x* is negative.

51175                        If the integer expression (math\_errhandling & MATH\_ERRNO) is non-zero,  
51176                        then *errno* shall be set to [EDOM]. If the integer expression (math\_errhandling  
51177                        & MATH\_ERREXCEPT) is non-zero, then the invalid floating-point exception  
51178                        shall be raised.

51179        Range Error    The value of *x* is 0.0, or the correct result would cause overflow.

51180                        If the integer expression (math\_errhandling & MATH\_ERRNO) is non-zero,  
51181                        then *errno* shall be set to [ERANGE]. If the integer expression  
51182                        (math\_errhandling & MATH\_ERREXCEPT) is non-zero, then the overflow  
51183                        floating-point exception shall be raised.

51184        Range Error    The value of *x* is too large in magnitude, or the correct result would cause  
51185                        underflow.

51186                        If the integer expression (math\_errhandling & MATH\_ERRNO) is non-zero,  
51187                        then *errno* shall be set to [ERANGE]. If the integer expression  
51188                        (math\_errhandling & MATH\_ERREXCEPT) is non-zero, then the underflow  
51189                        floating-point exception shall be raised.

51190 **EXAMPLES**

51191 None.

51192 **APPLICATION USAGE**

51193 On error, the expressions (`math_errhandling & MATH_ERRNO`) and (`math_errhandling &`  
51194 `MATH_ERREXCEPT`) are independent of each other, but at least one of them must be non-zero.

51195 **RATIONALE**

51196 None.

51197 **FUTURE DIRECTIONS**

51198 None.

51199 **SEE ALSO**

51202 **CHANGE HISTORY**

51203 First released in Issue 1. Derived from Issue 1 of the SVID.

51204 **Issue 5**

51205 The DESCRIPTION is updated to indicate how an application should check for an error. This  
51206 text was previously published in the APPLICATION USAGE section.

51207 **Issue 6**

51208 The DESCRIPTION is updated to avoid use of the term “must” for application requirements.

51209 The RETURN VALUE and ERRORS sections are reworked for alignment of the error handling  
51210 with the ISO/IEC 9899:1999 standard.
