## Abstract

This standard defines a standard operating system interface and environment, including a command interpreter (or “shell”), and common utility programs to support applications portability at the source code level. It is the single common revision to IEEE Std 1003.1-1996, IEEE Std 1003.2-1992, and the Base Specifications of The Open Group Single UNIX<sup>®</sup>† Specification, Version 2. This standard is intended to be used by both applications developers and system implementors and comprises four major components (each in an associated volume):

- General terms, concepts, and interfaces common to all volumes of this standard, including utility conventions and C-language header definitions, are included in the Base Definitions volume.
- Definitions for system service functions and subroutines, language-specific system services for the C programming language, function issues, including portability, error handling, and error recovery, are included in the System Interfaces volume.
- Definitions for a standard source code-level interface to command interpretation services (a “shell”) and common utility programs for application programs are included in the Shell and Utilities volume.
- Extended rationale that did not fit well into the rest of the document structure, containing historical information concerning the contents of this standard and why features were included or discarded by the standard developers, is included in the Rationale (Informative) volume.

The following areas are outside the scope of this standard:

- Graphics interfaces
- Database management system interfaces
- Record I/O considerations
- Object or binary code portability
- System configuration and resource availability

This standard describes the external characteristics and facilities that are of importance to applications developers, rather than the internal construction techniques employed to achieve these capabilities. Special emphasis is placed on those functions and facilities that are needed in a wide variety of commercial applications.

## Keywords

application program interface (API), argument, asynchronous, basic regular expression (BRE), batch job, batch system, built-in utility, byte, child, command language interpreter, CPU, extended regular expression (ERE), FIFO, file access control mechanism, input/output (I/O), job control, network, portable operating system interface (POSIX<sup>®</sup>†), parent, shell, stream, string, synchronous, system, thread, X/Open System Interface (XSI)

### **Permissions**

Authorization to photocopy portions of this standard for internal or personal use is granted provided that the appropriate fee is paid to the Copyright Clearance Center or the equivalent body outside of the U.S. Permission to make multiple copies for educational purposes in the U.S. requires agreement and a license fee to be paid to the Copyright Clearance Center.

Beyond these provisions, permission to reproduce all or any part of this standard must be with the consent of both copyright holders and may be subject to a license fee. Both copyright holders will need to be satisfied that the other has granted permission. Requests to the copyright holders should be sent by email to [austin-group-permissions@opengroup.org](mailto:austin-group-permissions@opengroup.org).

### **Feedback**

This standard has been prepared by the Austin Group. Feedback relating to the material contained in this standard may be submitted using the Austin Group web site at <http://www.opengroup.org/austin/defectform.html>.

## IEEE

IEEE Standards documents are developed within the IEEE Societies and the Standards Coordinating Committees of the IEEE Standards Association (IEEE-SA) Standards Board. The IEEE develops its standards through a consensus development process, approved by the American National Standards Institute, which brings together volunteers representing varied viewpoints and interests to achieve the final product. Volunteers are not necessarily members of the Institute and serve without compensation. While the IEEE administers the process and establishes rules to promote fairness in the consensus development process, the IEEE does not independently evaluate, test, or verify the accuracy of any of the information contained in its standards.

Use of an IEEE Standard is wholly voluntary. The IEEE disclaims liability for any personal injury, property, or other damage, of any nature whatsoever, whether special, indirect, consequential, or compensatory, directly or indirectly resulting from the publication, use of, or reliance upon this, or any other IEEE Standard document.

**The IEEE does not warrant or represent the accuracy or content of the material contained herein, and expressly disclaims any express or implied warranty, including any implied warranty of merchantability or fitness for a specific purpose, or that the use of the material contained herein is free from patent infringement. IEEE Standards documents are supplied "AS IS".**

The existence of an IEEE Standard does not imply that there are no other ways to produce, test, measure, purchase, market, or provide other goods and services related to the scope of the IEEE Standard. Furthermore, the viewpoint expressed at the time a standard is approved and issued is subject to change brought about through developments in the state of the art and comments received from users of the standard. Every IEEE Standard is subjected to review at least every five years for revision or reaffirmation. When a document is more than five years old and has not been reaffirmed, it is reasonable to conclude that its contents, although still of some value, do not wholly reflect the present state of the art. Users are cautioned to check to determine that they have the latest edition of any IEEE Standard.

In publishing and making this document available, the IEEE is not suggesting or rendering professional or other services for, or on behalf of, any person or entity. Nor is the IEEE undertaking to perform any duty owed by any other person or entity to another. Any person utilizing this, and any other IEEE Standards document, should rely upon the advice of a competent professional in determining the exercise of reasonable care in any given circumstances.

Interpretations: Occasionally questions may arise regarding the meaning of portions of standards as they relate to specific applications. When the need for interpretations is brought to the attention of the IEEE, the Institute will initiate action to prepare appropriate responses. Since IEEE Standards represent a consensus of concerned interests, it is important to ensure that any interpretation has also received the concurrence of a balance of interests. For this reason, IEEE and the members of its societies and Standards Coordinating Committees are not able to provide an instant response to interpretation requests except in those cases where the matter has previously received formal consideration.

Comments for revision of IEEE Standards are welcome from any interested party, regardless of membership affiliation with the IEEE.<sup>1</sup> Suggestions for changes in documents should be in the form of a proposed change of text, together with appropriate supporting comments. Comments on standards and requests for interpretations should be addressed to:

Secretary, IEEE-SA Standards Board, 445 Hoes Lane, P.O. Box 1331, Piscataway, NJ 08855-1331, U.S.A.

Attention is called to the possibility that implementation of this standard may require use of subject matter covered by patent rights. By publication of this standard, no position is taken with respect to the existence or validity of any patent rights in connection therewith. The IEEE shall not be responsible for identifying patents for which a license may be required by an IEEE Standard or for conducting inquiries into the legal validity or scope of those patents that are brought to its attention.

A patent holder has filed a statement of assurance that it will grant licenses under these rights without compensation or under reasonable rates and non-discriminatory, reasonable terms and conditions to all applicants desiring to obtain such licenses. The IEEE makes no representation as to the reasonableness of rates and/or terms and conditions of the license agreements offered by patent holders. Further information may be obtained from the IEEE Standards Department.

The IEEE and its designees are the sole entities that may authorize the use of IEEE-owned certification marks and/or trademarks to indicate compliance with the materials set forth herein. Authorization to photocopy portions of any individual standard for internal or personal use is granted in the U.S. by the Institute of Electrical and Electronics Engineers, Inc., provided that the appropriate fee is paid to the Copyright Clearance Center.<sup>2</sup> Permission to photocopy portions of any individual standard for educational classroom use can also be obtained through the Copyright Clearance Center. To arrange for payment of the licensing fee, please contact:

Copyright Clearance Center, Customer Service, 222 Rosewood Drive, Danvers, MA 01923, U.S.A., Tel.: +1 978 750 8400

Amendments, corrigenda, and interpretations for this standard, or information about the IEEE standards development process, may be found at <http://standards.ieee.org>.

Full catalog and ordering information on all IEEE publications is available from the IEEE Online Catalog & Store at <http://shop.ieee.org/store>.

1. For this standard, please send comments via the Austin Group as requested on page iii.

2. Please refer to the special provisions for this standard on page iii concerning permissions from both copyright holders and arrangements to cover photocopying and reproduction across the world, as well as by commercial organizations wishing to license the material for use in product documentation.

## The Open Group

The Open Group, a vendor and technology-neutral consortium, is committed to delivering greater business efficiency by bringing together buyers and suppliers of information technology to lower the time, cost, and risks associated with integrating new technology across the enterprise.

The Open Group's mission is to offer all organizations concerned with open information infrastructures a forum to share knowledge, integrate open initiatives, and certify approved products and processes in a manner in which they continue to trust our impartiality.

In the global eCommerce world of today, no single economic entity can achieve independence while still ensuring interoperability. The assurance that products will interoperate with each other across differing systems and platforms is essential to the success of eCommerce and business workflow. The Open Group, with its proven testing and certification program, is the international guarantor of interoperability in the new century.

The Open Group provides opportunities to exchange information and shape the future of IT. The Open Group's members include some of the largest and most influential organizations in the world. The flexible structure of The Open Groups membership allows for almost any organization, no matter what their size, to join and have a voice in shaping the future of the IT world.

More information is available on The Open Group web site at <http://www.opengroup.org>.

The Open Group has over 15 years' experience in developing and operating certification programs and has extensive experience developing and facilitating industry adoption of test suites used to validate conformance to an open standard or specification. The Open Group portfolio of test suites includes the *Westwood* family of tests for this standard and the associated certification program for Version 3 of the Single UNIX Specification, as well tests for CDE, CORBA, Motif, Linux, LDAP, POSIX.1, POSIX.2, POSIX Realtime, Sockets, UNIX, XPG4, XNFS, XTI, and X11. The Open Group test tools are essential for proper development and maintenance of standards-based products, ensuring conformance of products to industry-standard APIs, applications portability, and interoperability. In-depth testing identifies defects at the earliest possible point in the development cycle, saving costs in development and quality assurance.

More information is available at <http://www.opengroup.org/testing>.

The Open Group publishes a wide range of technical documentation, the main part of which is focused on development of Technical and Product Standards and Guides, but which also includes white papers, technical studies, branding and testing documentation, and business titles. Full details and a catalog are available at <http://www.opengroup.org/pubs>.

As with all *live* documents, Technical Standards and Specifications require revision to align with new developments and associated international standards. To distinguish between revised specifications which are fully backwards compatible and those which are not:

- A new *Version* indicates there is no change to the definitive information contained in the previous publication of that title, but additions/extensions are included. As such, it *replaces* the previous publication.
- A new *Issue* indicates there is substantive change to the definitive information contained in the previous publication of that title, and there may also be additions/extensions. As such, both previous and new documents are maintained as current publications.

Readers should note that Corrigenda may apply to any publication. Corrigenda information is published at <http://www.opengroup.org/corrigenda>.

Full catalog and ordering information on all Open Group publications is available at <http://www.opengroup.org/pubs>.

# Introduction

**Note:** This introduction is not part of IEEE Std 1003.1-2001, Standard for Information Technology — Portable Operating System Interface (POSIX).

This standard has been jointly developed by the IEEE and The Open Group. It is both an IEEE Standard and an Open Group Technical Standard.

## **The Austin Group**

This standard was developed, and is maintained, by a joint working group of members of the IEEE Portable Applications Standards Committee, members of The Open Group, and members of ISO/IEC Joint Technical Committee 1. This joint working group is known as the Austin Group.<sup>3</sup> The Austin Group arose out of discussions amongst the parties which started in early 1998, leading to an initial meeting and formation of the group in September 1998. The purpose of the Austin Group has been to revise, combine, and update the following standards: ISO/IEC 9945-1, ISO/IEC 9945-2, IEEE Std 1003.1, IEEE Std 1003.2, and the Base Specifications of The Open Group Single UNIX Specification.

After two initial meetings, an agreement was signed in July 1999 between The Open Group and the Institute of Electrical and Electronics Engineers (IEEE), Inc., to formalize the project with the first draft of the revised specifications being made available at the same time. Under this agreement, The Open Group and IEEE agreed to share joint copyright of the resulting work. The Open Group has provided the chair and secretariat for the Austin Group.

The base document for the revision was The Open Group's Base volumes of its Single UNIX Specification, Version 2. These were selected since they were a superset of the existing POSIX.1 and POSIX.2 specifications and had some organizational aspects that would benefit the audience for the new revision.

The approach to specification development has been one of “write once, adopt everywhere”, with the deliverables being a set of specifications that carry the IEEE POSIX designation and The Open Group's Technical Standard designation, and, if approved, an ISO/IEC designation. This set of specifications forms the core of the Single UNIX Specification, Version 3.

This unique development has combined both the industry-led efforts and the formal standardization activities into a single initiative, and included a wide spectrum of participants. The Austin Group continues as the maintenance body for this document.

Anyone wishing to participate in the Austin Group should contact the chair with their request. There are no fees for participation or membership. You may participate as an observer or as a contributor. You do not have to attend face-to-face meetings to participate; electronic participation is most welcome. For more information on the Austin Group and how to participate, see <http://www.opengroup.org/austin>.

---

3. The Austin Group is named after the location of the inaugural meeting held at the IBM facility in Austin, Texas in September 1998.

## Background

The developers of this standard represent a cross section of hardware manufacturers, vendors of operating systems and other software development tools, software designers, consultants, academics, authors, applications programmers, and others.

Conceptually, this standard describes a set of fundamental services needed for the efficient construction of application programs. Access to these services has been provided by defining an interface, using the C programming language, a command interpreter, and common utility programs that establish standard semantics and syntax. Since this interface enables application writers to write portable applications—it was developed with that goal in mind—it has been designated POSIX,<sup>4</sup> an acronym for Portable Operating System Interface.

Although originated to refer to the original IEEE Std 1003.1-1988, the name POSIX more correctly refers to a *family* of related standards: IEEE Std 1003.*n* and the parts of ISO/IEC 9945. In earlier editions of the IEEE standard, the term POSIX was used as a synonym for IEEE Std 1003.1-1988. A preferred term, POSIX.1, emerged. This maintained the advantages of readability of the symbol “POSIX” without being ambiguous with the POSIX family of standards.

## Audience

The intended audience for this standard is all persons concerned with an industry-wide standard operating system based on the UNIX system. This includes at least four groups of people:

1. Persons buying hardware and software systems
2. Persons managing companies that are deciding on future corporate computing directions
3. Persons implementing operating systems, and especially
4. Persons developing applications where portability is an objective

## Purpose

Several principles guided the development of this standard:

- Application-Oriented

The basic goal was to promote portability of application programs across UNIX system environments by developing a clear, consistent, and unambiguous standard for the interface specification of a portable operating system based on the UNIX system documentation. This standard codifies the common, existing definition of the UNIX system.

- Interface, Not Implementation

This standard defines an interface, not an implementation. No distinction is made between library functions and system calls; both are referred to as functions. No details of the implementation of any function are given (although historical practice is sometimes indicated in the RATIONALE section). Symbolic names are given for constants (such as signals and error numbers) rather than numbers.

---

4. The name POSIX was suggested by Richard Stallman. It is expected to be pronounced *pahz-icks*, as in *positive*, not *poh-six*, or other variations. The pronunciation has been published in an attempt to promulgate a standardized way of referring to a standard operating system interface.

- Source, Not Object, Portability

This standard has been written so that a program written and translated for execution on one conforming implementation may also be translated for execution on another conforming implementation. This standard does not guarantee that executable (object or binary) code will execute under a different conforming implementation than that for which it was translated, even if the underlying hardware is identical.

- The C Language

The system interfaces and header definitions are written in terms of the standard C language as specified in the ISO C standard.

- No Superuser, No System Administration

There was no intention to specify all aspects of an operating system. System administration facilities and functions are excluded from this standard, and functions usable only by the superuser have not been included. Still, an implementation of the standard interface may also implement features not in this standard. This standard is also not concerned with hardware constraints or system maintenance.

- Minimal Interface, Minimally Defined

In keeping with the historical design principles of the UNIX system, the mandatory core facilities of this standard have been kept as minimal as possible. Additional capabilities have been added as optional extensions.

- Broadly Implementable

The developers of this standard endeavored to make all specified functions implementable across a wide range of existing and potential systems, including:

1. All of the current major systems that are ultimately derived from the original UNIX system code (Version 7 or later)
2. Compatible systems that are not derived from the original UNIX system code
3. Emulations hosted on entirely different operating systems
4. Networked systems
5. Distributed systems
6. Systems running on a broad range of hardware

No direct references to this goal appear in this standard, but some results of it are mentioned in the Rationale (Informative) volume.

- Minimal Changes to Historical Implementations

When the original version of IEEE Std 1003.1 was published, there were no known historical implementations that did not have to change. However, there was a broad consensus on a set of functions, types, definitions, and concepts that formed an interface that was common to most historical implementations.

The adoption of the 1988 and 1990 IEEE system interface standards, the 1992 IEEE shell and utilities standard, the various Open Group (formerly X/Open) specifications, and the subsequent revisions and addenda to all of them have consolidated this consensus, and this revision reflects the significantly increased level of consensus arrived at since the original versions. The earlier standards and their modifications specified a number of areas where consensus had not been reached before, and these are now reflected in this revision. The authors of the original versions tried, as much as possible, to follow the principles below

when creating new specifications:

1. By standardizing an interface like one in an historical implementation; for example, directories
2. By specifying an interface that is readily implementable in terms of, and backwards-compatible with, historical implementations, such as the extended *tar* format defined in the *pax* utility
3. By specifying an interface that, when added to an historical implementation, will not conflict with it; for example, the *sigaction()* function

This revision tries to minimize the number of changes required to implementations which conform to the earlier versions of the approved standards to bring them into conformance with the current standard. Specifically, the scope of this work excluded doing any “new” work, but rather collecting into a single document what had been spread across a number of documents, and presenting it in what had been proven in practice to be a more effective way. Some changes to prior conforming implementations were unavoidable, primarily as a consequence of resolving conflicts found in prior revisions, or which became apparent when bringing the various pieces together.

However, since it references the 1999 version of the ISO C standard, and no longer supports “Common Usage C”, there are a number of unavoidable changes. Applications portability is similarly affected.

This standard is specifically not a codification of a particular vendor’s product.

It should be noted that implementations will have different kinds of extensions. Some will reflect “historical usage” and will be preserved for execution of pre-existing applications. These functions should be considered “obsolescent” and the standard functions used for new applications. Some extensions will represent functions beyond the scope of this standard. These need to be used with careful management to be able to adapt to future extensions of this standard and/or port to implementations that provide these services in a different manner.

- Minimal Changes to Existing Application Code

A goal of this standard was to minimize additional work for the developers of applications. However, because every known historical implementation will have to change at least slightly to conform, some applications will have to change.

### **This Standard**

This standard defines the Portable Operating System Interface (POSIX) requirements and consists of the following volumes:

- Base Definitions
- Shell and Utilities
- System Interfaces (this volume)
- Rationale (Informative)

**This Volume**

The System Interfaces volume describes the interfaces offered to application programs by POSIX-conformant systems. Readers are expected to be experienced C language programmers, and to be familiar with the Base Definitions volume.

This volume is structured as follows:

- Chapter 1 explains the status of this volume and its relationship to other formal standards.
- Chapter 2 contains important concepts, terms, and caveats relating to the rest of this volume.
- Chapter 3 defines the functional interfaces to the POSIX-conformant system.

Comprehensive references are available in the index.

**Typographical Conventions**

The following typographical conventions are used throughout this standard. In the text, this standard is referred to as IEEE Std 1003.1-2001, which is technically identical to The Open Group Base Specifications, Issue 6.

The typographical conventions listed here are for ease of reading only. Editorial inconsistencies in the use of typography are unintentional and have no normative meaning in this standard.

Reference	Example	Notes
C-Language Data Structure	<b>aiocb</b>	
C-Language Data Structure Member	<i>aio_lio_opcode</i>	
C-Language Data Type	<b>long</b>	
C-Language External Variable	<i>errno</i>	
C-Language Function	<i>system()</i>	
C-Language Function Argument	<i>arg1</i>	
C-Language Function Family	<i>exec</i>	
C-Language Header	<b>&lt;sys/stat.h&gt;</b>	
C-Language Keyword	<b>return</b>	
C-Language Macro with Argument	<i>assert()</i>	
C-Language Macro with No Argument	<b>INET_ADDRSTRLEN</b>	
C-Language Preprocessing Directive	<b>#define</b>	
Commands within a Utility	<b>a, c</b>	
Conversion Specification, Specifier/Modifier Character	<i>%A, g, E</i>	1
Environment Variable	<i>PATH</i>	
Error Number	<b>[EINTR]</b>	
Example Output	<b>Hello, World</b>	
Filename	<b>/tmp</b>	
Literal Character	<i>'c', '\r', '\'</i>	2
Literal String	<i>"abcde"</i>	2
Optional Items in Utility Syntax	<b>[ ]</b>	
Parameter	<b>&lt;directory pathname&gt;</b>	
Special Character	<b>&lt;newline&gt;</b>	3
Symbolic Constant	<b>_POSIX_VDISABLE</b>	
Symbolic Limit, Configuration Value	<b>{LINE_MAX}</b>	4
Syntax	<b>#include &lt;sys/stat.h&gt;</b>	

Reference	Example	Notes
User Input and Example Code	echo Hello, World	5
Utility Name	<i>awk</i>	
Utility Operand	<i>file_name</i>	
Utility Option	<b>-c</b>	
Utility Option with Option-Argument	<b>-w width</b>	

**Notes:**

1. Conversion specifications, specifier characters, and modifier characters are used primarily in date-related functions and utilities and the *fprintf* and *scanf* formatting functions.
2. Unless otherwise noted, the quotes shall not be used as input or output. When used in a list item, the quotes are omitted. For literal characters, '\ ' (or any of the other sequences such as ' ') is the same as the C constant '\\ ' (or '\ ').
3. The style selected for some of the special characters, such as <newline>, matches the form of the input given to the *localedef* utility. Generally, the characters selected for this special treatment are those that are not visually distinct, such as the control characters <tab> or <newline>.
4. Names surrounded by braces represent symbolic limits or configuration values which may be declared in appropriate headers by means of the C **#define** construct.
5. Brackets shown in this font, "[ ]", are part of the syntax and do *not* indicate optional items. In syntax the '| ' symbol is used to separate alternatives, and ellipses ("...") are used to show that additional arguments are optional.

Shading is used to identify extensions and options; see Section 1.8.1 (on page 3).

Footnotes and notes within the body of the normative text are for information only (informative).

Informative sections (such as Rationale, Change History, Application Usage, and so on) are denoted by continuous shading bars in the margins.

Ranges of values are indicated with parentheses or brackets as follows:

- $(a,b)$  means the range of all values from  $a$  to  $b$ , including neither  $a$  nor  $b$ .
- $[a,b]$  means the range of all values from  $a$  to  $b$ , including  $a$  and  $b$ .
- $[a,b)$  means the range of all values from  $a$  to  $b$ , including  $a$ , but not  $b$ .
- $(a,b]$  means the range of all values from  $a$  to  $b$ , including  $b$ , but not  $a$ .

**Notes:**

1. Symbolic limits are used in this volume instead of fixed values for portability. The values of most of these constants are defined in the Base Definitions volume, <limits.h> or <unistd.h>.
2. The values of errors are defined in the Base Definitions volume, <errno.h>.

## **The Austin Group**

This standard was prepared by the Austin Group, sponsored by the Portable Applications Standards Committee of the IEEE Computer Society, The Open Group, and ISO/SC22 WG15. At the time of approval, the membership of the Austin Group was as follows.

**Andrew Josey**, Chair

**Donald W. Cragun**, Organizational Representative, IEEE PASC

**Nicholas Stoughton**, Organizational Representative, ISO/SC22 WG15

**Mark Brown**, Organizational Representative, The Open Group

**Cathy Hughes**, Technical Editor

## **Austin Group Technical Reviewers**

## *Participants*

### **The Open Group**

When The Open Group approved the Base Specifications, Issue 6 on 12 September 2001, the membership of The Open Group Base Working Group was as follows.

**Andrew Josey**, Chair

**Finnbarr P. Murphy**, Vice-Chair

**Mark Brown**, Austin Group Liaison

**Cathy Hughes**, Technical Editor

### **Base Working Group Members**

Bouazza Bachar

Mark Brown

Dave Butenhof

Donald W. Cragun

Larry Dwyer

Joanna Farley

Andrew Gollan

Karen D. Gordon

Gary Miller

Finnbarr P. Murphy

Frank Prindle

Andrew K. Roach

Curtis Royster Jr.

Nicholas Stoughton

Kenjiro Tsuji

**IEEE**

When the IEEE Standards Board approved IEEE Std 1003.1-2001 on 6 December 2001, the membership of the committees was as follows.

**Portable Applications Standards Committee (PASC)**

**Lowell G. Johnson**, Chair  
**Joseph M. Gwinn**, Vice-Chair  
**Jay Ashford**, Functional Chair  
**Andrew Josey**, Functional Chair  
**Curtis Royster Jr.**, Functional Chair  
**Nicholas Stoughton**, Secretary

**Balloting Committee**

The following members of the balloting committee voted on IEEE Std 1003.1-2001. Balloters may have voted for approval, disapproval, or abstention.

Harold C. Adams	Steven A. Haaser	Frank Prindle
Pierre-Jean Arcos	Charles E. Hammons	Francois Riche
Jay Ashford	Chris J. Harding	John D. Riley
Theodore P. Baker	Barry Hedquist	Andrew K. Roach
Robert Barned	Vincent E. Henley	Helmut Roth
David J. Blackwood	Karl Heubaum	Jaideep Roy
Shirley Bockstahler-Brandt	Niklas Holsti	Curtis Royster Jr.
James Bottomley	Thomas Hosmer	Stephen C. Schwarm
Mark Brown	Jim D. Isaak	Richard Seibel
Eric W. Burger	Lowell G. Johnson	David L. Shroads Jr.
Alan Burns	Michael B. Jones	W. Olin Sibert
Dave Butenhof	Andrew Josey	Keld Jorn Simonsen
Keith Chow	Michael J. Karels	Nicholas Stoughton
Donald W. Cragun	Steven Kramer	Donn S. Terry
Juan Antonio De La Puente	Thomas M. Kurihara	Mark-Rene Uchida
Ming De Zhou	C. Douglass Locke	Scott A. Valcourt
Steven J. Dovich	Roger J. Martin	Michael W. Vannier
Richard P. Draves	Craig H. Meyer	Frederick N. Webb
Philip H. Enslow	Finnbarr P. Murphy	Paul A.T. Wolfgang
Michael Gonzalez	John Napier	Oren Yuen
Karen D. Gordon	Peter E. Obermayer	Janusz Zalewski
Joseph M. Gwinn	James T. Oblinger	

The following organizational representative voted on this standard:

**Andrew Josey**, X/Open Company Ltd.

## Participants

### IEEE-SA Standards Board

When the IEEE-SA Standards Board approved IEEE Std 1003.1-2001 on 6 December 2001, it had the following membership:

**Donald N. Heirman**, Chair

**James T. Carlo**, Vice-Chair

**Judith Gorman**, Secretary

Satish K. Aggarwal

Mark D. Bowman

Gary R. Engmann

Harold E. Epstein

H. Landis Floyd

Jay Forster\*

Howard M. Frazier

Ruben D. Garzon

James H. Gurney

Richard J. Holleman

Lowell G. Johnson

Robert J. Kennelly

Joseph L. Koepfinger\*

Peter H. Lips

L. Bruce McClung

Daleep C. Mohla

James W. Moore

Robert F. Munzner

Ronald C. Petersen

Gerald H. Peterson

John B. Posey

Gary S. Robinson

Akio Tojo

Donald W. Zipse

Also included are the following non-voting IEEE-SA Standards Board liaisons:

**Alan Cookson**, NIST Representative

**Donald R. Volzka**, TAB Representative

**Yvette Ho Sang**, **Don Messina**, **Savoula Amanatidis**, IEEE Project Editors

# Trademarks

The following information is given for the convenience of users of this standard and does not constitute endorsement of these products by The Open Group or the IEEE. There may be other products mentioned in the text that might be covered by trademark protection and readers are advised to verify them independently.

1003.1<sup>TM</sup> is a trademark of the Institute of Electrical and Electronic Engineers, Inc.

AIX<sup>®</sup> is a registered trademark of IBM Corporation.

AT&T<sup>®</sup> is a registered trademark of AT&T in the U.S.A. and other countries.

BSD<sup>TM</sup> is a trademark of the University of California, Berkeley, U.S.A.

Hewlett-Packard<sup>®</sup>, HP<sup>®</sup>, and HP-UX<sup>®</sup> are registered trademarks of Hewlett-Packard Company.

IBM<sup>®</sup> is a registered trademark of International Business Machines Corporation.

Motif<sup>®</sup>, OSF/1<sup>®</sup>, UNIX<sup>®</sup>, and the “X Device” are registered trademarks and IT DialTone<sup>TM</sup> and The Open Group<sup>TM</sup> are trademarks of The Open Group in the U.S. and other countries.

POSIX<sup>®</sup> is a registered trademark of the Institute of Electrical and Electronic Engineers, Inc.

Sun<sup>®</sup> and Sun Microsystems<sup>®</sup> are registered trademarks of Sun Microsystems, Inc.

/usr/group<sup>®</sup> is a registered trademark of UniForum, the International Network of UNIX System Users.

# *Acknowledgements*

The contributions of the following organizations to the development of IEEE Std 1003.1-2001 are gratefully acknowledged:

- AT&T for permission to reproduce portions of its copyrighted System V Interface Definition (SVID) and material from the UNIX System V Release 2.0 documentation.
- The SC22 WG14 Committees.

This standard was prepared by the Austin Group, a joint working group of the IEEE, The Open Group, and ISO SC22 WG15.

MSE Working Draft

Working draft of ISO/IEC 9899:1990/Add3:Draft, Addendum 3 — Multibyte Support Extensions (MSE) as documented in the ISO Working Paper SC22/WG14/N205 dated 31 March 1992.

POSIX.0: 1995

IEEE Std 1003.0-1995, IEEE Guide to the POSIX Open System Environment (OSE) (identical to ISO/IEC TR 14252).

POSIX.1: 1988

IEEE Std 1003.1-1988, IEEE Standard for Information Technology — Portable Operating System Interface (POSIX) — Part 1: System Application Program Interface (API) [C Language].

POSIX.1: 1990

IEEE Std 1003.1-1990, IEEE Standard for Information Technology — Portable Operating System Interface (POSIX) — Part 1: System Application Program Interface (API) [C Language].

POSIX.1a

P1003.1a, Standard for Information Technology — Portable Operating System Interface (POSIX) — Part 1: System Application Program Interface (API) — (C Language) Amendment

POSIX.1d: 1999

IEEE Std 1003.1d-1999, IEEE Standard for Information Technology — Portable Operating System Interface (POSIX) — Part 1: System Application Program Interface (API) — Amendment 4: Additional Realtime Extensions [C Language].

POSIX.1g: 2000

IEEE Std 1003.1g-2000, IEEE Standard for Information Technology — Portable Operating System Interface (POSIX) — Part 1: System Application Program Interface (API) — Amendment 6: Protocol-Independent Interfaces (PII).

POSIX.1j: 2000

IEEE Std 1003.1j-2000, IEEE Standard for Information Technology — Portable Operating System Interface (POSIX) — Part 1: System Application Program Interface (API) — Amendment 5: Advanced Realtime Extensions [C Language].

POSIX.1q: 2000

IEEE Std 1003.1q-2000, IEEE Standard for Information Technology — Portable Operating System Interface (POSIX) — Part 1: System Application Program Interface (API) — Amendment 7: Tracing [C Language].

POSIX.2b

P1003.2b, Standard for Information Technology — Portable Operating System Interface (POSIX) — Part 2: Shell and Utilities — Amendment

POSIX.2d:-1994

IEEE Std 1003.2d: 1994, IEEE Standard for Information Technology — Portable Operating System Interface (POSIX) — Part 2: Shell and Utilities — Amendment 1: Batch Environment.

POSIX.13:-1998

IEEE Std 1003.13: 1998, IEEE Standard for Information Technology — Standardized Application Environment Profile (AEP) — POSIX Realtime Application Support.

# Introduction

## 1.1 Scope

The scope of IEEE Std 1003.1-2001 is described in the Base Definitions volume of IEEE Std 1003.1-2001.

## 1.2 Conformance

Conformance requirements for IEEE Std 1003.1-2001 are defined in the Base Definitions volume of IEEE Std 1003.1-2001, Chapter 2, Conformance.

## 1.3 Normative References

Normative references for IEEE Std 1003.1-2001 are defined in the Base Definitions volume of IEEE Std 1003.1-2001.

## 1.4 Change History

Change history is described in the Rationale (Informative) volume of IEEE Std 1003.1-2001, and in the CHANGE HISTORY section of reference pages.

## 1.5 Terminology

This section appears in the Base Definitions volume of IEEE Std 1003.1-2001, but is repeated here for convenience:

For the purposes of IEEE Std 1003.1-2001, the following terminology definitions apply:

### **can**

Describes a permissible optional feature or behavior available to the user or application. The feature or behavior is mandatory for an implementation that conforms to IEEE Std 1003.1-2001. An application can rely on the existence of the feature or behavior.

### **implementation-defined**

Describes a value or behavior that is not defined by IEEE Std 1003.1-2001 but is selected by an implementor. The value or behavior may vary among implementations that conform to IEEE Std 1003.1-2001. An application should not rely on the existence of the value or behavior. An application that relies on such a value or behavior cannot be assured to be portable across conforming implementations.

The implementor shall document such a value or behavior so that it can be used correctly by an application.

### **legacy**

Describes a feature or behavior that is being retained for compatibility with older applications, but which has limitations which make it inappropriate for developing portable

33 applications. New applications should use alternative means of obtaining equivalent  
34 functionality.

35 **may**

36 Describes a feature or behavior that is optional for an implementation that conforms to  
37 IEEE Std 1003.1-2001. An application should not rely on the existence of the feature or  
38 behavior. An application that relies on such a feature or behavior cannot be assured to be  
39 portable across conforming implementations.

40 To avoid ambiguity, the opposite of *may* is expressed as *need not*, instead of *may not*.

41 **shall**

42 For an implementation that conforms to IEEE Std 1003.1-2001, describes a feature or  
43 behavior that is mandatory. An application can rely on the existence of the feature or  
44 behavior.

45 For an application or user, describes a behavior that is mandatory.

46 **should**

47 For an implementation that conforms to IEEE Std 1003.1-2001, describes a feature or  
48 behavior that is recommended but not mandatory. An application should not rely on the  
49 existence of the feature or behavior. An application that relies on such a feature or behavior  
50 cannot be assured to be portable across conforming implementations.

51 For an application, describes a feature or behavior that is recommended programming  
52 practice for optimum portability.

53 **undefined**

54 Describes the nature of a value or behavior not defined by IEEE Std 1003.1-2001 which  
55 results from use of an invalid program construct or invalid data input.

56 The value or behavior may vary among implementations that conform to  
57 IEEE Std 1003.1-2001. An application should not rely on the existence or validity of the  
58 value or behavior. An application that relies on any particular value or behavior cannot be  
59 assured to be portable across conforming implementations.

60 **unspecified**

61 Describes the nature of a value or behavior not specified by IEEE Std 1003.1-2001 which  
62 results from use of a valid program construct or valid data input.

63 The value or behavior may vary among implementations that conform to  
64 IEEE Std 1003.1-2001. An application should not rely on the existence or validity of the  
65 value or behavior. An application that relies on any particular value or behavior cannot be  
66 assured to be portable across conforming implementations.

## 67 1.6 Definitions

68 Concepts and definitions are defined in the Base Definitions volume of IEEE Std 1003.1-2001.

## 69 1.7 Relationship to Other Formal Standards

70 Great care has been taken to ensure that this volume of IEEE Std 1003.1-2001 is fully aligned with  
71 the following standards:

72 ISO C (1999)

73 ISO/IEC 9899: 1999, Programming Languages — C.

74 Parts of the ISO/IEC 9899: 1999 standard (hereinafter referred to as the ISO C standard) are  
75 referenced to describe requirements also mandated by this volume of IEEE Std 1003.1-2001.  
76 Some functions and headers included within this volume of IEEE Std 1003.1-2001 have a version  
77 in the ISO C standard; in this case CX markings are added as appropriate to show where the  
78 ISO C standard has been extended (see Section 1.8.1). Any conflict between this volume of  
79 IEEE Std 1003.1-2001 and the ISO C standard is unintentional.

80 This volume of IEEE Std 1003.1-2001 also allows, but does not require, mathematics functions to  
81 support IEEE Std 754-1985 and IEEE Std 854-1987.

## 82 1.8 Portability

83 Some of the utilities in the Shell and Utilities volume of IEEE Std 1003.1-2001 and functions in  
84 the System Interfaces volume of IEEE Std 1003.1-2001 describe functionality that might not be  
85 fully portable to systems meeting the requirements for POSIX conformance (see the Base  
86 Definitions volume of IEEE Std 1003.1-2001, Chapter 2, Conformance).

87 Where optional, enhanced, or reduced functionality is specified, the text is shaded and a code in  
88 the margin identifies the nature of the option, extension, or warning (see Section 1.8.1). For  
89 maximum portability, an application should avoid such functionality.

### 90 1.8.1 Codes

91 Margin codes and their meanings are listed in the Base Definitions volume of  
92 IEEE Std 1003.1-2001, but are repeated here for convenience:

93 ADV **Advisory Information**

94 The functionality described is optional. The functionality described is also an extension to the  
95 ISO C standard.

96 Where applicable, functions are marked with the ADV margin legend in the SYNOPSIS section.  
97 Where additional semantics apply to a function, the material is identified by use of the ADV  
98 margin legend.

99 AIO **Asynchronous Input and Output**

100 The functionality described is optional. The functionality described is also an extension to the  
101 ISO C standard.

102 Where applicable, functions are marked with the AIO margin legend in the SYNOPSIS section.  
103 Where additional semantics apply to a function, the material is identified by use of the AIO  
104 margin legend.

105 BAR **Barriers**

106 The functionality described is optional. The functionality described is also an extension to the

107		ISO C standard.
108		Where applicable, functions are marked with the BAR margin legend in the SYNOPSIS section.
109		Where additional semantics apply to a function, the material is identified by use of the BAR
110		margin legend.
111	BE	<b>Batch Environment Services and Utilities</b>
112		The functionality described is optional.
113		Where applicable, utilities are marked with the BE margin legend in the SYNOPSIS section.
114		Where additional semantics apply to a utility, the material is identified by use of the BE margin
115		legend.
116	CD	<b>C-Language Development Utilities</b>
117		The functionality described is optional.
118		Where applicable, utilities are marked with the CD margin legend in the SYNOPSIS section.
119		Where additional semantics apply to a utility, the material is identified by use of the CD margin
120		legend.
121	CPT	<b>Process CPU-Time Clocks</b>
122		The functionality described is optional. The functionality described is also an extension to the
123		ISO C standard.
124		Where applicable, functions are marked with the CPT margin legend in the SYNOPSIS section.
125		Where additional semantics apply to a function, the material is identified by use of the CPT
126		margin legend.
127	CS	<b>Clock Selection</b>
128		The functionality described is optional. The functionality described is also an extension to the
129		ISO C standard.
130		Where applicable, functions are marked with the CS margin legend in the SYNOPSIS section.
131		Where additional semantics apply to a function, the material is identified by use of the CS
132		margin legend.
133	CX	<b>Extension to the ISO C standard</b>
134		The functionality described is an extension to the ISO C standard. Application writers may make
135		use of an extension as it is supported on all IEEE Std 1003.1-2001-conforming systems.
136		With each function or header from the ISO C standard, a statement to the effect that “any
137		conflict is unintentional” is included. That is intended to refer to a direct conflict.
138		IEEE Std 1003.1-2001 acts in part as a profile of the ISO C standard, and it may choose to further
139		constrain behaviors allowed to vary by the ISO C standard. Such limitations are not considered
140		conflicts.
141		Where additional semantics apply to a function or header, the material is identified by use of the
142		CX margin legend.
143	FD	<b>FORTRAN Development Utilities</b>
144		The functionality described is optional.
145		Where applicable, utilities are marked with the FD margin legend in the SYNOPSIS section.
146		Where additional semantics apply to a utility, the material is identified by use of the FD margin
147		legend.
148	FR	<b>FORTRAN Runtime Utilities</b>
149		The functionality described is optional.

150 Where applicable, utilities are marked with the FR margin legend in the SYNOPSIS section.  
151 Where additional semantics apply to a utility, the material is identified by use of the FR margin  
152 legend.

153 FSC **File Synchronization**

154 The functionality described is optional. The functionality described is also an extension to the  
155 ISO C standard.

156 Where applicable, functions are marked with the FSC margin legend in the SYNOPSIS section.  
157 Where additional semantics apply to a function, the material is identified by use of the FSC  
158 margin legend.

159 IP6 **IPV6**

160 The functionality described is optional. The functionality described is also an extension to the  
161 ISO C standard.

162 Where applicable, functions are marked with the IP6 margin legend in the SYNOPSIS section.  
163 Where additional semantics apply to a function, the material is identified by use of the IP6  
164 margin legend.

165 MC1 **Advisory Information and either Memory Mapped Files or Shared Memory Objects**

166 The functionality described is optional. The functionality described is also an extension to the  
167 ISO C standard.

168 This is a shorthand notation for combinations of multiple option codes.

169 Where applicable, functions are marked with the MC1 margin legend in the SYNOPSIS section.  
170 Where additional semantics apply to a function, the material is identified by use of the MC1  
171 margin legend.

172 Refer to the Base Definitions volume of IEEE Std 1003.1-2001, Section 1.5.2, Margin Code  
173 Notation.

174 MC2 **Memory Mapped Files, Shared Memory Objects, or Memory Protection**

175 The functionality described is optional. The functionality described is also an extension to the  
176 ISO C standard.

177 This is a shorthand notation for combinations of multiple option codes.

178 Where applicable, functions are marked with the MC2 margin legend in the SYNOPSIS section.  
179 Where additional semantics apply to a function, the material is identified by use of the MC2  
180 margin legend.

181 Refer to the Base Definitions volume of IEEE Std 1003.1-2001, Section 1.5.2, Margin Code  
182 Notation.

183 MF **Memory Mapped Files**

184 The functionality described is optional. The functionality described is also an extension to the  
185 ISO C standard.

186 Where applicable, functions are marked with the MF margin legend in the SYNOPSIS section.  
187 Where additional semantics apply to a function, the material is identified by use of the MF  
188 margin legend.

189 ML **Process Memory Locking**

190 The functionality described is optional. The functionality described is also an extension to the  
191 ISO C standard.

192 Where applicable, functions are marked with the ML margin legend in the SYNOPSIS section.  
193 Where additional semantics apply to a function, the material is identified by use of the ML

194 margin legend.

195 MLR **Range Memory Locking**  
196 The functionality described is optional. The functionality described is also an extension to the  
197 ISO C standard.

198 Where applicable, functions are marked with the MLR margin legend in the SYNOPSIS section.  
199 Where additional semantics apply to a function, the material is identified by use of the MLR  
200 margin legend.

201 MON **Monotonic Clock**  
202 The functionality described is optional. The functionality described is also an extension to the  
203 ISO C standard.

204 Where applicable, functions are marked with the MON margin legend in the SYNOPSIS section.  
205 Where additional semantics apply to a function, the material is identified by use of the MON  
206 margin legend.

207 MPR **Memory Protection**  
208 The functionality described is optional. The functionality described is also an extension to the  
209 ISO C standard.

210 Where applicable, functions are marked with the MPR margin legend in the SYNOPSIS section.  
211 Where additional semantics apply to a function, the material is identified by use of the MPR  
212 margin legend.

213 MSG **Message Passing**  
214 The functionality described is optional. The functionality described is also an extension to the  
215 ISO C standard.

216 Where applicable, functions are marked with the MSG margin legend in the SYNOPSIS section.  
217 Where additional semantics apply to a function, the material is identified by use of the MSG  
218 margin legend.

219 MX **IEC 60559 Floating-Point Option**  
220 The functionality described is optional. The functionality described is also an extension to the  
221 ISO C standard.

222 Where applicable, functions are marked with the MX margin legend in the SYNOPSIS section.  
223 Where additional semantics apply to a function, the material is identified by use of the MX  
224 margin legend.

225 OB **Obsolescent**  
226 The functionality described may be withdrawn in a future version of this volume of  
227 IEEE Std 1003.1-2001. Strictly Conforming POSIX Applications and Strictly Conforming XSI  
228 Applications shall not use obsolescent features.

229 Where applicable, the material is identified by use of the OB margin legend.

230 OF **Output Format Incompletely Specified**  
231 The functionality described is an XSI extension. The format of the output produced by the utility  
232 is not fully specified. It is therefore not possible to post-process this output in a consistent  
233 fashion. Typical problems include unknown length of strings and unspecified field delimiters.

234 Where applicable, the material is identified by use of the OF margin legend.

235 OH **Optional Header**  
236 In the SYNOPSIS section of some interfaces in the System Interfaces volume of  
237 IEEE Std 1003.1-2001 an included header is marked as in the following example:

238	OH	<code>#include &lt;sys/types.h&gt;</code>
239		<code>#include &lt;grp.h&gt;</code>
240		<code>struct group *getgrnam(const char *name);</code>
241		The OH margin legend indicates that the marked header is not required on XSI-conformant systems.
242		
243	PIO	<b>Prioritized Input and Output</b>
244		The functionality described is optional. The functionality described is also an extension to the ISO C standard.
245		
246		Where applicable, functions are marked with the PIO margin legend in the SYNOPSIS section.
247		Where additional semantics apply to a function, the material is identified by use of the PIO margin legend.
248		
249	PS	<b>Process Scheduling</b>
250		The functionality described is optional. The functionality described is also an extension to the ISO C standard.
251		
252		Where applicable, functions are marked with the PS margin legend in the SYNOPSIS section.
253		Where additional semantics apply to a function, the material is identified by use of the PS margin legend.
254		
255	RS	<b>Raw Sockets</b>
256		The functionality described is optional. The functionality described is also an extension to the ISO C standard.
257		
258		Where applicable, functions are marked with the RS margin legend in the SYNOPSIS section.
259		Where additional semantics apply to a function, the material is identified by use of the RS margin legend.
260		
261	RTS	<b>Realtime Signals Extension</b>
262		The functionality described is optional. The functionality described is also an extension to the ISO C standard.
263		
264		Where applicable, functions are marked with the RTS margin legend in the SYNOPSIS section.
265		Where additional semantics apply to a function, the material is identified by use of the RTS margin legend.
266		
267	SD	<b>Software Development Utilities</b>
268		The functionality described is optional.
269		Where applicable, utilities are marked with the SD margin legend in the SYNOPSIS section.
270		Where additional semantics apply to a utility, the material is identified by use of the SD margin legend.
271		
272	SEM	<b>Semaphores</b>
273		The functionality described is optional. The functionality described is also an extension to the ISO C standard.
274		
275		Where applicable, functions are marked with the SEM margin legend in the SYNOPSIS section.
276		Where additional semantics apply to a function, the material is identified by use of the SEM margin legend.
277		
278	SHM	<b>Shared Memory Objects</b>
279		The functionality described is optional. The functionality described is also an extension to the ISO C standard.
280		
281		Where applicable, functions are marked with the SHM margin legend in the SYNOPSIS section.
282		Where additional semantics apply to a function, the material is identified by use of the SHM

283 margin legend.

284 SIO **Synchronized Input and Output**  
285 The functionality described is optional. The functionality described is also an extension to the  
286 ISO C standard.

287 Where applicable, functions are marked with the SIO margin legend in the SYNOPSIS section.  
288 Where additional semantics apply to a function, the material is identified by use of the SIO  
289 margin legend.

290 SPI **Spin Locks**  
291 The functionality described is optional. The functionality described is also an extension to the  
292 ISO C standard.

293 Where applicable, functions are marked with the SPI margin legend in the SYNOPSIS section.  
294 Where additional semantics apply to a function, the material is identified by use of the SPI  
295 margin legend.

296 SPN **Spawn**  
297 The functionality described is optional. The functionality described is also an extension to the  
298 ISO C standard.

299 Where applicable, functions are marked with the SPN margin legend in the SYNOPSIS section.  
300 Where additional semantics apply to a function, the material is identified by use of the SPN  
301 margin legend.

302 SS **Process Sporadic Server**  
303 The functionality described is optional. The functionality described is also an extension to the  
304 ISO C standard.

305 Where applicable, functions are marked with the SS margin legend in the SYNOPSIS section.  
306 Where additional semantics apply to a function, the material is identified by use of the SS  
307 margin legend.

308 TCT **Thread CPU-Time Clocks**  
309 The functionality described is optional. The functionality described is also an extension to the  
310 ISO C standard.

311 Where applicable, functions are marked with the TCT margin legend in the SYNOPSIS section.  
312 Where additional semantics apply to a function, the material is identified by use of the TCT  
313 margin legend.

314 TEF **Trace Event Filter**  
315 The functionality described is optional. The functionality described is also an extension to the  
316 ISO C standard.

317 Where applicable, functions are marked with the TEF margin legend in the SYNOPSIS section.  
318 Where additional semantics apply to a function, the material is identified by use of the TEF  
319 margin legend.

320 THR **Threads**  
321 The functionality described is optional. The functionality described is also an extension to the  
322 ISO C standard.

323 Where applicable, functions are marked with the THR margin legend in the SYNOPSIS section.  
324 Where additional semantics apply to a function, the material is identified by use of the THR  
325 margin legend.

326 TMO **Timeouts**  
327 The functionality described is optional. The functionality described is also an extension to the

328 ISO C standard.

329 Where applicable, functions are marked with the TMO margin legend in the SYNOPSIS section.  
330 Where additional semantics apply to a function, the material is identified by use of the TMO  
331 margin legend.

332 TMR **Timers**  
333 The functionality described is optional. The functionality described is also an extension to the  
334 ISO C standard.

335 Where applicable, functions are marked with the TMR margin legend in the SYNOPSIS section.  
336 Where additional semantics apply to a function, the material is identified by use of the TMR  
337 margin legend.

338 TPI **Thread Priority Inheritance**  
339 The functionality described is optional. The functionality described is also an extension to the  
340 ISO C standard.

341 Where applicable, functions are marked with the TPI margin legend in the SYNOPSIS section.  
342 Where additional semantics apply to a function, the material is identified by use of the TPI  
343 margin legend.

344 TPP **Thread Priority Protection**  
345 The functionality described is optional. The functionality described is also an extension to the  
346 ISO C standard.

347 Where applicable, functions are marked with the TPP margin legend in the SYNOPSIS section.  
348 Where additional semantics apply to a function, the material is identified by use of the TPP  
349 margin legend.

350 TPS **Thread Execution Scheduling**  
351 The functionality described is optional. The functionality described is also an extension to the  
352 ISO C standard.

353 Where applicable, functions are marked with the TPS margin legend for the SYNOPSIS section.  
354 Where additional semantics apply to a function, the material is identified by use of the TPS  
355 margin legend.

356 TRC **Trace**  
357 The functionality described is optional. The functionality described is also an extension to the  
358 ISO C standard.

359 Where applicable, functions are marked with the TRC margin legend in the SYNOPSIS section.  
360 Where additional semantics apply to a function, the material is identified by use of the TRC  
361 margin legend.

362 TRI **Trace Inherit**  
363 The functionality described is optional. The functionality described is also an extension to the  
364 ISO C standard.

365 Where applicable, functions are marked with the TRI margin legend in the SYNOPSIS section.  
366 Where additional semantics apply to a function, the material is identified by use of the TRI  
367 margin legend.

368 TRL **Trace Log**  
369 The functionality described is optional. The functionality described is also an extension to the  
370 ISO C standard.

371 Where applicable, functions are marked with the TRL margin legend in the SYNOPSIS section.  
372 Where additional semantics apply to a function, the material is identified by use of the TRL

373 margin legend.

374 TSA **Thread Stack Address Attribute**  
375 The functionality described is optional. The functionality described is also an extension to the  
376 ISO C standard.

377 Where applicable, functions are marked with the TSA margin legend for the SYNOPSIS section.  
378 Where additional semantics apply to a function, the material is identified by use of the TSA  
379 margin legend.

380 TSF **Thread-Safe Functions**  
381 The functionality described is optional. The functionality described is also an extension to the  
382 ISO C standard.

383 Where applicable, functions are marked with the TSF margin legend in the SYNOPSIS section.  
384 Where additional semantics apply to a function, the material is identified by use of the TSF  
385 margin legend.

386 TSH **Thread Process-Shared Synchronization**  
387 The functionality described is optional. The functionality described is also an extension to the  
388 ISO C standard.

389 Where applicable, functions are marked with the TSH margin legend in the SYNOPSIS section.  
390 Where additional semantics apply to a function, the material is identified by use of the TSH  
391 margin legend.

392 TSP **Thread Sporadic Server**  
393 The functionality described is optional. The functionality described is also an extension to the  
394 ISO C standard.

395 Where applicable, functions are marked with the TSP margin legend in the SYNOPSIS section.  
396 Where additional semantics apply to a function, the material is identified by use of the TSP  
397 margin legend.

398 TSS **Thread Stack Address Size**  
399 The functionality described is optional. The functionality described is also an extension to the  
400 ISO C standard.

401 Where applicable, functions are marked with the TSS margin legend in the SYNOPSIS section.  
402 Where additional semantics apply to a function, the material is identified by use of the TSS  
403 margin legend.

404 TYM **Typed Memory Objects**  
405 The functionality described is optional. The functionality described is also an extension to the  
406 ISO C standard.

407 Where applicable, functions are marked with the TYM margin legend in the SYNOPSIS section.  
408 Where additional semantics apply to a function, the material is identified by use of the TYM  
409 margin legend.

410 UP **User Portability Utilities**  
411 The functionality described is optional.

412 Where applicable, utilities are marked with the UP margin legend in the SYNOPSIS section.  
413 Where additional semantics apply to a utility, the material is identified by use of the UP margin  
414 legend.

415 XSI **Extension**  
416 The functionality described is an XSI extension. Functionality marked XSI is also an extension to  
417 the ISO C standard. Application writers may confidently make use of an extension on all

418 systems supporting the X/Open System Interfaces Extension.  
 419 If an entire SYNOPSIS section is shaded and marked XSI, all the functionality described in that  
 420 reference page is an extension. See the Base Definitions volume of IEEE Std 1003.1-2001, Section  
 421 3.439, XSI.

422 XSR **XSI STREAMS**

423 The functionality described is optional. The functionality described is also an extension to the  
 424 ISO C standard.

425 Where applicable, functions are marked with the XSR margin legend in the SYNOPSIS section.  
 426 Where additional semantics apply to a function, the material is identified by use of the XSR  
 427 margin legend.

## 428 1.9 Format of Entries

429 The entries in Chapter 3 are based on a common format as follows. The only sections relating to  
 430 conformance are the SYNOPSIS, DESCRIPTION, RETURN VALUE, and ERRORS sections.

### 431 NAME

432 This section gives the name or names of the entry and briefly states its purpose.

### 433 SYNOPSIS

434 This section summarizes the use of the entry being described. If it is necessary to  
 435 include a header to use this function, the names of such headers are shown, for  
 436 example:

```
437 #include <stdio.h>
```

### 438 DESCRIPTION

439 This section describes the functionality of the function or header.

### 440 RETURN VALUE

441 This section indicates the possible return values, if any.

442 If the implementation can detect errors, “successful completion” means that no error  
 443 has been detected during execution of the function. If the implementation does detect  
 444 an error, the error is indicated.

445 For functions where no errors are defined, “successful completion” means that if the  
 446 implementation checks for errors, no error has been detected. If the implementation can  
 447 detect errors, and an error is detected, the indicated return value is returned and *errno*  
 448 may be set.

### 449 ERRORS

450 This section gives the symbolic names of the error values returned by a function or  
 451 stored into a variable accessed through the symbol *errno* if an error occurs.

452 “No errors are defined” means that error values returned by a function or stored into a  
 453 variable accessed through the symbol *errno*, if any, depend on the implementation.

### 454 EXAMPLES

455 This section is informative.

456 This section gives examples of usage, where appropriate. In the event of conflict  
 457 between an example and a normative part of this volume of IEEE Std 1003.1-2001, the  
 458 normative material is to be taken as correct.

**459 APPLICATION USAGE**

460 This section is informative.

461 This section gives warnings and advice to application writers about the entry. In the  
462 event of conflict between warnings and advice and a normative part of this volume of  
463 IEEE Std 1003.1-2001, the normative material is to be taken as correct.

**464 RATIONALE**

465 This section is informative.

466 This section contains historical information concerning the contents of this volume of  
467 IEEE Std 1003.1-2001 and why features were included or discarded by the standard  
468 developers.

**469 FUTURE DIRECTIONS**

470 This section is informative.

471 This section provides comments which should be used as a guide to current thinking;  
472 there is not necessarily a commitment to adopt these future directions.

**473 SEE ALSO**

474 This section is informative.

475 This section gives references to related information.

**476 CHANGE HISTORY**

477 This section is informative.

478 This section shows the derivation of the entry and any significant changes that have  
479 been made to it.

# General Information

480

481 This chapter covers information that is relevant to all the functions specified in Chapter 3 and  
482 the Base Definitions volume of IEEE Std 1003.1-2001, Chapter 13, Headers.

## 483 2.1 Use and Implementation of Functions

484 Each of the following statements shall apply unless explicitly stated otherwise in the detailed  
485 descriptions that follow:

- 486 1. If an argument to a function has an invalid value (such as a value outside the domain of  
487 the function, or a pointer outside the address space of the program, or a null pointer), the  
488 behavior is undefined.
- 489 2. Any function declared in a header may also be implemented as a macro defined in the  
490 header, so a function should not be declared explicitly if its header is included. Any macro  
491 definition of a function can be suppressed locally by enclosing the name of the function in  
492 parentheses, because the name is then not followed by the left parenthesis that indicates  
493 expansion of a macro function name. For the same syntactic reason, it is permitted to take  
494 the address of a function even if it is also defined as a macro. The use of the C-language  
495 **#undef** construct to remove any such macro definition shall also ensure that an actual  
496 function is referred to.
- 497 3. Any invocation of a function that is implemented as a macro shall expand to code that  
498 evaluates each of its arguments exactly once, fully protected by parentheses where  
499 necessary, so it is generally safe to use arbitrary expressions as arguments. Likewise, those  
500 function-like macros described in the following sections may be invoked in an expression  
501 anywhere a function with a compatible return type could be called.
- 502 4. Provided that a function can be declared without reference to any type defined in a header,  
503 it is also permissible to declare the function explicitly and use it without including its  
504 associated header.
- 505 5. If a function that accepts a variable number of arguments is not declared (explicitly or by  
506 including its associated header), the behavior is undefined.

## 507 2.2 The Compilation Environment

### 508 2.2.1 POSIX.1 Symbols

509 Certain symbols in this volume of IEEE Std 1003.1-2001 are defined in headers (see the Base  
510 Definitions volume of IEEE Std 1003.1-2001, Chapter 13, Headers). Some of those headers could  
511 also define symbols other than those defined by IEEE Std 1003.1-2001, potentially conflicting  
512 with symbols used by the application. Also, IEEE Std 1003.1-2001 defines symbols that are not  
513 permitted by other standards to appear in those headers without some control on the visibility  
514 of those symbols.

515 Symbols called “feature test macros” are used to control the visibility of symbols that might be  
516 included in a header. Implementations, future versions of IEEE Std 1003.1-2001, and other  
517 standards may define additional feature test macros.

518 In the compilation of an application that **#defines** a feature test macro specified by  
 519 IEEE Std 1003.1-2001, no header defined by IEEE Std 1003.1-2001 shall be included prior to the  
 520 definition of the feature test macro. This restriction also applies to any implementation-  
 521 provided header in which these feature test macros are used. If the definition of the macro does  
 522 not precede the **#include**, the result is undefined.

523 Feature test macros shall begin with the underscore character ('\_').

#### 524 2.2.1.1 *The `_POSIX_C_SOURCE` Feature Test Macro*

525 A POSIX-conforming application should ensure that the feature test macro `_POSIX_C_SOURCE`  
 526 is defined before inclusion of any header.

527 When an application includes a header described by IEEE Std 1003.1-2001, and when this feature  
 528 test macro is defined to have the value 200112L:

- 529 1. All symbols required by IEEE Std 1003.1-2001 to appear when the header is included shall  
 530 be made visible.
- 531 2. Symbols that are explicitly permitted, but not required, by IEEE Std 1003.1-2001 to appear  
 532 in that header (including those in reserved name spaces) may be made visible.
- 533 3. Additional symbols not required or explicitly permitted by IEEE Std 1003.1-2001 to be in  
 534 that header shall not be made visible, except when enabled by another feature test macro.

535 Identifiers in IEEE Std 1003.1-2001 may only be undefined using the **#undef** directive as  
 536 described in Section 2.1 (on page 13) or Section 2.2.2. These **#undef** directives shall follow all  
 537 **#include** directives of any header in IEEE Std 1003.1-2001.

538 **Note:** The POSIX.1-1990 standard specified a macro called `_POSIX_SOURCE`. This has been  
 539 superseded by `_POSIX_C_SOURCE`.

#### 540 2.2.1.2 *The `_XOPEN_SOURCE` Feature Test Macro*

541 XSI An XSI-conforming application should ensure that the feature test macro `_XOPEN_SOURCE` is  
 542 defined with the value 600 before inclusion of any header. This is needed to enable the  
 543 functionality described in Section 2.2.1.1 and in addition to enable the XSI extension.

544 Since this volume of IEEE Std 1003.1-2001 is aligned with the ISO C standard, and since all  
 545 functionality enabled by `_POSIX_C_SOURCE` set equal to 200112L is enabled by  
 546 `_XOPEN_SOURCE` set equal to 600, there should be no need to define `_POSIX_C_SOURCE` if  
 547 `_XOPEN_SOURCE` is so defined. Therefore, if `_XOPEN_SOURCE` is set equal to 600 and  
 548 `_POSIX_C_SOURCE` is set equal to 200112L, the behavior is the same as if only  
 549 `_XOPEN_SOURCE` is defined and set equal to 600. However, should `_POSIX_C_SOURCE` be set  
 550 to a value greater than 200112L, the behavior is unspecified.

### 551 2.2.2 The Name Space

552 All identifiers in this volume of IEEE Std 1003.1-2001, except *environ*, are defined in at least one  
 553 of the headers, as shown in the Base Definitions volume of IEEE Std 1003.1-2001, Chapter 13,  
 554 XSI Headers. When `_XOPEN_SOURCE` or `_POSIX_C_SOURCE` is defined, each header defines or  
 555 declares some identifiers, potentially conflicting with identifiers used by the application. The set  
 556 of identifiers visible to the application consists of precisely those identifiers from the header  
 557 pages of the included headers, as well as additional identifiers reserved for the implementation.  
 558 In addition, some headers may make visible identifiers from other headers as indicated on the  
 559 relevant header pages.

560 Implementations may also add members to a structure or union without controlling the  
561 visibility of those members with a feature test macro, as long as a user-defined macro with the  
562 same name cannot interfere with the correct interpretation of the program. The identifiers  
563 reserved for use by the implementation are described below:

- 564 1. Each identifier with external linkage described in the header section is reserved for use as  
565 an identifier with external linkage if the header is included.
- 566 2. Each macro described in the header section is reserved for any use if the header is  
567 included.
- 568 3. Each identifier with file scope described in the header section is reserved for use as an  
569 identifier with file scope in the same name space if the header is included.

570 The prefixes `posix_`, `POSIX_`, and `_POSIX_` are reserved for use by IEEE Std 1003.1-2001 and  
571 other POSIX standards. Implementations may add symbols to the headers shown in the  
572 following table, provided the identifiers for those symbols begin with the corresponding  
573 reserved prefixes in the following table, and do not use the reserved prefixes `posix_`, `POSIX_`, or  
574 `_POSIX_`.

687	<wordexp.h>	WRDE_

688 **Note:** The notation [0–9] indicates any digit. The notation [A–Z] indicates any uppercase letter in the  
689 portable character set. The notation [0–9a–z\_] indicates any digit, any lowercase letter in the  
690 portable character set, or underscore.

691 The following reserved names are used as exact matches for <termios.h>:

692	XSI	CBAUD	EXTB	VDSUSP
693		DEFECHO	FLUSHO	VLNEXT
694		ECHOCTL	LOBLK	VREPRINT
695		ECHOKE	PENDIN	VSTATUS
696		ECHOPRT	SWTCH	VWERASE
697		EXTA	VDISCARD	

698 The following identifiers are reserved regardless of the inclusion of headers:

- 699 1. All identifiers that begin with an underscore and either an uppercase letter or another  
700 underscore are always reserved for any use by the implementation.
- 701 2. All identifiers that begin with an underscore are always reserved for use as identifiers with  
702 file scope in both the ordinary identifier and tag name spaces.
- 703 3. All identifiers in the table below are reserved for use as identifiers with external linkage.  
704 Some of these identifiers do not appear in this volume of IEEE Std 1003.1-2001, but are  
705 reserved for future use by the ISO C standard.

789	cerfl	fabs	lgammaf	roundl	

790 **Note:** The notation [a-z] indicates any lowercase letter in the portable character set. The  
 791 notation '\*' indicates any combination of digits, letters in the portable character set, or  
 792 underscore.

793 4. All functions and external identifiers defined in the Base Definitions volume of  
 794 IEEE Std 1003.1-2001, Chapter 13, Headers are reserved for use as identifiers with external  
 795 linkage.

796           5. All the identifiers defined in this volume of IEEE Std 1003.1-2001 that have external linkage  
797           are always reserved for use as identifiers with external linkage.

798           No other identifiers are reserved.

799           Applications shall not declare or define identifiers with the same name as an identifier reserved  
800           in the same context. Since macro names are replaced whenever found, independent of scope and  
801           name space, macro names matching any of the reserved identifier names shall not be defined by  
802           an application if any associated header is included.

803           Except that the effect of each inclusion of `<assert.h>` depends on the definition of `NDEBUG`,  
804           headers may be included in any order, and each may be included more than once in a given  
805           scope, with no difference in effect from that of being included only once.

806           If used, the application shall ensure that a header is included outside of any external declaration  
807           or definition, and it shall be first included before the first reference to any type or macro it  
808           defines, or to any function or object it declares. However, if an identifier is declared or defined in  
809           more than one header, the second and subsequent associated headers may be included after the  
810           initial reference to the identifier. Prior to the inclusion of a header, the application shall not  
811           define any macros with names lexically identical to symbols defined by that header.

## 812   **2.3 Error Numbers**

813           Most functions can provide an error number. The means by which each function provides its  
814           error numbers is specified in its description.

815           Some functions provide the error number in a variable accessed through the symbol *errno*. The  
816           symbol *errno*, defined by including the `<errno.h>` header, expands to a modifiable lvalue of type  
817           **int**. It is unspecified whether *errno* is a macro or an identifier declared with external linkage. If a  
818           macro definition is suppressed in order to access an actual object, or a program defines an  
819           identifier with the name *errno*, the behavior is undefined.

820           The value of *errno* should only be examined when it is indicated to be valid by a function's return  
821           value. No function in this volume of IEEE Std 1003.1-2001 shall set *errno* to zero. For each thread  
822           of a process, the value of *errno* shall not be affected by function calls or assignments to *errno* by  
823           other threads.

824           Some functions return an error number directly as the function value. These functions return a  
825           value of zero to indicate success.

826           If more than one error occurs in processing a function call, any one of the possible errors may be  
827           returned, as the order of detection is undefined.

828           Implementations may support additional errors not included in this list, may generate errors  
829           included in this list under circumstances other than those described here, or may contain  
830           extensions or limitations that prevent some errors from occurring. The ERRORS section on each  
831           reference page specifies whether an error shall be returned, or whether it may be returned.  
832           Implementations shall not generate a different error number from the ones described here for  
833           error conditions described in this volume of IEEE Std 1003.1-2001, but may generate additional  
834           errors unless explicitly disallowed for a particular function.

835           Each implementation shall document, in the conformance document, situations in which each of  
836           the optional conditions defined in IEEE Std 1003.1-2001 is detected. The conformance document  
837           may also contain statements that one or more of the optional error conditions are not detected.

838           For functions under the Threads option for which [EINTR] is not listed as a possible error  
839           condition in this volume of IEEE Std 1003.1-2001, an implementation shall not return an error

840		code of [EINTR].
841		The following symbolic names identify the possible error numbers, in the context of the
842		functions specifically defined in this volume of IEEE Std 1003.1-2001; these general descriptions
843		are more precisely defined in the ERRORS sections of the functions that return them. Only these
844		symbolic names should be used in programs, since the actual value of the error number is
845		unspecified. All values listed in this section shall be unique integer constant expressions with
846		type <b>int</b> suitable for use in <b>#if</b> preprocessing directives, except as noted below. The values for all
847		these names shall be found in the <b>&lt;errno.h&gt;</b> header defined in the Base Definitions volume of
848		IEEE Std 1003.1-2001. The actual values are unspecified by this volume of IEEE Std 1003.1-2001.
849		[E2BIG]
850		Argument list too long. The sum of the number of bytes used by the new process image's
851		argument list and environment list is greater than the system-imposed limit of {ARG_MAX}
852		bytes.
853		or:
854		Lack of space in an output buffer.
855		or:
856		Argument is greater than the system-imposed maximum.
857		[EACCES]
858		Permission denied. An attempt was made to access a file in a way forbidden by its file
859		access permissions.
860		[EADDRINUSE]
861		Address in use. The specified address is in use.
862		[EADDRNOTAVAIL]
863		Address not available. The specified address is not available from the local system.
864		[EAFNOSUPPORT]
865		Address family not supported. The implementation does not support the specified address
866		family, or the specified address is not a valid address for the address family of the specified
867		socket.
868		[EAGAIN]
869		Resource temporarily unavailable. This is a temporary condition and later calls to the same
870		routine may complete normally.
871		[EALREADY]
872		Connection already in progress. A connection request is already in progress for the specified
873		socket.
874		[EBADF]
875		Bad file descriptor. A file descriptor argument is out of range, refers to no open file, or a
876		read (write) request is made to a file that is only open for writing (reading).
877		[EBADMSG]
878	XS	Bad message. During a <i>read()</i> , <i>getmsg()</i> , <i>getpmsg()</i> , or <i>ioctl()</i> I_RECVFD request to a
879		STREAMS device, a message arrived at the head of the STREAM that is inappropriate for
880		the function receiving the message.
881		<i>read()</i> Message waiting to be read on a STREAM is not a data message.
882		<i>getmsg()</i> or <i>getpmsg()</i>
883		A file descriptor was received instead of a control message.

884	<code>ioctl()</code>	Control or data information was received instead of a file descriptor when
885		<code>I_RECVFD</code> was specified.
886		or:
887		Bad Message. The implementation has detected a corrupted message.
888	[EBUSY]	
889		Resource busy. An attempt was made to make use of a system resource that is not currently
890		available, as it is being used by another process in a manner that would have conflicted with
891		the request being made by this process.
892	[ECANCELED]	
893		Operation canceled. The associated asynchronous operation was canceled before
894		completion.
895	[ECHILD]	
896		No child process. A <code>wait()</code> or <code>waitpid()</code> function was executed by a process that had no
897		existing or unwaited-for child process.
898	[ECONNABORTED]	
899		Connection aborted. The connection has been aborted.
900	[ECONNREFUSED]	
901		Connection refused. An attempt to connect to a socket was refused because there was no
902		process listening or because the queue of connection requests was full and the underlying
903		protocol does not support retransmissions.
904	[ECONNRESET]	
905		Connection reset. The connection was forcibly closed by the peer.
906	[EDEADLK]	
907		Resource deadlock would occur. An attempt was made to lock a system resource that
908		would have resulted in a deadlock situation.
909	[EDESTADDRREQ]	
910		Destination address required. No bind address was established.
911	[EDOM]	
912		Domain error. An input argument is outside the defined domain of the mathematical
913		function (defined in the ISO C standard).
914	[EDQUOT]	
915		Reserved.
916	[EEXIST]	
917		File exists. An existing file was mentioned in an inappropriate context; for example, as a
918		new link name in the <code>link()</code> function.
919	[EFAULT]	
920		Bad address. The system detected an invalid address in attempting to use an argument of a
921		call. The reliable detection of this error cannot be guaranteed, and when not detected may
922		result in the generation of a signal, indicating an address violation, which is sent to the
923		process.
924	[EFBIG]	
925		File too large. The size of a file would exceed the maximum file size of an implementation or
926		offset maximum established in the corresponding file description.

927	[EHOSTUNREACH]
928	Host is unreachable. The destination host cannot be reached (probably because the host is
929	down or a remote router cannot reach it).
930	[EIDRM]
931	Identifier removed. Returned during XSI interprocess communication if an identifier has
932	been removed from the system.
933	[EILSEQ]
934	Illegal byte sequence. A wide-character code has been detected that does not correspond to
935	a valid character, or a byte sequence does not form a valid wide-character code (defined in
936	the ISO C standard).
937	[EINPROGRESS]
938	Operation in progress. This code is used to indicate that an asynchronous operation has not
939	yet completed.
940	or:
941	O_NONBLOCK is set for the socket file descriptor and the connection cannot be
942	immediately established.
943	[EINTR]
944	Interrupted function call. An asynchronous signal was caught by the process during the
945	execution of an interruptible function. If the signal handler performs a normal return, the
946	interrupted function call may return this condition (see the Base Definitions volume of
947	IEEE Std 1003.1-2001, <signal.h>).
948	[EINVAL]
949	Invalid argument. Some invalid argument was supplied; for example, specifying an
950	undefined signal in a <i>signal()</i> function or a <i>kill()</i> function.
951	[EIO]
952	Input/output error. Some physical input or output error has occurred. This error may be
953	reported on a subsequent operation on the same file descriptor. Any other error-causing
954	operation on the same file descriptor may cause the [EIO] error indication to be lost.
955	[EISCONN]
956	Socket is connected. The specified socket is already connected.
957	[EISDIR]
958	Is a directory. An attempt was made to open a directory with write mode specified.
959	[ELOOP]
960	Symbolic link loop. A loop exists in symbolic links encountered during pathname
961	resolution. This error may also be returned if more than {SYMLOOP_MAX} symbolic links
962	are encountered during pathname resolution.
963	[EMFILE]
964	Too many open files. An attempt was made to open more than the maximum number of file
965	descriptors allowed in this process.
966	[EMLINK]
967	Too many links. An attempt was made to have the link count of a single file exceed
968	{LINK_MAX}.
969	[EMSGSIZE]
970	Message too large. A message sent on a transport provider was larger than an internal
971	message buffer or some other network limit.

972	or:
973	Inappropriate message buffer length.
974	[EMULTIHOP]
975	Reserved.
976	[ENAMETOOLONG]
977	Filename too long. The length of a pathname exceeds {PATH_MAX}, or a pathname
978	component is longer than {NAME_MAX}. This error may also occur when pathname
979	substitution, as a result of encountering a symbolic link during pathname resolution, results
980	in a pathname string the size of which exceeds {PATH_MAX}.
981	[ENETDOWN]
982	Network is down. The local network interface used to reach the destination is down.
983	[ENETRESET]
984	The connection was aborted by the network.
985	[ENETUNREACH]
986	Network unreachable. No route to the network is present.
987	[ENFILE]
988	Too many files open in system. Too many files are currently open in the system. The system
989	has reached its predefined limit for simultaneously open files and temporarily cannot accept
990	requests to open another one.
991	[ENOBUFS]
992	No buffer space available. Insufficient buffer resources were available in the system to
993	perform the socket operation.
994	XSR [ENODATA]
995	No message available. No message is available on the STREAM head read queue.
996	[ENODEV]
997	No such device. An attempt was made to apply an inappropriate function to a device; for
998	example, trying to read a write-only device such as a printer.
999	[ENOENT]
1000	No such file or directory. A component of a specified pathname does not exist, or the
1001	pathname is an empty string.
1002	[ENOEXEC]
1003	Executable file format error. A request is made to execute a file that, although it has the
1004	appropriate permissions, is not in the format required by the implementation for executable
1005	files.
1006	[ENOLCK]
1007	No locks available. A system-imposed limit on the number of simultaneous file and record
1008	locks has been reached and no more are currently available.
1009	[ENOLINK]
1010	Reserved.
1011	[ENOMEM]
1012	Not enough space. The new process image requires more memory than is allowed by the
1013	hardware or system-imposed memory management constraints.
1014	[ENOMSG]
1015	No message of the desired type. The message queue does not contain a message of the

1016		required type during XSI interprocess communication.
1017		[ENOPROTOOPT]
1018		Protocol not available. The protocol option specified to <i>setsockopt()</i> is not supported by the
1019		implementation.
1020		[ENOSPC]
1021		No space left on a device. During the <i>write()</i> function on a regular file or when extending a
1022		directory, there is no free space left on the device.
1023	XSR	[ENOSR]
1024		No STREAM resources. Insufficient STREAMS memory resources are available to perform a
1025		STREAMS-related function. This is a temporary condition; it may be recovered from if other
1026		processes release resources.
1027	XSR	[ENOSTR]
1028		Not a STREAM. A STREAM function was attempted on a file descriptor that was not
1029		associated with a STREAMS device.
1030		[ENOSYS]
1031		Function not implemented. An attempt was made to use a function that is not available in
1032		this implementation.
1033		[ENOTCONN]
1034		Socket not connected. The socket is not connected.
1035		[ENOTDIR]
1036		Not a directory. A component of the specified pathname exists, but it is not a directory,
1037		when a directory was expected.
1038		[ENOTEMPTY]
1039		Directory not empty. A directory other than an empty directory was supplied when an
1040		empty directory was expected.
1041		[ENOTSOCK]
1042		Not a socket. The file descriptor does not refer to a socket.
1043		[ENOTSUP]
1044		Not supported. The implementation does not support this feature of the Realtime Option
1045		Group.
1046		[ENOTTY]
1047		Inappropriate I/O control operation. A control function has been attempted for a file or
1048		special file for which the operation is inappropriate.
1049		[ENXIO]
1050		No such device or address. Input or output on a special file refers to a device that does not
1051		exist, or makes a request beyond the capabilities of the device. It may also occur when, for
1052		example, a tape drive is not on-line.
1053		[EOPNOTSUPP]
1054		Operation not supported on socket. The type of socket (address family or protocol) does not
1055		support the requested operation.
1056		[EOVERFLOW]
1057		Value too large to be stored in data type. An operation was attempted which would
1058		generate a value that is outside the range of values that can be represented in the relevant
1059		data type or that are allowed for a given data item.

1060	[EPERM]
1061	Operation not permitted. An attempt was made to perform an operation limited to
1062	processes with appropriate privileges or to the owner of a file or other resource.
1063	[EPIPE]
1064	Broken pipe. A write was attempted on a socket, pipe, or FIFO for which there is no process
1065	to read the data.
1066	[EPROTO]
1067	Protocol error. Some protocol error occurred. This error is device-specific, but is generally
1068	not related to a hardware failure.
1069	[EPROTONOSUPPORT]
1070	Protocol not supported. The protocol is not supported by the address family, or the protocol
1071	is not supported by the implementation.
1072	[EPROTOTYPE]
1073	Protocol wrong type for socket. The socket type is not supported by the protocol.
1074	[ERANGE]
1075	Result too large or too small. The result of the function is too large (overflow) or too small
1076	(underflow) to be represented in the available space (defined in the ISO C standard).
1077	[EROFS]
1078	Read-only file system. An attempt was made to modify a file or directory on a file system
1079	that is read-only.
1080	[ESPIPE]
1081	Invalid seek. An attempt was made to access the file offset associated with a pipe or FIFO.
1082	[ESRCH]
1083	No such process. No process can be found corresponding to that specified by the given
1084	process ID.
1085	[ESTALE]
1086	Reserved.
1087	XSR [ETIME]
1088	STREAM <i>ioctl()</i> timeout. The timer set for a STREAMS <i>ioctl()</i> call has expired. The cause of
1089	this error is device-specific and could indicate either a hardware or software failure, or a
1090	timeout value that is too short for the specific operation. The status of the <i>ioctl()</i> operation
1091	is unspecified.
1092	[ETIMEDOUT]
1093	Connection timed out. The connection to a remote machine has timed out. If the connection
1094	timed out during execution of the function that reported this error (as opposed to timing
1095	out prior to the function being called), it is unspecified whether the function has completed
1096	some or all of the documented behavior associated with a successful completion of the
1097	function.
1098	or:
1099	Operation timed out. The time limit associated with the operation was exceeded before the
1100	operation completed.
1101	[ETXTBSY]
1102	Text file busy. An attempt was made to execute a pure-procedure program that is currently
1103	open for writing, or an attempt has been made to open for writing a pure-procedure
1104	program that is being executed.

1105 [EWOULDBLOCK]  
 1106 Operation would block. An operation on a socket marked as non-blocking has encountered  
 1107 a situation such as no data available that otherwise would have caused the function to  
 1108 suspend execution.

1109 A conforming implementation may assign the same values for [EWOULDBLOCK] and  
 1110 [EAGAIN].

1111 [EXDEV]  
 1112 Improper link. A link to a file on another file system was attempted.

### 1113 2.3.1 Additional Error Numbers

1114 Additional implementation-defined error numbers may be defined in `<errno.h>`.

## 1115 2.4 Signal Concepts

### 1116 2.4.1 Signal Generation and Delivery

1117 A signal is said to be “generated” for (or sent to) a process or thread when the event that causes  
 1118 the signal first occurs. Examples of such events include detection of hardware faults, timer  
 1119 RTS expiration, signals generated via the `sigevent` structure and terminal activity, as well as  
 1120 RTS invocations of the `kill()` and `sigqueue()` functions. In some circumstances, the same event  
 1121 generates signals for multiple processes.

1122 At the time of generation, a determination shall be made whether the signal has been generated  
 1123 for the process or for a specific thread within the process. Signals which are generated by some  
 1124 action attributable to a particular thread, such as a hardware fault, shall be generated for the  
 1125 thread that caused the signal to be generated. Signals that are generated in association with a  
 1126 process ID or process group ID or an asynchronous event, such as terminal activity, shall be  
 1127 generated for the process.

1128 Each process has an action to be taken in response to each signal defined by the system (see  
 1129 Section 2.4.3 (on page 31)). A signal is said to be “delivered” to a process when the appropriate  
 1130 action for the process and signal is taken. A signal is said to be “accepted” by a process when the  
 1131 signal is selected and returned by one of the `sigwait()` functions.

1132 During the time between the generation of a signal and its delivery or acceptance, the signal is  
 1133 said to be “pending”. Ordinarily, this interval cannot be detected by an application. However, a  
 1134 signal can be “blocked” from delivery to a thread. If the action associated with a blocked signal  
 1135 is anything other than to ignore the signal, and if that signal is generated for the thread, the  
 1136 signal shall remain pending until it is unblocked, it is accepted when it is selected and returned  
 1137 by a call to the `sigwait()` function, or the action associated with it is set to ignore the signal.  
 1138 Signals generated for the process shall be delivered to exactly one of those threads within the  
 1139 process which is in a call to a `sigwait()` function selecting that signal or has not blocked delivery  
 1140 of the signal. If there are no threads in a call to a `sigwait()` function selecting that signal, and if all  
 1141 threads within the process block delivery of the signal, the signal shall remain pending on the  
 1142 process until a thread calls a `sigwait()` function selecting that signal, a thread unblocks delivery  
 1143 of the signal, or the action associated with the signal is set to ignore the signal. If the action  
 1144 associated with a blocked signal is to ignore the signal and if that signal is generated for the  
 1145 process, it is unspecified whether the signal is discarded immediately upon generation or  
 1146 remains pending.

1147 Each thread has a “signal mask” that defines the set of signals currently blocked from delivery  
 1148 to it. The signal mask for a thread shall be initialized from that of its parent or creating thread,  
 1149 or from the corresponding thread in the parent process if the thread was created as the result of a  
 1150 call to *fork()*. The *pthread\_sigmask()*, *sigaction()*, *sigprocmask()*, and *sigsuspend()* functions control  
 1151 the manipulation of the signal mask.

1152 The determination of which action is taken in response to a signal is made at the time the signal  
 1153 is delivered, allowing for any changes since the time of generation. This determination is  
 1154 independent of the means by which the signal was originally generated. If a subsequent  
 1155 occurrence of a pending signal is generated, it is implementation-defined as to whether the  
 1156 RTS signal is delivered or accepted more than once in circumstances other than those in which  
 1157 queuing is required under the Realtime Signals Extension option. The order in which multiple,  
 1158 simultaneously pending signals outside the range SIGRTMIN to SIGRTMAX are delivered to or  
 1159 accepted by a process is unspecified.

1160 When any stop signal (SIGSTOP, SIGTSTP, SIGTTIN, SIGTTOU) is generated for a process, any  
 1161 pending SIGCONT signals for that process shall be discarded. Conversely, when SIGCONT is  
 1162 generated for a process, all pending stop signals for that process shall be discarded. When  
 1163 SIGCONT is generated for a process that is stopped, the process shall be continued, even if the  
 1164 SIGCONT signal is blocked or ignored. If SIGCONT is blocked and not ignored, it shall remain  
 1165 pending until it is either unblocked or a stop signal is generated for the process.

1166 An implementation shall document any condition not specified by this volume of  
 1167 IEEE Std 1003.1-2001 under which the implementation generates signals.

## 1168 2.4.2 Realtime Signal Generation and Delivery

1169 RTS This section describes extensions to support realtime signal generation and delivery. This  
 1170 functionality is dependent on support of the Realtime Signals Extension option (and the rest of  
 1171 this section is not further shaded for this option).

1172 Some signal-generating functions, such as high-resolution timer expiration, asynchronous I/O  
 1173 completion, interprocess message arrival, and the *sigqueue()* function, support the specification  
 1174 of an application-defined value, either explicitly as a parameter to the function or in a **sigevent**  
 1175 structure parameter. The **sigevent** structure is defined in `<signal.h>` and contains at least the  
 1176 following members:

1177

Member Type	Member Name	Description
<b>int</b>	<i>sigev_notify</i>	Notification type.
<b>int</b>	<i>sigev_signo</i>	Signal number.
<b>union signal</b>	<i>sigev_value</i>	Signal value.
<b>void*(*) (unsigned signal)</b>	<i>sigev_notify_function</i>	Notification function.
<b>(pthread_attr_t*)</b>	<i>sigev_notify_attributes</i>	Notification attributes.

1184 The *sigev\_notify* member specifies the notification mechanism to use when an asynchronous  
 1185 event occurs. This volume of IEEE Std 1003.1-2001 defines the following values for the  
 1186 *sigev\_notify* member:

1187 SIGEV\_NONE No asynchronous notification shall be delivered when the event of  
 1188 interest occurs.

1189 SIGEV\_SIGNAL The signal specified in *sigev\_signo* shall be generated for the process when  
 1190 the event of interest occurs. If the implementation supports the Realtime  
 1191 Signals Extension option and if the SA\_SIGINFO flag is set for that signal  
 1192 number, then the signal shall be queued to the process and the value

1193 specified in *sigev\_value* shall be the *si\_value* component of the generated  
 1194 signal. If SA\_SIGINFO is not set for that signal number, it is unspecified  
 1195 whether the signal is queued and what value, if any, is sent.

1196 SIGEV\_THREAD A notification function shall be called to perform notification.

1197 An implementation may define additional notification mechanisms.

1198 The *sigev\_signo* member specifies the signal to be generated. The *sigev\_value* member is the  
 1199 application-defined value to be passed to the signal-catching function at the time of the signal  
 1200 delivery or to be returned at signal acceptance as the *si\_value* member of the **siginfo\_t** structure.

1201 The **signal** union is defined in <signal.h> and contains at least the following members:

1202

1203

1204

1205

Member Type	Member Name	Description
<b>int</b>	<i>sival_int</i>	Integer signal value.
<b>void*</b>	<i>sival_ptr</i>	Pointer signal value.

1206 The *sival\_int* member shall be used when the application-defined value is of type **int**; the  
 1207 *sival\_ptr* member shall be used when the application-defined value is a pointer.

1208 When a signal is generated by the *sigqueue()* function or any signal-generating function that  
 1209 supports the specification of an application-defined value, the signal shall be marked pending  
 1210 and, if the SA\_SIGINFO flag is set for that signal, the signal shall be queued to the process along  
 1211 with the application-specified signal value. Multiple occurrences of signals so generated are  
 1212 queued in FIFO order. It is unspecified whether signals so generated are queued when the  
 1213 SA\_SIGINFO flag is not set for that signal.

1214 Signals generated by the *kill()* function or other events that cause signals to occur, such as  
 1215 detection of hardware faults, *alarm()* timer expiration, or terminal activity, and for which the  
 1216 implementation does not support queuing, shall have no effect on signals already queued for the  
 1217 same signal number.

1218 When multiple unblocked signals, all in the range SIGRTMIN to SIGRTMAX, are pending, the  
 1219 behavior shall be as if the implementation delivers the pending unblocked signal with the lowest  
 1220 signal number within that range. No other ordering of signal delivery is specified.

1221 If, when a pending signal is delivered, there are additional signals queued to that signal number,  
 1222 the signal shall remain pending. Otherwise, the pending indication shall be reset.

1223 Multi-threaded programs can use an alternate event notification mechanism. When a  
 1224 notification is processed, and the *sigev\_notify* member of the **sigevent** structure has the value  
 1225 SIGEV\_THREAD, the function *sigev\_notify\_function* is called with parameter *sigev\_value*.

1226 The function shall be executed in an environment as if it were the *start\_routine* for a newly  
 1227 created thread with thread attributes specified by *sigev\_notify\_attributes*. If *sigev\_notify\_attributes*  
 1228 is NULL, the behavior shall be as if the thread were created with the *detachstate* attribute set to  
 1229 PTHREAD\_CREATE\_DETACHED. Supplying an attributes structure with a *detachstate* attribute  
 1230 of PTHREAD\_CREATE\_JOINABLE results in undefined behavior. The signal mask of this  
 1231 thread is implementation-defined.

1232 **2.4.3 Signal Actions**

1233 There are three types of action that can be associated with a signal: SIG\_DFL, SIG\_IGN, or a  
 1234 pointer to a function. Initially, all signals shall be set to SIG\_DFL or SIG\_IGN prior to entry of  
 1235 the *main()* routine (see the *exec* functions). The actions prescribed by these values are as follows:

1236 SIG\_DFL Signal-specific default action.

1237 The default actions for the signals defined in this volume of IEEE Std 1003.1-2001  
 1238 RTS are specified under `<signal.h>`. If the Realtime Signals Extension option is  
 1239 supported, the default actions for the realtime signals in the range SIGRTMIN to  
 1240 SIGRTMAX shall be to terminate the process abnormally.

1241 If the default action is to stop the process, the execution of that process is  
 1242 temporarily suspended. When a process stops, a SIGCHLD signal shall be  
 1243 generated for its parent process, unless the parent process has set the  
 1244 SA\_NOCLDSTOP flag. While a process is stopped, any additional signals that are  
 1245 sent to the process shall not be delivered until the process is continued, except  
 1246 SIGKILL which always terminates the receiving process. A process that is a  
 1247 member of an orphaned process group shall not be allowed to stop in response to  
 1248 the SIGTSTP, SIGTTIN, or SIGTTOU signals. In cases where delivery of one of  
 1249 these signals would stop such a process, the signal shall be discarded.

1250 Setting a signal action to SIG\_DFL for a signal that is pending, and whose default  
 1251 action is to ignore the signal (for example, SIGCHLD), shall cause the pending  
 1252 signal to be discarded, whether or not it is blocked.

1253 The default action for SIGCONT is to resume execution at the point where the  
 1254 RTS process was stopped, after first handling any pending unblocked signals. If the  
 1255 Realtime Signals Extension option is supported, any queued values pending shall  
 1256 be discarded and the resources used to queue them shall be released and returned  
 1257 to the system for other use.

1258 XSI When a stopped process is continued, a SIGCHLD signal may be generated for its  
 1259 parent process, unless the parent process has set the SA\_NOCLDSTOP flag.

1260 SIG\_IGN Ignore signal.

1261 Delivery of the signal shall have no effect on the process. The behavior of a process  
 1262 RTS is undefined after it ignores a SIGFPE, SIGILL, SIGSEGV, or SIGBUS signal that  
 1263 RTS was not generated by *kill()*, *sigqueue()*, or *raise()*.

1264 The system shall not allow the action for the signals SIGKILL or SIGSTOP to be set  
 1265 to SIG\_IGN.

1266 Setting a signal action to SIG\_IGN for a signal that is pending shall cause the  
 1267 pending signal to be discarded, whether or not it is blocked.

1268 If a process sets the action for the SIGCHLD signal to SIG\_IGN, the behavior is  
 1269 XSI unspecified, except as specified below.

1270 If the action for the SIGCHLD signal is set to SIG\_IGN, child processes of the  
 1271 calling processes shall not be transformed into zombie processes when they  
 1272 terminate. If the calling process subsequently waits for its children, and the process  
 1273 has no unwaited-for children that were transformed into zombie processes, it shall  
 1274 block until all of its children terminate, and *wait()*, *waitid()*, and *waitpid()* shall fail  
 1275 and set *errno* to [ECHILD].

1276 RTS If the Realtime Signals Extension option is supported, any queued values pending  
 1277 shall be discarded and the resources used to queue them shall be released and  
 1278 made available to queue other signals.

1279 *pointer to a function*

1280 Catch signal.

1281 On delivery of the signal, the receiving process is to execute the signal-catching  
 1282 function at the specified address. After returning from the signal-catching function,  
 1283 the receiving process shall resume execution at the point at which it was  
 1284 interrupted.

1285 If the SA\_SIGINFO flag for the signal is cleared, the signal-catching function shall  
 1286 be entered as a C-language function call as follows:

```
1287 void func(int signo);
```

1288 XSI|RTS If the SA\_SIGINFO flag for the signal is set, the signal-catching function shall be  
 1289 entered as a C-language function call as follows:

```
1290 void func(int signo, siginfo_t *info, void *context);
```

1291 where *func* is the specified signal-catching function, *signo* is the signal number of  
 1292 the signal being delivered, and *info* is a pointer to a **siginfo\_t** structure defined in  
 1293 **<signal.h>** containing at least the following members:

Member Type	Member Name	Description
int	<i>si_signo</i>	Signal number.
int	<i>si_code</i>	Cause of the signal.
union signal	<i>si_value</i>	Signal value.

1299 The *si\_signo* member shall contain the signal number. This shall be the same as the  
 1300 *signo* parameter. The *si\_code* member shall contain a code identifying the cause of  
 1301 the signal. The following values are defined for *si\_code*:

1302 SI\_USER The signal was sent by the *kill()* function. The implementation  
 1303 may set *si\_code* to SI\_USER if the signal was sent by the *raise()* or  
 1304 *abort()* functions or any similar functions provided as  
 1305 implementation extensions.

1306 RTS SI\_QUEUE The signal was sent by the *sigqueue()* function.

1307 RTS SI\_TIMER The signal was generated by the expiration of a timer set by  
 1308 *timer\_settime()*.

1309 RTS SI\_ASYNCIO The signal was generated by the completion of an asynchronous  
 1310 I/O request.

1311 RTS SI\_MESGQ The signal was generated by the arrival of a message on an  
 1312 empty message queue.

1313 If the signal was not generated by one of the functions or events listed above, the  
 1314 *si\_code* shall be set to an implementation-defined value that is not equal to any of  
 1315 the values defined above.

1316 RTS If the Realtime Signals Extension is supported, and *si\_code* is one of SI\_QUEUE,  
 1317 SI\_TIMER, SI\_ASYNCIO, or SI\_MESGQ, then *si\_value* shall contain the  
 1318 application-specified signal value. Otherwise, the contents of *si\_value* are  
 1319 undefined.

1320 The behavior of a process is undefined after it returns normally from a signal-  
 1321 XSI catching function for a SIGBUS, SIGFPE, SIGILL, or SIGSEGV signal that was not  
 1322 RTS generated by *kill()*, *sigqueue()*, or *raise()*.

1323 The system shall not allow a process to catch the signals SIGKILL and SIGSTOP.

1324 If a process establishes a signal-catching function for the SIGCHLD signal while it  
 1325 has a terminated child process for which it has not waited, it is unspecified  
 1326 whether a SIGCHLD signal is generated to indicate that child process.

1327 When signal-catching functions are invoked asynchronously with process  
 1328 execution, the behavior of some of the functions defined by this volume of  
 1329 IEEE Std 1003.1-2001 is unspecified if they are called from a signal-catching  
 1330 function.

1331 The following table defines a set of functions that shall be either reentrant or non-  
 1332 interruptible by signals and shall be async-signal-safe. Therefore applications may  
 1333 invoke them, without restriction, from signal-catching functions:

1334	<i>_Exit()</i>	<i>fpathconf()</i>	<i>raise()</i>	<i>sigprocmask()</i>
1335	<i>_exit()</i>	<i>fstat()</i>	<i>read()</i>	<i>sigqueue()</i>
1336	<i>accept()</i>	<i>fsync()</i>	<i>readlink()</i>	<i>sigset()</i>
1337	<i>access()</i>	<i>ftruncate()</i>	<i>recv()</i>	<i>sigsuspend()</i>
1338	<i>aio_error()</i>	<i>getegid()</i>	<i>recvfrom()</i>	<i>socket()</i>
1339	<i>aio_return()</i>	<i>geteuid()</i>	<i>recvmsg()</i>	<i>socketpair()</i>
1340	<i>aio_suspend()</i>	<i>getgid()</i>	<i>rename()</i>	<i>stat()</i>
1341	<i>alarm()</i>	<i>getgroups()</i>	<i>rmdir()</i>	<i>symlink()</i>
1342	<i>bind()</i>	<i>getpeername()</i>	<i>select()</i>	<i>sysconf()</i>
1343	<i>cfgetispeed()</i>	<i>getpgrp()</i>	<i>sem_post()</i>	<i>tcdrain()</i>
1344	<i>cfgetospeed()</i>	<i>getpid()</i>	<i>send()</i>	<i>tcflow()</i>
1345	<i>cfsetispeed()</i>	<i>getppid()</i>	<i>sendmsg()</i>	<i>tcflush()</i>
1346	<i>cfsetospeed()</i>	<i>getsockname()</i>	<i>sendto()</i>	<i>tcgetattr()</i>
1347	<i>chdir()</i>	<i>getsockopt()</i>	<i>setgid()</i>	<i>tcgetpgrp()</i>
1348	<i>chmod()</i>	<i>getuid()</i>	<i>setpgid()</i>	<i>tcsendbreak()</i>
1349	<i>chown()</i>	<i>kill()</i>	<i>setsid()</i>	<i>tcsetattr()</i>
1350	<i>clock_gettime()</i>	<i>link()</i>	<i>setsockopt()</i>	<i>tcsetpgrp()</i>
1351	<i>close()</i>	<i>listen()</i>	<i>setuid()</i>	<i>time()</i>
1352	<i>connect()</i>	<i>lseek()</i>	<i>shutdown()</i>	<i>timer_getoverrun()</i>
1353	<i>creat()</i>	<i>lstat()</i>	<i>sigaction()</i>	<i>timer_gettime()</i>
1354	<i>dup()</i>	<i>mkdir()</i>	<i>sigaddset()</i>	<i>timer_settime()</i>
1355	<i>dup2()</i>	<i>mkfifo()</i>	<i>sigdelset()</i>	<i>times()</i>
1356	<i>execle()</i>	<i>open()</i>	<i>sigemptyset()</i>	<i>umask()</i>
1357	<i>execve()</i>	<i>pathconf()</i>	<i>sigfillset()</i>	<i>uname()</i>
1358	<i>fchmod()</i>	<i>pause()</i>	<i>sigismember()</i>	<i>unlink()</i>
1359	<i>fchown()</i>	<i>pipe()</i>	<i>sleep()</i>	<i>utime()</i>
1360	<i>fcntl()</i>	<i>poll()</i>	<i>signal()</i>	<i>wait()</i>
1361	<i>fdatasync()</i>	<i>posix_trace_event()</i>	<i>sigpause()</i>	<i>waitpid()</i>
1362	<i>fork()</i>	<i>pselect()</i>	<i>sigpending()</i>	<i>write()</i>

1363 All functions not in the above table are considered to be unsafe with respect to  
 1364 signals. In the presence of signals, all functions defined by this volume of  
 1365 IEEE Std 1003.1-2001 shall behave as defined when called from or interrupted by a  
 1366 signal-catching function, with a single exception: when a signal interrupts an  
 1367 unsafe function and the signal-catching function calls an unsafe function, the

1368 behavior is undefined.

1369 When a signal is delivered to a thread, if the action of that signal specifies termination, stop, or  
1370 continue, the entire process shall be terminated, stopped, or continued, respectively.

#### 1371 **2.4.4 Signal Effects on Other Functions**

1372 Signals affect the behavior of certain functions defined by this volume of IEEE Std 1003.1-2001 if  
1373 delivered to a process while it is executing such a function. If the action of the signal is to  
1374 terminate the process, the process shall be terminated and the function shall not return. If the  
1375 action of the signal is to stop the process, the process shall stop until continued or terminated.  
1376 Generation of a SIGCONT signal for the process shall cause the process to be continued, and the  
1377 original function shall continue at the point the process was stopped. If the action of the signal is  
1378 to invoke a signal-catching function, the signal-catching function shall be invoked; in this case  
1379 the original function is said to be “interrupted” by the signal. If the signal-catching function  
1380 executes a **return** statement, the behavior of the interrupted function shall be as described  
1381 individually for that function, except as noted for unsafe functions. Signals that are ignored shall  
1382 not affect the behavior of any function; signals that are blocked shall not affect the behavior of  
1383 any function until they are unblocked and then delivered, except as specified for the *sigpending()*  
1384 and *sigwait()* functions.

#### 1385 **2.5 Standard I/O Streams**

1386 A stream is associated with an external file (which may be a physical device) by “opening” a file,  
1387 which may involve “creating” a new file. Creating an existing file causes its former contents to  
1388 be discarded if necessary. If a file can support positioning requests (such as a disk file, as  
1389 opposed to a terminal), then a “file position indicator” associated with the stream is positioned  
1390 at the start (byte number 0) of the file, unless the file is opened with append mode, in which case  
1391 it is implementation-defined whether the file position indicator is initially positioned at the  
1392 beginning or end of the file. The file position indicator is maintained by subsequent reads,  
1393 writes, and positioning requests, to facilitate an orderly progression through the file. All input  
1394 takes place as if bytes were read by successive calls to *fgetc()*; all output takes place as if bytes  
1395 were written by successive calls to *fputc()*.

1396 When a stream is “unbuffered”, bytes are intended to appear from the source or at the  
1397 destination as soon as possible; otherwise, bytes may be accumulated and transmitted as a block.  
1398 When a stream is “fully buffered”, bytes are intended to be transmitted as a block when a buffer  
1399 is filled. When a stream is “line buffered”, bytes are intended to be transmitted as a block when a  
1400 newline byte is encountered. Furthermore, bytes are intended to be transmitted as a block when  
1401 a buffer is filled, when input is requested on an unbuffered stream, or when input is requested  
1402 on a line-buffered stream that requires the transmission of bytes. Support for these  
1403 characteristics is implementation-defined, and may be affected via *setbuf()* and *setvbuf()*.

1404 A file may be disassociated from a controlling stream by “closing” the file. Output streams are  
1405 flushed (any unwritten buffer contents are transmitted) before the stream is disassociated from  
1406 the file. The value of a pointer to a **FILE** object is unspecified after the associated file is closed  
1407 (including the standard streams).

1408 A file may be subsequently reopened, by the same or another program execution, and its  
1409 contents reclaimed or modified (if it can be repositioned at its start). If the *main()* function  
1410 returns to its original caller, or if the *exit()* function is called, all open files are closed (hence all  
1411 output streams are flushed) before program termination. Other paths to program termination,  
1412 such as calling *abort()*, need not close all files properly.

1413 The address of the **FILE** object used to control a stream may be significant; a copy of a **FILE**  
1414 object need not necessarily serve in place of the original.

1415 At program start-up, three streams are predefined and need not be opened explicitly: *standard*  
1416 *input* (for reading conventional input), *standard output* (for writing conventional output), and  
1417 *standard error* (for writing diagnostic output). When opened, the standard error stream is not  
1418 fully buffered; the standard input and standard output streams are fully buffered if and only if  
1419 the stream can be determined not to refer to an interactive device.

## 1420 2.5.1 Interaction of File Descriptors and Standard I/O Streams

1421 cx This section describes the interaction of file descriptors and standard I/O streams. This  
1422 functionality is an extension to the ISO C standard (and the rest of this section is not further CX  
1423 shaded).

1424 An open file description may be accessed through a file descriptor, which is created using  
1425 functions such as *open()* or *pipe()*, or through a stream, which is created using functions such as  
1426 *fopen()* or *popen()*. Either a file descriptor or a stream is called a “handle” on the open file  
1427 description to which it refers; an open file description may have several handles.

1428 Handles can be created or destroyed by explicit user action, without affecting the underlying  
1429 open file description. Some of the ways to create them include *fcntl()*, *dup()*, *fdopen()*, *fileno()*,  
1430 and *fork()*. They can be destroyed by at least *fclose()*, *close()*, and the *exec* functions.

1431 A file descriptor that is never used in an operation that could affect the file offset (for example,  
1432 *read()*, *write()*, or *lseek()*) is not considered a handle for this discussion, but could give rise to one  
1433 (for example, as a consequence of *fdopen()*, *dup()*, or *fork()*). This exception does not include the  
1434 file descriptor underlying a stream, whether created with *fopen()* or *fdopen()*, so long as it is not  
1435 used directly by the application to affect the file offset. The *read()* and *write()* functions  
1436 implicitly affect the file offset; *lseek()* explicitly affects it.

1437 The result of function calls involving any one handle (the “active handle”) is defined elsewhere  
1438 in this volume of IEEE Std 1003.1-2001, but if two or more handles are used, and any one of them  
1439 is a stream, the application shall ensure that their actions are coordinated as described below. If  
1440 this is not done, the result is undefined.

1441 A handle which is a stream is considered to be closed when either an *fclose()* or *freopen()* is  
1442 executed on it (the result of *freopen()* is a new stream, which cannot be a handle on the same  
1443 open file description as its previous value), or when the process owning that stream terminates  
1444 with *exit()*, *abort()*, or due to a signal. A file descriptor is closed by *close()*, *\_exit()*, or the *exec*  
1445 functions when `FD_CLOEXEC` is set on that file descriptor.

1446 For a handle to become the active handle, the application shall ensure that the actions below are  
1447 performed between the last use of the handle (the current active handle) and the first use of the  
1448 second handle (the future active handle). The second handle then becomes the active handle. All  
1449 activity by the application affecting the file offset on the first handle shall be suspended until it  
1450 again becomes the active file handle. (If a stream function has as an underlying function one that  
1451 affects the file offset, the stream function shall be considered to affect the file offset.)

1452 The handles need not be in the same process for these rules to apply.

1453 Note that after a *fork()*, two handles exist where one existed before. The application shall ensure  
1454 that, if both handles can ever be accessed, they are both in a state where the other could become  
1455 the active handle first. The application shall prepare for a *fork()* exactly as if it were a change of  
1456 active handle. (If the only action performed by one of the processes is one of the *exec* functions or  
1457 *\_exit()* (not *exit()*), the handle is never accessed in that process.)

1458 For the first handle, the first applicable condition below applies. After the actions required  
1459 below are taken, if the handle is still open, the application can close it.

- 1460 • If it is a file descriptor, no action is required.
- 1461 • If the only further action to be performed on any handle to this open file descriptor is to close  
1462 it, no action need be taken.
- 1463 • If it is a stream which is unbuffered, no action need be taken.
- 1464 • If it is a stream which is line buffered, and the last byte written to the stream was a  
1465 <newline> (that is, as if a:  
1466 

```
putc( '\n' )
```

  
1467 was the most recent operation on that stream), no action need be taken.
- 1468 • If it is a stream which is open for writing or appending (but not also open for reading), the  
1469 application shall either perform an *flush()*, or the stream shall be closed.
- 1470 • If the stream is open for reading and it is at the end of the file (*feof()* is true), no action need  
1471 be taken.
- 1472 • If the stream is open with a mode that allows reading and the underlying open file  
1473 description refers to a device that is capable of seeking, the application shall either perform  
1474 an *flush()*, or the stream shall be closed.

1475 Otherwise, the result is undefined.

1476 For the second handle:

- 1477 • If any previous active handle has been used by a function that explicitly changed the file  
1478 offset, except as required above for the first handle, the application shall perform an *lseek()* or  
1479 *fseek()* (as appropriate to the type of handle) to an appropriate location.

1480 If the active handle ceases to be accessible before the requirements on the first handle, above,  
1481 have been met, the state of the open file description becomes undefined. This might occur during  
1482 functions such as a *fork()* or *\_exit()*.

1483 The *exec* functions make inaccessible all streams that are open at the time they are called,  
1484 independent of which streams or file descriptors may be available to the new process image.

1485 When these rules are followed, regardless of the sequence of handles used, implementations  
1486 shall ensure that an application, even one consisting of several processes, shall yield correct  
1487 results: no data shall be lost or duplicated when writing, and all data shall be written in order,  
1488 except as requested by seeks. It is implementation-defined whether, and under what conditions,  
1489 all input is seen exactly once.

1490 If the rules above are not followed, the result is unspecified.

1491 Each function that operates on a stream is said to have zero or more “underlying functions”.  
1492 This means that the stream function shares certain traits with the underlying functions, but does  
1493 not require that there be any relation between the implementations of the stream function and its  
1494 underlying functions.

1495 **2.5.2 Stream Orientation and Encoding Rules**

1496 For conformance to the ISO/IEC 9899:1999 standard, the definition of a stream includes an  
 1497 “orientation”. After a stream is associated with an external file, but before any operations are  
 1498 performed on it, the stream is without orientation. Once a wide-character input/output function  
 1499 has been applied to a stream without orientation, the stream shall become “wide-oriented”.  
 1500 Similarly, once a byte input/output function has been applied to a stream without orientation,  
 1501 the stream shall become “byte-oriented”. Only a call to the *freopen()* function or the *fwide()*  
 1502 function can otherwise alter the orientation of a stream.

1503 A successful call to *freopen()* shall remove any orientation. The three predefined streams *standard*  
 1504 *input*, *standard output*, and *standard error* shall be unoriented at program start-up.

1505 Byte input/output functions cannot be applied to a wide-oriented stream, and wide-character  
 1506 input/output functions cannot be applied to a byte-oriented stream. The remaining stream  
 1507 operations shall not affect and shall not be affected by a stream’s orientation, except for the  
 1508 following additional restriction:

- 1509 • For wide-oriented streams, after a successful call to a file-positioning function that leaves the  
 1510 file position indicator prior to the end-of-file, a wide-character output function can overwrite  
 1511 a partial character; any file contents beyond the byte(s) written are henceforth undefined.

1512 Each wide-oriented stream has an associated **mbstate\_t** object that stores the current parse state  
 1513 of the stream. A successful call to *fgetpos()* shall store a representation of the value of this  
 1514 **mbstate\_t** object as part of the value of the **fpos\_t** object. A later successful call to *fsetpos()* using  
 1515 the same stored **fpos\_t** value shall restore the value of the associated **mbstate\_t** object as well as  
 1516 the position within the controlled stream.

1517 Implementations that support multiple encoding rules associate an encoding rule with the  
 1518 stream. The encoding rule shall be determined by the setting of the *LC\_CTYPE* category in the  
 1519 current locale at the time when the stream becomes wide-oriented. As with the stream’s  
 1520 orientation, the encoding rule associated with a stream cannot be changed once it has been set,  
 1521 except by a successful call to *freopen()* which clears the encoding rule and resets the orientation  
 1522 to unoriented.

1523 Although wide-oriented streams are conceptually sequences of wide characters, the external file  
 1524 associated with a wide-oriented stream is a sequence of (possibly multi-byte) characters  
 1525 generalized as follows:

- 1526 • Multi-byte encodings within files may contain embedded null bytes (unlike multi-byte  
 1527 encodings valid for use internal to the program).
- 1528 • A file need not begin nor end in the initial shift state.

1529 Moreover, the encodings used for characters may differ among files. Both the nature and choice  
 1530 of such encodings are implementation-defined.

1531 The wide-character input functions read characters from the stream and convert them to wide  
 1532 characters as if they were read by successive calls to the *fgetwc()* function. Each conversion shall  
 1533 occur as if by a call to the *mbrtowc()* function, with the conversion state described by the stream’s  
 1534 **mbstate\_t** object, **except the encoding rule associated with the stream is used instead of the**  
 1535 **encoding rule implied by the *LC\_CTYPE* category of the current locale.**

1536 The wide-character output functions convert wide characters to (possibly multi-byte) characters  
 1537 and write them to the stream as if they were written by successive calls to the *fputwc()* function.  
 1538 Each conversion shall occur as if by a call to the *wcrtomb()* function, with the conversion state  
 1539 **described by the stream’s own **mbstate\_t** object, except the encoding rule associated with the**  
 1540 **stream is used instead of the encoding rule implied by the *LC\_CTYPE* category of the current**

1541 **locale.**

1542 An “encoding error” shall occur if the character sequence presented to the underlying *mbrtowc()*  
 1543 function does not form a valid (generalized) character, or if the code value passed to the  
 1544 underlying *wcrtomb()* function does not correspond to a valid (generalized) character. The  
 1545 wide-character input/output functions and the byte input/output functions store the value of  
 1546 the macro [EILSEQ] in *errno* if and only if an encoding error occurs.

## 1547 **2.6 STREAMS**

1548 **XSR** STREAMS functionality is provided on implementations supporting the XSI STREAMS Option  
 1549 Group. This functionality is dependent on support of the XSI STREAMS option (and the rest of  
 1550 this section is not further shaded for this option).

1551 STREAMS provides a uniform mechanism for implementing networking services and other  
 1552 character-based I/O. The STREAMS function provides direct access to protocol modules.  
 1553 STREAMS modules are unspecified objects. Access to STREAMS modules is provided by  
 1554 interfaces in IEEE Std 1003.1-2001. Creation of STREAMS modules is outside the scope of  
 1555 IEEE Std 1003.1-2001.

1556 A STREAM is typically a full-duplex connection between a process and an open device or  
 1557 pseudo-device. However, since pipes may be STREAMS-based, a STREAM can be a full-duplex  
 1558 connection between two processes. The STREAM itself exists entirely within the implementation  
 1559 and provides a general character I/O function for processes. It optionally includes one or more  
 1560 intermediate processing modules that are interposed between the process end of the STREAM  
 1561 (STREAM head) and a device driver at the end of the STREAM (STREAM end).

1562 STREAMS I/O is based on messages. There are three types of message:

- 1563 • *Data messages* containing actual data for input or output
- 1564 • *Control data* containing instructions for the STREAMS modules and underlying  
 1565 implementation
- 1566 • Other messages, which include file descriptors

1567 The interface between the STREAM and the rest of the implementation is provided by a set of  
 1568 functions at the STREAM head. When a process calls *write()*, *writv()*, *putmsg()*, *putpmsg()*, or  
 1569 *ioctl()*, messages are sent down the STREAM, and *read()*, *readv()*, *getmsg()*, or *getpmsg()* accepts  
 1570 data from the STREAM and passes it to a process. Data intended for the device at the  
 1571 downstream end of the STREAM is packaged into messages and sent downstream, while data  
 1572 and signals from the device are composed into messages by the device driver and sent upstream  
 1573 to the STREAM head.

1574 When a STREAMS-based device is opened, a STREAM shall be created that contains the  
 1575 STREAM head and the STREAM end (driver). If pipes are STREAMS-based in an  
 1576 implementation, when a pipe is created, two STREAMS shall be created, each containing a  
 1577 STREAM head. Other modules are added to the STREAM using *ioctl()*. New modules are  
 1578 “pushed” onto the STREAM one at a time in last-in, first-out (LIFO) style, as though the  
 1579 STREAM was a push-down stack.

1580 **Priority**

1581 Message types are classified according to their queuing priority and may be *normal* (non-  
 1582 priority), *priority*, or *high-priority* messages. A message belongs to a particular priority band that  
 1583 determines its ordering when placed on a queue. Normal messages have a priority band of 0 and  
 1584 shall always be placed at the end of the queue following all other messages in the queue. High-  
 1585 priority messages are always placed at the head of a queue, but shall be discarded if there is  
 1586 already a high-priority message in the queue. Their priority band shall be ignored; they are  
 1587 high-priority by virtue of their type. Priority messages have a priority band greater than 0.  
 1588 Priority messages are always placed after any messages of the same or higher priority. High-  
 1589 priority and priority messages are used to send control and data information outside the normal  
 1590 flow of control. By convention, high-priority messages shall not be affected by flow control.  
 1591 Normal and priority messages have separate flow controls.

1592 **Message Parts**

1593 A process may access STREAMS messages that contain a data part, control part, or both. The  
 1594 data part is that information which is transmitted over the communication medium and the  
 1595 control information is used by the local STREAMS modules. The other types of messages are  
 1596 used between modules and are not accessible to processes. Messages containing only a data part  
 1597 are accessible via *putmsg()*, *putpmsg()*, *getmsg()*, *getpmsg()*, *read()*, *readv()*, *write()*, or *writv()*.  
 1598 Messages containing a control part with or without a data part are accessible via calls to  
 1599 *putmsg()*, *putpmsg()*, *getmsg()*, or *getpmsg()*.

1600 **2.6.1 Accessing STREAMS**

1601 A process accesses STREAMS-based files using the standard functions *close()*, *ioctl()*, *getmsg()*,  
 1602 *getpmsg()*, *open()*, *pipe()*, *poll()*, *putmsg()*, *putpmsg()*, *read()*, or *write()*. Refer to the applicable  
 1603 function definitions for general properties and errors.

1604 Calls to *ioctl()* shall perform control functions on the STREAM associated with the file descriptor  
 1605 *fildev*. The control functions may be performed by the STREAM head, a STREAMS module, or  
 1606 the STREAMS driver for the STREAM.

1607 STREAMS modules and drivers can detect errors, sending an error message to the STREAM  
 1608 head, thus causing subsequent functions to fail and set *errno* to the value specified in the  
 1609 message. In addition, STREAMS modules and drivers can elect to fail a particular *ioctl()* request  
 1610 alone by sending a negative acknowledgement message to the STREAM head. This shall cause  
 1611 just the pending *ioctl()* request to fail and set *errno* to the value specified in the message.

1612 **2.7 XSI Interprocess Communication**

1613 XSI This section describes extensions to support interprocess communication. This functionality is  
 1614 dependent on support of the XSI extension (and the rest of this section is not further shaded for  
 1615 this option).

1616 The following message passing, semaphore, and shared memory services form an XSI  
 1617 interprocess communication facility. Certain aspects of their operation are common, and are  
 1618 defined as follows.

1619  
1620  
1621  
1622  
1623  
1624

IPC Functions		
<i>msgctl()</i>	<i>semctl()</i>	<i>shmctl()</i>
<i>msgget()</i>	<i>semget()</i>	<i>shmdt()</i>
<i>msgrcv()</i>	<i>semop()</i>	<i>shmget()</i>
<i>msgsnd()</i>	<i>shmat()</i>	

1625 Another interprocess communication facility is provided by functions in the Realtime Option  
1626 Group; see Section 2.8 (on page 41).

### 1627 2.7.1 IPC General Description

1628 Each individual shared memory segment, message queue, and semaphore set shall be identified  
1629 by a unique positive integer, called, respectively, a shared memory identifier, *shmid*, a  
1630 semaphore identifier, *semid*, and a message queue identifier, *msqid*. The identifiers shall be  
1631 returned by calls to *shmget()*, *semget()*, and *msgget()*, respectively.

1632 Associated with each identifier is a data structure which contains data related to the operations  
1633 which may be or may have been performed; see the Base Definitions volume of  
1634 IEEE Std 1003.1-2001, <sys/shm.h>, <sys/sem.h>, and <sys/msg.h> for their descriptions.

1635 Each of the data structures contains both ownership information and an **ipc\_perm** structure (see  
1636 the Base Definitions volume of IEEE Std 1003.1-2001, <sys/ipc.h>) which are used in conjunction  
1637 to determine whether or not read/write (read/alter for semaphores) permissions should be  
1638 granted to processes using the IPC facilities. The *mode* member of the **ipc\_perm** structure acts as  
1639 a bit field which determines the permissions.

1640 The values of the bits are given below in octal notation.

1641  
1642  
1643  
1644  
1645  
1646  
1647  
1648

Bit	Meaning
0400	Read by user.
0200	Write by user.
0040	Read by group.
0020	Write by group.
0004	Read by others.
0002	Write by others.

1649 The name of the **ipc\_perm** structure is *shm\_perm*, *sem\_perm*, or *msg\_perm*, depending on which  
1650 service is being used. In each case, read and write/alter permissions shall be granted to a process  
1651 if one or more of the following are true ("xxx" is replaced by *shm*, *sem*, or *msg*, as appropriate):

- 1652 • The process has appropriate privileges.
- 1653 • The effective user ID of the process matches *xxx\_perm.cuid* or *xxx\_perm.uid* in the data  
1654 structure associated with the IPC identifier, and the appropriate bit of the *user* field in  
1655 *xxx\_perm.mode* is set.
- 1656 • The effective user ID of the process does not match *xxx\_perm.cuid* or *xxx\_perm.uid* but the  
1657 effective group ID of the process matches *xxx\_perm.cgid* or *xxx\_perm.gid* in the data structure  
1658 associated with the IPC identifier, and the appropriate bit of the *group* field in *xxx\_perm.mode*  
1659 is set.
- 1660 • The effective user ID of the process does not match *xxx\_perm.cuid* or *xxx\_perm.uid* and the  
1661 effective group ID of the process does not match *xxx\_perm.cgid* or *xxx\_perm.gid* in the data  
1662 structure associated with the IPC identifier, but the appropriate bit of the *other* field in  
1663 *xxx\_perm.mode* is set.

1664 Otherwise, the permission shall be denied.

## 1665 **2.8 Realtime**

1666 This section defines functions to support the source portability of applications with realtime  
1667 requirements. The presence of many of these functions is dependent on support for  
1668 implementation options described in the text.

1669 The specific functional areas included in this section and their scope include the following. Full  
1670 definitions of these terms can be found in the Base Definitions volume of IEEE Std 1003.1-2001,  
1671 Chapter 3, Definitions.

- 1672 • Semaphores
- 1673 • Process Memory Locking
- 1674 • Memory Mapped Files and Shared Memory Objects
- 1675 • Priority Scheduling
- 1676 • Realtime Signal Extension
- 1677 • Timers
- 1678 • Interprocess Communication
- 1679 • Synchronized Input and Output
- 1680 • Asynchronous Input and Output

1681 All the realtime functions defined in this volume of IEEE Std 1003.1-2001 are portable, although  
1682 some of the numeric parameters used by an implementation may have hardware dependencies.

### 1683 **2.8.1 Realtime Signals**

1684 RTS Realtime signal generation and delivery is dependent on support for the Realtime Signals  
1685 Extension option.

1686 See Section 2.4.2 (on page 29).

### 1687 **2.8.2 Asynchronous I/O**

1688 AIO The functionality described in this section is dependent on support of the Asynchronous Input  
1689 and Output option (and the rest of this section is not further shaded for this option).

1690 An asynchronous I/O control block structure **aio<sub>cb</sub>** is used in many asynchronous I/O  
1691 functions. It is defined in the Base Definitions volume of IEEE Std 1003.1-2001, `<aio.h>` and has  
1692 at least the following members:

1693	Member Type	Member Name	Description
1694	<b>int</b>	<i>aio_fildes</i>	File descriptor.
1695	<b>off_t</b>	<i>aio_offset</i>	File offset.
1696	<b>volatile void*</b>	<i>aio_buf</i>	Location of buffer.
1697	<b>size_t</b>	<i>aio_nbytes</i>	Length of transfer.
1698	<b>int</b>	<i>aio_reqprio</i>	Request priority offset.
1699	<b>struct sigevent</b>	<i>aio_sigevent</i>	Signal number and value.
1700	<b>int</b>	<i>aio_lio_opcode</i>	Operation to be performed.

1701 The *aio\_fildes* element is the file descriptor on which the asynchronous operation is performed.

1702 If `O_APPEND` is not set for the file descriptor *aio\_fildes* and if *aio\_fildes* is associated with a  
 1703 device that is capable of seeking, then the requested operation takes place at the absolute  
 1704 position in the file as given by *aio\_offset*, as if `lseek()` were called immediately prior to the  
 1705 operation with an *offset* argument equal to *aio\_offset* and a *whence* argument equal to `SEEK_SET`.  
 1706 If `O_APPEND` is set for the file descriptor, or if *aio\_fildes* is associated with a device that is  
 1707 incapable of seeking, write operations append to the file in the same order as the calls were  
 1708 made, with the following exception: under implementation-defined circumstances, such as  
 1709 operation on a multi-processor or when requests of differing priorities are submitted at the same  
 1710 time, the ordering restriction may be relaxed. Since there is no way for a strictly conforming  
 1711 application to determine whether this relaxation applies, all strictly conforming applications  
 1712 which rely on ordering of output shall be written in such a way that they will operate correctly if  
 1713 the relaxation applies. After a successful call to enqueue an asynchronous I/O operation, the  
 1714 value of the file offset for the file is unspecified. The *aio\_nbytes* and *aio\_buf* elements are the same  
 1715 as the *nbyte* and *buf* arguments defined by `read()` and `write()`, respectively.

1716 If `_POSIX_PRIORITIZED_IO` and `_POSIX_PRIORITY_SCHEDULING` are defined, then  
 1717 asynchronous I/O is queued in priority order, with the priority of each asynchronous operation  
 1718 based on the current scheduling priority of the calling process. The *aio\_reqprio* member can be  
 1719 used to lower (but not raise) the asynchronous I/O operation priority and is within the range  
 1720 zero through `{AIO_PRIO_DELTA_MAX}`, inclusive. Unless both `_POSIX_PRIORITIZED_IO` and  
 1721 `_POSIX_PRIORITY_SCHEDULING` are defined, the order of processing asynchronous I/O  
 1722 requests is unspecified. When both `_POSIX_PRIORITIZED_IO` and  
 1723 `_POSIX_PRIORITY_SCHEDULING` are defined, the order of processing of requests submitted  
 1724 by processes whose schedulers are not `SCHED_FIFO`, `SCHED_RR`, or `SCHED_SPORADIC` is  
 1725 unspecified. The priority of an asynchronous request is computed as (process scheduling  
 1726 priority) minus *aio\_reqprio*. The priority assigned to each asynchronous I/O request is an  
 1727 indication of the desired order of execution of the request relative to other asynchronous I/O  
 1728 requests for this file. If `_POSIX_PRIORITIZED_IO` is defined, requests issued with the same  
 1729 priority to a character special file are processed by the underlying device in FIFO order; the order  
 1730 of processing of requests of the same priority issued to files that are not character special files is  
 1731 unspecified. Numerically higher priority values indicate requests of higher priority. The value of  
 1732 *aio\_reqprio* has no effect on process scheduling priority. When prioritized asynchronous I/O  
 1733 requests to the same file are blocked waiting for a resource required for that I/O operation, the  
 1734 higher-priority I/O requests shall be granted the resource before lower-priority I/O requests are  
 1735 granted the resource. The relative priority of asynchronous I/O and synchronous I/O is  
 1736 implementation-defined. If `_POSIX_PRIORITIZED_IO` is defined, the implementation shall  
 1737 define for which files I/O prioritization is supported.

1738 The *aio\_sigevent* determines how the calling process shall be notified upon I/O completion, as  
 1739 specified in Section 2.4.1 (on page 28). If *aio\_sigevent.sigev\_notify* is `SIGEV_NONE`, then no signal  
 1740 shall be posted upon I/O completion, but the error status for the operation and the return status  
 1741 for the operation shall be set appropriately.

1742 The *aio\_lio\_opcode* field is used only by the *lio\_listio()* call. The *lio\_listio()* call allows multiple  
 1743 asynchronous I/O operations to be submitted at a single time. The function takes as an  
 1744 argument an array of pointers to **aiocb** structures. Each **aiocb** structure indicates the operation to  
 1745 be performed (read or write) via the *aio\_lio\_opcode* field.

1746 The address of the **aiocb** structure is used as a handle for retrieving the error status and return  
 1747 status of the asynchronous operation while it is in progress.

1748 The **aiocb** structure and the data buffers associated with the asynchronous I/O operation are  
 1749 being used by the system for asynchronous I/O while, and only while, the error status of the

1750 asynchronous operation is equal to [EINPROGRESS]. Applications shall not modify the **aiocb**  
 1751 structure while the structure is being used by the system for asynchronous I/O.

1752 The return status of the asynchronous operation is the number of bytes transferred by the I/O  
 1753 operation. If the error status is set to indicate an error completion, then the return status is set to  
 1754 the return value that the corresponding *read()*, *write()*, or *fsync()* call would have returned.  
 1755 When the error status is not equal to [EINPROGRESS], the return status shall reflect the return  
 1756 status of the corresponding synchronous operation.

### 1757 **2.8.3 Memory Management**

#### 1758 *2.8.3.1 Memory Locking*

1759 ML The functionality described in this section is dependent on support of the Process Memory  
 1760 Locking option (and the rest of this section is not further shaded for this option).

1761 Range memory locking operations are defined in terms of pages. Implementations may restrict  
 1762 the size and alignment of range lockings to be on page-size boundaries. The page size, in bytes,  
 1763 is the value of the configurable system variable {PAGESIZE}. If an implementation has no  
 1764 restrictions on size or alignment, it may specify a 1-byte page size.

1765 Memory locking guarantees the residence of portions of the address space. It is  
 1766 implementation-defined whether locking memory guarantees fixed translation between virtual  
 1767 addresses (as seen by the process) and physical addresses. Per-process memory locks are not  
 1768 inherited across a *fork()*, and all memory locks owned by a process are unlocked upon *exec* or  
 1769 process termination. Unmapping of an address range removes any memory locks established on  
 1770 that address range by this process.

#### 1771 *2.8.3.2 Memory Mapped Files*

1772 MF The functionality described in this section is dependent on support of the Memory Mapped Files  
 1773 option (and the rest of this section is not further shaded for this option).

1774 Range memory mapping operations are defined in terms of pages. Implementations may  
 1775 restrict the size and alignment of range mappings to be on page-size boundaries. The page size,  
 1776 in bytes, is the value of the configurable system variable {PAGESIZE}. If an implementation has  
 1777 no restrictions on size or alignment, it may specify a 1-byte page size.

1778 Memory mapped files provide a mechanism that allows a process to access files by directly  
 1779 incorporating file data into its address space. Once a file is mapped into a process address space,  
 1780 the data can be manipulated as memory. If more than one process maps a file, its contents are  
 1781 shared among them. If the mappings allow shared write access, then data written into the  
 1782 memory object through the address space of one process appears in the address spaces of all  
 1783 processes that similarly map the same portion of the memory object.

1784 SHM Shared memory objects are named regions of storage that may be independent of the file system  
 1785 and can be mapped into the address space of one or more processes to allow them to share the  
 1786 associated memory.

1787 SHM An *unlink()* of a file or *shm\_unlink()* of a shared memory object, while causing the removal of the  
 1788 name, does not unmap any mappings established for the object. Once the name has been  
 1789 removed, the contents of the memory object are preserved as long as it is referenced. The  
 1790 memory object remains referenced as long as a process has the memory object open or has some  
 1791 area of the memory object mapped.

1792 **2.8.3.3** *Memory Protection*

1793 MPR MF The functionality described in this section is dependent on support of the Memory Protection  
 1794 and Memory Mapped Files option (and the rest of this section is not further shaded for these  
 1795 options).

1796 When an object is mapped, various application accesses to the mapped region may result in  
 1797 signals. In this context, SIGBUS is used to indicate an error using the mapped object, and  
 1798 SIGSEGV is used to indicate a protection violation or misuse of an address:

- 1799 • A mapping may be restricted to disallow some types of access.
- 1800 • Write attempts to memory that was mapped without write access, or any access to memory  
 1801 mapped PROT\_NONE, shall result in a SIGSEGV signal.
- 1802 • References to unmapped addresses shall result in a SIGSEGV signal.
- 1803 • Reference to whole pages within the mapping, but beyond the current length of the object,  
 1804 shall result in a SIGBUS signal.
- 1805 • The size of the object is unaffected by access beyond the end of the object (even if a SIGBUS is  
 1806 not generated).

1807 **2.8.3.4** *Typed Memory Objects*

1808 TYM The functionality described in this section is dependent on support of the Typed Memory  
 1809 Objects option (and the rest of this section is not further shaded for this option).

1810 Implementations may support the Typed Memory Objects option without supporting the  
 1811 Memory Mapped Files option or the Shared Memory Objects option. Typed memory objects are  
 1812 implementation-configurable named storage pools accessible from one or more processors in a  
 1813 system, each via one or more ports, such as backplane buses, LANs, I/O channels, and so on.  
 1814 Each valid combination of a storage pool and a port is identified through a name that is defined  
 1815 at system configuration time, in an implementation-defined manner; the name may be  
 1816 independent of the file system. Using this name, a typed memory object can be opened and  
 1817 mapped into process address space. For a given storage pool and port, it is necessary to support  
 1818 both dynamic allocation from the pool as well as mapping at an application-supplied offset  
 1819 within the pool; when dynamic allocation has been performed, subsequent deallocation must be  
 1820 supported. Lastly, accessing typed memory objects from different ports requires a method for  
 1821 obtaining the offset and length of contiguous storage of a region of typed memory (dynamically  
 1822 allocated or not); this allows typed memory to be shared among processes and/or processors  
 1823 while being accessed from the desired port.

1824 **2.8.4** **Process Scheduling**

1825 PS The functionality described in this section is dependent on support of the Process Scheduling  
 1826 option (and the rest of this section is not further shaded for this option).

1827 **Scheduling Policies**

1828 The scheduling semantics described in this volume of IEEE Std 1003.1-2001 are defined in terms  
 1829 of a conceptual model that contains a set of thread lists. No implementation structures are  
 1830 necessarily implied by the use of this conceptual model. It is assumed that no time elapses  
 1831 during operations described using this model, and therefore no simultaneous operations are  
 1832 possible. This model discusses only processor scheduling for runnable threads, but it should be  
 1833 noted that greatly enhanced predictability of realtime applications results if the sequencing of  
 1834 other resources takes processor scheduling policy into account.

1835 There is, conceptually, one thread list for each priority. A runnable thread will be on the thread  
 1836 list for that thread's priority. Multiple scheduling policies shall be provided. Each non-empty  
 1837 thread list is ordered, contains a head as one end of its order, and a tail as the other. The purpose  
 1838 of a scheduling policy is to define the allowable operations on this set of lists (for example,  
 1839 moving threads between and within lists).

1840 Each process shall be controlled by an associated scheduling policy and priority. These  
 1841 parameters may be specified by explicit application execution of the *sched\_setscheduler()* or  
 1842 *sched\_setparam()* functions.

1843 Each thread shall be controlled by an associated scheduling policy and priority. These  
 1844 parameters may be specified by explicit application execution of the *pthread\_setschedparam()*  
 1845 function.

1846 Associated with each policy is a priority range. Each policy definition shall specify the minimum  
 1847 priority range for that policy. The priority ranges for each policy may but need not overlap the  
 1848 priority ranges of other policies.

1849 A conforming implementation shall select the thread that is defined as being at the head of the  
 1850 highest priority non-empty thread list to become a running thread, regardless of its associated  
 1851 policy. This thread is then removed from its thread list.

1852 Four scheduling policies are specifically required. Other implementation-defined scheduling  
 1853 policies may be defined. The following symbols are defined in the Base Definitions volume of  
 1854 IEEE Std 1003.1-2001, <*sched.h*>:

1855 **SCHED\_FIFO** First in, first out (FIFO) scheduling policy.

1856 **SCHED\_RR** Round robin scheduling policy.

1857 **SCHED\_SPORADIC** Sporadic server scheduling policy.

1858 **SCHED\_OTHER** Another scheduling policy.

1859 The values of these symbols shall be distinct.

## 1860 **SCHED\_FIFO**

1861 Conforming implementations shall include a scheduling policy called the FIFO scheduling  
 1862 policy.

1863 Threads scheduled under this policy are chosen from a thread list that is ordered by the time its  
 1864 threads have been on the list without being executed; generally, the head of the list is the thread  
 1865 that has been on the list the longest time, and the tail is the thread that has been on the list the  
 1866 shortest time.

1867 Under the **SCHED\_FIFO** policy, the modification of the definitional thread lists is as follows:

- 1868 1. When a running thread becomes a preempted thread, it becomes the head of the thread list  
 1869 for its priority.
- 1870 2. When a blocked thread becomes a runnable thread, it becomes the tail of the thread list for  
 1871 its priority.
- 1872 3. When a running thread calls the *sched\_setscheduler()* function, the process specified in the  
 1873 function call is modified to the specified policy and the priority specified by the *param*  
 1874 argument.
- 1875 4. When a running thread calls the *sched\_setparam()* function, the priority of the process  
 1876 specified in the function call is modified to the priority specified by the *param* argument.

- 1877 5. When a running thread calls the *pthread\_setschedparam()* function, the thread specified in  
 1878 the function call is modified to the specified policy and the priority specified by the *param*  
 1879 argument.
- 1880 6. When a running thread calls the *pthread\_setschedprio()* function, the thread specified in the  
 1881 function call is modified to the priority specified by the *prio* argument.
- 1882 7. If a thread whose policy or priority has been modified other than by *pthread\_setschedprio()*  
 1883 is a running thread or is runnable, it then becomes the tail of the thread list for its new  
 1884 priority.
- 1885 8. If a thread whose policy or priority has been modified by *pthread\_setschedprio()* is a  
 1886 running thread or is runnable, the effect on its position in the thread list depends on the  
 1887 direction of the modification, as follows:
- 1888 a. If the priority is raised, the thread becomes the tail of the thread list.
- 1889 b. If the priority is unchanged, the thread does not change position in the thread list.
- 1890 c. If the priority is lowered, the thread becomes the head of the thread list.
- 1891 9. When a running thread issues the *sched\_yield()* function, the thread becomes the tail of the  
 1892 thread list for its priority.
- 1893 10. At no other time is the position of a thread with this scheduling policy within the thread  
 1894 lists affected.

1895 For this policy, valid priorities shall be within the range returned by the *sched\_get\_priority\_max()*  
 1896 and *sched\_get\_priority\_min()* functions when SCHED\_FIFO is provided as the parameter.  
 1897 Conforming implementations shall provide a priority range of at least 32 priorities for this  
 1898 policy.

#### 1899 **SCHED\_RR**

1900 Conforming implementations shall include a scheduling policy called the “round robin”  
 1901 scheduling policy. This policy shall be identical to the SCHED\_FIFO policy with the additional  
 1902 condition that when the implementation detects that a running thread has been executing as a  
 1903 running thread for a time period of the length returned by the *sched\_rr\_get\_interval()* function or  
 1904 longer, the thread shall become the tail of its thread list and the head of that thread list shall be  
 1905 removed and made a running thread.

1906 The effect of this policy is to ensure that if there are multiple SCHED\_RR threads at the same  
 1907 priority, one of them does not monopolize the processor. An application should not rely only on  
 1908 the use of SCHED\_RR to ensure application progress among multiple threads if the application  
 1909 includes threads using the SCHED\_FIFO policy at the same or higher priority levels or  
 1910 SCHED\_RR threads at a higher priority level.

1911 A thread under this policy that is preempted and subsequently resumes execution as a running  
 1912 thread completes the unexpired portion of its round robin interval time period.

1913 For this policy, valid priorities shall be within the range returned by the *sched\_get\_priority\_max()*  
 1914 and *sched\_get\_priority\_min()* functions when SCHED\_RR is provided as the parameter.  
 1915 Conforming implementations shall provide a priority range of at least 32 priorities for this  
 1916 policy.

1917 **SCHED\_SPORADIC**

1918 SS|TSP The functionality described in this section is dependent on support of the Process Sporadic  
 1919 Server or Thread Sporadic Server options (and the rest of this section is not further shaded for  
 1920 these options).

1921 If `_POSIX_SPORADIC_SERVER` or `_POSIX_THREAD_SPORADIC_SERVER` is defined, the  
 1922 implementation shall include a scheduling policy identified by the value `SCHED_SPORADIC`.

1923 The sporadic server policy is based primarily on two parameters: the replenishment period and  
 1924 the available execution capacity. The replenishment period is given by the `sched_ss_repl_period`  
 1925 member of the **sched\_param** structure. The available execution capacity is initialized to the  
 1926 value given by the `sched_ss_init_budget` member of the same parameter. The sporadic server  
 1927 policy is identical to the `SCHED_FIFO` policy with some additional conditions that cause the  
 1928 thread's assigned priority to be switched between the values specified by the `sched_priority` and  
 1929 `sched_ss_low_priority` members of the **sched\_param** structure.

1930 The priority assigned to a thread using the sporadic server scheduling policy is determined in  
 1931 the following manner: if the available execution capacity is greater than zero and the number of  
 1932 pending replenishment operations is strictly less than `sched_ss_max_repl`, the thread is assigned  
 1933 the priority specified by `sched_priority`; otherwise, the assigned priority shall be  
 1934 `sched_ss_low_priority`. If the value of `sched_priority` is less than or equal to the value of  
 1935 `sched_ss_low_priority`, the results are undefined. When active, the thread shall belong to the  
 1936 thread list corresponding to its assigned priority level, according to the mentioned priority  
 1937 assignment. The modification of the available execution capacity and, consequently of the  
 1938 assigned priority, is done as follows:

- 1939 1. When the thread at the head of the `sched_priority` list becomes a running thread, its  
 1940 execution time shall be limited to at most its available execution capacity, plus the  
 1941 resolution of the execution time clock used for this scheduling policy. This resolution shall  
 1942 be implementation-defined.
- 1943 2. Each time the thread is inserted at the tail of the list associated with `sched_priority`—  
 1944 because as a blocked thread it became runnable with priority `sched_priority` or because a  
 1945 replenishment operation was performed—the time at which this operation is done is  
 1946 posted as the `activation_time`.
- 1947 3. When the running thread with assigned priority equal to `sched_priority` becomes a  
 1948 preempted thread, it becomes the head of the thread list for its priority, and the execution  
 1949 time consumed is subtracted from the available execution capacity. If the available  
 1950 execution capacity would become negative by this operation, it shall be set to zero.
- 1951 4. When the running thread with assigned priority equal to `sched_priority` becomes a blocked  
 1952 thread, the execution time consumed is subtracted from the available execution capacity,  
 1953 and a replenishment operation is scheduled, as described in 6 and 7. If the available  
 1954 execution capacity would become negative by this operation, it shall be set to zero.
- 1955 5. When the running thread with assigned priority equal to `sched_priority` reaches the limit  
 1956 imposed on its execution time, it becomes the tail of the thread list for  
 1957 `sched_ss_low_priority`, the execution time consumed is subtracted from the available  
 1958 execution capacity (which becomes zero), and a replenishment operation is scheduled, as  
 1959 described in 6 and 7.
- 1960 6. Each time a replenishment operation is scheduled, the amount of execution capacity to be  
 1961 replenished, `replenish_amount`, is set equal to the execution time consumed by the thread  
 1962 since the `activation_time`. The replenishment is scheduled to occur at `activation_time` plus  
 1963 `sched_ss_repl_period`. If the scheduled time obtained is before the current time, the

1964 replenishment operation is carried out immediately. Several replenishment operations may  
 1965 be pending at the same time, each of which will be serviced at its respective scheduled  
 1966 time. With the above rules, the number of replenishment operations simultaneously  
 1967 pending for a given thread that is scheduled under the sporadic server policy shall not be  
 1968 greater than *sched\_ss\_max\_repl*.

1969 7. A replenishment operation consists of adding the corresponding *replenish\_amount* to the  
 1970 available execution capacity at the scheduled time. If, as a consequence of this operation,  
 1971 the execution capacity would become larger than *sched\_ss\_initial\_budget*, it shall be  
 1972 rounded down to a value equal to *sched\_ss\_initial\_budget*. Additionally, if the thread was  
 1973 runnable or running, and had assigned priority equal to *sched\_ss\_low\_priority*, then it  
 1974 becomes the tail of the thread list for *sched\_priority*.

1975 Execution time is defined in Section 2.2.2 (on page 14).

1976 For this policy, changing the value of a CPU-time clock via *clock\_settime()* shall have no effect on  
 1977 its behavior.

1978 For this policy, valid priorities shall be within the range returned by the *sched\_get\_priority\_min()*  
 1979 and *sched\_get\_priority\_max()* functions when SCHED\_SPORADIC is provided as the parameter.  
 1980 Conforming implementations shall provide a priority range of at least 32 distinct priorities for  
 1981 this policy.

1982 **SCHED\_OTHER**

1983 Conforming implementations shall include one scheduling policy identified as SCHED\_OTHER  
 1984 (which may execute identically with either the FIFO or round robin scheduling policy). The  
 1985 effect of scheduling threads with the SCHED\_OTHER policy in a system in which other threads  
 1986 ss are executing under SCHED\_FIFO, SCHED\_RR, or SCHED\_SPORADIC is implementation-  
 1987 defined.

1988 This policy is defined to allow strictly conforming applications to be able to indicate in a  
 1989 portable manner that they no longer need a realtime scheduling policy.

1990 For threads executing under this policy, the implementation shall use only priorities within the  
 1991 range returned by the *sched\_get\_priority\_max()* and *sched\_get\_priority\_min()* functions when  
 1992 SCHED\_OTHER is provided as the parameter.

1993 **2.8.5 Clocks and Timers**

1994 TMR The functionality described in this section is dependent on support of the Timers option (and the  
 1995 rest of this section is not further shaded for this option).

1996 The **<time.h>** header defines the types and manifest constants used by the timing facility.

1997 **Time Value Specification Structures**

1998 Many of the timing facility functions accept or return time value specifications. A time value  
 1999 structure **timespec** specifies a single time value and includes at least the following members:

2000

2001

2002

2003

Member Type	Member Name	Description
<b>time_t</b>	<i>tv_sec</i>	Seconds.
<b>long</b>	<i>tv_nsec</i>	Nanoseconds.

2004 The *tv\_nsec* member is only valid if greater than or equal to zero, and less than the number of  
 2005 nanoseconds in a second (1 000 million). The time interval described by this structure is (*tv\_sec* \*  
 2006 10<sup>9</sup> + *tv\_nsec*) nanoseconds.

2007 A time value structure **itimerspec** specifies an initial timer value and a repetition interval for use  
 2008 by the per-process timer functions. This structure includes at least the following members:

2009  
 2010  
 2011  
 2012

Member Type	Member Name	Description
<b>struct timespec</b>	<i>it_interval</i>	Timer period.
<b>struct timespec</b>	<i>it_value</i>	Timer expiration.

2013 If the value described by *it\_value* is non-zero, it indicates the time to or time of the next timer  
 2014 expiration (for relative and absolute timer values, respectively). If the value described by *it\_value*  
 2015 is zero, the timer shall be disarmed.

2016 If the value described by *it\_interval* is non-zero, it specifies an interval which shall be used in  
 2017 reloading the timer when it expires; that is, a periodic timer is specified. If the value described by  
 2018 *it\_interval* is zero, the timer is disarmed after its next expiration; that is, a one-shot timer is  
 2019 specified.

2020 **Timer Event Notification Control Block**

2021 RTS Per-process timers may be created that notify the process of timer expirations by queuing a  
 2022 realtime extended signal. The **sigevent** structure, defined in the Base Definitions volume of  
 2023 IEEE Std 1003.1-2001, <**signal.h**>, is used in creating such a timer. The **sigevent** structure  
 2024 contains the signal number and an application-specific data value which shall be used when  
 2025 notifying the calling process of timer expiration events.

2026 **Manifest Constants**

2027 The following constants are defined in the Base Definitions volume of IEEE Std 1003.1-2001,  
 2028 <**time.h**>:

2029 **CLOCK\_REALTIME** The identifier for the system-wide realtime clock.

2030 **TIMER\_ABSTIME** Flag indicating time is absolute with respect to the clock associated  
 2031 with a timer.

2032 MON **CLOCK\_MONOTONIC** The identifier for the system-wide monotonic clock, which is defined  
 2033 as a clock whose value cannot be set via *clock\_settime()* and which  
 2034 cannot have backward clock jumps. The maximum possible clock  
 2035 jump is implementation-defined.

2036 MON The maximum allowable resolution for **CLOCK\_REALTIME** and **CLOCK\_MONOTONIC** clocks  
 2037 and all time services based on these clocks is represented by **{\_POSIX\_CLOCKRES\_MIN}** and  
 2038 shall be defined as 20 ms (1/50 of a second). Implementations may support smaller values of  
 2039 resolution for these clocks to provide finer granularity time bases. The actual resolution  
 2040 supported by an implementation for a specific clock is obtained using the *clock\_getres()* function.  
 2041 If the actual resolution supported for a time service based on one of these clocks differs from the  
 2042 resolution supported for that clock, the implementation shall document this difference.

2043 MON The minimum allowable maximum value for **CLOCK\_REALTIME** and **CLOCK\_MONOTONIC**  
 2044 clocks and all absolute time services based on them is the same as that defined by the ISO C  
 2045 standard for the **time\_t** type. If the maximum value supported by a time service based on one of  
 2046 these clocks differs from the maximum value supported by that clock, the implementation shall  
 2047 document this difference.

2048 **Execution Time Monitoring**

2049 CPT If `_POSIX_CPUTIME` is defined, process CPU-time clocks shall be supported in addition to the  
2050 clocks described in **Manifest Constants** (on page 49).

2051 TCT If `_POSIX_THREAD_CPUTIME` is defined, thread CPU-time clocks shall be supported.

2052 CPT|TCT CPU-time clocks measure execution or CPU time, which is defined in the Base Definitions  
2053 volume of IEEE Std 1003.1-2001, Section 3.117, CPU Time (Execution Time). The mechanism  
2054 used to measure execution time is described in the Base Definitions volume of  
2055 IEEE Std 1003.1-2001, Section 4.9, Measurement of Execution Time.

2056 CPT If `_POSIX_CPUTIME` is defined, the following constant of the type `clockid_t` is defined in  
2057 `<time.h>`:

2058 `CLOCK_PROCESS_CPUTIME_ID`

2059 When this value of the type `clockid_t` is used in a `clock()` or `timer*()` function call, it is  
2060 interpreted as the identifier of the CPU-time clock associated with the process making the  
2061 function call.  
2062

2063 TCT If `_POSIX_THREAD_CPUTIME` is defined, the following constant of the type `clockid_t` is  
2064 defined in `<time.h>`:

2065 `CLOCK_THREAD_CPUTIME_ID`

2066 When this value of the type `clockid_t` is used in a `clock()` or `timer*()` function call, it is  
2067 interpreted as the identifier of the CPU-time clock associated with the thread making the  
2068 function call.

2069 **2.9 Threads**

2070 THR The functionality described in this section is dependent on support of the Threads option (and  
2071 the rest of this section is not further shaded for this option).

2072 This section defines functionality to support multiple flows of control, called “threads”, within a  
2073 process. For the definition of threads, see the Base Definitions volume of IEEE Std 1003.1-2001,  
2074 Section 3.393, Thread.

2075 The specific functional areas covered by threads and their scope include:

- 2076 • Thread management: the creation, control, and termination of multiple flows of control in the  
2077 same process under the assumption of a common shared address space
- 2078 • Synchronization primitives optimized for tightly coupled operation of multiple control flows  
2079 in a common, shared address space

2080 **2.9.1 Thread-Safety**

2081 All functions defined by this volume of IEEE Std 1003.1-2001 shall be thread-safe, except that the  
2082 following functions<sup>1</sup> need not be thread-safe.

2083 \_\_\_\_\_

2084 1. The functions in the table are not shaded to denote applicable options. Individual reference pages should be consulted.

2085	<i>asctime()</i>	<i>ecvt()</i>	<i>gethostent()</i>	<i>getutxline()</i>	<i>putc_unlocked()</i>
2086	<i>basename()</i>	<i>encrypt()</i>	<i>getlogin()</i>	<i>gmtime()</i>	<i>putchar_unlocked()</i>
2087	<i>catgets()</i>	<i>endgrent()</i>	<i>getnetbyaddr()</i>	<i>hcreate()</i>	<i>putenv()</i>
2088	<i>crypt()</i>	<i>endpwent()</i>	<i>getnetbyname()</i>	<i>hdestroy()</i>	<i>pututxline()</i>
2089	<i>ctime()</i>	<i>endtxent()</i>	<i>getnetent()</i>	<i>hsearch()</i>	<i>rand()</i>
2090	<i>dbm_clearerr()</i>	<i>fcvt()</i>	<i>getopt()</i>	<i>inet_ntoa()</i>	<i>readdir()</i>
2091	<i>dbm_close()</i>	<i>ftw()</i>	<i>getprotobyname()</i>	<i>l64a()</i>	<i>setenv()</i>
2092	<i>dbm_delete()</i>	<i>gcvt()</i>	<i>getprotobynumber()</i>	<i>lgamma()</i>	<i>setgrent()</i>
2093	<i>dbm_error()</i>	<i>getc_unlocked()</i>	<i>getprotoent()</i>	<i>lgammaf()</i>	<i>setkey()</i>
2094	<i>dbm_fetch()</i>	<i>getchar_unlocked()</i>	<i>getpwent()</i>	<i>lgammal()</i>	<i>setpwent()</i>
2095	<i>dbm_firstkey()</i>	<i>getdate()</i>	<i>getpwnam()</i>	<i>localeconv()</i>	<i>setutxent()</i>
2096	<i>dbm_nextkey()</i>	<i>getenv()</i>	<i>getpwuid()</i>	<i>localtime()</i>	<i>strerror()</i>
2097	<i>dbm_open()</i>	<i>getgrent()</i>	<i>getservbyname()</i>	<i>lrnd48()</i>	<i>strtok()</i>
2098	<i>dbm_store()</i>	<i>getgrgid()</i>	<i>getservbyport()</i>	<i>mrnd48()</i>	<i>ttyname()</i>
2099	<i>dirname()</i>	<i>getgrnam()</i>	<i>getservent()</i>	<i>nftw()</i>	<i>unsetenv()</i>
2100	<i>derror()</i>	<i>gethostbyaddr()</i>	<i>getutxent()</i>	<i>nl_langinfo()</i>	<i>wcstombs()</i>
2101	<i>drand48()</i>	<i>gethostbyname()</i>	<i>getutxid()</i>	<i>ptsname()</i>	<i>wctomb()</i>

2102 The *ctermid()* and *tmpnam()* functions need not be thread-safe if passed a NULL argument. The  
 2103 *wctomb()* and *wcsrtombs()* functions need not be thread-safe if passed a NULL *ps* argument.

2104 Implementations shall provide internal synchronization as necessary in order to satisfy this  
 2105 requirement.

## 2106 2.9.2 Thread IDs

2107 Although implementations may have thread IDs that are unique in a system, applications  
 2108 should only assume that thread IDs are usable and unique within a single process. The effect of  
 2109 calling any of the functions defined in this volume of IEEE Std 1003.1-2001 and passing as an  
 2110 argument the thread ID of a thread from another process is unspecified. A conforming  
 2111 implementation is free to reuse a thread ID after the thread terminates if it was created with the  
 2112 *detachstate* attribute set to *PTHREAD\_CREATE\_DETACHED* or if *pthread\_detach()* or  
 2113 *pthread\_join()* has been called for that thread. If a thread is detached, its thread ID is invalid for  
 2114 use as an argument in a call to *pthread\_detach()* or *pthread\_join()*.

## 2115 2.9.3 Thread Mutexes

2116 A thread that has blocked shall not prevent any unblocked thread that is eligible to use the same  
 2117 processing resources from eventually making forward progress in its execution. Eligibility for  
 2118 processing resources is determined by the scheduling policy.

2119 A thread shall become the owner of a mutex, *m*, when one of the following occurs:

- 2120 • It returns successfully from *pthread\_mutex\_lock()* with *m* as the *mutex* argument.
- 2121 • It returns successfully from *pthread\_mutex\_trylock()* with *m* as the *mutex* argument.
- 2122 TMO • It returns successfully from *pthread\_mutex\_timedlock()* with *m* as the *mutex* argument.
- 2123 • It returns (successfully or not) from *pthread\_cond\_wait()* with *m* as the *mutex* argument  
 2124 (except as explicitly indicated otherwise for certain errors).
- 2125 • It returns (successfully or not) from *pthread\_cond\_timedwait()* with *m* as the *mutex* argument  
 2126 (except as explicitly indicated otherwise for certain errors).

2127 The thread shall remain the owner of *m* until one of the following occurs:

- 2128 • It executes `pthread_mutex_unlock()` with `m` as the *mutex* argument
  - 2129 • It blocks in a call to `pthread_cond_wait()` with `m` as the *mutex* argument.
  - 2130 • It blocks in a call to `pthread_cond_timedwait()` with `m` as the *mutex* argument.
- 2131 The implementation shall behave as if at all times there is at most one owner of any mutex.
- 2132 A thread that becomes the owner of a mutex is said to have “acquired” the mutex and the mutex  
 2133 is said to have become “locked”; when a thread gives up ownership of a mutex it is said to have  
 2134 “released” the mutex and the mutex is said to have become “unlocked”.

## 2135 2.9.4 Thread Scheduling

2136 TPS The functionality described in this section is dependent on support of the Thread Execution  
 2137 Scheduling option (and the rest of this section is not further shaded for this option).

### 2138 Thread Scheduling Attributes

2139 In support of the scheduling function, threads have attributes which are accessed through the  
 2140 `pthread_attr_t` thread creation attributes object.

2141 The *contentionscope* attribute defines the scheduling contention scope of the thread to be either  
 2142 `PTHREAD_SCOPE_PROCESS` or `PTHREAD_SCOPE_SYSTEM`.

2143 The *inheritsched* attribute specifies whether a newly created thread is to inherit the scheduling  
 2144 attributes of the creating thread or to have its scheduling values set according to the other  
 2145 scheduling attributes in the `pthread_attr_t` object.

2146 The *schedpolicy* attribute defines the scheduling policy for the thread. The *schedparam* attribute  
 2147 defines the scheduling parameters for the thread. The interaction of threads having different  
 2148 policies within a process is described as part of the definition of those policies.

2149 If the Thread Execution Scheduling option is defined, and the *schedpolicy* attribute specifies one  
 2150 of the priority-based policies defined under this option, the *schedparam* attribute contains the  
 2151 scheduling priority of the thread. A conforming implementation ensures that the priority value  
 2152 in *schedparam* is in the range associated with the scheduling policy when the thread attributes  
 2153 object is used to create a thread, or when the scheduling attributes of a thread are dynamically  
 2154 modified. The meaning of the priority value in *schedparam* is the same as that of *priority*.

2155 TSP If `_POSIX_THREAD_SPORADIC_SERVER` is defined, the *schedparam* attribute supports four  
 2156 new members that are used for the sporadic server scheduling policy. These members are  
 2157 *sched\_ss\_low\_priority*, *sched\_ss\_repl\_period*, *sched\_ss\_init\_budget*, and *sched\_ss\_max\_repl*. The  
 2158 meaning of these attributes is the same as in the definitions that appear under Section 2.8.4 (on  
 2159 page 44).

2160 When a process is created, its single thread has a scheduling policy and associated attributes  
 2161 equal to the process’ policy and attributes. The default scheduling contention scope value is  
 2162 implementation-defined. The default values of other scheduling attributes are implementation-  
 2163 defined.

**2164 Thread Scheduling Contention Scope**

2165 The scheduling contention scope of a thread defines the set of threads with which the thread  
2166 competes for use of the processing resources. The scheduling operation selects at most one  
2167 thread to execute on each processor at any point in time and the thread's scheduling attributes  
2168 (for example, *priority*), whether under process scheduling contention scope or system scheduling  
2169 contention scope, are the parameters used to determine the scheduling decision.

2170 The scheduling contention scope, in the context of scheduling a mixed scope environment,  
2171 affects threads as follows:

- 2172 • A thread created with `PTHREAD_SCOPE_SYSTEM` scheduling contention scope contends  
2173 for resources with all other threads in the same scheduling allocation domain relative to their  
2174 system scheduling attributes. The system scheduling attributes of a thread created with  
2175 `PTHREAD_SCOPE_SYSTEM` scheduling contention scope are the scheduling attributes with  
2176 which the thread was created. The system scheduling attributes of a thread created with  
2177 `PTHREAD_SCOPE_PROCESS` scheduling contention scope are the implementation-defined  
2178 mapping into system attribute space of the scheduling attributes with which the thread was  
2179 created.
- 2180 • Threads created with `PTHREAD_SCOPE_PROCESS` scheduling contention scope contend  
2181 directly with other threads within their process that were created with  
2182 `PTHREAD_SCOPE_PROCESS` scheduling contention scope. The contention is resolved  
2183 based on the threads' scheduling attributes and policies. It is unspecified how such threads  
2184 are scheduled relative to threads in other processes or threads with  
2185 `PTHREAD_SCOPE_SYSTEM` scheduling contention scope.
- 2186 • Conforming implementations shall support the `PTHREAD_SCOPE_PROCESS` scheduling  
2187 contention scope, the `PTHREAD_SCOPE_SYSTEM` scheduling contention scope, or both.

**2188 Scheduling Allocation Domain**

2189 Implementations shall support scheduling allocation domains containing one or more  
2190 processors. It should be noted that the presence of multiple processors does not automatically  
2191 indicate a scheduling allocation domain size greater than one. Conforming implementations on  
2192 multi-processors may map all or any subset of the CPUs to one or multiple scheduling allocation  
2193 domains, and could define these scheduling allocation domains on a per-thread, per-process, or  
2194 per-system basis, depending on the types of applications intended to be supported by the  
2195 implementation. The scheduling allocation domain is independent of scheduling contention  
2196 scope, as the scheduling contention scope merely defines the set of threads with which a thread  
2197 contends for processor resources, while scheduling allocation domain defines the set of  
2198 processors for which it contends. The semantics of how this contention is resolved among  
2199 threads for processors is determined by the scheduling policies of the threads.

2200 The choice of scheduling allocation domain size and the level of application control over  
2201 scheduling allocation domains is implementation-defined. Conforming implementations may  
2202 change the size of scheduling allocation domains and the binding of threads to scheduling  
2203 allocation domains at any time.

2204 For application threads with scheduling allocation domains of size equal to one, the scheduling  
2205 rules defined for `SCHED_FIFO` and `SCHED_RR` shall be used; see **Scheduling Policies** (on page  
2206 44). All threads with system scheduling contention scope, regardless of the processes in which  
2207 they reside, compete for the processor according to their priorities. Threads with process  
2208 scheduling contention scope compete only with other threads with process scheduling  
2209 contention scope within their process.

2210 For application threads with scheduling allocation domains of size greater than one, the rules  
 2211 TSP defined for SCHED\_FIFO, SCHED\_RR, and SCHED\_SPORADIC shall be used in an  
 2212 implementation-defined manner. Each thread with system scheduling contention scope  
 2213 competes for the processors in its scheduling allocation domain in an implementation-defined  
 2214 manner according to its priority. Threads with process scheduling contention scope are  
 2215 scheduled relative to other threads within the same scheduling contention scope in the process.

2216 TSP If \_POSIX\_THREAD\_SPORADIC\_SERVER is defined, the rules defined for SCHED\_SPORADIC  
 2217 in **Scheduling Policies** (on page 44) shall be used in an implementation-defined manner for  
 2218 application threads whose scheduling allocation domain size is greater than one.

## 2219 Scheduling Documentation

2220 If \_POSIX\_PRIORITY\_SCHEDULING is defined, then any scheduling policies beyond  
 2221 TSP SCHED\_OTHER, SCHED\_FIFO, SCHED\_RR, and SCHED\_SPORADIC, as well as the effects of  
 2222 the scheduling policies indicated by these other values, and the attributes required in order to  
 2223 support such a policy, are implementation-defined. Furthermore, the implementation shall  
 2224 document the effect of all processor scheduling allocation domain values supported for these  
 2225 policies.

## 2226 2.9.5 Thread Cancellation

2227 The thread cancellation mechanism allows a thread to terminate the execution of any other  
 2228 thread in the process in a controlled manner. The target thread (that is, the one that is being  
 2229 canceled) is allowed to hold cancellation requests pending in a number of ways and to perform  
 2230 application-specific cleanup processing when the notice of cancellation is acted upon.

2231 Cancellation is controlled by the cancellation control functions. Each thread maintains its own  
 2232 cancelability state. Cancellation may only occur at cancellation points or when the thread is  
 2233 asynchronously cancelable.

2234 The thread cancellation mechanism described in this section depends upon programs having set  
 2235 *deferred* cancelability state, which is specified as the default. Applications shall also carefully  
 2236 follow static lexical scoping rules in their execution behavior. For example, use of *setjmp()*,  
 2237 *return*, *goto*, and so on, to leave user-defined cancellation scopes without doing the necessary  
 2238 scope pop operation results in undefined behavior.

2239 Use of asynchronous cancelability while holding resources which potentially need to be released  
 2240 may result in resource loss. Similarly, cancellation scopes may only be safely manipulated  
 2241 (pushed and popped) when the thread is in the *deferred* or *disabled* cancelability states.

### 2242 2.9.5.1 Cancelability States

2243 The cancelability state of a thread determines the action taken upon receipt of a cancellation  
 2244 request. The thread may control cancellation in a number of ways.

2245 Each thread maintains its own cancelability state, which may be encoded in two bits:

- 2246 1. Cancelability-Enable: When cancelability is PTHREAD\_CANCEL\_DISABLE (as defined in  
 2247 the Base Definitions volume of IEEE Std 1003.1-2001, <**pthread.h**>), cancellation requests  
 2248 against the target thread are held pending. By default, cancelability is set to  
 2249 PTHREAD\_CANCEL\_ENABLE (as defined in <**pthread.h**>).
- 2250 2. Cancelability Type: When cancelability is enabled and the cancelability type is  
 2251 PTHREAD\_CANCEL\_ASYNCHRONOUS (as defined in <**pthread.h**>), new or pending  
 2252 cancellation requests may be acted upon at any time. When cancelability is enabled and the  
 2253 cancelability type is PTHREAD\_CANCEL\_DEFERRED (as defined in <**pthread.h**>),

2254 cancellation requests are held pending until a cancellation point (see below) is reached. If  
 2255 cancelability is disabled, the setting of the cancelability type has no immediate effect as all  
 2256 cancellation requests are held pending; however, once cancelability is enabled again the  
 2257 new type is in effect. The cancelability type is PTHREAD\_CANCEL\_DEFERRED in all  
 2258 newly created threads including the thread in which *main()* was first invoked.

### 2259 2.9.5.2 Cancellation Points

2260 Cancellation points shall occur when a thread is executing the following functions:

2261	<i>accept()</i>	<i>mq_timedsend()</i>	<i>putpmsg()</i>	<i>sigsuspend()</i>
2262	<i>aio_suspend()</i>	<i>msgrcv()</i>	<i>pwrite()</i>	<i>sigtimedwait()</i>
2263	<i>clock_nanosleep()</i>	<i>msgsnd()</i>	<i>read()</i>	<i>sigwait()</i>
2264	<i>close()</i>	<i>msync()</i>	<i>readv()</i>	<i>sigwaitinfo()</i>
2265	<i>connect()</i>	<i>nanosleep()</i>	<i>recv()</i>	<i>sleep()</i>
2266	<i>creat()</i>	<i>open()</i>	<i>recvfrom()</i>	<i>system()</i>
2267	<i>fcntl()</i> <sup>2</sup>	<i>pause()</i>	<i>recvmsg()</i>	<i>tcdrain()</i>
2268	<i>fsync()</i>	<i>poll()</i>	<i>select()</i>	<i>usleep()</i>
2269	<i>getmsg()</i>	<i>pread()</i>	<i>sem_timedwait()</i>	<i>wait()</i>
2270	<i>getpmsg()</i>	<i>pthread_cond_timedwait()</i>	<i>sem_wait()</i>	<i>waitid()</i>
2271	<i>lockf()</i>	<i>pthread_cond_wait()</i>	<i>send()</i>	<i>waitpid()</i>
2272	<i>mq_receive()</i>	<i>pthread_join()</i>	<i>sendmsg()</i>	<i>write()</i>
2273	<i>mq_send()</i>	<i>pthread_testcancel()</i>	<i>sendto()</i>	<i>writev()</i>
2274	<i>mq_timedreceive()</i>	<i>putmsg()</i>	<i>sigpause()</i>	

2275 \_\_\_\_\_

2276 2. When the *cmd* argument is F\_SETLKW.

2277 A cancelation point may also occur when a thread is executing the following functions:

2278	<i>catclose()</i>	<i>ftell()</i>	<i>getwc()</i>	<i>pthread_rwlock_wrlock()</i>
2279	<i>catgets()</i>	<i>ftello()</i>	<i>getwchar()</i>	<i>putc()</i>
2280	<i>catopen()</i>	<i>ftw()</i>	<i>getwd()</i>	<i>putc_unlocked()</i>
2281	<i>closedir()</i>	<i>fwprintf()</i>	<i>glob()</i>	<i>putchar()</i>
2282	<i>closelog()</i>	<i>fwrite()</i>	<i>iconv_close()</i>	<i>putchar_unlocked()</i>
2283	<i>ctermid()</i>	<i>fwscanf()</i>	<i>iconv_open()</i>	<i>puts()</i>
2284	<i>dbm_close()</i>	<i>getc()</i>	<i>ioctl()</i>	<i>pututxline()</i>
2285	<i>dbm_delete()</i>	<i>getc_unlocked()</i>	<i>lseek()</i>	<i>putwc()</i>
2286	<i>dbm_fetch()</i>	<i>getchar()</i>	<i>mkstemp()</i>	<i>putwchar()</i>
2287	<i>dbm_nextkey()</i>	<i>getchar_unlocked()</i>	<i>nftw()</i>	<i>readdir()</i>
2288	<i>dbm_open()</i>	<i>getcwd()</i>	<i>opendir()</i>	<i>readdir_r()</i>
2289	<i>dbm_store()</i>	<i>getdate()</i>	<i>openlog()</i>	<i>remove()</i>
2290	<i>dlclose()</i>	<i>getgrent()</i>	<i>pclose()</i>	<i>rename()</i>
2291	<i>dlopen()</i>	<i>getgrgid()</i>	<i>perror()</i>	<i>rewind()</i>
2292	<i>endgrent()</i>	<i>getgrgid_r()</i>	<i>popen()</i>	<i>rewinddir()</i>
2293	<i>endhostent()</i>	<i>getgrnam()</i>	<i>posix_fadvise()</i>	<i>scanf()</i>
2294	<i>endnetent()</i>	<i>getgrnam_r()</i>	<i>posix_fallocate()</i>	<i>seekdir()</i>
2295	<i>endprotoent()</i>	<i>gethostbyaddr()</i>	<i>posix_madvise()</i>	<i>semop()</i>
2296	<i>endpwent()</i>	<i>gethostbyname()</i>	<i>posix_spawn()</i>	<i>setgrent()</i>
2297	<i>endservent()</i>	<i>gethostent()</i>	<i>posix_spawnnp()</i>	<i>sethostent()</i>
2298	<i>endutxent()</i>	<i>gethostname()</i>	<i>posix_trace_clear()</i>	<i>setnetent()</i>
2299	<i>fclose()</i>	<i>getlogin()</i>	<i>posix_trace_close()</i>	<i>setprotoent()</i>
2300	<i>fcntl()</i> <sup>3</sup>	<i>getlogin_r()</i>	<i>posix_trace_create()</i>	<i>setpwent()</i>
2301	<i>fflush()</i>	<i>getnetbyaddr()</i>	<i>posix_trace_create_withlog()</i>	<i>setservent()</i>
2302	<i>fgetc()</i>	<i>getnetbyname()</i>	<i>posix_trace_eventtypelist_getnext_id()</i>	<i>setutxent()</i>
2303	<i>fgetpos()</i>	<i>getnetent()</i>	<i>posix_trace_eventtypelist_rewind()</i>	<i>strerror()</i>
2304	<i>fgets()</i>	<i>getprotobyname()</i>	<i>posix_trace_flush()</i>	<i>syslog()</i>
2305	<i>fgetwc()</i>	<i>getprotobynumber()</i>	<i>posix_trace_get_attr()</i>	<i>tmpfile()</i>
2306	<i>fgetws()</i>	<i>getprotoent()</i>	<i>posix_trace_get_filter()</i>	<i>tmpnam()</i>
2307	<i>fopen()</i>	<i>getpwent()</i>	<i>posix_trace_get_status()</i>	<i>ttyname()</i>
2308	<i>fprintf()</i>	<i>getpwnam()</i>	<i>posix_trace_getnext_event()</i>	<i>ttyname_r()</i>
2309	<i>fputc()</i>	<i>getpwnam_r()</i>	<i>posix_trace_open()</i>	<i>ungetc()</i>
2310	<i>fputs()</i>	<i>getpwuid()</i>	<i>posix_trace_rewind()</i>	<i>ungetwc()</i>
2311	<i>fputwc()</i>	<i>getpwuid_r()</i>	<i>posix_trace_set_filter()</i>	<i>unlink()</i>
2312	<i>fputws()</i>	<i>gets()</i>	<i>posix_trace_shutdown()</i>	<i>vfprintf()</i>
2313	<i>fread()</i>	<i>getservbyname()</i>	<i>posix_trace_timedgetnext_event()</i>	<i>vfwprintf()</i>
2314	<i>freopen()</i>	<i>getservbyport()</i>	<i>posix_typed_mem_open()</i>	<i>vprintf()</i>
2315	<i>fscanf()</i>	<i>getservent()</i>	<i>printf()</i>	<i>vwprintf()</i>
2316	<i>fseek()</i>	<i>getutxent()</i>	<i>pthread_rwlock_rdlock()</i>	<i>wprintf()</i>
2317	<i>fseeko()</i>	<i>getutxid()</i>	<i>pthread_rwlock_timedrdlock()</i>	<i>wscanf()</i>
2318	<i>fsetpos()</i>	<i>getutxline()</i>	<i>pthread_rwlock_timedwrlock()</i>	

2319 An implementation shall not introduce cancelation points into any other functions specified in  
2320 this volume of IEEE Std 1003.1-2001.

2321 \_\_\_\_\_

2322 3. For any value of the *cmd* argument.

2323 The side effects of acting upon a cancelation request while suspended during a call of a function  
2324 are the same as the side effects that may be seen in a single-threaded program when a call to a  
2325 function is interrupted by a signal and the given function returns [EINTR]. Any such side effects  
2326 occur before any cancelation cleanup handlers are called.

2327 Whenever a thread has cancelability enabled and a cancelation request has been made with that  
2328 thread as the target, and the thread then calls any function that is a cancelation point (such as  
2329 *pthread\_testcancel()* or *read()*), the cancelation request shall be acted upon before the function  
2330 returns. If a thread has cancelability enabled and a cancelation request is made with the thread  
2331 as a target while the thread is suspended at a cancelation point, the thread shall be awakened  
2332 and the cancelation request shall be acted upon. However, if the thread is suspended at a  
2333 cancelation point and the event for which it is waiting occurs before the cancelation request is  
2334 acted upon, it is unspecified whether the cancelation request is acted upon or whether the  
2335 cancelation request remains pending and the thread resumes normal execution.

### 2336 2.9.5.3 Thread Cancelation Cleanup Handlers

2337 Each thread maintains a list of cancelation cleanup handlers. The programmer uses the  
2338 *pthread\_cleanup\_push()* and *pthread\_cleanup\_pop()* functions to place routines on and remove  
2339 routines from this list.

2340 When a cancelation request is acted upon, the routines in the list are invoked one by one in LIFO  
2341 sequence; that is, the last routine pushed onto the list (Last In) is the first to be invoked (First  
2342 Out). The thread invokes the cancelation cleanup handler with cancelation disabled until the last  
2343 cancelation cleanup handler returns. When the cancelation cleanup handler for a scope is  
2344 invoked, the storage for that scope remains valid. If the last cancelation cleanup handler returns,  
2345 thread execution is terminated and a status of PTHREAD\_CANCELED is made available to any  
2346 threads joining with the target. The symbolic constant PTHREAD\_CANCELED expands to a  
2347 constant expression of type (**void \***) whose value matches no pointer to an object in memory nor  
2348 the value NULL.

2349 The cancelation cleanup handlers are also invoked when the thread calls *pthread\_exit()*.

2350 A side effect of acting upon a cancelation request while in a condition variable wait is that the  
2351 mutex is re-acquired before calling the first cancelation cleanup handler. In addition, the thread  
2352 is no longer considered to be waiting for the condition and the thread shall not have consumed  
2353 any pending condition signals on the condition.

2354 A cancelation cleanup handler cannot exit via *longjmp()* or *siglongjmp()*.

### 2355 2.9.5.4 Async-Cancel Safety

2356 The *pthread\_cancel()*, *pthread\_setcancelstate()*, and *pthread\_setcanceltype()* functions are defined to  
2357 be async-cancel safe.

2358 No other functions in this volume of IEEE Std 1003.1-2001 are required to be async-cancel-safe.

**2359 2.9.6 Thread Read-Write Locks**

2360 Multiple readers, single writer (read-write) locks allow many threads to have simultaneous  
2361 read-only access to data while allowing only one thread to have exclusive write access at any  
2362 given time. They are typically used to protect data that is read more frequently than it is  
2363 changed.

2364 One or more readers acquire read access to the resource by performing a read lock operation on  
2365 the associated read-write lock. A writer acquires exclusive write access by performing a write  
2366 lock operation. Basically, all readers exclude any writers and a writer excludes all readers and  
2367 any other writers.

2368 A thread that has blocked on a read-write lock (for example, has not yet returned from a  
2369 *pthread\_rwlock\_rdlock()* or *pthread\_rwlock\_wrlock()* call) shall not prevent any unblocked thread  
2370 that is eligible to use the same processing resources from eventually making forward progress in  
2371 its execution. Eligibility for processing resources shall be determined by the scheduling policy.

2372 Read-write locks can be used to synchronize threads in the current process and other processes if  
2373 they are allocated in memory that is writable and shared among the cooperating processes and  
2374 have been initialized for this behavior.

**2375 2.9.7 Thread Interactions with Regular File Operations**

2376 All of the functions *chmod()*, *close()*, *fchmod()*, *fcntl()*, *fstat()*, *ftruncate()*, *lseek()*, *open()*, *read()*,  
2377 *readlink()*, *stat()*, *symlink()*, and *write()* shall be atomic with respect to each other in the effects  
2378 specified in IEEE Std 1003.1-2001 when they operate on regular files. If two threads each call one  
2379 of these functions, each call shall either see all of the specified effects of the other call, or none of  
2380 them.

**2381 2.10 Sockets**

2382 A socket is an endpoint for communication using the facilities described in this section. A socket  
2383 is created with a specific socket type, described in Section 2.10.6 (on page 59), and is associated  
2384 with a specific protocol, detailed in Section 2.10.3 (on page 59). A socket is accessed via a file  
2385 descriptor obtained when the socket is created.

**2386 2.10.1 Address Families**

2387 All network protocols are associated with a specific address family. An address family provides  
2388 basic services to the protocol implementation to allow it to function within a specific network  
2389 environment. These services may include packet fragmentation and reassembly, routing,  
2390 addressing, and basic transport. An address family is normally comprised of a number of  
2391 protocols, one per socket type. Each protocol is characterized by an abstract socket type. It is not  
2392 required that an address family support all socket types. An address family may contain  
2393 multiple protocols supporting the same socket abstraction.

2394 Section 2.10.17 (on page 66), Section 2.10.19 (on page 67), and Section 2.10.20 (on page 67),  
2395 respectively, describe the use of sockets for local UNIX connections, for Internet protocols based  
2396 on IPv4, and for Internet protocols based on IPv6.

**2397 2.10.2 Addressing**

2398 An address family defines the format of a socket address. All network addresses are described  
2399 using a general structure, called a **sockaddr**, as defined in the Base Definitions volume of  
2400 IEEE Std 1003.1-2001, <**sys/socket.h**>. However, each address family imposes finer and more  
2401 specific structure, generally defining a structure with fields specific to the address family. The  
2402 field *sa\_family* in the **sockaddr** structure contains the address family identifier, specifying the  
2403 format of the *sa\_data* area. The size of the *sa\_data* area is unspecified.

**2404 2.10.3 Protocols**

2405 A protocol supports one of the socket abstractions detailed in Section 2.10.6. Selecting a protocol  
2406 involves specifying the address family, socket type, and protocol number to the *socket()*  
2407 function. Certain semantics of the basic socket abstractions are protocol-specific. All protocols  
2408 are expected to support the basic model for their particular socket type, but may, in addition,  
2409 provide non-standard facilities or extensions to a mechanism.

**2410 2.10.4 Routing**

2411 Sockets provides packet routing facilities. A routing information database is maintained, which  
2412 is used in selecting the appropriate network interface when transmitting packets.

**2413 2.10.5 Interfaces**

2414 Each network interface in a system corresponds to a path through which messages can be sent  
2415 and received. A network interface usually has a hardware device associated with it, though  
2416 certain interfaces such as the loopback interface, do not.

**2417 2.10.6 Socket Types**

2418 A socket is created with a specific type, which defines the communication semantics and which  
2419 RS allows the selection of an appropriate communication protocol. Four types are defined:  
2420 **SOCK\_RAW**, **SOCK\_STREAM**, **SOCK\_SEQPACKET**, and **SOCK\_DGRAM**. Implementations  
2421 may specify additional socket types.

2422 The **SOCK\_STREAM** socket type provides reliable, sequenced, full-duplex octet streams  
2423 between the socket and a peer to which the socket is connected. A socket of type  
2424 **SOCK\_STREAM** must be in a connected state before any data may be sent or received. Record  
2425 boundaries are not maintained; data sent on a stream socket using output operations of one size  
2426 may be received using input operations of smaller or larger sizes without loss of data. Data may  
2427 be buffered; successful return from an output function does not imply that the data has been  
2428 delivered to the peer or even transmitted from the local system. If data cannot be successfully  
2429 transmitted within a given time then the connection is considered broken, and subsequent  
2430 operations shall fail. A SIGPIPE signal is raised if a thread sends on a broken stream (one that is  
2431 no longer connected). Support for an out-of-band data transmission facility is protocol-specific.

2432 The **SOCK\_SEQPACKET** socket type is similar to the **SOCK\_STREAM** type, and is also  
2433 connection-oriented. The only difference between these types is that record boundaries are  
2434 maintained using the **SOCK\_SEQPACKET** type. A record can be sent using one or more output  
2435 operations and received using one or more input operations, but a single operation never  
2436 transfers parts of more than one record. Record boundaries are visible to the receiver via the  
2437 **MSG\_EOR** flag in the received message flags returned by the *recvmsg()* function. It is protocol-  
2438 specific whether a maximum record size is imposed.

2439 The **SOCK\_DGRAM** socket type supports connectionless data transfer which is not necessarily  
2440 acknowledged or reliable. Datagrams may be sent to the address specified (possibly multicast or

2441 broadcast) in each output operation, and incoming datagrams may be received from multiple  
2442 sources. The source address of each datagram is available when receiving the datagram. An  
2443 application may also pre-specify a peer address, in which case calls to output functions shall  
2444 send to the pre-specified peer. If a peer has been specified, only datagrams from that peer shall  
2445 be received. A datagram must be sent in a single output operation, and must be received in a  
2446 single input operation. The maximum size of a datagram is protocol-specific; with some  
2447 protocols, the limit is implementation-defined. Output datagrams may be buffered within the  
2448 system; thus, a successful return from an output function does not guarantee that a datagram is  
2449 actually sent or received. However, implementations should attempt to detect any errors  
2450 possible before the return of an output function, reporting any error by an unsuccessful return  
2451 value.

2452 RS The SOCK\_RAW socket type is similar to the SOCK\_DGRAM type. It differs in that it is  
2453 normally used with communication providers that underlie those used for the other socket  
2454 types. For this reason, the creation of a socket with type SOCK\_RAW shall require appropriate  
2455 privilege. The format of datagrams sent and received with this socket type generally include  
2456 specific protocol headers, and the formats are protocol-specific and implementation-defined.

### 2457 **2.10.7 Socket I/O Mode**

2458 The I/O mode of a socket is described by the O\_NONBLOCK file status flag which pertains to  
2459 the open file description for the socket. This flag is initially off when a socket is created, but may  
2460 be set and cleared by the use of the F\_SETFL command of the *fcntl()* function.

2461 When the O\_NONBLOCK flag is set, functions that would normally block until they are  
2462 complete shall either return immediately with an error, or shall complete asynchronously to the  
2463 execution of the calling process. Data transfer operations (the *read()*, *write()*, *send()*, and *recv()*  
2464 functions) shall complete immediately, transfer only as much as is available, and then return  
2465 without blocking, or return an error indicating that no transfer could be made without blocking.  
2466 The *connect()* function initiates a connection and shall return without blocking when  
2467 O\_NONBLOCK is set; it shall return the error [EINPROGRESS] to indicate that the connection  
2468 was initiated successfully, but that it has not yet completed.

### 2469 **2.10.8 Socket Owner**

2470 The owner of a socket is unset when a socket is created. The owner may be set to a process ID or  
2471 process group ID using the F\_SETOWN command of the *fcntl()* function.

### 2472 **2.10.9 Socket Queue Limits**

2473 The transmit and receive queue sizes for a socket are set when the socket is created. The default  
2474 sizes used are both protocol-specific and implementation-defined. The sizes may be changed  
2475 using the *setsockopt()* function.

### 2476 **2.10.10 Pending Error**

2477 Errors may occur asynchronously, and be reported to the socket in response to input from the  
2478 network protocol. The socket stores the pending error to be reported to a user of the socket at the  
2479 next opportunity. The error is returned in response to a subsequent *send()*, *recv()*, or *getsockopt()*  
2480 operation on the socket, and the pending error is then cleared.

**2481 2.10.11 Socket Receive Queue**

2482 A socket has a receive queue that buffers data when it is received by the system until it is  
2483 removed by a receive call. Depending on the type of the socket and the communication provider,  
2484 the receive queue may also contain ancillary data such as the addressing and other protocol data  
2485 associated with the normal data in the queue, and may contain out-of-band or expedited data.  
2486 The limit on the queue size includes any normal, out-of-band data, datagram source addresses,  
2487 and ancillary data in the queue. The description in this section applies to all sockets, even though  
2488 some elements cannot be present in some instances.

2489 The contents of a receive buffer are logically structured as a series of data segments with  
2490 associated ancillary data and other information. A data segment may contain normal data or  
2491 out-of-band data, but never both. A data segment may complete a record if the protocol  
2492 supports records (always true for types SOCK\_SEQPACKET and SOCK\_DGRAM). A record  
2493 may be stored as more than one segment; the complete record might never be present in the  
2494 receive buffer at one time, as a portion might already have been returned to the application, and  
2495 another portion might not yet have been received from the communications provider. A data  
2496 segment may contain ancillary protocol data, which is logically associated with the segment.  
2497 Ancillary data is received as if it were queued along with the first normal data octet in the  
2498 segment (if any). A segment may contain ancillary data only, with no normal or out-of-band  
2499 data. For the purposes of this section, a datagram is considered to be a data segment that  
2500 terminates a record, and that includes a source address as a special type of ancillary data. Data  
2501 segments are placed into the queue as data is delivered to the socket by the protocol. Normal  
2502 data segments are placed at the end of the queue as they are delivered. If a new segment  
2503 contains the same type of data as the preceding segment and includes no ancillary data, and if  
2504 the preceding segment does not terminate a record, the segments are logically merged into a  
2505 single segment.

2506 The receive queue is logically terminated if an end-of-file indication has been received or a  
2507 connection has been terminated. A segment shall be considered to be terminated if another  
2508 segment follows it in the queue, if the segment completes a record, or if an end-of-file or other  
2509 connection termination has been reported. The last segment in the receive queue shall also be  
2510 considered to be terminated while the socket has a pending error to be reported.

2511 A receive operation shall never return data or ancillary data from more than one segment.

**2512 2.10.12 Socket Out-of-Band Data State**

2513 The handling of received out-of-band data is protocol-specific. Out-of-band data may be placed  
2514 in the socket receive queue, either at the end of the queue or before all normal data in the queue.  
2515 In this case, out-of-band data is returned to an application program by a normal receive call.  
2516 Out-of-band data may also be queued separately rather than being placed in the socket receive  
2517 queue, in which case it shall be returned only in response to a receive call that requests out-of-  
2518 band data. It is protocol-specific whether an out-of-band data mark is placed in the receive  
2519 queue to demarcate data preceding the out-of-band data and following the out-of-band data. An  
2520 out-of-band data mark is logically an empty data segment that cannot be merged with other  
2521 segments in the queue. An out-of-band data mark is never returned in response to an input  
2522 operation. The *socketmark()* function can be used to test whether an out-of-band data mark is the  
2523 first element in the queue. If an out-of-band data mark is the first element in the queue when an  
2524 input function is called without the MSG\_PEEK option, the mark is removed from the queue and  
2525 the following data (if any) is processed as if the mark had not been present.

**2526 2.10.13 Connection Indication Queue**

2527 Sockets that are used to accept incoming connections maintain a queue of outstanding  
2528 connection indications. This queue is a list of connections that are awaiting acceptance by the  
2529 application; see *listen()*.

**2530 2.10.14 Signals**

2531 One category of event at the socket interface is the generation of signals. These signals report  
2532 protocol events or process errors relating to the state of the socket. The generation or delivery of  
2533 a signal does not change the state of the socket, although the generation of the signal may have  
2534 been caused by a state change.

2535 The SIGPIPE signal shall be sent to a thread that attempts to send data on a socket that is no  
2536 longer able to send. In addition, the send operation fails with the error [EPIPE].

2537 If a socket has an owner, the SIGURG signal is sent to the owner of the socket when it is notified  
2538 of expedited or out-of-band data. The socket state at this time is protocol-dependent, and the  
2539 status of the socket is specified in Section 2.10.17 (on page 66), Section 2.10.19 (on page 67), and  
2540 Section 2.10.20 (on page 67). Depending on the protocol, the expedited data may or may not  
2541 have arrived at the time of signal generation.

**2542 2.10.15 Asynchronous Errors**

2543 If any of the following conditions occur asynchronously for a socket, the corresponding value  
2544 listed below shall become the pending error for the socket:

2545 [ECONNABORTED]

2546 The connection was aborted locally.

2547 [ECONNREFUSED]

2548 For a connection-mode socket attempting a non-blocking connection, the attempt to connect  
2549 was forcefully rejected. For a connectionless-mode socket, an attempt to deliver a datagram  
2550 was forcefully rejected.

2551 [ECONNRESET]

2552 The peer has aborted the connection.

2553 [EHOSTDOWN]

2554 The destination host has been determined to be down or disconnected.

2555 [EHOSTUNREACH]

2556 The destination host is not reachable.

2557 [EMSGSIZE]

2558 For a connectionless-mode socket, the size of a previously sent datagram prevented  
2559 delivery.

2560 [ENETDOWN]

2561 The local network connection is not operational.

2562 [ENETRESET]

2563 The connection was aborted by the network.

2564 [ENETUNREACH]

2565 The destination network is not reachable.

2566 **2.10.16 Use of Options**

2567 There are a number of socket options which either specialize the behavior of a socket or provide  
 2568 useful information. These options may be set at different protocol levels and are always present  
 2569 at the uppermost “socket” level.

2570 Socket options are manipulated by two functions, *getsockopt()* and *setsockopt()*. These functions  
 2571 allow an application program to customize the behavior and characteristics of a socket to  
 2572 provide the desired effect.

2573 All of the options have default values. The type and meaning of these values is defined by the  
 2574 protocol level to which they apply. Instead of using the default values, an application program  
 2575 may choose to customize one or more of the options. However, in the bulk of cases, the default  
 2576 values are sufficient for the application.

2577 Some of the options are used to enable or disable certain behavior within the protocol modules  
 2578 (for example, turn on debugging) while others may be used to set protocol-specific information  
 2579 (for example, IP time-to-live on all the application’s outgoing packets). As each of the options is  
 2580 introduced, its effect on the underlying protocol modules is described.

2581 Table 2-1 shows the value for the socket level.

2582 **Table 2-1** Value of Level for Socket Options

Name	Description
SOL_SOCKET	Options are intended for the sockets level.

2583  
 2584  
 2585 Table 2-2 (on page 64) lists those options present at the socket level; that is, when the *level*  
 2586 parameter of the *getsockopt()* or *setsockopt()* function is SOL\_SOCKET, the types of the option  
 2587 value parameters associated with each option, and a brief synopsis of the meaning of the option  
 2588 value parameter. Unless otherwise noted, each may be examined with *getsockopt()* and set with  
 2589 *setsockopt()* on all types of socket.

2619

Option	Parameter Type	Parameter Meaning
SO_BROADCAST	int	Non-zero requests permission to transmit broadcast datagrams (SOCK_DGRAM sockets only).
SO_DEBUG	int	Non-zero requests debugging in underlying protocol modules.
SO_DONTROUTE	int	Non-zero requests bypass of normal routing; route based on destination address only.
SO_ERROR	int	Requests and clears pending error information on the socket ( <i>getsockopt()</i> only).
SO_KEEPALIVE	int	Non-zero requests periodic transmission of keepalive messages (protocol-specific).
SO_LINGER	struct linger	Specify actions to be taken for queued, unsent data on <i>close()</i> : linger on/off and linger time in seconds.
SO_OOBINLINE	int	Non-zero requests that out-of-band data be placed into normal data input queue as received.
SO_RCVBUF	int	Size of receive buffer (in bytes).
SO_RCVLOWAT	int	Minimum amount of data to return to application for input operations (in bytes).
SO_RCVTIMEO	struct timeval	Timeout value for a socket receive operation.
SO_REUSEADDR	int	Non-zero requests reuse of local addresses in <i>bind()</i> (protocol-specific).
SO_SNDBUF	int	Size of send buffer (in bytes).
SO_SNDLOWAT	int	Minimum amount of data to send for output operations (in bytes).
SO_SNDTIMEO	struct timeval	Timeout value for a socket send operation.
SO_TYPE	int	Identify socket type ( <i>getsockopt()</i> only).

2636

The SO\_BROADCAST option requests permission to send broadcast datagrams on the socket. Support for SO\_BROADCAST is protocol-specific. The default for SO\_BROADCAST is that the ability to send broadcast datagrams on a socket is disabled.

The SO\_DEBUG option enables debugging in the underlying protocol modules. This can be useful for tracing the behavior of the underlying protocol modules during normal system operation. The semantics of the debug reports are implementation-defined. The default value for SO\_DEBUG is for debugging to be turned off.

The SO\_DONTROUTE option requests that outgoing messages bypass the standard routing facilities. The destination must be on a directly-connected network, and messages are directed to the appropriate network interface according to the destination address. It is protocol-specific whether this option has any effect and how the outgoing network interface is chosen. Support for this option with each protocol is implementation-defined.

The SO\_ERROR option is used only on *getsockopt()*. When this option is specified, *getsockopt()* shall return any pending error on the socket and clear the error status. It shall return a value of 0 if there is no pending error. SO\_ERROR may be used to check for asynchronous errors on connected connectionless-mode sockets or for other types of asynchronous errors. SO\_ERROR has no default value.

2637 The SO\_KEEPALIVE option enables the periodic transmission of messages on a connected  
2638 socket. The behavior of this option is protocol-specific. The default value for SO\_KEEPALIVE is  
2639 zero, specifying that this capability is turned off.

2640 The SO\_LINGER option controls the action of the interface when unsent messages are queued  
2641 on a socket and a *close()* is performed. The details of this option are protocol-specific. The  
2642 default value for SO\_LINGER is zero, or off, for the *L\_onoff* element of the option value and zero  
2643 seconds for the linger time specified by the *L\_linger* element.

2644 The SO\_OOBINLINE option is valid only on protocols that support out-of-band data. The  
2645 SO\_OOBINLINE option requests that out-of-band data be placed in the normal data input queue  
2646 as received; it is then accessible using the *read()* or *recv()* functions without the MSG\_OOB flag  
2647 set. The default for SO\_OOBINLINE is off; that is, for out-of-band data not to be placed in the  
2648 normal data input queue.

2649 The SO\_RCVBUF option requests that the buffer space allocated for receive operations on this  
2650 socket be set to the value, in bytes, of the option value. Applications may wish to increase buffer  
2651 size for high volume connections, or may decrease buffer size to limit the possible backlog of  
2652 incoming data. The default value for the SO\_RCVBUF option value is implementation-defined,  
2653 and may vary by protocol.

2654 The maximum value for the option for a socket may be obtained by the use of the *fpathconf()*  
2655 function, using the value *\_PC\_SOCKET\_MAXBUF*.

2656 The SO\_RCVLOWAT option sets the minimum number of bytes to process for socket input  
2657 operations. In general, receive calls block until any (non-zero) amount of data is received, then  
2658 return the smaller of the amount available or the amount requested. The default value for  
2659 SO\_RCVLOWAT is 1, and does not affect the general case. If SO\_RCVLOWAT is set to a larger  
2660 value, blocking receive calls normally wait until they have received the smaller of the low water  
2661 mark value or the requested amount. Receive calls may still return less than the low water mark  
2662 if an error occurs, a signal is caught, or the type of data next in the receive queue is different  
2663 from that returned (for example, out-of-band data). As mentioned previously, the default value  
2664 for SO\_RCVLOWAT is 1 byte. It is implementation-defined whether the SO\_RCVLOWAT option  
2665 can be set.

2666 The SO\_RCVTIMEO option is an option to set a timeout value for input operations. It accepts a  
2667 **timeval** structure with the number of seconds and microseconds specifying the limit on how  
2668 long to wait for an input operation to complete. If a receive operation has blocked for this much  
2669 time without receiving additional data, it shall return with a partial count or *errno* shall be set to  
2670 [EWOULDBLOCK] if no data were received. The default for this option is the value zero, which  
2671 indicates that a receive operation will not time out. It is implementation-defined whether the  
2672 SO\_RCVTIMEO option can be set.

2673 The SO\_REUSEADDR option indicates that the rules used in validating addresses supplied in a  
2674 *bind()* should allow reuse of local addresses. Operation of this option is protocol-specific. The  
2675 default value for SO\_REUSEADDR is off; that is, reuse of local addresses is not permitted.

2676 The SO\_SNDBUF option requests that the buffer space allocated for send operations on this  
2677 socket be set to the value, in bytes, of the option value. The default value for the SO\_SNDBUF  
2678 option value is implementation-defined, and may vary by protocol. The maximum value for the  
2679 option for a socket may be obtained by the use of the *fpathconf()* function, using the value  
2680 *\_PC\_SOCKET\_MAXBUF*.

2681 The SO\_SNDLOWAT option sets the minimum number of bytes to process for socket output  
2682 operations. Most output operations process all of the data supplied by the call, delivering data to  
2683 the protocol for transmission and blocking as necessary for flow control. Non-blocking output  
2684 operations process as much data as permitted subject to flow control without blocking, but

2685 process no data if flow control does not allow the smaller of the send low water mark value or  
 2686 the entire request to be processed. A *select()* operation testing the ability to write to a socket shall  
 2687 return true only if the send low water mark could be processed. The default value for  
 2688 SO\_SNDLOWAT is implementation-defined and protocol-specific. It is implementation-defined  
 2689 whether the SO\_SNDLOWAT option can be set.

2690 The SO\_SNDTIMEO option is an option to set a timeout value for the amount of time that an  
 2691 output function shall block because flow control prevents data from being sent. As noted in  
 2692 Table 2-2 (on page 64), the option value is a **timeval** structure with the number of seconds and  
 2693 microseconds specifying the limit on how long to wait for an output operation to complete. If a  
 2694 send operation has blocked for this much time, it shall return with a partial count or *errno* set to  
 2695 [EWOULDBLOCK] if no data were sent. The default for this option is the value zero, which  
 2696 indicates that a send operation will not time out. It is implementation-defined whether the  
 2697 SO\_SNDTIMEO option can be set.

2698 The SO\_TYPE option is used only on *getsockopt()*. When this option is specified, *getsockopt()*  
 2699 shall return the type of the socket (for example, SOCK\_STREAM). This option is useful to  
 2700 servers that inherit sockets on start-up. SO\_TYPE has no default value.

### 2701 **2.10.17 Use of Sockets for Local UNIX Connections**

2702 Support for UNIX domain sockets is mandatory.

2703 UNIX domain sockets provide process-to-process communication in a single system.

#### 2704 *2.10.17.1 Headers*

2705 The symbolic constant AF\_UNIX defined in the `<sys/socket.h>` header is used to identify the  
 2706 UNIX domain address family. The `<sys/un.h>` header contains other definitions used in  
 2707 connection with UNIX domain sockets. See the Base Definitions volume of IEEE Std 1003.1-2001,  
 2708 Chapter 13, Headers.

2709 The **sockaddr\_storage** structure defined in `<sys/socket.h>` shall be large enough to  
 2710 accommodate a **sockaddr\_un** structure (see the `<sys/un.h>` header defined in the Base  
 2711 Definitions volume of IEEE Std 1003.1-2001, Chapter 13, Headers) and shall be aligned at an  
 2712 appropriate boundary so that pointers to it can be cast as pointers to **sockaddr\_un** structures  
 2713 and used to access the fields of those structures without alignment problems. When a  
 2714 **sockaddr\_storage** structure is cast as a **sockaddr\_un** structure, the *ss\_family* field maps onto the  
 2715 *sun\_family* field.

### 2716 **2.10.18 Use of Sockets over Internet Protocols**

2717 When a socket is created in the Internet family with a protocol value of zero, the implementation  
 2718 shall use the protocol listed below for the type of socket created.

2719 SOCK\_STREAM      IPPROTO\_TCP.

2720 SOCK\_DGRAM      IPPROTO\_UDP.

2721 RS      SOCK\_RAW      IPPROTO\_RAW.

2722 SOCK\_SEQPACKET    Unspecified.

2723 RS      A raw interface to IP is available by creating an Internet socket of type SOCK\_RAW. The default  
 2724 protocol for type SOCK\_RAW shall be identified in the IP header with the value  
 2725 IPPROTO\_RAW. Applications should not use the default protocol when creating a socket with  
 2726 type SOCK\_RAW, but should identify a specific protocol by value. The ICMP control protocol is  
 2727 accessible from a raw socket by specifying a value of IPPROTO\_ICMP for protocol.

## 2728 **2.10.19 Use of Sockets over Internet Protocols Based on IPv4**

2729 Support for sockets over Internet protocols based on IPv4 is mandatory.

### 2730 *2.10.19.1 Headers*

2731 The symbolic constant `AF_INET` defined in the `<sys/socket.h>` header is used to identify the  
 2732 IPv4 Internet address family. The `<netinet/in.h>` header contains other definitions used in  
 2733 connection with IPv4 Internet sockets. See the Base Definitions volume of IEEE Std 1003.1-2001,  
 2734 Chapter 13, Headers.

2735 The `sockaddr_storage` structure defined in `<sys/socket.h>` shall be large enough to  
 2736 accommodate a `sockaddr_in` structure (see the `<netinet/in.h>` header defined in the Base  
 2737 Definitions volume of IEEE Std 1003.1-2001, Chapter 13, Headers) and shall be aligned at an  
 2738 appropriate boundary so that pointers to it can be cast as pointers to `sockaddr_in` structures and  
 2739 used to access the fields of those structures without alignment problems. When a  
 2740 `sockaddr_storage` structure is cast as a `sockaddr_in` structure, the `ss_family` field maps onto the  
 2741 `sin_family` field.

## 2742 **2.10.20 Use of Sockets over Internet Protocols Based on IPv6**

2743 IP6 This section describes extensions to support sockets over Internet protocols based on IPv6. This  
 2744 functionality is dependent on support of the IPV6 option (and the rest of this section is not  
 2745 further shaded for this option).

2746 To enable smooth transition from IPv4 to IPv6, the features defined in this section may, in certain  
 2747 circumstances, also be used in connection with IPv4; see Section 2.10.20.2 (on page 68).

### 2748 *2.10.20.1 Addressing*

2749 IPv6 overcomes the addressing limitations of previous versions by using 128-bit addresses  
 2750 instead of 32-bit addresses. The IPv6 address architecture is described in RFC 2373.

2751 There are three kinds of IPv6 address:

#### 2752 Unicast

2753 Identifies a single interface.

2754 A unicast address can be global, link-local (designed for use on a single link), or site-local  
 2755 (designed for systems not connected to the Internet). Link-local and site-local addresses  
 2756 need not be globally unique.

#### 2757 Anycast

2758 Identifies a set of interfaces such that a packet sent to the address can be delivered to any  
 2759 member of the set.

2760 An anycast address is similar to a unicast address; the nodes to which an anycast address is  
 2761 assigned must be explicitly configured to know that it is an anycast address.

#### 2762 Multicast

2763 Identifies a set of interfaces such that a packet sent to the address should be delivered to  
 2764 every member of the set.

2765 An application can send multicast datagrams by simply specifying an IPv6 multicast  
 2766 address in the `address` argument of `sendto()`. To receive multicast datagrams, an application  
 2767 must join the multicast group (using `setsockopt()` with `IPV6_JOIN_GROUP`) and must bind  
 2768 to the socket the UDP port on which datagrams will be received. Some applications should  
 2769 also bind the multicast group address to the socket, to prevent other datagrams destined to  
 2770 that port from being delivered to the socket.

2771 A multicast address can be global, node-local, link-local, site-local, or organization-local.  
2772 The following special IPv6 addresses are defined:  
2773 Unspecified  
2774 An address that is not assigned to any interface and is used to indicate the absence of an  
2775 address.  
2776 Loopback  
2777 A unicast address that is not assigned to any interface and can be used by a node to send  
2778 packets to itself.  
2779 Two sets of IPv6 addresses are defined to correspond to IPv4 addresses:  
2780 IPv4-compatible addresses  
2781 These are assigned to nodes that support IPv6 and can be used when traffic is “tunneled”  
2782 through IPv4.  
2783 IPv4-mapped addresses  
2784 These are used to represent IPv4 addresses in IPv6 address format; see Section 2.10.20.2.  
2785 Note that the unspecified address and the loopback address must not be treated as IPv4-  
2786 compatible addresses.

#### 2787 2.10.20.2 Compatibility with IPv4

2788 The API provides the ability for IPv6 applications to interoperate with applications using IPv4,  
2789 by using IPv4-mapped IPv6 addresses. These addresses can be generated automatically by the  
2790 *getaddrinfo()* function when the specified host has only IPv4 addresses.

2791 Applications can use AF\_INET6 sockets to open TCP connections to IPv4 nodes, or send UDP  
2792 packets to IPv4 nodes, by simply encoding the destination's IPv4 address as an IPv4-mapped  
2793 IPv6 address, and passing that address, within a **sockaddr\_in6** structure, in the *connect()*,  
2794 *sendto()*, or *sendmsg()* function. When applications use AF\_INET6 sockets to accept TCP  
2795 connections from IPv4 nodes, or receive UDP packets from IPv4 nodes, the system shall return  
2796 the peer's address to the application in the *accept()*, *recvfrom()*, *recvmsg()*, or *getpeername()*  
2797 function using a **sockaddr\_in6** structure encoded this way. If a node has an IPv4 address, then  
2798 the implementation shall allow applications to communicate using that address via an  
2799 AF\_INET6 socket. In such a case, the address will be represented at the API by the  
2800 corresponding IPv4-mapped IPv6 address. Also, the implementation may allow an AF\_INET6  
2801 socket bound to **in6addr\_any** to receive inbound connections and packets destined to one of the  
2802 node's IPv4 addresses.

2803 An application can use AF\_INET6 sockets to bind to a node's IPv4 address by specifying the  
2804 address as an IPv4-mapped IPv6 address in a **sockaddr\_in6** structure in the *bind()* function. For  
2805 an AF\_INET6 socket bound to a node's IPv4 address, the system shall return the address in the  
2806 *getsockname()* function as an IPv4-mapped IPv6 address in a **sockaddr\_in6** structure.

#### 2807 2.10.20.3 Interface Identification

2808 Each local interface is assigned a unique positive integer as a numeric index. Indexes start at 1;  
2809 zero is not used. There may be gaps so that there is no current interface for a particular positive  
2810 index. Each interface also has a unique implementation-defined name.

## 2811 2.10.20.4 Options

2812 The following options apply at the IPPROTO\_IPV6 level:

## 2813 IPV6\_JOIN\_GROUP

2814 When set via *setsockopt()*, it joins the application to a multicast group on an interface  
2815 (identified by its index) and addressed by a given multicast address, enabling packets sent  
2816 to that address to be read via the socket. If the interface index is specified as zero, the  
2817 system selects the interface (for example, by looking up the address in a routing table and  
2818 using the resulting interface).

2819 An attempt to read this option using *getsockopt()* shall result in an [EOPNOTSUPP] error.

2820 The parameter type of this option is a pointer to an **ipv6\_mreq** structure.

## 2821 IPV6\_LEAVE\_GROUP

2822 When set via *setsockopt()*, it removes the application from the multicast group on an  
2823 interface (identified by its index) and addressed by a given multicast address.

2824 An attempt to read this option using *getsockopt()* shall result in an [EOPNOTSUPP] error.

2825 The parameter type of this option is a pointer to an **ipv6\_mreq** structure.

## 2826 IPV6\_MULTICAST\_HOPS

2827 The value of this option is the hop limit for outgoing multicast IPv6 packets sent via the  
2828 socket. Its possible values are the same as those of IPV6\_UNICAST\_HOPS. If the  
2829 IPV6\_MULTICAST\_HOPS option is not set, a value of 1 is assumed. This option can be set  
2830 via *setsockopt()* and read via *getsockopt()*.

2831 The parameter type of this option is a pointer to an **int**. (Default value: 1)

## 2832 IPV6\_MULTICAST\_IF

2833 The index of the interface to be used for outgoing multicast packets. It can be set via  
2834 *setsockopt()* and read via *getsockopt()*. If the interface index is specified as zero, the system  
2835 selects the interface (for example, by looking up the address in a routing table and using the  
2836 resulting interface).

2837 The parameter type of this option is a pointer to an **unsigned int**. (Default value: 0)

## 2838 IPV6\_MULTICAST\_LOOP

2839 This option controls whether outgoing multicast packets should be delivered back to the  
2840 local application when the sending interface is itself a member of the destination multicast  
2841 group. If it is set to 1 they are delivered. If it is set to 0 they are not. Other values result in an  
2842 [EINVAL] error. This option can be set via *setsockopt()* and read via *getsockopt()*.

2843 The parameter type of this option is a pointer to an **unsigned int** which is used as a Boolean  
2844 value. (Default value: 1)

## 2845 IPV6\_UNICAST\_HOPS

2846 The value of this option is the hop limit for outgoing unicast IPv6 packets sent via the  
2847 socket. If the option is not set, or is set to -1, the system selects a default value. Attempts to  
2848 set a value less than -1 or greater than 255 shall result in an [EINVAL] error. This option can  
2849 be set via *setsockopt()* and read via *getsockopt()*.

2850 The parameter type of this option is a pointer to an **int**. (Default value: Unspecified)

## 2851 IPV6\_V6ONLY

2852 This socket option restricts AF\_INET6 sockets to IPv6 communications only. AF\_INET6  
2853 sockets may be used for both IPv4 and IPv6 communications. Some applications may want  
2854 to restrict their use of an AF\_INET6 socket to IPv6 communications only. For these

2855 applications, the IPv6\_V6ONLY socket option is defined. When this option is turned on, the  
 2856 socket can be used to send and receive IPv6 packets only. This is an IPPROTO\_IPV6-level  
 2857 option.

2858 The parameter type of this option is a pointer to an **int** which is used as a Boolean value.  
 2859 (Default value: 0)

2860 An [EOPNOTSUPP] error shall result if IPV6\_JOIN\_GROUP or IPV6\_LEAVE\_GROUP is used  
 2861 with *getsockopt()*.

#### 2862 2.10.20.5 Headers

2863 The symbolic constant AF\_INET6 is defined in the `<sys/socket.h>` header to identify the IPv6  
 2864 Internet address family. See the Base Definitions volume of IEEE Std 1003.1-2001, Chapter 13,  
 2865 Headers.

2866 The **sockaddr\_storage** structure defined in `<sys/socket.h>` shall be large enough to  
 2867 accommodate a **sockaddr\_in6** structure (see the `<netinet/in.h>` header defined in the Base  
 2868 Definitions volume of IEEE Std 1003.1-2001, Chapter 13, Headers) and shall be aligned at an  
 2869 appropriate boundary so that pointers to it can be cast as pointers to **sockaddr\_in6** structures  
 2870 and used to access the fields of those structures without alignment problems. When a  
 2871 **sockaddr\_storage** structure is cast as a **sockaddr\_in6** structure, the *ss\_family* field maps onto the  
 2872 *sin6\_family* field.

2873 The `<netinet/in.h>`, `<arpa/inet.h>`, and `<netdb.h>` headers contain other definitions used in  
 2874 connection with IPv6 Internet sockets; see the Base Definitions volume of IEEE Std 1003.1-2001,  
 2875 Chapter 13, Headers.

## 2876 2.11 Tracing

2877 TRC This section describes extensions to support tracing of user applications. This functionality is  
 2878 dependent on support of the Trace option (and the rest of this section is not further shaded for  
 2879 this option).

2880 The tracing facilities defined in IEEE Std 1003.1-2001 allow a process to select a set of trace event  
 2881 types, to activate a trace stream of the selected trace events as they occur in the flow of  
 2882 execution, and to retrieve the recorded trace events.

2883 The tracing operation relies on three logically different components: the traced process, the  
 2884 controller process, and the analyzer process. During the execution of the traced process, when a  
 2885 trace point is reached, a trace event is recorded into the trace streams created for that process in  
 2886 which the associated trace event type identifier is not being filtered out. The controller process  
 2887 controls the operation of recording the trace events into the trace stream. It shall be able to:

- 2888 • Initialize the attributes of a trace stream
- 2889 • Create the trace stream (for a specified traced process) using those attributes
- 2890 • Start and stop tracing for the trace stream
- 2891 • Filter the type of trace events to be recorded, if the Trace Event Filter option is supported
- 2892 • Shut a trace stream down

2893 These operations can be done for an active trace stream. The analyzer process retrieves the  
 2894 traced events either at runtime, when the trace stream has not yet been shut down, but is still  
 2895 recording trace events; or after opening a trace log that had been previously recorded and shut  
 2896 down. These three logically different operations can be performed by the same process, or can be

2897 distributed into different processes.

2898 A trace stream identifier can be created by a call to *posix\_trace\_create()*,  
2899 *posix\_trace\_create\_withlog()*, or *posix\_trace\_open()*. The *posix\_trace\_create()* and  
2900 *posix\_trace\_create\_withlog()* functions should be used by a controller process. The  
2901 *posix\_trace\_open()* should be used by an analyzer process.

2902 The tracing functions can serve different purposes. One purpose is debugging the possibly pre-  
2903 instrumented code, while another is post-mortem fault analysis. These two potential uses differ  
2904 in that the first requires pre-filtering capabilities to avoid overwhelming the trace stream and  
2905 permits focusing on expected information; while the second needs comprehensive trace  
2906 capabilities in order to be able to record all types of information.

2907 The events to be traced belong to two classes:

- 2908 1. User trace events (generated by the application instrumentation)
- 2909 2. System trace events (generated by the operating system)

2910 The trace interface defines several system trace event types associated with control of and  
2911 operation of the trace stream. This small set of system trace events includes the minimum  
2912 required to interpret correctly the trace event information present in the stream. Other desirable  
2913 system trace events for some particular application profile may be implemented and are  
2914 encouraged; for example, process and thread scheduling, signal occurrence, and so on.

2915 Each traced process shall have a mapping of the trace event names to trace event type identifiers  
2916 that have been defined for that process. Each active trace stream shall have a mapping that  
2917 incorporates all the trace event type identifiers predefined by the trace system plus all the  
2918 mappings of trace event names to trace event type identifiers of the processes that are being  
2919 traced into that trace stream. These mappings are defined from the instrumented application by  
2920 calling the *posix\_trace\_eventid\_open()* function and from the controller process by calling the  
2921 *posix\_trace\_trid\_eventid\_open()* function. For a pre-recorded trace stream, the list of trace event  
2922 types is obtained from the pre-recorded trace log.

2923 The *st\_ctime* and *st\_mtime* fields of a file associated with an active trace stream shall be marked  
2924 for update every time any of the tracing operations modifies that file.

2925 The *st\_atime* field of a file associated with a trace stream shall be marked for update every time  
2926 any of the tracing operations causes data to be read from that file.

2927 Results are undefined if the application performs any operation on a file descriptor associated  
2928 with an active or pre-recorded trace stream until *posix\_trace\_shutdown()* or *posix\_trace\_close()* is  
2929 called for that trace stream.

2930 The main purpose of this option is to define a complete set of functions and concepts that allow  
2931 a conforming application to be traced from creation to termination, whatever its realtime  
2932 constraints and properties.

## 2933 2.11.1 Tracing Data Definitions

### 2934 2.11.1.1 Structures

2935 The **<trace.h>** header shall define the *posix\_trace\_status\_info* and *posix\_trace\_event\_info* structures  
2936 described below. Implementations may add extensions to these structures.

2937 **posix\_trace\_status\_info Structure**

2938 To facilitate control of a trace stream, information about the current state of an active trace  
 2939 stream can be obtained dynamically. This structure is returned by a call to the  
 2940 *posix\_trace\_get\_status()* function.

2941 The **posix\_trace\_status\_info** structure defined in `<trace.h>` shall contain at least the following  
 2942 members:

2943  
 2944  
 2945  
 2946  
 2947  
 2948

Member Type	Member Name	Description
<b>int</b>	<i>posix_stream_status</i>	The operating mode of the trace stream.
<b>int</b>	<i>posix_stream_full_status</i>	The full status of the trace stream.
<b>int</b>	<i>posix_stream_overrun_status</i>	Indicates whether trace events were lost in the trace stream.

2949 If the Trace Log option is supported in addition to the Trace option, the **posix\_trace\_status\_info**  
 2950 structure defined in `<trace.h>` shall contain at least the following additional members:

2951  
 2952  
 2953  
 2954  
 2955  
 2956  
 2957  
 2958

Member Type	Member Name	Description
<b>int</b>	<i>posix_stream_flush_status</i>	Indicates whether a flush is in progress.
<b>int</b>	<i>posix_stream_flush_error</i>	Indicates whether any error occurred during the last flush operation.
<b>int</b>	<i>posix_log_overrun_status</i>	Indicates whether trace events were lost in the trace log.
<b>int</b>	<i>posix_log_full_status</i>	The full status of the trace log.

2959 The *posix\_stream\_status* member indicates the operating mode of the trace stream and shall have  
 2960 one of the following values defined by manifest constants in the `<trace.h>` header:

2961 **POSIX\_TRACE\_RUNNING**

2962 Tracing is in progress; that is, the trace stream is accepting trace events.

2963 **POSIX\_TRACE\_SUSPENDED**

2964 The trace stream is not accepting trace events. The tracing operation has not yet started or  
 2965 has stopped, either following a *posix\_trace\_stop()* function call or because the trace resources  
 2966 are exhausted.

2967 The *posix\_stream\_full\_status* member indicates the full status of the trace stream, and it shall have  
 2968 one of the following values defined by manifest constants in the `<trace.h>` header:

2969 **POSIX\_TRACE\_FULL**

2970 The space in the trace stream for trace events is exhausted.

2971 **POSIX\_TRACE\_NOT\_FULL**

2972 There is still space available in the trace stream.

2973 The combination of the *posix\_stream\_status* and *posix\_stream\_full\_status* members also indicates  
 2974 the actual status of the stream. The status shall be interpreted as follows:

2975 **POSIX\_TRACE\_RUNNING** and **POSIX\_TRACE\_NOT\_FULL**

2976 This status combination indicates that tracing is in progress, and there is space available for  
 2977 recording more trace events.

2978 **POSIX\_TRACE\_RUNNING** and **POSIX\_TRACE\_FULL**

2979 This status combination indicates that tracing is in progress and that the trace stream is full  
 2980 of trace events. This status combination cannot occur unless the *stream-full-policy* is set to

2981           POSIX\_TRACE\_LOOP. The trace stream contains trace events recorded during a moving  
 2982           time window of prior trace events, and some older trace events may have been overwritten  
 2983           and thus lost.

2984           POSIX\_TRACE\_SUSPENDED and POSIX\_TRACE\_NOT\_FULL  
 2985           This status combination indicates that tracing has not yet been started, has been stopped by  
 2986           the *posix\_trace\_stop()* function, or has been cleared by the *posix\_trace\_clear()* function.

2987           POSIX\_TRACE\_SUSPENDED and POSIX\_TRACE\_FULL  
 2988           This status combination indicates that tracing has been stopped by the implementation  
 2989           because the *stream-full-policy* attribute was POSIX\_TRACE\_UNTIL\_FULL and trace  
 2990           resources were exhausted, or that the trace stream was stopped by the function  
 2991           *posix\_trace\_stop()* at a time when trace resources were exhausted.

2992           The *posix\_stream\_outrun\_status* member indicates whether trace events were lost in the trace  
 2993           stream, and shall have one of the following values defined by manifest constants in the  
 2994           <trace.h> header:

2995           POSIX\_TRACE\_OVERRUN  
 2996           At least one trace event was lost and thus was not recorded in the trace stream.

2997           POSIX\_TRACE\_NO\_OVERRUN  
 2998           No trace events were lost.

2999           When the corresponding trace stream is created, the *posix\_stream\_outrun\_status* member shall be  
 3000           set to POSIX\_TRACE\_NO\_OVERRUN.

3001           Whenever an overrun occurs, the *posix\_stream\_outrun\_status* member shall be set to  
 3002           POSIX\_TRACE\_OVERRUN.

3003           An overrun occurs when:

- 3004           • The policy is POSIX\_TRACE\_LOOP and a recorded trace event is overwritten.
- 3005           • The policy is POSIX\_TRACE\_UNTIL\_FULL and the trace stream is full when a trace event is  
 3006           generated.
- 3007           • If the Trace Log option is supported, the policy is POSIX\_TRACE\_FLUSH and at least one  
 3008           trace event is lost while flushing the trace stream to the trace log.

3009           The *posix\_stream\_outrun\_status* member is reset to zero after its value is read.

3010           If the Trace Log option is supported in addition to the Trace option, the *posix\_stream\_flush\_status*,  
 3011           *posix\_stream\_flush\_error*, *posix\_log\_outrun\_status*, and *posix\_log\_full\_status* members are defined  
 3012           as follows; otherwise, they are undefined.

3013           The *posix\_stream\_flush\_status* member indicates whether a flush operation is being performed  
 3014           and shall have one of the following values defined by manifest constants in the header  
 3015           <trace.h>:

3016           POSIX\_TRACE\_FLUSHING  
 3017           The trace stream is currently being flushed to the trace log.

3018           POSIX\_TRACE\_NOT\_FLUSHING  
 3019           No flush operation is in progress.

3020           The *posix\_stream\_flush\_status* member shall be set to POSIX\_TRACE\_FLUSHING if a flush  
 3021           operation is in progress either due to a call to the *posix\_trace\_flush()* function (explicit or caused  
 3022           by a trace stream shutdown operation) or because the trace stream has become full with the  
 3023           *stream-full-policy* attribute set to POSIX\_TRACE\_FLUSH. The *posix\_stream\_flush\_status* member  
 3024           shall be set to POSIX\_TRACE\_NOT\_FLUSHING if no flush operation is in progress.

3025 The *posix\_stream\_flush\_error* member shall be set to zero if no error occurred during flushing. If  
 3026 an error occurred during a previous flushing operation, the *posix\_stream\_flush\_error* member  
 3027 shall be set to the value of the first error that occurred. If more than one error occurs while  
 3028 flushing, error values after the first shall be discarded. The *posix\_stream\_flush\_error* member is  
 3029 reset to zero after its value is read.

3030 The *posix\_log\_overrun\_status* member indicates whether trace events were lost in the trace log,  
 3031 and shall have one of the following values defined by manifest constants in the `<trace.h>`  
 3032 header:

3033 POSIX\_TRACE\_OVERRUN  
 3034 At least one trace event was lost.

3035 POSIX\_TRACE\_NO\_OVERRUN  
 3036 No trace events were lost.

3037 When the corresponding trace stream is created, the *posix\_log\_overrun\_status* member shall be set  
 3038 to POSIX\_TRACE\_NO\_OVERRUN. Whenever an overrun occurs, this status shall be set to  
 3039 POSIX\_TRACE\_OVERRUN. The *posix\_log\_overrun\_status* member is reset to zero after its value  
 3040 is read.

3041 The *posix\_log\_full\_status* member indicates the full status of the trace log, and it shall have one of  
 3042 the following values defined by manifest constants in the `<trace.h>` header:

3043 POSIX\_TRACE\_FULL  
 3044 The space in the trace log is exhausted.

3045 POSIX\_TRACE\_NOT\_FULL  
 3046 There is still space available in the trace log.

3047 The *posix\_log\_full\_status* member is only meaningful if the *log-full-policy* attribute is either  
 3048 POSIX\_TRACE\_UNTIL\_FULL or POSIX\_TRACE\_LOOP.

3049 For an active trace stream without log, that is created by the *posix\_trace\_create()* function, the  
 3050 *posix\_log\_overrun\_status* member shall be set to POSIX\_TRACE\_NO\_OVERRUN and the  
 3051 *posix\_log\_full\_status* member shall be set to POSIX\_TRACE\_NOT\_FULL.

### 3052 **posix\_trace\_event\_info Structure**

3053 The trace event structure **posix\_trace\_event\_info** contains the information for one recorded  
 3054 trace event. This structure is returned by the set of functions *posix\_trace\_getnext\_event()*,  
 3055 *posix\_trace\_timedgetnext\_event()*, and *posix\_trace\_trygetnext\_event()*.

3056 The **posix\_trace\_event\_info** structure defined in `<trace.h>` shall contain at least the following  
 3057 members:

Member Type	Member Name	Description
<b>trace_event_id_t</b>	<i>posix_event_id</i>	Trace event type identification.
<b>pid_t</b>	<i>posix_pid</i>	Process ID of the process that generated the trace event.
<b>void *</b>	<i>posix_prog_address</i>	Address at which the trace point was invoked.
<b>int</b>	<i>posix_truncation_status</i>	Status about the truncation of the data associated with this trace event.
<b>struct timespec</b>	<i>posix_timestamp</i>	Time at which the trace event was generated.

3066 In addition, if the Trace option and the Threads option are both supported, the  
 3067 **posix\_trace\_event\_info** structure defined in `<trace.h>` shall contain the following additional  
 3068 member:

3069  
3070  
3071  
3072  
3073

Member Type	Member Name	Description
<b>pthread_t</b>	<i>posix_thread_id</i>	Thread ID of the thread that generated the trace event.

3074  
3075  
3076  
3077  
3078

The *posix\_event\_id* member represents the identification of the trace event type and its value is not directly defined by the user. This identification is returned by a call to one of the following functions: *posix\_trace\_trid\_eventid\_open()*, *posix\_trace\_eventtypelist\_getnext\_id()*, or *posix\_trace\_eventid\_open()*. The name of the trace event type can be obtained by calling *posix\_trace\_eventid\_get\_name()*.

3079  
3080  
3081

The *posix\_pid* is the process identifier of the traced process which generated the trace event. If the *posix\_event\_id* member is one of the implementation-defined system trace events and that trace event is not associated with any process, the *posix\_pid* member shall be set to zero.

3082  
3083  
3084  
3085  
3086

For a user trace event, the *posix\_prog\_address* member is the process mapped address of the point at which the associated call to the *posix\_trace\_event()* function was made. For a system trace event, if the trace event is caused by a system service explicitly called by the application, the *posix\_prog\_address* member shall be the address of the process at the point where the call to that system service was made.

3087  
3088  
3089  
3090  
3091

The *posix\_truncation\_status* member defines whether the data associated with a trace event has been truncated at the time the trace event was generated, or at the time the trace event was read from the trace stream, or (if the Trace Log option is supported) from the trace log (see the *event* argument from the *posix\_trace\_getnext\_event()* function). The *posix\_truncation\_status* member shall have one of the following values defined by manifest constants in the `<trace.h>` header:

3092  
3093

POSIX\_TRACE\_NOT\_TRUNCATED

All the traced data is available.

3094  
3095

POSIX\_TRACE\_TRUNCATED\_RECORD

Data was truncated at the time the trace event was generated.

3096

POSIX\_TRACE\_TRUNCATED\_READ

3097  
3098  
3099

Data was truncated at the time the trace event was read from a trace stream or a trace log because the reader's buffer was too small. This truncation status overrides the POSIX\_TRACE\_TRUNCATED\_RECORD status.

3100  
3101  
3102

The *posix\_timestamp* member shall be the time at which the trace event was generated. The clock used is implementation-defined, but the resolution of this clock can be retrieved by a call to the *posix\_trace\_attr\_getclockres()* function.

3103

If the Threads option is supported in addition to the Trace option:

3104  
3105  
3106

- The *posix\_thread\_id* member is the identifier of the thread that generated the trace event. If the *posix\_event\_id* member is one of the implementation-defined system trace events and that trace event is not associated with any thread, the *posix\_thread\_id* member shall be set to zero.

3107

Otherwise, this member is undefined.

### 3108 2.11.1.2 Trace Stream Attributes

3109  
3110

Trace streams have attributes that compose the **posix\_trace\_attr\_t** trace stream attributes object. This object shall contain at least the following attributes:

3111

- The *generation-version* attribute identifies the origin and version of the trace system.

- 3112 • The *trace-name* attribute is a character string defined by the trace controller, and that  
3113 identifies the trace stream.
- 3114 • The *creation-time* attribute represents the time of the creation of the trace stream.
- 3115 • The *clock-resolution* attribute defines the clock resolution of the clock used to generate  
3116 timestamps.
- 3117 • The *stream-min-size* attribute defines the minimum size in bytes of the trace stream strictly  
3118 reserved for the trace events.
- 3119 • The *stream-full-policy* attribute defines the policy followed when the trace stream is full; its  
3120 value is `POSIX_TRACE_LOOP`, `POSIX_TRACE_UNTIL_FULL`, or `POSIX_TRACE_FLUSH`.
- 3121 • The *max-data-size* attribute defines the maximum record size in bytes of a trace event.

3122 In addition, if the Trace option and the Trace Inherit option are both supported, the  
3123 **posix\_trace\_attr\_t** trace stream creation attributes object shall contain at least the following  
3124 attributes:

- 3125 • The *inheritance* attribute specifies whether a newly created trace stream will inherit tracing in  
3126 its parent's process trace stream. It is either `POSIX_TRACE_INHERITED` or  
3127 `POSIX_TRACE_CLOSE_FOR_CHILD`.

3128 In addition, if the Trace option and the Trace Log option are both supported, the  
3129 **posix\_trace\_attr\_t** trace stream creation attributes object shall contain at least the following  
3130 attribute:

- 3131 • If the file type corresponding to the trace log supports the `POSIX_TRACE_LOOP` or the  
3132 `POSIX_TRACE_UNTIL_FULL` policies, the *log-max-size* attribute defines the maximum size  
3133 in bytes of the trace log associated with an active trace stream. Other stream data—for  
3134 example, trace attribute values—shall not be included in this size.
- 3135 • The *log-full-policy* attribute defines the policy of a trace log associated with an active trace  
3136 stream to be `POSIX_TRACE_LOOP`, `POSIX_TRACE_UNTIL_FULL`, or  
3137 `POSIX_TRACE_APPEND`.

## 3138 2.11.2 Trace Event Type Definitions

### 3139 2.11.2.1 System Trace Event Type Definitions

3140 The following system trace event types, defined in the `<trace.h>` header, track the invocation of  
3141 the trace operations:

- 3142 • `POSIX_TRACE_START` shall be associated with a trace start operation.
- 3143 • `POSIX_TRACE_STOP` shall be associated with a trace stop operation.
- 3144 • If the Trace Event Filter option is supported, `POSIX_TRACE_FILTER` shall be associated with  
3145 a trace event type filter change operation.

3146 The following system trace event types, defined in the `<trace.h>` header, report operational trace  
3147 events:

- 3148 • `POSIX_TRACE_OVERFLOW` shall mark the beginning of a trace overflow condition.
- 3149 • `POSIX_TRACE_RESUME` shall mark the end of a trace overflow condition.
- 3150 • If the Trace Log option is supported, `POSIX_TRACE_FLUSH_START` shall mark the  
3151 beginning of a flush operation.

3152 • If the Trace Log option is supported, POSIX\_TRACE\_FLUSH\_STOP shall mark the end of a  
 3153 flush operation.

3154 • If an implementation-defined trace error condition is reported, it shall be marked  
 3155 POSIX\_TRACE\_ERROR.

3156 The interpretation of a trace stream or a trace log by a trace analyzer process relies on the  
 3157 information recorded for each trace event, and also on system trace events that indicate the  
 3158 invocation of trace control operations and trace system operational trace events.

3159 The POSIX\_TRACE\_START and POSIX\_TRACE\_STOP trace events specify the time windows  
 3160 during which the trace stream is running.

3161 • The POSIX\_TRACE\_STOP trace event with an associated data that is equal to zero indicates  
 3162 a call of the function *posix\_trace\_stop()*.

3163 • The POSIX\_TRACE\_STOP trace event with an associated data that is different from zero  
 3164 indicates an automatic stop of the trace stream (see *posix\_trace\_attr\_getstreamfullpolicy()*).

3165 The POSIX\_TRACE\_FILTER trace event indicates that a trace event type filter value changed  
 3166 while the trace stream was running.

3167 The POSIX\_TRACE\_ERROR serves to inform the analyzer process that an implementation-  
 3168 defined internal error of the trace system occurred.

3169 The POSIX\_TRACE\_OVERFLOW trace event shall be reported with a timestamp equal to the  
 3170 timestamp of the first trace event overwritten. This is an indication that some generated trace  
 3171 events have been lost.

3172 The POSIX\_TRACE\_RESUME trace event shall be reported with a timestamp equal to the  
 3173 timestamp of the first valid trace event reported after the overflow condition ends and shall be  
 3174 reported before this first valid trace event. This is an indication that the trace system is reliably  
 3175 recording trace events after an overflow condition.

3176 Each of these trace event types shall be defined by a constant trace event name and a  
 3177 **trace\_event\_id\_t** constant; trace event data is associated with some of these trace events.

3178 If the Trace option is supported and the Trace Event Filter option and the Trace Log option are  
 3179 not supported, the following predefined system trace events in Table 2-3 shall be defined:

3180 **Table 2-3** Trace Option: System Trace Events

Event Name	Constant	Associated Data
		Data Type
posix_trace_error	POSIX_TRACE_ERROR	error <b>int</b>
posix_trace_start	POSIX_TRACE_START	None.
posix_trace_stop	POSIX_TRACE_STOP	auto <b>int</b>
posix_trace_overflow	POSIX_TRACE_OVERFLOW	None.
posix_trace_resume	POSIX_TRACE_RESUME	None.

3190 If the Trace option and the Trace Event Filter option are both supported, and if the Trace Log  
 3191 option is not supported, the following predefined system trace events in Table 2-4 (on page 78)  
 3192 shall be defined:

3193

**Table 2-4** Trace and Trace Event Filter Options: System Trace Events

posix_trace_stop	POSIX_TRACE_STOP	auto
		<b>int</b>
posix_trace_overflow	POSIX_TRACE_OVERFLOW	None.
posix_trace_resume	POSIX_TRACE_RESUME	None.
posix_trace_flush_start	POSIX_TRACE_FLUSH_START	None.
posix_trace_flush_stop	POSIX_TRACE_FLUSH_STOP	None.

3222

3223

If the Trace option, the Trace Event Filter option, and the Trace Log option are all supported, the following predefined system trace events in Table 2-6 (on page 79) shall be defined:

3224 **Table 2-6** Trace, Trace Log, and Trace Event Filter Options: System Trace Events

Event Name	Constant	Associated Data
		Data Type
posix_trace_error	POSIX_TRACE_ERROR	error <b>int</b>
posix_trace_start	POSIX_TRACE_START	event_filter <b>trace_event_set_t</b>
posix_trace_stop	POSIX_TRACE_STOP	auto <b>int</b>
posix_trace_filter	POSIX_TRACE_FILTER	old_event_filter new_event_filter <b>trace_event_set_t</b>
posix_trace_overflow	POSIX_TRACE_OVERFLOW	None.
posix_trace_resume	POSIX_TRACE_RESUME	None.
posix_trace_flush_start	POSIX_TRACE_FLUSH_START	None.
posix_trace_flush_stop	POSIX_TRACE_FLUSH_STOP	None.

3240 **2.11.2.2** User Trace Event Type Definitions

3241 The user trace event `POSIX_TRACE_UNNAMED_USEREVENT` is defined in the `<trace.h>`  
 3242 header. If the limit of per-process user trace event names represented by  
 3243 `{TRACE_USER_EVENT_MAX}` has already been reached, this predefined user event shall be  
 3244 returned when the application tries to register more events than allowed. The data associated  
 3245 with this trace event is application-defined.

3246 The following predefined user trace event in Table 2-7 shall be defined:

3247 **Table 2-7** Trace Option: User Trace Event

Event Name	Constant
posix_trace_unnamed_userevent	POSIX_TRACE_UNNAMED_USEREVENT

3250 **2.11.3** Trace Functions

3251 The trace interface is built and structured to improve portability through use of trace data of  
 3252 opaque type. The object-oriented approach for the manipulation of trace attributes and trace  
 3253 event type identifiers requires definition of many constructor and selector functions which  
 3254 operate on these opaque types. Also, the trace interface must support several different tracing  
 3255 roles. To facilitate reading the trace interface, the trace functions are grouped into small  
 3256 functional sets supporting the three different roles:

- 3257 • A trace controller process requires functions to set up and customize all the resources needed  
 3258 to run a trace stream, including:
  - 3259 — Attribute initialization and destruction (`posix_trace_attr_init()`)
  - 3260 — Identification information manipulation (`posix_trace_attr_getgenversion()`)
  - 3261 — Trace system behavior modification (`posix_trace_attr_getinherited()`)
  - 3262 — Trace stream and trace log size set (`posix_trace_attr_getmaxusereventsize()`)

- 3263 — Trace stream creation, flush, and shutdown (*posix\_trace\_create()*)
- 3264 — Trace stream and trace log clear (*posix\_trace\_clear()*)
- 3265 — Trace event type identifier manipulation (*posix\_trace\_trid\_eventid\_open()*)
- 3266 — Trace event type identifier list exploration (*posix\_trace\_eventtypelist\_getnext\_id()*)
- 3267 — Trace event type set manipulation (*posix\_trace\_eventset\_empty()*)
- 3268 — Trace event type filter set (*posix\_trace\_set\_filter()*)
- 3269 — Trace stream start and stop (*posix\_trace\_start()*)
- 3270 — Trace stream information and status read (*posix\_trace\_get\_attr()*)
- 3271 • A traced process requires functions to instrument trace points:
- 3272 — Trace event type identifiers definition and trace points insertion (*posix\_trace\_event()*)
- 3273 • A trace analyzer process requires functions to retrieve information from a trace stream and
- 3274 trace log:
- 3275 — Identification information read (*posix\_trace\_attr\_getgenversion()*)
- 3276 — Trace system behavior information read (*posix\_trace\_attr\_getinherited()*)
- 3277 — Trace stream and trace log size get (*posix\_trace\_attr\_getmaxusereventsized()*)
- 3278 — Trace event type identifier manipulation (*posix\_trace\_trid\_eventid\_open()*)
- 3279 — Trace event type identifier list exploration (*posix\_trace\_eventtypelist\_getnext\_id()*)
- 3280 — Trace log open, rewind, and close (*posix\_trace\_open()*)
- 3281 — Trace stream information and status read (*posix\_trace\_get\_attr()*)
- 3282 — Trace event read (*posix\_trace\_getnext\_event()*)

## 3283 2.12 Data Types

3284 All of the data types used by various functions are defined by the implementation. The  
 3285 following table describes some of these types. Other types referenced in the description of a  
 3286 function, not mentioned here, can be found in the appropriate header for that function.

3287

3288

3289

3292

3293

3294

3295

3296

3297

3298

Defined Type	Description
<b>cc_t</b>	Type used for terminal special characters.
<b>clock_t</b>	Integer or real-floating type used for processor times, as defined in the ISO C standard.
<b>clockid_t</b>	Used for clock ID type in some timer functions.
<b>dev_t</b>	Arithmetic type used for device numbers.
<b>DIR</b>	Type representing a directory stream.
<b>div_t</b>	Structure type returned by the <i>div()</i> function.
<b>FILE</b>	Structure containing information about a file.
<b>glob_t</b>	Structure type used in pathname pattern matching.
<b>fpos_t</b>	Type containing all information needed to specify uniquely every

3299	Defined Type	Description
3300		
3301		position within a file.
3302	<b>gid_t</b>	Integer type used for group IDs.
3303	<b>iconv_t</b>	Type used for conversion descriptors.
3304	<b>id_t</b>	Integer type used as a general identifier; can be used to contain at least the largest of a <b>pid_t</b> , <b>uid_t</b> , or <b>gid_t</b> .
3305		
3306	<b>ino_t</b>	Unsigned integer type used for file serial numbers.
3307	<b>key_t</b>	Arithmetic type used for XSI interprocess communication.
3308	<b>ldiv_t</b>	Structure type returned by the <i>ldiv()</i> function.
3309	<b>mode_t</b>	Integer type used for file attributes.
3310	<b>mqd_t</b>	Used for message queue descriptors.
3311	<b>nfds_t</b>	Integer type used for the number of file descriptors.
3312	<b>nlink_t</b>	Integer type used for link counts.
3313	<b>off_t</b>	Signed integer type used for file sizes.
3314	<b>pid_t</b>	Signed integer type used for process and process group IDs.
3315	<b>pthread_attr_t</b>	Used to identify a thread attribute object.
3316	<b>pthread_cond_t</b>	Used for condition variables.
3317	<b>pthread_condattr_t</b>	Used to identify a condition attribute object.
3318	<b>pthread_key_t</b>	Used for thread-specific data keys.
3319	<b>pthread_mutex_t</b>	Used for mutexes.
3320	<b>pthread_mutexattr_t</b>	Used to identify a mutex attribute object.
3321	<b>pthread_once_t</b>	Used for dynamic package initialization.
3322	<b>pthread_rwlock_t</b>	Used for read-write locks.
3323	<b>pthread_rwlockattr_t</b>	Used for read-write lock attributes.
3324	<b>pthread_t</b>	Used to identify a thread.
3325	<b>ptrdiff_t</b>	Signed integer type of the result of subtracting two pointers.
3326	<b>regex_t</b>	Structure type used in regular expression matching.
3327	<b>regmatch_t</b>	Structure type used in regular expression matching.
3328	<b>rlim_t</b>	Unsigned integer type used for limit values, to which objects of type <b>int</b> and <b>off_t</b> can be cast without loss of value.
3329		
3330	<b>sem_t</b>	Type used in performing semaphore operations.
3331	<b>sig_atomic_t</b>	Integer type of an object that can be accessed as an atomic entity, even in the presence of asynchronous interrupts.
3332		
3333	<b>sigset_t</b>	Integer or structure type of an object used to represent sets of signals.
3334		
3335	<b>size_t</b>	Unsigned integer type used for size of objects.
3336	<b>speed_t</b>	Type used for terminal baud rates.
3337	<b>ssize_t</b>	Signed integer type used for a count of bytes or an error indication.
3338		
3339	<b>suseconds_t</b>	Signed integer type used for time in microseconds.
3340	<b>tcflag_t</b>	Type used for terminal modes.
3341	<b>time_t</b>	Integer or real-floating type used for time in seconds, as defined in the ISO C standard.
3342		
3343	<b>timer_t</b>	Used for timer ID returned by the <i>timer_create()</i> function.
3344	<b>uid_t</b>	Integer type used for user IDs.
3345	<b>useconds_t</b>	Unsigned integer type used for time in microseconds.
3346	<b>va_list</b>	Type used for traversing variable argument lists.
3347	<b>wchar_t</b>	Integer type whose range of values can represent distinct codes for

3348  
3349  
3350  
3351  
3352  
3353  
3354  
3355

Defined Type	Description
	all members of the largest extended character set specified by the supported locales.
<b>wctype_t</b>	Scalar type which represents a character class descriptor.
<b>wint_t</b>	Integer type capable of storing any valid value of <b>wchar_t</b> or WEOF.
<b>wordexp_t</b>	Structure type used in word expansion.

# *System Interfaces*

3356

3357  
3358

This chapter describes the functions, macros, and external variables to support applications portability at the C-language source level.

3359 **NAME**

3360       FD\_CLR — macros for synchronous I/O multiplexing

3361 **SYNOPSIS**

3362       #include <sys/time.h>

3363       FD\_CLR(int *fd*, fd\_set \**fdset*);

3364       FD\_ISSET(int *fd*, fd\_set \**fdset*);

3365       FD\_SET(int *fd*, fd\_set \**fdset*);

3366       FD\_ZERO(fd\_set \**fdset*);

3367 **DESCRIPTION**

3368       Refer to *pselect()*.

3369 **NAME**

3370        \_Exit, \_exit — terminate a process

3371 **SYNOPSIS**

3372        #include &lt;unistd.h&gt;

3373        void \_Exit(int *status*);3374        void \_exit(int *status*);3375 **DESCRIPTION**3376        Refer to *exit()*.

3377 **NAME**

3378        \_longjmp, \_setjmp — non-local goto

3379 **SYNOPSIS**

```
3380 xSI       #include <setjmp.h>
```

```
3381       void _longjmp(jmp_buf env, int val);
```

```
3382       int _setjmp(jmp_buf env);
```

3383

3384 **DESCRIPTION**

3385        The *\_longjmp()* and *\_setjmp()* functions shall be equivalent to *longjmp()* and *setjmp()*,  
3386        respectively, with the additional restriction that *\_longjmp()* and *\_setjmp()* shall not manipulate  
3387        the signal mask.

3388        If *\_longjmp()* is called even though *env* was never initialized by a call to *\_setjmp()*, or when the  
3389        last such call was in a function that has since returned, the results are undefined.

3390 **RETURN VALUE**

3391        Refer to *longjmp()* and *setjmp()*.

3392 **ERRORS**

3393        No errors are defined.

3394 **EXAMPLES**

3395        None.

3396 **APPLICATION USAGE**

3397        If *\_longjmp()* is executed and the environment in which *\_setjmp()* was executed no longer exists,  
3398        errors can occur. The conditions under which the environment of the *\_setjmp()* no longer exists  
3399        include exiting the function that contains the *\_setjmp()* call, and exiting an inner block with  
3400        temporary storage. This condition might not be detectable, in which case the *\_longjmp()* occurs  
3401        and, if the environment no longer exists, the contents of the temporary storage of an inner block  
3402        are unpredictable. This condition might also cause unexpected process termination. If the  
3403        function has returned, the results are undefined.

3404        Passing *longjmp()* a pointer to a buffer not created by *setjmp()*, passing *\_longjmp()* a pointer to a  
3405        buffer not created by *\_setjmp()*, passing *siglongjmp()* a pointer to a buffer not created by  
3406        *sigsetjmp()*, or passing any of these three functions a buffer that has been modified by the user  
3407        can cause all the problems listed above, and more.

3408        The *\_longjmp()* and *\_setjmp()* functions are included to support programs written to historical  
3409        system interfaces. New applications should use *siglongjmp()* and *sigsetjmp()* respectively.

3410 **RATIONALE**

3411        None.

3412 **FUTURE DIRECTIONS**

3413        The *\_longjmp()* and *\_setjmp()* functions may be marked LEGACY in a future version.

3414 **SEE ALSO**

3415        *longjmp()*, *setjmp()*, *siglongjmp()*, *sigsetjmp()*, the Base Definitions volume of  
3416        IEEE Std 1003.1-2001, <setjmp.h>

3417 **CHANGE HISTORY**

3418        First released in Issue 4, Version 2.

3419 **Issue 5**

3420 Moved from X/OPEN UNIX extension to BASE.

3421 **NAME**

3422        \_toupper — transliterate uppercase characters to lowercase

3423 **SYNOPSIS**

3424 xSI     #include <ctype.h>

3425        int \_tolower(int c);

3426

3427 **DESCRIPTION**

3428        The *\_tolower()* macro shall be equivalent to *tolower(c)* except that the application shall ensure  
3429        that the argument *c* is an uppercase letter.

3430 **RETURN VALUE**

3431        Upon successful completion, *\_tolower()* shall return the lowercase letter corresponding to the  
3432        argument passed.

3433 **ERRORS**

3434        No errors are defined.

3435 **EXAMPLES**

3436        None.

3437 **APPLICATION USAGE**

3438        None.

3439 **RATIONALE**

3440        None.

3441 **FUTURE DIRECTIONS**

3442        None.

3443 **SEE ALSO**

3444        *tolower()*, *isupper()*, the Base Definitions volume of IEEE Std 1003.1-2001, Chapter 7, Locale,  
3445        <ctype.h>

3446 **CHANGE HISTORY**

3447        First released in Issue 1. Derived from Issue 1 of the SVID.

3448 **Issue 6**

3449        The DESCRIPTION is updated to avoid use of the term “must” for application requirements.

3450 **NAME**

3451        \_toupper — transliterate lowercase characters to uppercase

3452 **SYNOPSIS**

3453 xSI       #include &lt;ctype.h&gt;

3454       int \_toupper(int c);

3455

3456 **DESCRIPTION**3457        The *\_toupper()* macro shall be equivalent to *toupper()* except that the application shall ensure  
3458        that the argument *c* is a lowercase letter.3459 **RETURN VALUE**3460        Upon successful completion, *\_toupper()* shall return the uppercase letter corresponding to the  
3461        argument passed.3462 **ERRORS**

3463        No errors are defined.

3464 **EXAMPLES**

3465        None.

3466 **APPLICATION USAGE**

3467        None.

3468 **RATIONALE**

3469        None.

3470 **FUTURE DIRECTIONS**

3471        None.

3472 **SEE ALSO**3473        *islower()*, *toupper()*, the Base Definitions volume of IEEE Std 1003.1-2001, Chapter 7, Locale,  
3474        <ctype.h>3475 **CHANGE HISTORY**

3476        First released in Issue 1. Derived from Issue 1 of the SVID.

3477 **Issue 6**

3478        The DESCRIPTION is updated to avoid use of the term “must” for application requirements.

3479 **NAME**

3480 a64l, l64a — convert between a 32-bit integer and a radix-64 ASCII string

3481 **SYNOPSIS**

```
3482 xSI #include <stdlib.h>
3483 long a64l(const char *s);
3484 char *l64a(long value);
3485
```

3486 **DESCRIPTION**

3487 These functions maintain numbers stored in radix-64 ASCII characters. This is a notation by  
 3488 which 32-bit integers can be represented by up to six characters; each character represents a digit  
 3489 in radix-64 notation. If the type **long** contains more than 32 bits, only the low-order 32 bits shall  
 3490 be used for these operations.

3491 The characters used to represent digits are '.' (dot) for 0, '/' for 1, '0' through '9' for [2,11],  
 3492 'A' through 'Z' for [12,37], and 'a' through 'z' for [38,63].

3493 The *a64l()* function shall take a pointer to a radix-64 representation, in which the first digit is the  
 3494 least significant, and return the corresponding **long** value. If the string pointed to by *s* contains  
 3495 more than six characters, *a64l()* shall use the first six. If the first six characters of the string  
 3496 contain a null terminator, *a64l()* shall use only characters preceding the null terminator. The  
 3497 *a64l()* function shall scan the character string from left to right with the least significant digit on  
 3498 the left, decoding each character as a 6-bit radix-64 number. If the type **long** contains more than  
 3499 32 bits, the resulting value is sign-extended. The behavior of *a64l()* is unspecified if *s* is a null  
 3500 pointer or the string pointed to by *s* was not generated by a previous call to *l64a()*.

3501 The *l64a()* function shall take a **long** argument and return a pointer to the corresponding radix-  
 3502 64 representation. The behavior of *l64a()* is unspecified if *value* is negative.

3503 The value returned by *l64a()* may be a pointer into a static buffer. Subsequent calls to *l64a()* may  
 3504 overwrite the buffer.

3505 The *l64a()* function need not be reentrant. A function that is not required to be reentrant is not  
 3506 required to be thread-safe.

3507 **RETURN VALUE**

3508 Upon successful completion, *a64l()* shall return the **long** value resulting from conversion of the  
 3509 input string. If a string pointed to by *s* is an empty string, *a64l()* shall return 0L.

3510 The *l64a()* function shall return a pointer to the radix-64 representation. If *value* is 0L, *l64a()* shall  
 3511 return a pointer to an empty string.

3512 **ERRORS**

3513 No errors are defined.

3514 **EXAMPLES**

3515 None.

3516 **APPLICATION USAGE**

3517 If the type **long** contains more than 32 bits, the result of *a64l(l64a(x))* is *x* in the low-order 32 bits.

3518 **RATIONALE**

3519 This is not the same encoding as used by either encoding variant of the *uuencode* utility.

3520 **FUTURE DIRECTIONS**

3521 None.

3522 **SEE ALSO**3523 *strtol()*, the Base Definitions volume of IEEE Std 1003.1-2001, `<stdlib.h>`, the Shell and Utilities  
3524 volume of IEEE Std 1003.1-2001, *uuencode*3525 **CHANGE HISTORY**

3526 First released in Issue 4, Version 2.

3527 **Issue 5**

3528 Moved from X/OPEN UNIX extension to BASE.

3529 Normative text previously in the APPLICATION USAGE section is moved to the  
3530 DESCRIPTION.

3531 A note indicating that these functions need not be reentrant is added to the DESCRIPTION.

3532 **NAME**

3533 abort — generate an abnormal process abort

3534 **SYNOPSIS**

3535 #include &lt;stdlib.h&gt;

3536 void abort(void);

3537 **DESCRIPTION**

3538 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
3539 conflict between the requirements described here and the ISO C standard is unintentional. This  
3540 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

3541 The *abort()* function shall cause abnormal process termination to occur, unless the signal  
3542 SIGABRT is being caught and the signal handler does not return.

3543 CX The abnormal termination processing shall include at least the effect of *fclose()* on all open  
3544 streams and the default actions defined for SIGABRT.

3545 XSI On XSI-conformant systems, in addition the abnormal termination processing shall include the  
3546 effect of *fclose()* on message catalog descriptors.

3547 The SIGABRT signal shall be sent to the calling process as if by means of *raise()* with the  
3548 argument SIGABRT.

3549 CX The status made available to *wait()* or *waitpid()* by *abort()* shall be that of a process terminated  
3550 by the SIGABRT signal. The *abort()* function shall override blocking or ignoring the SIGABRT  
3551 signal.

3552 **RETURN VALUE**3553 The *abort()* function shall not return.3554 **ERRORS**

3555 No errors are defined.

3556 **EXAMPLES**

3557 None.

3558 **APPLICATION USAGE**

3559 Catching the signal is intended to provide the application writer with a portable means to abort  
3560 processing, free from possible interference from any implementation-defined functions.

3561 **RATIONALE**

3562 None.

3563 **FUTURE DIRECTIONS**

3564 None.

3565 **SEE ALSO**

3566 *exit()*, *kill()*, *raise()*, *signal()*, *wait()*, *waitpid()*, the Base Definitions volume of  
3567 IEEE Std 1003.1-2001, <stdlib.h>

3568 **CHANGE HISTORY**

3569 First released in Issue 1. Derived from Issue 1 of the SVID.

3570 **Issue 6**

3571 Extensions beyond the ISO C standard are marked.

3572 **NAME**

3573       abs — return an integer absolute value

3574 **SYNOPSIS**

3575       #include &lt;stdlib.h&gt;

3576       int abs(int i);

3577 **DESCRIPTION**

3578 cx     The functionality described on this reference page is aligned with the ISO C standard. Any  
3579     conflict between the requirements described here and the ISO C standard is unintentional. This  
3580     volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

3581     The *abs()* function shall compute the absolute value of its integer operand, *i*. If the result cannot  
3582     be represented, the behavior is undefined.

3583 **RETURN VALUE**3584       The *abs()* function shall return the absolute value of its integer operand.3585 **ERRORS**

3586       No errors are defined.

3587 **EXAMPLES**

3588       None.

3589 **APPLICATION USAGE**

3590       In two's-complement representation, the absolute value of the negative integer with largest  
3591       magnitude {INT\_MIN} might not be representable.

3592 **RATIONALE**

3593       None.

3594 **FUTURE DIRECTIONS**

3595       None.

3596 **SEE ALSO**3597       *fabs()*, *labs()*, the Base Definitions volume of IEEE Std 1003.1-2001, <stdlib.h>3598 **CHANGE HISTORY**

3599       First released in Issue 1. Derived from Issue 1 of the SVID.

3600 **Issue 6**

3601       Extensions beyond the ISO C standard are marked.

## 3602 NAME

3603 accept — accept a new connection on a socket

## 3604 SYNOPSIS

3605 #include &lt;sys/socket.h&gt;

3606 int accept(int *socket*, struct sockaddr \*restrict *address*,  
3607 socklen\_t \*restrict *address\_len*);

## 3608 DESCRIPTION

3609 The *accept()* function shall extract the first connection on the queue of pending connections,  
3610 create a new socket with the same socket type protocol and address family as the specified  
3611 socket, and allocate a new file descriptor for that socket.3612 The *accept()* function takes the following arguments:3613 *socket* Specifies a socket that was created with *socket()*, has been bound to an address  
3614 with *bind()*, and has issued a successful call to *listen()*.3615 *address* Either a null pointer, or a pointer to a **sockaddr** structure where the address of  
3616 the connecting socket shall be returned.3617 *address\_len* Points to a **socklen\_t** structure which on input specifies the length of the  
3618 supplied **sockaddr** structure, and on output specifies the length of the stored  
3619 address.3620 If *address* is not a null pointer, the address of the peer for the accepted connection shall be stored  
3621 in the **sockaddr** structure pointed to by *address*, and the length of this address shall be stored in  
3622 the object pointed to by *address\_len*.3623 If the actual length of the address is greater than the length of the supplied **sockaddr** structure,  
3624 the stored address shall be truncated.3625 If the protocol permits connections by unbound clients, and the peer is not bound, then the value  
3626 stored in the object pointed to by *address* is unspecified.3627 If the listen queue is empty of connection requests and O\_NONBLOCK is not set on the file  
3628 descriptor for the socket, *accept()* shall block until a connection is present. If the *listen()* queue is  
3629 empty of connection requests and O\_NONBLOCK is set on the file descriptor for the socket,  
3630 *accept()* shall fail and set *errno* to [EAGAIN] or [EWOULDBLOCK].3631 The accepted socket cannot itself accept more connections. The original socket remains open and  
3632 can accept more connections.

## 3633 RETURN VALUE

3634 Upon successful completion, *accept()* shall return the non-negative file descriptor of the accepted  
3635 socket. Otherwise, -1 shall be returned and *errno* set to indicate the error.

## 3636 ERRORS

3637 The *accept()* function shall fail if:

3638 [EAGAIN] or [EWOULDBLOCK]

3639 O\_NONBLOCK is set for the socket file descriptor and no connections are  
3640 present to be accepted.3641 [EBADF] The *socket* argument is not a valid file descriptor.

3642 [ECONNABORTED]

3643 A connection has been aborted.

3644	[EINTR]	The <i>accept()</i> function was interrupted by a signal that was caught before a valid connection arrived.
3645		
3646	[EINVAL]	The <i>socket</i> is not accepting connections.
3647	[EMFILE]	{OPEN_MAX} file descriptors are currently open in the calling process.
3648	[ENFILE]	The maximum number of file descriptors in the system are already open.
3649	[ENOTSOCK]	The <i>socket</i> argument does not refer to a socket.
3650	[EOPNOTSUPP]	The socket type of the specified socket does not support accepting connections.
3651		
3652		The <i>accept()</i> function may fail if:
3653	[ENOBUFS]	No buffer space is available.
3654	[ENOMEM]	There was insufficient memory available to complete the operation.
3655	XSR [EPROTO]	A protocol error has occurred; for example, the STREAMS protocol stack has not been initialized.
3656		

### 3657 EXAMPLES

3658 None.

### 3659 APPLICATION USAGE

3660 When a connection is available, *select()* indicates that the file descriptor for the socket is ready  
3661 for reading.

### 3662 RATIONALE

3663 None.

### 3664 FUTURE DIRECTIONS

3665 None.

### 3666 SEE ALSO

3667 *bind()*, *connect()*, *listen()*, *socket()*, the Base Definitions volume of IEEE Std 1003.1-2001,  
3668 <sys/socket.h>

### 3669 CHANGE HISTORY

3670 First released in Issue 6. Derived from the XNS, Issue 5.2 specification.

3671 The **restrict** keyword is added to the *accept()* prototype for alignment with the  
3672 ISO/IEC 9899:1999 standard.

3673 **NAME**

3674           access — determine accessibility of a file

3675 **SYNOPSIS**

3676           #include &lt;unistd.h&gt;

3677           int access(const char \*path, int amode);

3678 **DESCRIPTION**

3679           The `access()` function shall check the file named by the pathname pointed to by the `path`  
 3680           argument for accessibility according to the bit pattern contained in `amode`, using the real user ID  
 3681           in place of the effective user ID and the real group ID in place of the effective group ID.

3682           The value of `amode` is either the bitwise-inclusive OR of the access permissions to be checked  
 3683           (R\_OK, W\_OK, X\_OK) or the existence test (F\_OK).

3684           If any access permissions are checked, each shall be checked individually, as described in the  
 3685           Base Definitions volume of IEEE Std 1003.1-2001, Chapter 3, Definitions. If the process has  
 3686           appropriate privileges, an implementation may indicate success for X\_OK even if none of the  
 3687           execute file permission bits are set.

3688 **RETURN VALUE**

3689           If the requested access is permitted, `access()` succeeds and shall return 0; otherwise, -1 shall be  
 3690           returned and `errno` shall be set to indicate the error.

3691 **ERRORS**3692           The `access()` function shall fail if:

3693           [EACCES]           Permission bits of the file mode do not permit the requested access, or search  
 3694           permission is denied on a component of the path prefix.

3695           [ELOOP]           A loop exists in symbolic links encountered during resolution of the `path`  
 3696           argument.

3697           [ENAMETOOLONG]       The length of the `path` argument exceeds {PATH\_MAX} or a pathname  
 3698           component is longer than {NAME\_MAX}.  
 3699

3700           [ENOENT]           A component of `path` does not name an existing file or `path` is an empty string.

3701           [ENOTDIR]           A component of the path prefix is not a directory.

3702           [EROFS]           Write access is requested for a file on a read-only file system.

3703           The `access()` function may fail if:

3704           [EINVAL]           The value of the `amode` argument is invalid.

3705           [ELOOP]           More than {SYMLOOP\_MAX} symbolic links were encountered during  
 3706           resolution of the `path` argument.

3707           [ENAMETOOLONG]       As a result of encountering a symbolic link in resolution of the `path` argument,  
 3708           the length of the substituted pathname string exceeded {PATH\_MAX}.  
 3709

3710           [ETXTBSY]           Write access is requested for a pure procedure (shared text) file that is being  
 3711           executed.

3712 **EXAMPLES**3713 **Testing for the Existence of a File**

3714 The following example tests whether a file named **myfile** exists in the **/tmp** directory.

```
3715 #include <unistd.h>
3716 ...
3717 int result;
3718 const char *filename = "/tmp/myfile";
3719 result = access (filename, F_OK);
```

3720 **APPLICATION USAGE**

3721 Additional values of *amode* other than the set defined in the description may be valid; for  
3722 example, if a system has extended access controls.

3723 **RATIONALE**

3724 In early proposals, some inadequacies in the *access()* function led to the creation of an *eaccess()*  
3725 function because:

- 3726 1. Historical implementations of *access()* do not test file access correctly when the process'  
3727 real user ID is superuser. In particular, they always return zero when testing execute  
3728 permissions without regard to whether the file is executable.
- 3729 2. The superuser has complete access to all files on a system. As a consequence, programs  
3730 started by the superuser and switched to the effective user ID with lesser privileges cannot  
3731 use *access()* to test their file access permissions.

3732 However, the historical model of *eaccess()* does not resolve problem (1), so this volume of  
3733 IEEE Std 1003.1-2001 now allows *access()* to behave in the desired way because several  
3734 implementations have corrected the problem. It was also argued that problem (2) is more easily  
3735 solved by using *open()*, *chdir()*, or one of the *exec* functions as appropriate and responding to the  
3736 error, rather than creating a new function that would not be as reliable. Therefore, *eaccess()* is not  
3737 included in this volume of IEEE Std 1003.1-2001.

3738 The sentence concerning appropriate privileges and execute permission bits reflects the two  
3739 possibilities implemented by historical implementations when checking superuser access for  
3740 *X\_OK*.

3741 New implementations are discouraged from returning *X\_OK* unless at least one execution  
3742 permission bit is set.

3743 **FUTURE DIRECTIONS**

3744 None.

3745 **SEE ALSO**

3746 *chmod()*, *stat()*, the Base Definitions volume of IEEE Std 1003.1-2001, **<unistd.h>**

3747 **CHANGE HISTORY**

3748 First released in Issue 1. Derived from Issue 1 of the SVID.

3749 **Issue 6**

3750 The following new requirements on POSIX implementations derive from alignment with the  
3751 Single UNIX Specification:

- 3752 • The [ELOOP] mandatory error condition is added.
- 3753 • A second [ENAMETOOLONG] is added as an optional error condition.

3754

- The [ETXTBSY] optional error condition is added.

3755

The following changes were made to align with the IEEE P1003.1a draft standard:

3756

- The [ELOOP] optional error condition is added.

3757 **NAME**

3758           acos, acosf, acosl — arc cosine functions

3759 **SYNOPSIS**

3760           #include &lt;math.h&gt;

3761           double acos(double x);

3762           float acosf(float x);

3763           long double acosl(long double x);

3764 **DESCRIPTION**

3765 **CX**       The functionality described on this reference page is aligned with the ISO C standard. Any  
 3766 conflict between the requirements described here and the ISO C standard is unintentional. This  
 3767 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

3768       These functions shall compute the principal value of the arc cosine of their argument *x*. The  
 3769 value of *x* should be in the range  $[-1,1]$ .

3770       An application wishing to check for error situations should set *errno* to zero and call  
 3771 *feclearexcept*(FE\_ALL\_EXCEPT) before calling these functions. On return, if *errno* is non-zero or  
 3772 *fetetestexcept*(FE\_INVALID | FE\_DIVBYZERO | FE\_OVERFLOW | FE\_UNDERFLOW) is non-  
 3773 zero, an error has occurred.

3774 **RETURN VALUE**

3775       Upon successful completion, these functions shall return the arc cosine of *x*, in the range  $[0,\pi]$   
 3776 radians.

3777 **MX**       For finite values of *x* not in the range  $[-1,1]$ , a domain error shall occur, and either a NaN (if  
 3778 supported), or an implementation-defined value shall be returned.

3779 **MX**       If *x* is NaN, a NaN shall be returned.

3780       If *x* is +1, +0 shall be returned.

3781       If *x* is  $\pm\text{Inf}$ , a domain error shall occur, and either a NaN (if supported), or an implementation-  
 3782 defined value shall be returned.

3783 **ERRORS**

3784       These functions shall fail if:

3785 **MX**       Domain Error    The *x* argument is finite and is not in the range  $[-1,1]$ , or is  $\pm\text{Inf}$ .

3786               If the integer expression (math\_errhandling & MATH\_ERRNO) is non-zero,  
 3787 then *errno* shall be set to [EDOM]. If the integer expression (math\_errhandling  
 3788 & MATH\_ERREXCEPT) is non-zero, then the invalid floating-point exception  
 3789 shall be raised.

3790 **EXAMPLES**

3791       None.

3792 **APPLICATION USAGE**

3793       On error, the expressions (math\_errhandling & MATH\_ERRNO) and (math\_errhandling &  
 3794 MATH\_ERREXCEPT) are independent of each other, but at least one of them must be non-zero.

3795 **RATIONALE**

3796       None.

3797 **FUTURE DIRECTIONS**

3798 None.

3799 **SEE ALSO**3800 *cos()*, *feclearexcept()*, *fetetestexcept()*, *isnan()*, the Base Definitions volume of IEEE Std 1003.1-2001,  
3801 Section 4.18, Treatment of Error Conditions for Mathematical Functions, <math.h>3802 **CHANGE HISTORY**

3803 First released in Issue 1. Derived from Issue 1 of the SVID.

3804 **Issue 5**3805 The DESCRIPTION is updated to indicate how an application should check for an error. This  
3806 text was previously published in the APPLICATION USAGE section.3807 **Issue 6**3808 The *acosf()* and *acosl()* functions are added for alignment with the ISO/IEC 9899:1999 standard.3809 The DESCRIPTION, RETURN VALUE, ERRORS, and APPLICATION USAGE sections are  
3810 revised to align with the ISO/IEC 9899:1999 standard.3811 IEC 60559:1989 standard floating-point extensions over the ISO/IEC 9899:1999 standard are  
3812 marked.

3813 **NAME**

3814 acosh, acoshf, acoshl, — inverse hyperbolic cosine functions

3815 **SYNOPSIS**

3816 #include &lt;math.h&gt;

3817 double acosh(double x);

3818 float acoshf(float x);

3819 long double acoshl(long double x);

3820 **DESCRIPTION**

3821 **CX** The functionality described on this reference page is aligned with the ISO C standard. Any  
 3822 conflict between the requirements described here and the ISO C standard is unintentional. This  
 3823 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

3824 These functions shall compute the inverse hyperbolic cosine of their argument *x*.

3825 An application wishing to check for error situations should set *errno* to zero and call  
 3826 *feclearexcept*(FE\_ALL\_EXCEPT) before calling these functions. On return, if *errno* is non-zero or  
 3827 *fetestexcept*(FE\_INVALID | FE\_DIVBYZERO | FE\_OVERFLOW | FE\_UNDERFLOW) is non-  
 3828 zero, an error has occurred.

3829 **RETURN VALUE**3830 Upon successful completion, these functions shall return the inverse hyperbolic cosine of their  
3831 argument.

3832 **MX** For finite values of  $x < 1$ , a domain error shall occur, and either a NaN (if supported), or an  
 3833 implementation-defined value shall be returned.

3834 **MX** If *x* is NaN, a NaN shall be returned.3835 If *x* is +1, +0 shall be returned.3836 If *x* is +Inf, +Inf shall be returned.

3837 If *x* is -Inf, a domain error shall occur, and either a NaN (if supported), or an implementation-  
 3838 defined value shall be returned.

3839 **ERRORS**

3840 These functions shall fail if:

3841 **MX** Domain Error The *x* argument is finite and less than +1.0, or is -Inf.

3842 If the integer expression (math\_errhandling & MATH\_ERRNO) is non-zero,  
 3843 then *errno* shall be set to [EDOM]. If the integer expression (math\_errhandling  
 3844 & MATH\_ERREXCEPT) is non-zero, then the invalid floating-point exception  
 3845 shall be raised.

3846 **EXAMPLES**

3847 None.

3848 **APPLICATION USAGE**

3849 On error, the expressions (math\_errhandling & MATH\_ERRNO) and (math\_errhandling &  
 3850 MATH\_ERREXCEPT) are independent of each other, but at least one of them must be non-zero.

3851 **RATIONALE**

3852 None.

3853 **FUTURE DIRECTIONS**

3854 None.

3855 **SEE ALSO**3856 *cosh()*, *feclearexcept()*, *fetetestexcept()*, the Base Definitions volume of IEEE Std 1003.1-2001, Section  
3857 4.18, Treatment of Error Conditions for Mathematical Functions, <math.h>3858 **CHANGE HISTORY**

3859 First released in Issue 4, Version 2.

3860 **Issue 5**

3861 Moved from X/OPEN UNIX extension to BASE.

3862 **Issue 6**3863 The *acosh()* function is no longer marked as an extension.3864 The *acoshf()*, and *acoshl()* functions are added for alignment with the ISO/IEC 9899:1999  
3865 standard.3866 The DESCRIPTION, RETURN VALUE, ERRORS, and APPLICATION USAGE sections are  
3867 revised to align with the ISO/IEC 9899:1999 standard.3868 IEC 60559:1989 standard floating-point extensions over the ISO/IEC 9899:1999 standard are  
3869 marked.

3870 **NAME**

3871        *acosl* — arc cosine functions

3872 **SYNOPSIS**

3873        #include <math.h>

3874        long double *acosl*(long double *x*);

3875 **DESCRIPTION**

3876        Refer to *acos*().

3877 **NAME**3878 aio\_cancel — cancel an asynchronous I/O request (**REALTIME**)3879 **SYNOPSIS**

3880 AIO #include &lt;aio.h&gt;

3881 int aio\_cancel(int *fildev*, struct aiocb \**aiocbp*);

3882

3883 **DESCRIPTION**

3884 The *aio\_cancel()* function shall attempt to cancel one or more asynchronous I/O requests  
3885 currently outstanding against file descriptor *fildev*. The *aiocbp* argument points to the  
3886 asynchronous I/O control block for a particular request to be canceled. If *aiocbp* is NULL, then  
3887 all outstanding cancelable asynchronous I/O requests against *fildev* shall be canceled.

3888 Normal asynchronous notification shall occur for asynchronous I/O operations that are  
3889 successfully canceled. If there are requests that cannot be canceled, then the normal  
3890 asynchronous completion process shall take place for those requests when they are completed.

3891 For requested operations that are successfully canceled, the associated error status shall be set to  
3892 [ECANCELED] and the return status shall be -1. For requested operations that are not  
3893 successfully canceled, the *aiocbp* shall not be modified by *aio\_cancel()*.

3894 If *aiocbp* is not NULL, then if *fildev* does not have the same value as the file descriptor with which  
3895 the asynchronous operation was initiated, unspecified results occur.

3896 Which operations are cancelable is implementation-defined.

3897 **RETURN VALUE**

3898 The *aio\_cancel()* function shall return the value AIO\_CANCELED to the calling process if the  
3899 requested operation(s) were canceled. The value AIO\_NOTCANCELED shall be returned if at  
3900 least one of the requested operation(s) cannot be canceled because it is in progress. In this case,  
3901 the state of the other operations, if any, referenced in the call to *aio\_cancel()* is not indicated by  
3902 the return value of *aio\_cancel()*. The application may determine the state of affairs for these  
3903 operations by using *aio\_error()*. The value AIO\_ALLDONE is returned if all of the operations  
3904 have already completed. Otherwise, the function shall return -1 and set *errno* to indicate the  
3905 error.

3906 **ERRORS**

3907 The *aio\_cancel()* function shall fail if:

3908 [EBADF] The *fildev* argument is not a valid file descriptor.

3909 **EXAMPLES**

3910 None.

3911 **APPLICATION USAGE**

3912 The *aio\_cancel()* function is part of the Asynchronous Input and Output option and need not be  
3913 available on all implementations.

3914 **RATIONALE**

3915 None.

3916 **FUTURE DIRECTIONS**

3917 None.

3918 **SEE ALSO**

3919 *aio\_read()*, *aio\_write()*, the Base Definitions volume of IEEE Std 1003.1-2001, <**aio.h**>

3920 **CHANGE HISTORY**

3921 First released in Issue 5. Included for alignment with the POSIX Realtime Extension.

3922 **Issue 6**

3923 The [ENOSYS] error condition has been removed as stubs need not be provided if an  
3924 implementation does not support the Asynchronous Input and Output option.

3925 The APPLICATION USAGE section is added.

3926 **NAME**

3927 aio\_error — retrieve errors status for an asynchronous I/O operation (**REALTIME**)

3928 **SYNOPSIS**

3929 AIO #include <aio.h>

3930 int aio\_error(const struct aiocb \*aiocbp);

3931

3932 **DESCRIPTION**

3933 The *aio\_error()* function shall return the error status associated with the **aiocb** structure  
3934 referenced by the *aiocbp* argument. The error status for an asynchronous I/O operation is the  
3935 SIO *errno* value that would be set by the corresponding *read()*, *write()*, *fdatasync()*, or *fsync()*  
3936 operation. If the operation has not yet completed, then the error status shall be equal to  
3937 [EINPROGRESS].

3938 **RETURN VALUE**

3939 If the asynchronous I/O operation has completed successfully, then 0 shall be returned. If the  
3940 asynchronous operation has completed unsuccessfully, then the error status, as described for  
3941 SIO *read()*, *write()*, *fdatasync()*, and *fsync()*, shall be returned. If the asynchronous I/O operation has  
3942 not yet completed, then [EINPROGRESS] shall be returned.

3943 **ERRORS**

3944 The *aio\_error()* function may fail if:

3945 [EINVAL] The *aiocbp* argument does not refer to an asynchronous operation whose  
3946 return status has not yet been retrieved.

3947 **EXAMPLES**

3948 None.

3949 **APPLICATION USAGE**

3950 The *aio\_error()* function is part of the Asynchronous Input and Output option and need not be  
3951 available on all implementations.

3952 **RATIONALE**

3953 None.

3954 **FUTURE DIRECTIONS**

3955 None.

3956 **SEE ALSO**

3957 *aio\_cancel()*, *aio\_fsync()*, *aio\_read()*, *aio\_return()*, *aio\_write()*, *close()*, *exec*, *exit()*, *fork()*, *lio\_listio()*,  
3958 *lseek()*, *read()*, the Base Definitions volume of IEEE Std 1003.1-2001, <**aio.h**>

3959 **CHANGE HISTORY**

3960 First released in Issue 5. Included for alignment with the POSIX Realtime Extension.

3961 **Issue 6**

3962 The [ENOSYS] error condition has been removed as stubs need not be provided if an  
3963 implementation does not support the Asynchronous Input and Output option.

3964 The APPLICATION USAGE section is added.

3965 **NAME**3966 aio\_fsync — asynchronous file synchronization (**REALTIME**)3967 **SYNOPSIS**

3968 AIO #include &lt;aio.h&gt;

3969 int aio\_fsync(int op, struct aiocb \*aiocbp);

3970

3971 **DESCRIPTION**

3972 The *aio\_fsync()* function shall asynchronously force all I/O operations associated with the file  
 3973 indicated by the file descriptor *aio\_fildes* member of the **aiocb** structure referenced by the *aiocbp*  
 3974 argument and queued at the time of the call to *aio\_fsync()* to the synchronized I/O completion  
 3975 state. The function call shall return when the synchronization request has been initiated or  
 3976 queued to the file or device (even when the data cannot be synchronized immediately).

3977 If *op* is O\_DSYNC, all currently queued I/O operations shall be completed as if by a call to  
 3978 *fdatasync()*; that is, as defined for synchronized I/O data integrity completion. If *op* is O\_SYNC,  
 3979 all currently queued I/O operations shall be completed as if by a call to *fsync()*; that is, as  
 3980 defined for synchronized I/O file integrity completion. If the *aio\_fsync()* function fails, or if the  
 3981 operation queued by *aio\_fsync()* fails, then, as for *fsync()* and *fdatasync()*, outstanding I/O  
 3982 operations are not guaranteed to have been completed.

3983 If *aio\_fsync()* succeeds, then it is only the I/O that was queued at the time of the call to  
 3984 *aio\_fsync()* that is guaranteed to be forced to the relevant completion state. The completion of  
 3985 subsequent I/O on the file descriptor is not guaranteed to be completed in a synchronized  
 3986 fashion.

3987 The *aiocbp* argument refers to an asynchronous I/O control block. The *aiocbp* value may be used  
 3988 as an argument to *aio\_error()* and *aio\_return()* in order to determine the error status and return  
 3989 status, respectively, of the asynchronous operation while it is proceeding. When the request is  
 3990 queued, the error status for the operation is [EINPROGRESS]. When all data has been  
 3991 successfully transferred, the error status shall be reset to reflect the success or failure of the  
 3992 operation. If the operation does not complete successfully, the error status for the operation shall  
 3993 be set to indicate the error. The *aio\_sigevent* member determines the asynchronous notification to  
 3994 occur as specified in Section 2.4.1 (on page 28) when all operations have achieved synchronized  
 3995 I/O completion. All other members of the structure referenced by *aiocbp* are ignored. If the  
 3996 control block referenced by *aiocbp* becomes an illegal address prior to asynchronous I/O  
 3997 completion, then the behavior is undefined.

3998 If the *aio\_fsync()* function fails or *aiocbp* indicates an error condition, data is not guaranteed to  
 3999 have been successfully transferred.

4000 **RETURN VALUE**

4001 The *aio\_fsync()* function shall return the value 0 to the calling process if the I/O operation is  
 4002 successfully queued; otherwise, the function shall return the value -1 and set *errno* to indicate  
 4003 the error.

4004 **ERRORS**4005 The *aio\_fsync()* function shall fail if:

4006 [EAGAIN] The requested asynchronous operation was not queued due to temporary  
 4007 resource limitations.

4008 [EBADF] The *aio\_fildes* member of the **aiocb** structure referenced by the *aiocbp* argument  
 4009 is not a valid file descriptor open for writing.

- 4010 [EINVAL] This implementation does not support synchronized I/O for this file.
- 4011 [EINVAL] A value of *op* other than O\_DSYNC or O\_SYNC was specified.
- 4012 In the event that any of the queued I/O operations fail, *aio\_fsync()* shall return the error  
4013 condition defined for *read()* and *write()*. The error is returned in the error status for the  
4014 asynchronous *fsync()* operation, which can be retrieved using *aio\_error()*.
- 4015 **EXAMPLES**
- 4016 None.
- 4017 **APPLICATION USAGE**
- 4018 The *aio\_fsync()* function is part of the Asynchronous Input and Output option and need not be  
4019 available on all implementations.
- 4020 **RATIONALE**
- 4021 None.
- 4022 **FUTURE DIRECTIONS**
- 4023 None.
- 4024 **SEE ALSO**
- 4025 *fcntl()*, *fdatasync()*, *fsync()*, *open()*, *read()*, *write()*, the Base Definitions volume of  
4026 IEEE Std 1003.1-2001, <**aio.h**>
- 4027 **CHANGE HISTORY**
- 4028 First released in Issue 5. Included for alignment with the POSIX Realtime Extension.
- 4029 **Issue 6**
- 4030 The [ENOSYS] error condition has been removed as stubs need not be provided if an  
4031 implementation does not support the Asynchronous Input and Output option.

4033 **NAME**4034 aio\_read — asynchronous read from a file (**REALTIME**)4035 **SYNOPSIS**

4036 AIO #include &lt;aio.h&gt;

4037 int aio\_read(struct aiocb \*aiocbp);

4038

4039 **DESCRIPTION**

4040 The *aio\_read()* function shall read *aiocbp->aio\_nbytes* from the file associated with  
 4041 *aiocbp->aio\_fildes* into the buffer pointed to by *aiocbp->aio\_buf*. The function call shall return when  
 4042 the read request has been initiated or queued to the file or device (even when the data cannot be  
 4043 delivered immediately).

4044 PIO If prioritized I/O is supported for this file, then the asynchronous operation shall be submitted  
 4045 at a priority equal to the scheduling priority of the process minus *aiocbp->aio\_reqprio*.

4046 The *aiocbp* value may be used as an argument to *aio\_error()* and *aio\_return()* in order to  
 4047 determine the error status and return status, respectively, of the asynchronous operation while it  
 4048 is proceeding. If an error condition is encountered during queuing, the function call shall return  
 4049 without having initiated or queued the request. The requested operation takes place at the  
 4050 absolute position in the file as given by *aio\_offset*, as if *lseek()* were called immediately prior to  
 4051 the operation with an *offset* equal to *aio\_offset* and a *whence* equal to *SEEK\_SET*. After a  
 4052 successful call to enqueue an asynchronous I/O operation, the value of the file offset for the file  
 4053 is unspecified.

4054 The *aiocbp->aio\_lio\_opcode* field shall be ignored by *aio\_read()*.

4055 The *aiocbp* argument points to an **aiocb** structure. If the buffer pointed to by *aiocbp->aio\_buf* or  
 4056 the control block pointed to by *aiocbp* becomes an illegal address prior to asynchronous I/O  
 4057 completion, then the behavior is undefined.

4058 Simultaneous asynchronous operations using the same *aiocbp* produce undefined results.

4059 SIO If synchronized I/O is enabled on the file associated with *aiocbp->aio\_fildes*, the behavior of this  
 4060 function shall be according to the definitions of synchronized I/O data integrity completion and  
 4061 synchronized I/O file integrity completion.

4062 For any system action that changes the process memory space while an asynchronous I/O is  
 4063 outstanding to the address range being changed, the result of that action is undefined.

4064 For regular files, no data transfer shall occur past the offset maximum established in the open  
 4065 file description associated with *aiocbp->aio\_fildes*.

4066 **RETURN VALUE**

4067 The *aio\_read()* function shall return the value zero to the calling process if the I/O operation is  
 4068 successfully queued; otherwise, the function shall return the value  $-1$  and set *errno* to indicate  
 4069 the error.

4070 **ERRORS**

4071 The *aio\_read()* function shall fail if:

4072 [EAGAIN] The requested asynchronous I/O operation was not queued due to system  
 4073 resource limitations.

4074 Each of the following conditions may be detected synchronously at the time of the call to  
 4075 *aio\_read()*, or asynchronously. If any of the conditions below are detected synchronously, the  
 4076 *aio\_read()* function shall return  $-1$  and set *errno* to the corresponding value. If any of the  
 4077 conditions below are detected asynchronously, the return status of the asynchronous operation

- 4078 is set to `-1`, and the error status of the asynchronous operation is set to the corresponding value.
- 4079 [EBADF] The `aiocbp->aio_fildes` argument is not a valid file descriptor open for reading.
- 4080 [EINVAL] The file offset value implied by `aiocbp->aio_offset` would be invalid,  
4081 `aiocbp->aio_reqprio` is not a valid value, or `aiocbp->aio_nbytes` is an invalid  
4082 value.
- 4083 In the case that the `aio_read()` successfully queues the I/O operation but the operation is  
4084 subsequently canceled or encounters an error, the return status of the asynchronous operation is  
4085 one of the values normally returned by the `read()` function call. In addition, the error status of  
4086 the asynchronous operation is set to one of the error statuses normally set by the `read()` function  
4087 call, or one of the following values:
- 4088 [EBADF] The `aiocbp->aio_fildes` argument is not a valid file descriptor open for reading.
- 4089 [ECANCELED] The requested I/O was canceled before the I/O completed due to an explicit  
4090 `aio_cancel()` request.
- 4091 [EINVAL] The file offset value implied by `aiocbp->aio_offset` would be invalid.
- 4092 The following condition may be detected synchronously or asynchronously:
- 4093 [EOVERFLOW] The file is a regular file, `aiocbp->aio_nbytes` is greater than 0, and the starting  
4094 offset in `aiocbp->aio_offset` is before the end-of-file and is at or beyond the offset  
4095 maximum in the open file description associated with `aiocbp->aio_fildes`.

**4096 EXAMPLES**

4097 None.

**4098 APPLICATION USAGE**

4099 The `aio_read()` function is part of the Asynchronous Input and Output option and need not be  
4100 available on all implementations.

**4101 RATIONALE**

4102 None.

**4103 FUTURE DIRECTIONS**

4104 None.

**4105 SEE ALSO**

4106 `aio_cancel()`, `aio_error()`, `lio_listio()`, `aio_return()`, `aio_write()`, `close()`, `exec`, `exit()`, `fork()`, `lseek()`,  
4107 `read()`, the Base Definitions volume of IEEE Std 1003.1-2001, `<aio.h>`

**4108 CHANGE HISTORY**

4109 First released in Issue 5. Included for alignment with the POSIX Realtime Extension.

4110 Large File Summit extensions are added.

**4111 Issue 6**

4112 The [ENOSYS] error condition has been removed as stubs need not be provided if an  
4113 implementation does not support the Asynchronous Input and Output option.

4114 The APPLICATION USAGE section is added.

- 4115 The following new requirements on POSIX implementations derive from alignment with the  
4116 Single UNIX Specification:
- 4117 • In the DESCRIPTION, text is added to indicate setting of the offset maximum in the open file  
4118 description. This change is to support large files.
  - 4119 • In the ERRORS section, the [Eoverflow] condition is added. This change is to support  
4120 large files.

4121 **NAME**4122 aio\_return — retrieve return status of an asynchronous I/O operation (**REALTIME**)4123 **SYNOPSIS**4124 AIO `#include <aio.h>`4125 `ssize_t aio_return(struct aiocb *aiocbp);`

4126

4127 **DESCRIPTION**

4128 The `aio_return()` function shall return the return status associated with the **aiocb** structure  
 4129 referenced by the `aiocbp` argument. The return status for an asynchronous I/O operation is the  
 4130 value that would be returned by the corresponding `read()`, `write()`, or `fsync()` function call. If the  
 4131 error status for the operation is equal to [EINPROGRESS], then the return status for the  
 4132 operation is undefined. The `aio_return()` function may be called exactly once to retrieve the  
 4133 return status of a given asynchronous operation; thereafter, if the same **aiocb** structure is used in  
 4134 a call to `aio_return()` or `aio_error()`, an error may be returned. When the **aiocb** structure referred  
 4135 to by `aiocbp` is used to submit another asynchronous operation, then `aio_return()` may be  
 4136 successfully used to retrieve the return status of that operation.

4137 **RETURN VALUE**

4138 If the asynchronous I/O operation has completed, then the return status, as described for `read()`,  
 4139 `write()`, and `fsync()`, shall be returned. If the asynchronous I/O operation has not yet completed,  
 4140 the results of `aio_return()` are undefined.

4141 **ERRORS**4142 The `aio_return()` function may fail if:

4143 [EINVAL] The `aiocbp` argument does not refer to an asynchronous operation whose  
 4144 return status has not yet been retrieved.

4145 **EXAMPLES**

4146 None.

4147 **APPLICATION USAGE**

4148 The `aio_return()` function is part of the Asynchronous Input and Output option and need not be  
 4149 available on all implementations.

4150 **RATIONALE**

4151 None.

4152 **FUTURE DIRECTIONS**

4153 None.

4154 **SEE ALSO**

4155 `aio_cancel()`, `aio_error()`, `aio_fsync()`, `aio_read()`, `aio_write()`, `close()`, `exec`, `exit()`, `fork()`, `lio_listio()`,  
 4156 `lseek()`, `read()`, the Base Definitions volume of IEEE Std 1003.1-2001, <**aio.h**>

4157 **CHANGE HISTORY**

4158 First released in Issue 5. Included for alignment with the POSIX Realtime Extension.

4159 **Issue 6**

4160 The [ENOSYS] error condition has been removed as stubs need not be provided if an  
 4161 implementation does not support the Asynchronous Input and Output option.

4162 The APPLICATION USAGE section is added.

4163 The [EINVAL] error condition is updated as a “may fail”. This is for consistency with the  
 4164 DESCRIPTION.

4165 **NAME**4166 aio\_suspend — wait for an asynchronous I/O request (**REALTIME**)4167 **SYNOPSIS**4168 AIO `#include <aio.h>`4169 `int aio_suspend(const struct aiocb * const list[], int nent,`  
4170 `const struct timespec *timeout);`

4171

4172 **DESCRIPTION**

4173 The *aio\_suspend()* function shall suspend the calling thread until at least one of the asynchronous  
 4174 I/O operations referenced by the *list* argument has completed, until a signal interrupts the  
 4175 function, or, if *timeout* is not NULL, until the time interval specified by *timeout* has passed. If any  
 4176 of the **aiocb** structures in the list correspond to completed asynchronous I/O operations (that is,  
 4177 the error status for the operation is not equal to [EINPROGRESS]) at the time of the call, the  
 4178 function shall return without suspending the calling thread. The *list* argument is an array of  
 4179 pointers to asynchronous I/O control blocks. The *nent* argument indicates the number of  
 4180 elements in the array. Each **aiocb** structure pointed to has been used in initiating an  
 4181 asynchronous I/O request via *aio\_read()*, *aio\_write()*, or *lio\_listio()*. This array may contain  
 4182 NULL pointers, which are ignored. If this array contains pointers that refer to **aiocb** structures  
 4183 that have not been used in submitting asynchronous I/O, the effect is undefined.

4184 If the time interval indicated in the **timespec** structure pointed to by *timeout* passes before any of  
 4185 the I/O operations referenced by *list* are completed, then *aio\_suspend()* shall return with an  
 4186 error. If the Monotonic Clock option is supported, the clock that shall be used to measure this  
 4187 time interval shall be the **CLOCK\_MONOTONIC** clock.

4188 **RETURN VALUE**

4189 If the *aio\_suspend()* function returns after one or more asynchronous I/O operations have  
 4190 completed, the function shall return zero. Otherwise, the function shall return a value of -1 and  
 4191 set *errno* to indicate the error.

4192 The application may determine which asynchronous I/O completed by scanning the associated  
 4193 error and return status using *aio\_error()* and *aio\_return()*, respectively.

4194 **ERRORS**4195 The *aio\_suspend()* function shall fail if:

4196 [EAGAIN] No asynchronous I/O indicated in the list referenced by *list* completed in the  
 4197 time interval indicated by *timeout*.

4198 [EINTR] A signal interrupted the *aio\_suspend()* function. Note that, since each  
 4199 asynchronous I/O operation may possibly provoke a signal when it  
 4200 completes, this error return may be caused by the completion of one (or more)  
 4201 of the very I/O operations being awaited.

4202 **EXAMPLES**

4203 None.

4204 **APPLICATION USAGE**

4205 The *aio\_suspend()* function is part of the Asynchronous Input and Output option and need not  
 4206 be available on all implementations.

4207 **RATIONALE**

4208 None.

4209 **FUTURE DIRECTIONS**

4210 None.

4211 **SEE ALSO**

4212 *aio\_read()*, *aio\_write()*, *lio\_listio()*, the Base Definitions volume of IEEE Std 1003.1-2001, <**aio.h**>

4213 **CHANGE HISTORY**

4214 First released in Issue 5. Included for alignment with the POSIX Realtime Extension.

4215 **Issue 6**

4216 The [ENOSYS] error condition has been removed as stubs need not be provided if an implementation does not support the Asynchronous Input and Output option.

4218 The APPLICATION USAGE section is added.

4219 The DESCRIPTION is updated for alignment with IEEE Std 1003.1j-2000 by specifying that the CLOCK\_MONOTONIC clock, if supported, is used.

4220

4221 **NAME**4222 aio\_write — asynchronous write to a file (**REALTIME**)4223 **SYNOPSIS**

4224 AIO #include &lt;aio.h&gt;

4225 int aio\_write(struct aiocb \*aiocbp);

4226

4227 **DESCRIPTION**

4228 The *aio\_write()* function shall write *aiocbp->aio\_nbytes* to the file associated with *aiocbp->aio\_fildes*  
 4229 from the buffer pointed to by *aiocbp->aio\_buf*. The function shall return when the write request  
 4230 has been initiated or, at a minimum, queued to the file or device.

4231 PIO If prioritized I/O is supported for this file, then the asynchronous operation shall be submitted  
 4232 at a priority equal to the scheduling priority of the process minus *aiocbp->aio\_reqprio*.

4233 The *aiocbp* argument may be used as an argument to *aio\_error()* and *aio\_return()* in order to  
 4234 determine the error status and return status, respectively, of the asynchronous operation while it  
 4235 is proceeding.

4236 The *aiocbp* argument points to an **aiocb** structure. If the buffer pointed to by *aiocbp->aio\_buf* or  
 4237 the control block pointed to by *aiocbp* becomes an illegal address prior to asynchronous I/O  
 4238 completion, then the behavior is undefined.

4239 If **O\_APPEND** is not set for the file descriptor *aio\_fildes*, then the requested operation shall take  
 4240 place at the absolute position in the file as given by *aio\_offset*, as if *lseek()* were called  
 4241 immediately prior to the operation with an *offset* equal to *aio\_offset* and a *whence* equal to  
 4242 **SEEK\_SET**. If **O\_APPEND** is set for the file descriptor, write operations append to the file in the  
 4243 same order as the calls were made. After a successful call to enqueue an asynchronous I/O  
 4244 operation, the value of the file offset for the file is unspecified.

4245 The *aiocbp->aio\_lio\_opcode* field shall be ignored by *aio\_write()*.

4246 Simultaneous asynchronous operations using the same *aiocbp* produce undefined results.

4247 SIO If synchronized I/O is enabled on the file associated with *aiocbp->aio\_fildes*, the behavior of this  
 4248 function shall be according to the definitions of synchronized I/O data integrity completion, and  
 4249 synchronized I/O file integrity completion.

4250 For any system action that changes the process memory space while an asynchronous I/O is  
 4251 outstanding to the address range being changed, the result of that action is undefined.

4252 For regular files, no data transfer shall occur past the offset maximum established in the open  
 4253 file description associated with *aiocbp->aio\_fildes*.

4254 **RETURN VALUE**

4255 The *aio\_write()* function shall return the value zero to the calling process if the I/O operation is  
 4256 successfully queued; otherwise, the function shall return the value  $-1$  and set *errno* to indicate  
 4257 the error.

4258 **ERRORS**

4259 The *aio\_write()* function shall fail if:

4260 [EAGAIN] The requested asynchronous I/O operation was not queued due to system  
 4261 resource limitations.

4262 Each of the following conditions may be detected synchronously at the time of the call to  
 4263 *aio\_write()*, or asynchronously. If any of the conditions below are detected synchronously, the  
 4264 *aio\_write()* function shall return  $-1$  and set *errno* to the corresponding value. If any of the

4265 conditions below are detected asynchronously, the return status of the asynchronous operation  
 4266 shall be set to -1, and the error status of the asynchronous operation is set to the corresponding  
 4267 value.

4268 [EBADF] The *aiocbp->aio\_fildes* argument is not a valid file descriptor open for writing.

4269 [EINVAL] The file offset value implied by *aiocbp->aio\_offset* would be invalid,  
 4270 *aiocbp->aio\_reqprio* is not a valid value, or *aiocbp->aio\_nbytes* is an invalid  
 4271 value.

4272 In the case that the *aio\_write()* successfully queues the I/O operation, the return status of the  
 4273 asynchronous operation shall be one of the values normally returned by the *write()* function call.  
 4274 If the operation is successfully queued but is subsequently canceled or encounters an error, the  
 4275 error status for the asynchronous operation contains one of the values normally set by the  
 4276 *write()* function call, or one of the following:

4277 [EBADF] The *aiocbp->aio\_fildes* argument is not a valid file descriptor open for writing.

4278 [EINVAL] The file offset value implied by *aiocbp->aio\_offset* would be invalid.

4279 [ECANCELED] The requested I/O was canceled before the I/O completed due to an explicit  
 4280 *aio\_cancel()* request.

4281 The following condition may be detected synchronously or asynchronously:

4282 [EFBIG] The file is a regular file, *aiocbp->aio\_nbytes* is greater than 0, and the starting  
 4283 offset in *aiocbp->aio\_offset* is at or beyond the offset maximum in the open file  
 4284 description associated with *aiocbp->aio\_fildes*.

#### 4285 EXAMPLES

4286 None.

#### 4287 APPLICATION USAGE

4288 The *aio\_write()* function is part of the Asynchronous Input and Output option and need not be  
 4289 available on all implementations.

#### 4290 RATIONALE

4291 None.

#### 4292 FUTURE DIRECTIONS

4293 None.

#### 4294 SEE ALSO

4295 *aio\_cancel()*, *aio\_error()*, *aio\_read()*, *aio\_return()*, *close()*, *exec*, *exit()*, *fork()*, *lio\_listio()*, *lseek()*,  
 4296 *write()*, the Base Definitions volume of IEEE Std 1003.1-2001, <**aio.h**>

#### 4297 CHANGE HISTORY

4298 First released in Issue 5. Included for alignment with the POSIX Realtime Extension.

4299 Large File Summit extensions are added.

#### 4300 Issue 6

4301 The [ENOSYS] error condition has been removed as stubs need not be provided if an  
 4302 implementation does not support the Asynchronous Input and Output option.

4303 The APPLICATION USAGE section is added.

4304 The following new requirements on POSIX implementations derive from alignment with the  
 4305 Single UNIX Specification:

- 4306 • In the DESCRIPTION, text is added to indicate that for regular files no data transfer occurs  
 4307 past the offset maximum established in the open file description associated with

4308

*aioctx->aio\_fildes.*

4309

- The [EFBIG] error is added as part of the large file support extensions.

## 4310 NAME

4311 alarm — schedule an alarm signal

## 4312 SYNOPSIS

4313 #include &lt;unistd.h&gt;

4314 unsigned alarm(unsigned *seconds*);

## 4315 DESCRIPTION

4316 The *alarm()* function shall cause the system to generate a SIGALRM signal for the process after  
 4317 the number of realtime seconds specified by *seconds* have elapsed. Processor scheduling delays  
 4318 may prevent the process from handling the signal as soon as it is generated.

4319 If *seconds* is 0, a pending alarm request, if any, is canceled.

4320 Alarm requests are not stacked; only one SIGALRM generation can be scheduled in this manner.  
 4321 If the SIGALRM signal has not yet been generated, the call shall result in rescheduling the time  
 4322 at which the SIGALRM signal is generated.

4323 XSI Interactions between *alarm()* and any of *setitimer()*, *ualarm()*, or *usleep()* are unspecified.

## 4324 RETURN VALUE

4325 If there is a previous *alarm()* request with time remaining, *alarm()* shall return a non-zero value  
 4326 that is the number of seconds until the previous request would have generated a SIGALRM  
 4327 signal. Otherwise, *alarm()* shall return 0.

## 4328 ERRORS

4329 The *alarm()* function is always successful, and no return value is reserved to indicate an error.

## 4330 EXAMPLES

4331 None.

## 4332 APPLICATION USAGE

4333 The *fork()* function clears pending alarms in the child process. A new process image created by  
 4334 one of the *exec* functions inherits the time left to an alarm signal in the old process' image.

4335 Application writers should note that the type of the argument *seconds* and the return value of  
 4336 *alarm()* is **unsigned**. That means that a Strictly Conforming POSIX System Interfaces  
 4337 Application cannot pass a value greater than the minimum guaranteed value for {UINT\_MAX},  
 4338 which the ISO C standard sets as 65 535, and any application passing a larger value is restricting  
 4339 its portability. A different type was considered, but historical implementations, including those  
 4340 with a 16-bit **int** type, consistently use either **unsigned** or **int**.

4341 Application writers should be aware of possible interactions when the same process uses both  
 4342 the *alarm()* and *sleep()* functions.

## 4343 RATIONALE

4344 Many historical implementations (including Version 7 and System V) allow an alarm to occur up  
 4345 to a second early. Other implementations allow alarms up to half a second or one clock tick  
 4346 early or do not allow them to occur early at all. The latter is considered most appropriate, since it  
 4347 gives the most predictable behavior, especially since the signal can always be delayed for an  
 4348 indefinite amount of time due to scheduling. Applications can thus choose the *seconds* argument  
 4349 as the minimum amount of time they wish to have elapse before the signal.

4350 The term “realtime” here and elsewhere (*sleep()*, *times()*) is intended to mean “wall clock” time  
 4351 as common English usage, and has nothing to do with “realtime operating systems”. It is in  
 4352 contrast to *virtual time*, which could be misinterpreted if just *time* were used.

4353 In some implementations, including 4.3 BSD, very large values of the *seconds* argument are  
 4354 silently rounded down to an implementation-defined maximum value. This maximum is large

4355 enough (to the order of several months) that the effect is not noticeable.

4356 There were two possible choices for alarm generation in multi-threaded applications: generation  
4357 for the calling thread or generation for the process. The first option would not have been  
4358 particularly useful since the alarm state is maintained on a per-process basis and the alarm that  
4359 is established by the last invocation of *alarm()* is the only one that would be active.

4360 Furthermore, allowing generation of an asynchronous signal for a thread would have introduced  
4361 an exception to the overall signal model. This requires a compelling reason in order to be  
4362 justified.

#### 4363 **FUTURE DIRECTIONS**

4364 None.

#### 4365 **SEE ALSO**

4366 *alarm()*, *exec*, *fork()*, *getitimer()*, *pause()*, *sigaction()*, *sleep()*, *ualarm()*, *usleep()*, the Base  
4367 Definitions volume of IEEE Std 1003.1-2001, <signal.h>, <unistd.h>

#### 4368 **CHANGE HISTORY**

4369 First released in Issue 1. Derived from Issue 1 of the SVID.

#### 4370 **Issue 6**

4371 The following new requirements on POSIX implementations derive from alignment with the  
4372 Single UNIX Specification:

- 4373 • The DESCRIPTION is updated to indicate that interactions with the *setitimer()*, *ualarm()*, and  
4374 *usleep()* functions are unspecified.

## 4375 NAME

4376 asctime, asctime\_r — convert date and time to a string

## 4377 SYNOPSIS

4378 #include &lt;time.h&gt;

4379 char \*asctime(const struct tm \*timeptr);

4380 TSF char \*asctime\_r(const struct tm \*restrict tm, char \*restrict buf);

4381

## 4382 DESCRIPTION

4383 CX For *asctime()*: The functionality described on this reference page is aligned with the ISO C  
 4384 standard. Any conflict between the requirements described here and the ISO C standard is  
 4385 unintentional. This volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

4386 The *asctime()* function shall convert the broken-down time in the structure pointed to by *timeptr*  
 4387 into a string in the form:

4388 Sun Sep 16 01:03:52 1973\n\0

4389 using the equivalent of the following algorithm:

```

4390 char *asctime(const struct tm *timeptr)
4391 {
4392     static char wday_name[7][3] = {
4393         "Sun", "Mon", "Tue", "Wed", "Thu", "Fri", "Sat"
4394     };
4395     static char mon_name[12][3] = {
4396         "Jan", "Feb", "Mar", "Apr", "May", "Jun",
4397         "Jul", "Aug", "Sep", "Oct", "Nov", "Dec"
4398     };
4399     static char result[26];
4400
4401     sprintf(result, "%.3s %.3s%3d %.2d:%.2d:%.2d %d\n",
4402             wday_name[timeptr->tm_wday],
4403             mon_name[timeptr->tm_mon],
4404             timeptr->tm_mday, timeptr->tm_hour,
4405             timeptr->tm_min, timeptr->tm_sec,
4406             1900 + timeptr->tm_year);
4407     return result;
4408 }

```

4408 The **tm** structure is defined in the <time.h> header.

4409 CX The *asctime()*, *ctime()*, *gmtime()*, and *localtime()* functions shall return values in one of two static  
 4410 objects: a broken-down time structure and an array of type **char**. Execution of any of the  
 4411 functions may overwrite the information returned in either of these objects by any of the other  
 4412 functions.

4413 The *asctime()* function need not be reentrant. A function that is not required to be reentrant is not  
 4414 required to be thread-safe.

4415 TSF The *asctime\_r()* function shall convert the broken-down time in the structure pointed to by *tm*  
 4416 into a string (of the same form as that returned by *asctime()*) that is placed in the user-supplied  
 4417 buffer pointed to by *buf* (which shall contain at least 26 bytes) and then return *buf*.

4418 **RETURN VALUE**

4419 Upon successful completion, *asctime()* shall return a pointer to the string.

4420 TSF Upon successful completion, *asctime\_r()* shall return a pointer to a character string containing  
4421 the date and time. This string is pointed to by the argument *buf*. If the function is unsuccessful,  
4422 it shall return NULL.

4423 **ERRORS**

4424 No errors are defined.

4425 **EXAMPLES**

4426 None.

4427 **APPLICATION USAGE**

4428 Values for the broken-down time structure can be obtained by calling *gmtime()* or *localtime()*.  
4429 This function is included for compatibility with older implementations, and does not support  
4430 localized date and time formats. Applications should use *strptime()* to achieve maximum  
4431 portability.

4432 The *asctime\_r()* function is thread-safe and shall return values in a user-supplied buffer instead  
4433 of possibly using a static data area that may be overwritten by each call.

4434 **RATIONALE**

4435 None.

4436 **FUTURE DIRECTIONS**

4437 None.

4438 **SEE ALSO**

4439 *clock()*, *ctime()*, *difftime()*, *gmtime()*, *localtime()*, *mktime()*, *strptime()*, *strptime()*, *time()*, *utime()*,  
4440 the Base Definitions volume of IEEE Std 1003.1-2001, <**time.h**>

4441 **CHANGE HISTORY**

4442 First released in Issue 1. Derived from Issue 1 of the SVID.

4443 **Issue 5**

4444 Normative text previously in the APPLICATION USAGE section is moved to the  
4445 DESCRIPTION.

4446 The *asctime\_r()* function is included for alignment with the POSIX Threads Extension.

4447 A note indicating that the *asctime()* function need not be reentrant is added to the  
4448 DESCRIPTION.

4449 **Issue 6**

4450 The *asctime\_r()* function is marked as part of the Thread-Safe Functions option.

4451 Extensions beyond the ISO C standard are marked.

4452 The APPLICATION USAGE section is updated to include a note on the thread-safe function and  
4453 its avoidance of possibly using a static data area.

4454 The DESCRIPTION of *asctime\_r()* is updated to describe the format of the string returned.

4455 The **restrict** keyword is added to the *asctime\_r()* prototype for alignment with the  
4456 ISO/IEC 9899:1999 standard.

4457 **NAME**

4458        asin, asinf, asinl — arc sine function

4459 **SYNOPSIS**

4460        #include &lt;math.h&gt;

4461        double asin(double x);

4462        float asinf(float x);

4463        long double asinl(long double x);

4464 **DESCRIPTION**

4465 **CX**        The functionality described on this reference page is aligned with the ISO C standard. Any  
 4466 conflict between the requirements described here and the ISO C standard is unintentional. This  
 4467 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

4468        These functions shall compute the principal value of the arc sine of their argument *x*. The value  
 4469 of *x* should be in the range  $[-1,1]$ .

4470        An application wishing to check for error situations should set *errno* to zero and call  
 4471 *feclearexcept*(FE\_ALL\_EXCEPT) before calling these functions. On return, if *errno* is non-zero or  
 4472 *fetetestexcept*(FE\_INVALID | FE\_DIVBYZERO | FE\_OVERFLOW | FE\_UNDERFLOW) is non-  
 4473 zero, an error has occurred.

4474 **RETURN VALUE**

4475        Upon successful completion, these functions shall return the arc sine of *x*, in the range  
 4476  $[-\pi/2, \pi/2]$  radians.

4477 **MX**        For finite values of *x* not in the range  $[-1,1]$ , a domain error shall occur, and either a NaN (if  
 4478 supported), or an implementation-defined value shall be returned.

4479 **MX**        If *x* is NaN, a NaN shall be returned.

4480        If *x* is  $\pm 0$ , *x* shall be returned.

4481        If *x* is  $\pm \text{Inf}$ , a domain error shall occur, and either a NaN (if supported), or an implementation-  
 4482 defined value shall be returned.

4483        If *x* is subnormal, a range error may occur and *x* should be returned.

4484 **ERRORS**

4485        These functions shall fail if:

4486 **MX**        **Domain Error**    The *x* argument is finite and is not in the range  $[-1,1]$ , or is  $\pm \text{Inf}$ .

4487                If the integer expression (math\_errhandling & MATH\_ERRNO) is non-zero,  
 4488 then *errno* shall be set to [EDOM]. If the integer expression (math\_errhandling  
 4489 & MATH\_ERREXCEPT) is non-zero, then the invalid floating-point exception  
 4490 shall be raised.

4491        These functions may fail if:

4492 **MX**        **Range Error**    The value of *x* is subnormal.

4493                If the integer expression (math\_errhandling & MATH\_ERRNO) is non-zero,  
 4494 then *errno* shall be set to [ERANGE]. If the integer expression  
 4495 (math\_errhandling & MATH\_ERREXCEPT) is non-zero, then the underflow  
 4496 floating-point exception shall be raised.

4497 **EXAMPLES**

4498       None.

4499 **APPLICATION USAGE**4500       On error, the expressions (math\_errhandling & MATH\_ERRNO) and (math\_errhandling &  
4501       MATH\_ERREXCEPT) are independent of each other, but at least one of them must be non-zero.4502 **RATIONALE**

4503       None.

4504 **FUTURE DIRECTIONS**

4505       None.

4506 **SEE ALSO**4507       *feclearexcept()*, *fetestexcept()*, *isnan()*, *sin()*, the Base Definitions volume of IEEE Std 1003.1-2001,  
4508       Section 4.18, Treatment of Error Conditions for Mathematical Functions, <math.h>4509 **CHANGE HISTORY**

4510       First released in Issue 1. Derived from Issue 1 of the SVID.

4511 **Issue 5**4512       The DESCRIPTION is updated to indicate how an application should check for an error. This  
4513       text was previously published in the APPLICATION USAGE section.4514 **Issue 6**4515       The *asinf()* and *asinl()* functions are added for alignment with the ISO/IEC 9899:1999 standard.4516       The DESCRIPTION, RETURN VALUE, ERRORS, and APPLICATION USAGE sections are  
4517       revised to align with the ISO/IEC 9899:1999 standard.4518       IEC 60559:1989 standard floating-point extensions over the ISO/IEC 9899:1999 standard are  
4519       marked.

4520 **NAME**

4521 asinh, asinhf, asinhl — inverse hyperbolic sine functions

4522 **SYNOPSIS**

4523 #include &lt;math.h&gt;

4524 double asinh(double x);

4525 float asinhf(float x);

4526 long double asinhl(long double x);

4527 **DESCRIPTION**

4528 **CX** The functionality described on this reference page is aligned with the ISO C standard. Any  
 4529 conflict between the requirements described here and the ISO C standard is unintentional. This  
 4530 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

4531 These functions shall compute the inverse hyperbolic sine of their argument *x*.

4532 An application wishing to check for error situations should set *errno* to zero and call  
 4533 *feclearexcept*(FE\_ALL\_EXCEPT) before calling these functions. On return, if *errno* is non-zero or  
 4534 *fetestexcept*(FE\_INVALID | FE\_DIVBYZERO | FE\_OVERFLOW | FE\_UNDERFLOW) is non-  
 4535 zero, an error has occurred.

4536 **RETURN VALUE**4537 Upon successful completion, these functions shall return the inverse hyperbolic sine of their  
4538 argument.4539 **MX** If *x* is NaN, a NaN shall be returned.4540 If *x* is  $\pm 0$ , or  $\pm\text{Inf}$ , *x* shall be returned.4541 If *x* is subnormal, a range error may occur and *x* should be returned.4542 **ERRORS**

4543 These functions may fail if:

4544 **MX** **Range Error** The value of *x* is subnormal.

4545 If the integer expression (math\_errhandling & MATH\_ERRNO) is non-zero,  
 4546 then *errno* shall be set to [ERANGE]. If the integer expression  
 4547 (math\_errhandling & MATH\_ERREXCEPT) is non-zero, then the underflow  
 4548 floating-point exception shall be raised.

4549 **EXAMPLES**

4550 None.

4551 **APPLICATION USAGE**

4552 On error, the expressions (math\_errhandling & MATH\_ERRNO) and (math\_errhandling &  
 4553 MATH\_ERREXCEPT) are independent of each other, but at least one of them must be non-zero.

4554 **RATIONALE**

4555 None.

4556 **FUTURE DIRECTIONS**

4557 None.

4558 **SEE ALSO**

4559 *feclearexcept*(), *fetestexcept*(), *sinh*(), the Base Definitions volume of IEEE Std 1003.1-2001, Section  
 4560 4.18, Treatment of Error Conditions for Mathematical Functions, <math.h>

4561 **CHANGE HISTORY**

4562 First released in Issue 4, Version 2.

4563 **Issue 5**

4564 Moved from X/OPEN UNIX extension to BASE.

4565 **Issue 6**4566 The *asinh()* function is no longer marked as an extension.4567 The *asinhf()* and *asinhll()* functions are added for alignment with the ISO/IEC 9899:1999 standard.  
45684569 The DESCRIPTION, RETURN VALUE, ERRORS, and APPLICATION USAGE sections are  
4570 revised to align with the ISO/IEC 9899:1999 standard.4571 IEC 60559:1989 standard floating-point extensions over the ISO/IEC 9899:1999 standard are  
4572 marked.

4573 **NAME**

4574        asinl — arc sine function

4575 **SYNOPSIS**

4576        #include <math.h>

4577        long double asinl(long double x);

4578 **DESCRIPTION**

4579        Refer to *asin()*.

4580 **NAME**

4581       assert — insert program diagnostics

4582 **SYNOPSIS**

4583       #include &lt;assert.h&gt;

4584       void assert(*scalar expression*);4585 **DESCRIPTION**

4586 **CX**       The functionality described on this reference page is aligned with the ISO C standard. Any  
4587 conflict between the requirements described here and the ISO C standard is unintentional. This  
4588 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

4589       The *assert()* macro shall insert diagnostics into programs; it shall expand to a **void** expression.  
4590 When it is executed, if *expression* (which shall have a **scalar** type) is false (that is, compares equal  
4591 to 0), *assert()* shall write information about the particular call that failed on *stderr* and shall call  
4592 *abort()*.

4593       The information written about the call that failed shall include the text of the argument, the  
4594 name of the source file, the source file line number, and the name of the enclosing function; the  
4595 latter are, respectively, the values of the preprocessing macros `__FILE__` and `__LINE__` and of  
4596 the identifier `__func__`.

4597       Forcing a definition of the name `NDEBUG`, either from the compiler command line or with the  
4598 preprocessor control statement `#define NDEBUG` ahead of the `#include <assert.h>` statement,  
4599 shall stop assertions from being compiled into the program.

4600 **RETURN VALUE**4601       The *assert()* macro shall not return a value.4602 **ERRORS**

4603       No errors are defined.

4604 **EXAMPLES**

4605       None.

4606 **APPLICATION USAGE**

4607       None.

4608 **RATIONALE**

4609       None.

4610 **FUTURE DIRECTIONS**

4611       None.

4612 **SEE ALSO**4613       *abort()*, *stderr*, the Base Definitions volume of IEEE Std 1003.1-2001, `<assert.h>`4614 **CHANGE HISTORY**

4615       First released in Issue 1. Derived from Issue 1 of the SVID.

4616 **Issue 6**

4617       The prototype for the *expression* argument to *assert()* is changed from **int** to **scalar** for alignment  
4618 with the ISO/IEC 9899:1999 standard.

4619       The DESCRIPTION of *assert()* is updated for alignment with the ISO/IEC 9899:1999 standard.

4620 **NAME**

4621 atan, atanf, atanl — arc tangent function

4622 **SYNOPSIS**

4623 #include &lt;math.h&gt;

4624 double atan(double x);

4625 float atanf(float x);

4626 long double atanl(long double x);

4627 **DESCRIPTION**

4628 **CX** The functionality described on this reference page is aligned with the ISO C standard. Any  
 4629 conflict between the requirements described here and the ISO C standard is unintentional. This  
 4630 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

4631 These functions shall compute the principal value of the arc tangent of their argument  $x$ .

4632 An application wishing to check for error situations should set *errno* to zero and call  
 4633 *feclearexcept*(FE\_ALL\_EXCEPT) before calling these functions. On return, if *errno* is non-zero or  
 4634 *fetestexcept*(FE\_INVALID | FE\_DIVBYZERO | FE\_OVERFLOW | FE\_UNDERFLOW) is non-  
 4635 zero, an error has occurred.

4636 **RETURN VALUE**4637 Upon successful completion, these functions shall return the arc tangent of  $x$  in the range  
4638  $[-\pi/2, \pi/2]$  radians.4639 **MX** If  $x$  is NaN, a NaN shall be returned.4640 If  $x$  is  $\pm 0$ ,  $x$  shall be returned.4641 If  $x$  is  $\pm \text{Inf}$ ,  $\pm \pi/2$  shall be returned.4642 If  $x$  is subnormal, a range error may occur and  $x$  should be returned.4643 **ERRORS**

4644 These functions may fail if:

4645 **MX** **Range Error** The value of  $x$  is subnormal.

4646 If the integer expression (math\_errhandling & MATH\_ERRNO) is non-zero,  
 4647 then *errno* shall be set to [ERANGE]. If the integer expression  
 4648 (math\_errhandling & MATH\_ERREXCEPT) is non-zero, then the underflow  
 4649 floating-point exception shall be raised.

4650 **EXAMPLES**

4651 None.

4652 **APPLICATION USAGE**

4653 On error, the expressions (math\_errhandling & MATH\_ERRNO) and (math\_errhandling &  
 4654 MATH\_ERREXCEPT) are independent of each other, but at least one of them must be non-zero.

4655 **RATIONALE**

4656 None.

4657 **FUTURE DIRECTIONS**

4658 None.

4659 **SEE ALSO**

 4662 <math.h>

4663 **CHANGE HISTORY**

4664 First released in Issue 1. Derived from Issue 1 of the SVID.

4665 **Issue 5**

4666 The DESCRIPTION is updated to indicate how an application should check for an error. This  
4667 text was previously published in the APPLICATION USAGE section.

4668 **Issue 6**

4669 The *atanf()* and *atanl()* functions are added for alignment with the ISO/IEC 9899:1999 standard.

4670 The DESCRIPTION, RETURN VALUE, ERRORS, and APPLICATION USAGE sections are  
4671 revised to align with the ISO/IEC 9899:1999 standard.

4672 IEC 60559:1989 standard floating-point extensions over the ISO/IEC 9899:1999 standard are  
4673 marked.

4674 **NAME**

4675         atan2, atan2f, atan2l — arc tangent functions

4676 **SYNOPSIS**

4677         #include &lt;math.h&gt;

4678         double atan2(double y, double x);

4679         float atan2f(float y, float x);

4680         long double atan2l(long double y, long double x);

4681 **DESCRIPTION**

4682 **CX**         The functionality described on this reference page is aligned with the ISO C standard. Any  
 4683 conflict between the requirements described here and the ISO C standard is unintentional. This  
 4684 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

4685         These functions shall compute the principal value of the arc tangent of  $y/x$ , using the signs of  
 4686 both arguments to determine the quadrant of the return value.

4687         An application wishing to check for error situations should set *errno* to zero and call  
 4688 *feclearexcept*(FE\_ALL\_EXCEPT) before calling these functions. On return, if *errno* is non-zero or  
 4689 *fetestexcept*(FE\_INVALID | FE\_DIVBYZERO | FE\_OVERFLOW | FE\_UNDERFLOW) is non-  
 4690 zero, an error has occurred.

4691 **RETURN VALUE**

4692         Upon successful completion, these functions shall return the arc tangent of  $y/x$  in the range  
 4693  $[-\pi, \pi]$  radians.

4694         If  $y$  is  $\pm 0$  and  $x$  is  $< 0$ ,  $\pm\pi$  shall be returned.

4695         If  $y$  is  $\pm 0$  and  $x$  is  $> 0$ ,  $\pm 0$  shall be returned.

4696         If  $y$  is  $< 0$  and  $x$  is  $\pm 0$ ,  $-\pi/2$  shall be returned.

4697         If  $y$  is  $> 0$  and  $x$  is  $\pm 0$ ,  $\pi/2$  shall be returned.

4698         If  $x$  is 0, a pole error shall not occur.

4699 **MX**         If either  $x$  or  $y$  is NaN, a NaN shall be returned.

4700         If the result underflows, a range error may occur and  $y/x$  should be returned.

4701         If  $y$  is  $\pm 0$  and  $x$  is  $-0$ ,  $\pm\pi$  shall be returned.

4702         If  $y$  is  $\pm 0$  and  $x$  is  $+0$ ,  $\pm 0$  shall be returned.

4703         For finite values of  $\pm y > 0$ , if  $x$  is  $-\text{Inf}$ ,  $\pm\pi$  shall be returned.

4704         For finite values of  $\pm y > 0$ , if  $x$  is  $+\text{Inf}$ ,  $\pm 0$  shall be returned.

4705         For finite values of  $x$ , if  $y$  is  $\pm\text{Inf}$ ,  $\pm\pi/2$  shall be returned.

4706         If  $y$  is  $\pm\text{Inf}$  and  $x$  is  $-\text{Inf}$ ,  $\pm 3\pi/4$  shall be returned.

4707         If  $y$  is  $\pm\text{Inf}$  and  $x$  is  $+\text{Inf}$ ,  $\pm\pi/4$  shall be returned.

4708         If both arguments are 0, a domain error shall not occur.

4709 **ERRORS**

4710         These functions may fail if:

4711 **MX**         **Range Error**         The result underflows.

4712         If the integer expression (math\_errhandling & MATH\_ERRNO) is non-zero,  
 4713 then *errno* shall be set to [ERANGE]. If the integer expression

4714 (math\_errhandling & MATH\_ERREXCEPT) is non-zero, then the underflow  
4715 floating-point exception shall be raised.

4716 **EXAMPLES**

4717 None.

4718 **APPLICATION USAGE**

4719 On error, the expressions (math\_errhandling & MATH\_ERRNO) and (math\_errhandling &  
4720 MATH\_ERREXCEPT) are independent of each other, but at least one of them must be non-zero.

4721 **RATIONALE**

4722 None.

4723 **FUTURE DIRECTIONS**

4724 None.

4725 **SEE ALSO**

4726 *atan()*, *feclearexcept()*, *fetestexcept()*, *isnan()*, *tan()*, the Base Definitions volume of  
4727 IEEE Std 1003.1-2001, Section 4.18, Treatment of Error Conditions for Mathematical Functions,  
4728 <math.h>

4729 **CHANGE HISTORY**

4730 First released in Issue 1. Derived from Issue 1 of the SVID.

4731 **Issue 5**

4732 The DESCRIPTION is updated to indicate how an application should check for an error. This  
4733 text was previously published in the APPLICATION USAGE section.

4734 **Issue 6**

4735 The *atan2f()* and *atan2l()* functions are added for alignment with the ISO/IEC 9899:1999  
4736 standard.

4737 The DESCRIPTION, RETURN VALUE, ERRORS, and APPLICATION USAGE sections are  
4738 revised to align with the ISO/IEC 9899:1999 standard.

4739 IEC 60559:1989 standard floating-point extensions over the ISO/IEC 9899:1999 standard are  
4740 marked.

4741 **NAME**4742        **atanf** — arc tangent function4743 **SYNOPSIS**

4744        #include &lt;math.h&gt;

4745        float atanf(float x);

4746 **DESCRIPTION**4747        Refer to *atan()*.

4748 **NAME**

4749         atanh, atanhf, atanh1 — inverse hyperbolic tangent functions

4750 **SYNOPSIS**

4751         #include &lt;math.h&gt;

4752         double atanh(double x);

4753         float atanhf(float x);

4754         long double atanh1(long double x);

4755 **DESCRIPTION**4756 **CX**         The functionality described on this reference page is aligned with the ISO C standard. Any  
4757 conflict between the requirements described here and the ISO C standard is unintentional. This  
4758 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.4759         These functions shall compute the inverse hyperbolic tangent of their argument *x*.4760         An application wishing to check for error situations should set *errno* to zero and call  
4761 *feclearexcept*(FE\_ALL\_EXCEPT) before calling these functions. On return, if *errno* is non-zero or  
4762 *fetestexcept*(FE\_INVALID | FE\_DIVBYZERO | FE\_OVERFLOW | FE\_UNDERFLOW) is non-  
4763 zero, an error has occurred.4764 **RETURN VALUE**4765         Upon successful completion, these functions shall return the inverse hyperbolic tangent of their  
4766 argument.4767         If *x* is  $\pm 1$ , a pole error shall occur, and *atanh()*, *atanhf()*, and *atanh1()* shall return the value of the  
4768 macro HUGE\_VAL, HUGE\_VALF, and HUGE\_VALL, respectively, with the same sign as the  
4769 correct value of the function.4770 **MX**         For finite  $|x| > 1$ , a domain error shall occur, and either a NaN (if supported), or an  
4771 implementation-defined value shall be returned.4772 **MX**         If *x* is NaN, a NaN shall be returned.4773         If *x* is  $\pm 0$ , *x* shall be returned.4774         If *x* is  $\pm \text{Inf}$ , a domain error shall occur, and either a NaN (if supported), or an implementation-  
4775 defined value shall be returned.4776         If *x* is subnormal, a range error may occur and *x* should be returned.4777 **ERRORS**

4778         These functions shall fail if:

4779 **MX**         Domain Error     The *x* argument is finite and not in the range  $[-1, 1]$ , or is  $\pm \text{Inf}$ .4780         If the integer expression (math\_errhandling & MATH\_ERRNO) is non-zero,  
4781 then *errno* shall be set to [EDOM]. If the integer expression (math\_errhandling  
4782 & MATH\_ERREXCEPT) is non-zero, then the invalid floating-point exception  
4783 shall be raised.4784         Pole Error            The *x* argument is  $\pm 1$ .4785         If the integer expression (math\_errhandling & MATH\_ERRNO) is non-zero,  
4786 then *errno* shall be set to [ERANGE]. If the integer expression  
4787 (math\_errhandling & MATH\_ERREXCEPT) is non-zero, then the divide-by-  
4788 zero floating-point exception shall be raised.

4789 These functions may fail if:

4790 MX **Range Error** The value of  $x$  is subnormal.

4791 If the integer expression `(math_errhandling & MATH_ERRNO)` is non-zero,  
 4792 then *errno* shall be set to [ERANGE]. If the integer expression  
 4793 `(math_errhandling & MATH_ERREXCEPT)` is non-zero, then the underflow  
 4794 floating-point exception shall be raised.

#### 4795 **EXAMPLES**

4796 None.

#### 4797 **APPLICATION USAGE**

4798 On error, the expressions `(math_errhandling & MATH_ERRNO)` and `(math_errhandling &`  
 4799 `MATH_ERREXCEPT)` are independent of each other, but at least one of them must be non-zero.

#### 4800 **RATIONALE**

4801 None.

#### 4802 **FUTURE DIRECTIONS**

4803 None.

#### 4804 **SEE ALSO**

4805 *feclearexcept()*, *fetestexcept()*, *tanh()*, the Base Definitions volume of IEEE Std 1003.1-2001, Section  
 4806 4.18, Treatment of Error Conditions for Mathematical Functions, <math.h>

#### 4807 **CHANGE HISTORY**

4808 First released in Issue 4, Version 2.

#### 4809 **Issue 5**

4810 Moved from X/OPEN UNIX extension to BASE.

#### 4811 **Issue 6**

4812 The *atanh()* function is no longer marked as an extension.

4813 The *atanhf()* and *atanhl()* functions are added for alignment with the ISO/IEC 9899:1999  
 4814 standard.

4815 The DESCRIPTION, RETURN VALUE, ERRORS, and APPLICATION USAGE sections are  
 4816 revised to align with the ISO/IEC 9899:1999 standard.

4817 IEC 60559:1989 standard floating-point extensions over the ISO/IEC 9899:1999 standard are  
 4818 marked.

4819 **NAME**

4820        atanl — arc tangent function

4821 **SYNOPSIS**

4822        #include <math.h>

4823        long double atanl(long double x);

4824 **DESCRIPTION**

4825        Refer to *atan()*.

4826 **NAME**

4827           atexit — register a function to run at process termination

4828 **SYNOPSIS**

4829           #include <stdlib.h>

4830           int atexit(void (\*func)(void));

4831 **DESCRIPTION**

4832 **CX**       The functionality described on this reference page is aligned with the ISO C standard. Any  
4833 conflict between the requirements described here and the ISO C standard is unintentional. This  
4834 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

4835       The *atexit()* function shall register the function pointed to by *func*, to be called without  
4836 arguments at normal program termination. At normal program termination, all functions  
4837 registered by the *atexit()* function shall be called, in the reverse order of their registration, except  
4838 that a function is called after any previously registered functions that had already been called at  
4839 the time it was registered. Normal termination occurs either by a call to *exit()* or a return from  
4840 *main()*.

4841       At least 32 functions can be registered with *atexit()*.

4842 **CX**       After a successful call to any of the *exec* functions, any functions previously registered by *atexit()*  
4843 shall no longer be registered.

4844 **RETURN VALUE**

4845       Upon successful completion, *atexit()* shall return 0; otherwise, it shall return a non-zero value.

4846 **ERRORS**

4847       No errors are defined.

4848 **EXAMPLES**

4849       None.

4850 **APPLICATION USAGE**

4851       The functions registered by a call to *atexit()* must return to ensure that all registered functions  
4852 are called.

4853       The application should call *sysconf()* to obtain the value of {ATEXIT\_MAX}, the number of  
4854 functions that can be registered. There is no way for an application to tell how many functions  
4855 have already been registered with *atexit()*.

4856 **RATIONALE**

4857       None.

4858 **FUTURE DIRECTIONS**

4859       None.

4860 **SEE ALSO**

4861       *exit()*, *sysconf()*, the Base Definitions volume of IEEE Std 1003.1-2001, <stdlib.h>

4862 **CHANGE HISTORY**

4863       First released in Issue 4. Derived from the ANSI C standard.

4864 **Issue 6**

4865       Extensions beyond the ISO C standard are marked.

4866       The DESCRIPTION is updated for alignment with the ISO/IEC 9899:1999 standard.

4867 **NAME**

4868        atof — convert a string to a double-precision number

4869 **SYNOPSIS**

4870        #include &lt;stdlib.h&gt;

4871        double atof(const char \*str);

4872 **DESCRIPTION**

4873 cx       The functionality described on this reference page is aligned with the ISO C standard. Any  
4874        conflict between the requirements described here and the ISO C standard is unintentional. This  
4875        volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

4876        The call *atof(str)* shall be equivalent to:4877        *strtod(str, (char \*\*)NULL)*,

4878        except that the handling of errors may differ. If the value cannot be represented, the behavior is  
4879        undefined.

4880 **RETURN VALUE**4881        The *atof()* function shall return the converted value if the value can be represented.4882 **ERRORS**

4883        No errors are defined.

4884 **EXAMPLES**

4885        None.

4886 **APPLICATION USAGE**

4887        The *atof()* function is subsumed by *strtod()* but is retained because it is used extensively in  
4888        existing code. If the number is not known to be in range, *strtod()* should be used because *atof()* is  
4889        not required to perform any error checking.

4890 **RATIONALE**

4891        None.

4892 **FUTURE DIRECTIONS**

4893        None.

4894 **SEE ALSO**4895        *strtod()*, the Base Definitions volume of IEEE Std 1003.1-2001, <stdlib.h>4896 **CHANGE HISTORY**

4897        First released in Issue 1. Derived from Issue 1 of the SVID.

4898 **NAME**

4899         atoi — convert a string to an integer

4900 **SYNOPSIS**

4901         #include &lt;stdlib.h&gt;

4902         int atoi(const char \*str);

4903 **DESCRIPTION**

4904 cx         The functionality described on this reference page is aligned with the ISO C standard. Any  
4905 conflict between the requirements described here and the ISO C standard is unintentional. This  
4906 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

4907         The call *atoi(str)* shall be equivalent to:

4908         (int) strtol(str, (char \*\*)NULL, 10)

4909         except that the handling of errors may differ. If the value cannot be represented, the behavior is  
4910 undefined.

4911 **RETURN VALUE**4912         The *atoi()* function shall return the converted value if the value can be represented.4913 **ERRORS**

4914         No errors are defined.

4915 **EXAMPLES**4916         **Converting an Argument**

4917         The following example checks for proper usage of the program. If there is an argument and the  
4918 decimal conversion of this argument (obtained using *atoi()*) is greater than 0, then the program  
4919 has a valid number of minutes to wait for an event.

```
4920         #include <stdlib.h>
4921         #include <stdio.h>
4922         ...
4923         int minutes_to_event;
4924         ...
4925         if (argc < 2 || ((minutes_to_event = atoi (argv[1]))) <= 0) {
4926             fprintf(stderr, "Usage: %s minutes\n", argv[0]); exit(1);
4927         }
4928         ...
```

4929 **APPLICATION USAGE**

4930         The *atoi()* function is subsumed by *strtol()* but is retained because it is used extensively in  
4931 existing code. If the number is not known to be in range, *strtol()* should be used because *atoi()* is  
4932 not required to perform any error checking.

4933 **RATIONALE**

4934         None.

4935 **FUTURE DIRECTIONS**

4936         None.

4937 **SEE ALSO**4938         *strtol()*, the Base Definitions volume of IEEE Std 1003.1-2001, <stdlib.h>

4939 **CHANGE HISTORY**

4940 First released in Issue 1. Derived from Issue 1 of the SVID.

4941 **NAME**

4942        atol, atoll — convert a string to a long integer

4943 **SYNOPSIS**

4944        #include &lt;stdlib.h&gt;

4945        long atol(const char \*str);

4946        long long atoll(const char \*nptr);

4947 **DESCRIPTION**4948 **cx**     The functionality described on this reference page is aligned with the ISO C standard. Any  
4949 conflict between the requirements described here and the ISO C standard is unintentional. This  
4950 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.4951        The call *atol(str)* shall be equivalent to:

4952        strtol(str, (char \*\*)NULL, 10)

4953        The call *atoll(str)* shall be equivalent to:

4954        strtoll(nptr, (char \*\*)NULL, 10)

4955        except that the handling of errors may differ. If the value cannot be represented, the behavior is  
4956 undefined.4957 **RETURN VALUE**

4958        These functions shall return the converted value if the value can be represented.

4959 **ERRORS**

4960        No errors are defined.

4961 **EXAMPLES**

4962        None.

4963 **APPLICATION USAGE**4964        The *atol()* function is subsumed by *strtol()* but is retained because it is used extensively in  
4965 existing code. If the number is not known to be in range, *strtol()* should be used because *atol()* is  
4966 not required to perform any error checking.4967 **RATIONALE**

4968        None.

4969 **FUTURE DIRECTIONS**

4970        None.

4971 **SEE ALSO**4972        *strtol()*, the Base Definitions volume of IEEE Std 1003.1-2001, <stdlib.h>4973 **CHANGE HISTORY**

4974        First released in Issue 1. Derived from Issue 1 of the SVID.

4975 **Issue 6**4976        The *atoll()* function is added for alignment with the ISO/IEC 9899:1999 standard.

4977 **NAME**4978        **basename** — return the last component of a pathname4979 **SYNOPSIS**4980 **XSI**        #include <libgen.h>

4981        char \*basename(char \*path);

4982

4983 **DESCRIPTION**4984        The *basename()* function shall take the pathname pointed to by *path* and return a pointer to the final component of the pathname, deleting any trailing '/' characters.4986        If the string consists entirely of the '/' character, *basename()* shall return a pointer to the string "/". If the string is exactly "///", it is implementation-defined whether '/' or "///" is returned.4989        If *path* is a null pointer or points to an empty string, *basename()* shall return a pointer to the string ".".4991        The *basename()* function may modify the string pointed to by *path*, and may return a pointer to static storage that may then be overwritten by a subsequent call to *basename()*.4993        The *basename()* function need not be reentrant. A function that is not required to be reentrant is not required to be thread-safe.4995 **RETURN VALUE**4996        The *basename()* function shall return a pointer to the final component of *path*.4997 **ERRORS**

4998        No errors are defined.

4999 **EXAMPLES**5000        **Using basename()**5001        The following program fragment returns a pointer to the value *lib*, which is the base name of **/usr/lib**.5002        

```
#include <libgen.h>
5003        ...
5004        char *name = "/usr/lib";
5005        char *base;
5006        ...
5007        base = basename(name);
5008        ...
```

5009        **Sample Input and Output Strings for basename()**5010        In the following table, the input string is the value pointed to by *path*, and the output string is the return value of the *basename()* function.

5012

5013

5014

5015

5016

5017

Input String	Output String
"/usr/lib"	"lib"
"/usr/"	"usr"
"/"	"/"
"/" / "	"/"
"/usr//lib/"	"lib"

5018 **APPLICATION USAGE**

5019 None.

5020 **RATIONALE**

5021 None.

5022 **FUTURE DIRECTIONS**

5023 None.

5026 Utilities volume of IEEE Std 1003.1-2001, *basename*5027 **CHANGE HISTORY**

5028 First released in Issue 4, Version 2.

5029 **Issue 5**

5030 Moved from X/OPEN UNIX extension to BASE.

5031 Normative text previously in the APPLICATION USAGE section is moved to the  
5032 DESCRIPTION.

5033 A note indicating that this function need not be reentrant is added to the DESCRIPTION.

5034 **Issue 6**

5035 In the DESCRIPTION, the note about reentrancy is expanded to cover thread-safety.

5036 **NAME**5037       bcmp — memory operations (**LEGACY**)5038 **SYNOPSIS**

5039 xSI       #include &lt;strings.h&gt;

5040       int bcmp(const void \*s1, const void \*s2, size\_t n);

5041

5042 **DESCRIPTION**5043       The *bcmp()* function shall compare the first *n* bytes of the area pointed to by *s1* with the area pointed to by *s2*.5045 **RETURN VALUE**5046       The *bcmp()* function shall return 0 if *s1* and *s2* are identical; otherwise, it shall return non-zero. Both areas are assumed to be *n* bytes long. If the value of *n* is 0, *bcmp()* shall return 0.5048 **ERRORS**

5049       No errors are defined.

5050 **EXAMPLES**

5051       None.

5052 **APPLICATION USAGE**5053       The *memcmp()* function is preferred over this function.5054       For maximum portability, it is recommended to replace the function call to *bcmp()* as follows:

5055       #define bcmp(b1,b2,len) memcmp((b1), (b2), (size\_t)(len))

5056 **RATIONALE**

5057       None.

5058 **FUTURE DIRECTIONS**

5059       This function may be withdrawn in a future version.

5060 **SEE ALSO**5061       *memcmp()*, the Base Definitions volume of IEEE Std 1003.1-2001, <strings.h>5062 **CHANGE HISTORY**

5063       First released in Issue 4, Version 2.

5064 **Issue 5**

5065       Moved from X/OPEN UNIX extension to BASE.

5066 **Issue 6**

5067       This function is marked LEGACY.

5068 **NAME**5069 `bcopy` — memory operations (**LEGACY**)5070 **SYNOPSIS**5071 XSI `#include <strings.h>`5072 `void bcopy(const void *s1, void *s2, size_t n);`

5073

5074 **DESCRIPTION**5075 The *bcopy()* function shall copy *n* bytes from the area pointed to by *s1* to the area pointed to by  
5076 *s2*.5077 The bytes are copied correctly even if the area pointed to by *s1* overlaps the area pointed to by  
5078 *s2*.5079 **RETURN VALUE**5080 The *bcopy()* function shall not return a value.5081 **ERRORS**

5082 No errors are defined.

5083 **EXAMPLES**

5084 None.

5085 **APPLICATION USAGE**5086 The *memmove()* function is preferred over this function.

5087 The following are approximately equivalent (note the order of the arguments):

5088 `bcopy(s1,s2,n) ~ memmove(s2,s1,n)`5089 For maximum portability, it is recommended to replace the function call to *bcopy()* as follows:5090 `#define bcopy(b1,b2,len) (memmove((b2), (b1), (len)), (void) 0)`5091 **RATIONALE**

5092 None.

5093 **FUTURE DIRECTIONS**

5094 This function may be withdrawn in a future version.

5095 **SEE ALSO**5096 *memmove()*, the Base Definitions volume of IEEE Std 1003.1-2001, `<strings.h>`5097 **CHANGE HISTORY**

5098 First released in Issue 4, Version 2.

5099 **Issue 5**

5100 Moved from X/OPEN UNIX extension to BASE.

5101 **Issue 6**

5102 This function is marked LEGACY.

5103 **NAME**

5104        bind — bind a name to a socket

5105 **SYNOPSIS**

5106        #include &lt;sys/socket.h&gt;

5107        int bind(int *socket*, const struct sockaddr \**address*,  
5108                socklen\_t *address\_len*);5109 **DESCRIPTION**5110        The *bind()* function shall assign a local socket address *address* to a socket identified by descriptor  
5111        *socket* that has no local socket address assigned. Sockets created with the *socket()* function are  
5112        initially unnamed; they are identified only by their address family.5113        The *bind()* function takes the following arguments:5114        *socket*                Specifies the file descriptor of the socket to be bound.5115        *address*               Points to a **sockaddr** structure containing the address to be bound to the  
5116        socket. The length and format of the address depend on the address family of  
5117        the socket.5118        *address\_len*         Specifies the length of the **sockaddr** structure pointed to by the *address*  
5119        argument.5120        The socket specified by *socket* may require the process to have appropriate privileges to use the  
5121        *bind()* function.5122 **RETURN VALUE**5123        Upon successful completion, *bind()* shall return 0; otherwise, -1 shall be returned and *errno* set  
5124        to indicate the error.5125 **ERRORS**5126        The *bind()* function shall fail if:

5127        [EADDRINUSE] The specified address is already in use.

5128        [EADDRNOTAVAIL]

5129                The specified address is not available from the local machine.

5130        [EAFNOSUPPORT]

5131                The specified address is not a valid address for the address family of the  
5132                specified socket.5133        [EBADF]                The *socket* argument is not a valid file descriptor.5134        [EINVAL]               The socket is already bound to an address, and the protocol does not support  
5135                binding to a new address; or the socket has been shut down.5136        [ENOTSOCK]            The *socket* argument does not refer to a socket.5137        [EOPNOTSUPP] The socket type of the specified socket does not support binding to an  
5138                address.5139        If the address family of the socket is AF\_UNIX, then *bind()* shall fail if:5140        [EACCES]               A component of the path prefix denies search permission, or the requested  
5141                name requires writing in a directory with a mode that denies write  
5142                permission.

5143        [EDESTADDRREQ] or [EISDIR]

5144                The *address* argument is a null pointer.

5145	[EIO]	An I/O error occurred.
5146	[ELOOP]	A loop exists in symbolic links encountered during resolution of the pathname in <i>address</i> .
5147		
5148	[ENAMETOOLONG]	
5149		A component of a pathname exceeded {NAME_MAX} characters, or an entire pathname exceeded {PATH_MAX} characters.
5150		
5151	[ENOENT]	A component of the pathname does not name an existing file or the pathname is an empty string.
5152		
5153	[ENOTDIR]	A component of the path prefix of the pathname in <i>address</i> is not a directory.
5154	[EROFS]	The name would reside on a read-only file system.
5155		The <i>bind()</i> function may fail if:
5156	[EACCES]	The specified address is protected and the current user does not have permission to bind to it.
5157		
5158	[EINVAL]	The <i>address_len</i> argument is not a valid length for the address family.
5159	[EISCONN]	The socket is already connected.
5160	[ELOOP]	More than {SYMLOOP_MAX} symbolic links were encountered during resolution of the pathname in <i>address</i> .
5161		
5162	[ENAMETOOLONG]	
5163		Pathname resolution of a symbolic link produced an intermediate result whose length exceeds {PATH_MAX}.
5164		
5165	[ENOBUFS]	Insufficient resources were available to complete the call.

**5166 EXAMPLES**

5167 None.

**5168 APPLICATION USAGE**

5169 An application program can retrieve the assigned socket name with the *getsockname()* function.

**5170 RATIONALE**

5171 None.

**5172 FUTURE DIRECTIONS**

5173 None.

**5174 SEE ALSO**

5175 *connect()*, *getsockname()*, *listen()*, *socket()*, the Base Definitions volume of IEEE Std 1003.1-2001,  
5176 <sys/socket.h>

**5177 CHANGE HISTORY**

5178 First released in Issue 6. Derived from the XNS, Issue 5.2 specification.

5179 **NAME**5180        **bsd\_signal** — simplified signal facilities5181 **SYNOPSIS**

5182 OB XSI    #include &lt;signal.h&gt;

5183        void (\*bsd\_signal(int sig, void (\*func)(int)))(int);

5184

5185 **DESCRIPTION**5186        The *bsd\_signal()* function provides a partially compatible interface for programs written to historical system interfaces (see APPLICATION USAGE).5188        The function call *bsd\_signal(sig, func)* shall be equivalent to the following:

5189        void (\*bsd\_signal(int sig, void (\*func)(int)))(int)

5190        {

5191            struct sigaction act, oact;

5192            act.sa\_handler = func;

5193            act.sa\_flags = SA\_RESTART;

5194            sigemptyset(&amp;act.sa\_mask);

5195            sigaddset(&amp;act.sa\_mask, sig);

5196            if (sigaction(sig, &amp;act, &amp;oact) == -1)

5197                return(SIG\_ERR);

5198            return(oact.sa\_handler);

5199        }

5200        The handler function should be declared:

5201        void handler(int sig);

5202        where *sig* is the signal number. The behavior is undefined if *func* is a function that takes more than one argument, or an argument of a different type.5204 **RETURN VALUE**5205        Upon successful completion, *bsd\_signal()* shall return the previous action for *sig*. Otherwise, SIG\_ERR shall be returned and *errno* shall be set to indicate the error.5207 **ERRORS**5208        Refer to *sigaction()*.5209 **EXAMPLES**

5210        None.

5211 **APPLICATION USAGE**5212        This function is a direct replacement for the BSD *signal()* function for simple applications that are installing a single-argument signal handler function. If a BSD signal handler function is being installed that expects more than one argument, the application has to be modified to use *sigaction()*. The *bsd\_signal()* function differs from *signal()* in that the SA\_RESTART flag is set and the SA\_RESETHAND is clear when *bsd\_signal()* is used. The state of these flags is not specified for *signal()*.5218        It is recommended that new applications use the *sigaction()* function.5219 **RATIONALE**

5220        None.

5221 **FUTURE DIRECTIONS**

5222       None.

5223 **SEE ALSO**5224       *sigaction()*, *sigaddset()*, *sigemptyset()*, *signal()*, the Base Definitions volume of  
5225       IEEE Std 1003.1-2001, <**signal.h**>5226 **CHANGE HISTORY**

5227       First released in Issue 4, Version 2.

5228 **Issue 5**

5229       Moved from X/OPEN UNIX extension to BASE.

5230 **Issue 6**

5231       This function is marked obsolescent.

5232 **NAME**5233       **bsearch** — binary search a sorted table5234 **SYNOPSIS**

5235       #include &lt;stdlib.h&gt;

5236       void \*bsearch(const void \*key, const void \*base, size\_t nel,  
5237                   size\_t width, int (\*compar)(const void \*, const void \*));5238 **DESCRIPTION**5239 **cx**     The functionality described on this reference page is aligned with the ISO C standard. Any  
5240 conflict between the requirements described here and the ISO C standard is unintentional. This  
5241 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.5242       The *bsearch()* function shall search an array of *nel* objects, the initial element of which is pointed  
5243 to by *base*, for an element that matches the object pointed to by *key*. The size of each element in  
5244 the array is specified by *width*.5245       The comparison function pointed to by *compar* shall be called with two arguments that point to  
5246 the *key* object and to an array element, in that order.5247       The application shall ensure that the function returns an integer less than, equal to, or greater  
5248 than 0 if the *key* object is considered, respectively, to be less than, to match, or to be greater than  
5249 the array element. The application shall ensure that the array consists of all the elements that  
5250 compare less than, all the elements that compare equal to, and all the elements that compare  
5251 greater than the *key* object, in that order.5252 **RETURN VALUE**5253       The *bsearch()* function shall return a pointer to a matching member of the array, or a null pointer  
5254 if no match is found. If two or more members compare equal, which member is returned is  
5255 unspecified.5256 **ERRORS**

5257       No errors are defined.

5258 **EXAMPLES**5259       The example below searches a table containing pointers to nodes consisting of a string and its  
5260 length. The table is ordered alphabetically on the string in the node pointed to by each entry.5261       The code fragment below reads in strings and either finds the corresponding node and prints out  
5262 the string and its length, or prints an error message.5263       #include <stdio.h>  
5264       #include <stdlib.h>  
5265       #include <string.h>  
  
5266       #define TABSIZE     1000  
  
5267       struct node {                                   /\* These are stored in the table. \*/  
5268           char \*string;  
5269           int length;  
5270       };  
5271       struct node table[TABSIZE];     /\* Table to be searched. \*/  
5272       .  
5273       .  
5274       .  
5275       {  
5276           struct node \*node\_ptr, node;  
5277           /\* Routine to compare 2 nodes. \*/

```

5278     int node_compare(const void *, const void *);
5279     char str_space[20]; /* Space to read string into. */
5280     .
5281     .
5282     .
5283     node.string = str_space;
5284     while (scanf("%s", node.string) != EOF) {
5285         node_ptr = (struct node *)bsearch((void *)&node,
5286             (void *)table, TABSIZE,
5287             sizeof(struct node), node_compare);
5288         if (node_ptr != NULL) {
5289             (void)printf("string = %20s, length = %d\n",
5290                 node_ptr->string, node_ptr->length);
5291         } else {
5292             (void)printf("not found: %s\n", node.string);
5293         }
5294     }
5295 }
5296 /*
5297     This routine compares two nodes based on an
5298     alphabetical ordering of the string field.
5299 */
5300 int
5301 node_compare(const void *node1, const void *node2)
5302 {
5303     return strcoll(((const struct node *)node1)->string,
5304         ((const struct node *)node2)->string);
5305 }

```

**5306 APPLICATION USAGE**

5307 The pointers to the key and the element at the base of the table should be of type pointer-to-  
5308 element.

5309 The comparison function need not compare every byte, so arbitrary data may be contained in  
5310 the elements in addition to the values being compared.

5311 In practice, the array is usually sorted according to the comparison function.

**5312 RATIONALE**

5313 None.

**5314 FUTURE DIRECTIONS**

5315 None.

**5316 SEE ALSO**

5317 *hcreate()*, *lsearch()*, *qsort()*, *tsearch()*, the Base Definitions volume of IEEE Std 1003.1-2001,  
5318 <stdlib.h>

**5319 CHANGE HISTORY**

5320 First released in Issue 1. Derived from Issue 1 of the SVID.

**5321 Issue 6**

5322 The DESCRIPTION is updated to avoid use of the term “must” for application requirements.

5323 **NAME**

5324 btowc — single byte to wide character conversion

5325 **SYNOPSIS**

5326 #include &lt;stdio.h&gt;

5327 #include &lt;wchar.h&gt;

5328 wint\_t btowc(int c);

5329 **DESCRIPTION**

5330 cx The functionality described on this reference page is aligned with the ISO C standard. Any  
5331 conflict between the requirements described here and the ISO C standard is unintentional. This  
5332 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

5333 The *btowc()* function shall determine whether *c* constitutes a valid (one-byte) character in the  
5334 initial shift state.

5335 The behavior of this function shall be affected by the *LC\_CTYPE* category of the current locale.

5336 **RETURN VALUE**

5337 The *btowc()* function shall return WEOF if *c* has the value EOF or if (**unsigned char**) *c* does not  
5338 constitute a valid (one-byte) character in the initial shift state. Otherwise, it shall return the  
5339 wide-character representation of that character.

5340 **ERRORS**

5341 No errors are defined.

5342 **EXAMPLES**

5343 None.

5344 **APPLICATION USAGE**

5345 None.

5346 **RATIONALE**

5347 None.

5348 **FUTURE DIRECTIONS**

5349 None.

5350 **SEE ALSO**5351 *wctob()*, the Base Definitions volume of IEEE Std 1003.1-2001, <wchar.h>5352 **CHANGE HISTORY**

5353 First released in Issue 5. Included for alignment with ISO/IEC 9899:1990/Amendment 1:1995  
5354 (E).

5355 **NAME**

5356        **bzero** — memory operations (**LEGACY**)

5357 **SYNOPSIS**

5358 XSI        #include <strings.h>

5359        void bzero(void \*s, size\_t n);

5360

5361 **DESCRIPTION**

5362        The *bzero()* function shall place *n* zero-valued bytes in the area pointed to by *s*.

5363 **RETURN VALUE**

5364        The *bzero()* function shall not return a value.

5365 **ERRORS**

5366        No errors are defined.

5367 **EXAMPLES**

5368        None.

5369 **APPLICATION USAGE**

5370        The *memset()* function is preferred over this function.

5371        For maximum portability, it is recommended to replace the function call to *bzero()* as follows:

5372        #define bzero(b,len) (memset((b), '\0', (len)), (void) 0)

5373 **RATIONALE**

5374        None.

5375 **FUTURE DIRECTIONS**

5376        This function may be withdrawn in a future version.

5377 **SEE ALSO**

5378        *memset()*, the Base Definitions volume of IEEE Std 1003.1-2001, <**strings.h**>

5379 **CHANGE HISTORY**

5414 **NAME**

5415 cacos, cacosf, cacosl — complex arc cosine functions

5416 **SYNOPSIS**

5417 #include &lt;complex.h&gt;

5418 double complex cacos(double complex z);

5419 float complex cacosf(float complex z);

5420 long double complex cacosl(long double complex z);

5421 **DESCRIPTION**

5422 cx The functionality described on this reference page is aligned with the ISO C standard. Any  
5423 conflict between the requirements described here and the ISO C standard is unintentional. This  
5424 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

5425 These functions shall compute the complex arc cosine of  $z$ , with branch cuts outside the interval  
5426  $[-1, +1]$  along the real axis.

5427 **RETURN VALUE**

5428 These functions shall return the complex arc cosine value, in the range of a strip mathematically  
5429 unbounded along the imaginary axis and in the interval  $[0, \pi]$  along the real axis.

5430 **ERRORS**

5431 No errors are defined.

5432 **EXAMPLES**

5433 None.

5434 **APPLICATION USAGE**

5435 None.

5436 **RATIONALE**

5437 None.

5443 First released in Issue 6. Derived from the ISO/IEC 9899:1999 standard.

5444 **NAME**

5445 cacosh, cacoshf, cacoshl — complex arc hyperbolic cosine functions

5446 **SYNOPSIS**

5447 #include &lt;complex.h&gt;

5448 double complex cacosh(double complex z);

5449 float complex cacoshf(float complex z);

5450 long double complex cacoshl(long double complex z);

5451 **DESCRIPTION**

5452 cx The functionality described on this reference page is aligned with the ISO C standard. Any  
5453 conflict between the requirements described here and the ISO C standard is unintentional. This  
5454 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

5455 These functions shall compute the complex arc hyperbolic cosine of  $z$ , with a branch cut at  
5456 values less than 1 along the real axis.

5457 **RETURN VALUE**

5458 These functions shall return the complex arc hyperbolic cosine value, in the range of a half-strip  
5459 of non-negative values along the real axis and in the interval  $[-i\pi, +i\pi]$  along the imaginary axis.

5460 **ERRORS**

5461 No errors are defined.

5462 **EXAMPLES**

5463 None.

5464 **APPLICATION USAGE**

5465 None.

5466 **RATIONALE**

5467 None.

5468 **FUTURE DIRECTIONS**

5469 None.

5470 **SEE ALSO**5471 *ccosh()*, the Base Definitions volume of IEEE Std 1003.1-2001, <complex.h>5472 **CHANGE HISTORY**

5473 First released in Issue 6. Derived from the ISO/IEC 9899:1999 standard.

5474 **NAME**5475        **cacosl** — complex arc cosine functions5476 **SYNOPSIS**

5477        #include &lt;complex.h&gt;

5478        long double complex cacosl(long double complex *z*);5479 **DESCRIPTION**5480        Refer to *cacos()*.

5481 **NAME**5482            *calloc* — a memory allocator5483 **SYNOPSIS**

5484            #include &lt;stdlib.h&gt;

5485            void \*calloc(size\_t *nelem*, size\_t *elsize*);5486 **DESCRIPTION**

5487 **CX**        The functionality described on this reference page is aligned with the ISO C standard. Any  
5488 conflict between the requirements described here and the ISO C standard is unintentional. This  
5489 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

5490        The *calloc()* function shall allocate unused space for an array of *nelem* elements each of whose  
5491 size in bytes is *elsize*. The space shall be initialized to all bits 0.

5492        The order and contiguity of storage allocated by successive calls to *calloc()* is unspecified. The  
5493 pointer returned if the allocation succeeds shall be suitably aligned so that it may be assigned to  
5494 a pointer to any type of object and then used to access such an object or an array of such objects  
5495 in the space allocated (until the space is explicitly freed or reallocated). Each such allocation  
5496 shall yield a pointer to an object disjoint from any other object. The pointer returned shall point  
5497 to the start (lowest byte address) of the allocated space. If the space cannot be allocated, a null  
5498 pointer shall be returned. If the size of the space requested is 0, the behavior is implementation-  
5499 defined: the value returned shall be either a null pointer or a unique pointer.

5500 **RETURN VALUE**

5501        Upon successful completion with both *nelem* and *elsize* non-zero, *calloc()* shall return a pointer to  
5502 the allocated space. If either *nelem* or *elsize* is 0, then either a null pointer or a unique pointer  
5503 value that can be successfully passed to *free()* shall be returned. Otherwise, it shall return a null  
5504 **CX** pointer and set *errno* to indicate the error.

5505 **ERRORS**5506        The *calloc()* function shall fail if:

5507 **CX**        [ENOMEM]        Insufficient memory is available.

5508 **EXAMPLES**

5509        None.

5510 **APPLICATION USAGE**

5511        There is now no requirement for the implementation to support the inclusion of &lt;malloc.h&gt;.

5512 **RATIONALE**

5513        None.

5514 **FUTURE DIRECTIONS**

5515        None.

5516 **SEE ALSO**5517        *free()*, *malloc()*, *realloc()*, the Base Definitions volume of IEEE Std 1003.1-2001, <stdlib.h>5518 **CHANGE HISTORY**

5519        First released in Issue 1. Derived from Issue 1 of the SVID.

5520 **Issue 6**

5521        Extensions beyond the ISO C standard are marked.

5522  
5523  
5524  
5525

The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:

- The setting of *errno* and the [ENOMEM] error condition are mandatory if an insufficient memory condition occurs.

5526 **NAME**

5527       carg, cargf, cargl — complex argument functions

5528 **SYNOPSIS**

5529       #include &lt;complex.h&gt;

5530       double carg(double complex z);

5531       float cargf(float complex z);

5532       long double cargl(long double complex z);

5533 **DESCRIPTION**5534 **CX**       The functionality described on this reference page is aligned with the ISO C standard. Any  
5535       conflict between the requirements described here and the ISO C standard is unintentional. This  
5536       volume of IEEE Std 1003.1-2001 defers to the ISO C standard.5537       These functions shall compute the argument (also called phase angle) of  $z$ , with a branch cut  
5538       along the negative real axis.5539 **RETURN VALUE**5540       These functions shall return the value of the argument in the interval  $[-\pi, +\pi]$ .5541 **ERRORS**

5542       No errors are defined.

5543 **EXAMPLES**

5544       None.

5545 **APPLICATION USAGE**

5546       None.

5547 **RATIONALE**

5548       None.

5549 **FUTURE DIRECTIONS**

5550       None.

5580       None.

5581 **SEE ALSO**5582       *csin()*, the Base Definitions volume of IEEE Std 1003.1-2001, <complex.h>5583 **CHANGE HISTORY**

5584       First released in Issue 6. Derived from the ISO/IEC 9899:1999 standard.

5585 **NAME**

5586       casinh, casinhf, casinhl — complex arc hyperbolic sine functions

5587 **SYNOPSIS**

5588       #include &lt;complex.h&gt;

5589       double complex casinh(double complex z);

5590       float complex casinhf(float complex z);

5591       long double complex casinhl(long double complex z);

5592 **DESCRIPTION**5593 **CX**       The functionality described on this reference page is aligned with the ISO C standard. Any  
5594 conflict between the requirements described here and the ISO C standard is unintentional. This  
5595 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.5596       These functions shall compute the complex arc hyperbolic sine of  $z$ , with branch cuts outside the  
5597 interval  $[-i, +i]$  along the imaginary axis.5598 **RETURN VALUE**5599       These functions shall return the complex arc hyperbolic sine value, in the range of a strip  
5600 mathematically unbounded along the real axis and in the interval  $[-i\pi/2, +i\pi/2]$  along the  
5601 imaginary axis.5602 **ERRORS**

5603       No errors are defined.

5604 **EXAMPLES**

5605       None.

5606 **APPLICATION USAGE**

5607       None.

5608 **RATIONALE**

5609       None.

5610 **FUTURE DIRECTIONS**

5611       None.

5612 **SEE ALSO**5613       `csinh()`, the Base Definitions volume of IEEE Std 1003.1-2001, <complex.h>5614 **CHANGE HISTORY**

5615       First released in Issue 6. Derived from the ISO/IEC 9899:1999 standard.

5616 **NAME**5617        **casinl** — complex arc sine functions5618 **SYNOPSIS**

5619        #include &lt;complex.h&gt;

5620        long double complex casinl(long double complex *z*);5621 **DESCRIPTION**5622        Refer to *casin()*.

5623 **NAME**

5624           catan, catanf, catanl — complex arc tangent functions

5625 **SYNOPSIS**

5626           #include &lt;complex.h&gt;

5627           double complex catan(double complex z);

5628           float complex catanf(float complex z);

5629           long double complex catanl(long double complex z);

5630 **DESCRIPTION**

5631 **CX**       The functionality described on this reference page is aligned with the ISO C standard. Any  
5632           conflict between the requirements described here and the ISO C standard is unintentional. This  
5633           volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

5634           These functions shall compute the complex arc tangent of  $z$ , with branch cuts outside the  
5635           interval  $[-i, +i]$  along the imaginary axis.

5636 **RETURN VALUE**

5637           These functions shall return the complex arc tangent value, in the range of a strip  
5638           mathematically unbounded along the imaginary axis and in the interval  $[-\pi/2, +\pi/2]$  along the  
5639           real axis.

5640 **ERRORS**

5641           No errors are defined.

5642 **EXAMPLES**

5643           None.

5644 **APPLICATION USAGE**

5645           None.

5646 **RATIONALE**

5647           None.

5648 **FUTURE DIRECTIONS**

5649           None.

5650 **SEE ALSO**

5651           ctan(), the Base Definitions volume of IEEE Std 1003.1-2001, &lt;complex.h&gt;

5652 **CHANGE HISTORY**

5653           First released in Issue 6. Derived from the ISO/IEC 9899:1999 standard.

5654 **NAME**

5655           catanh, catanhf, catanhl — complex arc hyperbolic tangent functions

5656 **SYNOPSIS**

5657           #include &lt;complex.h&gt;

5658           double complex catanh(double complex *z*);5659           float complex catanhf(float complex *z*);5660           long double complex catanhl(long double complex *z*);5661 **DESCRIPTION**

5662 **CX**       The functionality described on this reference page is aligned with the ISO C standard. Any  
5663           conflict between the requirements described here and the ISO C standard is unintentional. This  
5664           volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

5665           These functions shall compute the complex arc hyperbolic tangent of *z*, with branch cuts outside  
5666           the interval  $[-1, +1]$  along the real axis.

5667 **RETURN VALUE**

5668           These functions shall return the complex arc hyperbolic tangent value, in the range of a strip  
5669           mathematically unbounded along the real axis and in the interval  $[-i\pi/2, +i\pi/2]$  along the  
5670           imaginary axis.

5671 **ERRORS**

5672           No errors are defined.

5673 **EXAMPLES**

5674           None.

5675 **APPLICATION USAGE**

5676           None.

5677 **RATIONALE**

5678           None.

5679 **FUTURE DIRECTIONS**

5680           None.

5681 **SEE ALSO**5682           *ctanh()*, the Base Definitions volume of IEEE Std 1003.1-2001, <complex.h>5683 **CHANGE HISTORY**

5684           First released in Issue 6. Derived from the ISO/IEC 9899:1999 standard.

5685 **NAME**

5686        `catanl` — complex arc tangent functions

5687 **SYNOPSIS**

5688        `#include <complex.h>`

5689        `long double complex catanl(long double complex z);`

5690 **DESCRIPTION**

5691        Refer to *catan()*.

5692 **NAME**

5693       catclose — close a message catalog descriptor

5694 **SYNOPSIS**

5695 XSI       #include &lt;nl\_types.h&gt;

5696       int catclose(nl\_catd catd);

5697

5698 **DESCRIPTION**5699       The *catclose()* function shall close the message catalog identified by *catd*. If a file descriptor is  
5700       used to implement the type **nl\_catd**, that file descriptor shall be closed.5701 **RETURN VALUE**5702       Upon successful completion, *catclose()* shall return 0; otherwise, -1 shall be returned, and *errno*  
5703       set to indicate the error.5704 **ERRORS**5705       The *catclose()* function may fail if:

5706       [EBADF]       The catalog descriptor is not valid.

5707       [EINTR]       The *catclose()* function was interrupted by a signal.5708 **EXAMPLES**

5709       None.

5710 **APPLICATION USAGE**

5711       None.

5712 **RATIONALE**

5713       None.

5714 **FUTURE DIRECTIONS**

5715       None.

5716 **SEE ALSO**5717       *catgets()*, *catopen()*, the Base Definitions volume of IEEE Std 1003.1-2001, <nl\_types.h>5718 **CHANGE HISTORY**

5719       First released in Issue 2.

5720 **NAME**

5721       catgets — read a program message

5722 **SYNOPSIS**

5723 XSI       #include &lt;nl\_types.h&gt;

5724       char \*catgets(nl\_catd *catd*, int *set\_id*, int *msg\_id*, const char \**s*);

5725

5726 **DESCRIPTION**

5727       The *catgets()* function shall attempt to read message *msg\_id*, in set *set\_id*, from the message catalog identified by *catd*. The *catd* argument is a message catalog descriptor returned from an earlier call to *catopen()*. The *s* argument points to a default message string which shall be returned by *catgets()* if it cannot retrieve the identified message.

5731       The *catgets()* function need not be reentrant. A function that is not required to be reentrant is not required to be thread-safe.

5733 **RETURN VALUE**

5734       If the identified message is retrieved successfully, *catgets()* shall return a pointer to an internal buffer area containing the null-terminated message string. If the call is unsuccessful for any reason, *s* shall be returned and *errno* may be set to indicate the error.

5737 **ERRORS**5738       The *catgets()* function may fail if:

5739       [EBADF]       The *catd* argument is not a valid message catalog descriptor open for reading.

5740       [EBADMSG]     The message identified by *set\_id* and *msg\_id* in the specified message catalog did not satisfy implementation-defined security criteria.

5742       [EINTR]       The read operation was terminated due to the receipt of a signal, and no data was transferred.

5744       [EINVAL]     The message catalog identified by *catd* is corrupted.

5745       [ENOMSG]     The message identified by *set\_id* and *msg\_id* is not in the message catalog.

5746 **EXAMPLES**

5747       None.

5748 **APPLICATION USAGE**

5749       None.

5750 **RATIONALE**

5751       None.

5752 **FUTURE DIRECTIONS**

5753       None.

5754 **SEE ALSO**5755       *catclose()*, *catopen()*, the Base Definitions volume of IEEE Std 1003.1-2001, <nl\_types.h>5756 **CHANGE HISTORY**

5757       First released in Issue 2.

5758 **Issue 5**

5759       A note indicating that this function need not be reentrant is added to the DESCRIPTION.

5760 **Issue 6**

5761 In the DESCRIPTION, the note about reentrancy is expanded to cover thread-safety.

5762 **NAME**5763 `catopen` — open a message catalog5764 **SYNOPSIS**5765 xSI `#include <nl_types.h>`5766 `nl_catd catopen(const char *name, int oflag);`

5767

5768 **DESCRIPTION**

5769 The `catopen()` function shall open a message catalog and return a message catalog descriptor.  
 5770 The `name` argument specifies the name of the message catalog to be opened. If `name` contains a  
 5771 `'/'`, then `name` specifies a complete name for the message catalog. Otherwise, the environment  
 5772 variable `NLSPATH` is used with `name` substituted for the `%N` conversion specification (see the  
 5773 Base Definitions volume of IEEE Std 1003.1-2001, Chapter 8, Environment Variables). If  
 5774 `NLSPATH` exists in the environment when the process starts, then if the process has appropriate  
 5775 privileges, the behavior of `catopen()` is undefined. If `NLSPATH` does not exist in the environment,  
 5776 or if a message catalog cannot be found in any of the components specified by `NLSPATH`, then  
 5777 an implementation-defined default path shall be used. This default may be affected by the  
 5778 setting of `LC_MESSAGES` if the value of `oflag` is `NL_CAT_LOCALE`, or the `LANG` environment  
 5779 variable if `oflag` is 0.

5780 A message catalog descriptor shall remain valid in a process until that process closes it, or a  
 5781 successful call to one of the `exec` functions. A change in the setting of the `LC_MESSAGES`  
 5782 category may invalidate existing open catalogs.

5783 If a file descriptor is used to implement message catalog descriptors, the `FD_CLOEXEC` flag  
 5784 shall be set; see `<fcntl.h>`.

5785 If the value of the `oflag` argument is 0, the `LANG` environment variable is used to locate the  
 5786 catalog without regard to the `LC_MESSAGES` category. If the `oflag` argument is  
 5787 `NL_CAT_LOCALE`, the `LC_MESSAGES` category is used to locate the message catalog (see the  
 5788 Base Definitions volume of IEEE Std 1003.1-2001, Section 8.2, Internationalization Variables).

5789 **RETURN VALUE**

5790 Upon successful completion, `catopen()` shall return a message catalog descriptor for use on  
 5791 subsequent calls to `catgets()` and `catclose()`. Otherwise, `catopen()` shall return `(nl_catd) -1` and set  
 5792 `errno` to indicate the error.

5793 **ERRORS**5794 The `catopen()` function may fail if:

5795 [EACCES] Search permission is denied for the component of the path prefix of the  
 5796 message catalog or read permission is denied for the message catalog.

5797 [EMFILE] {OPEN\_MAX} file descriptors are currently open in the calling process.

5798 [ENAMETOOLONG]

5799 The length of a pathname of the message catalog exceeds {PATH\_MAX} or a  
 5800 pathname component is longer than {NAME\_MAX}.

5801 [ENAMETOOLONG]

5802 Pathname resolution of a symbolic link produced an intermediate result  
 5803 whose length exceeds {PATH\_MAX}.

5804 [ENFILE] Too many files are currently open in the system.

5805 [ENOENT] The message catalog does not exist or the `name` argument points to an empty  
 5806 string.

- 5807 [ENOMEM] Insufficient storage space is available.
- 5808 [ENOTDIR] A component of the path prefix of the message catalog is not a directory.
- 5809 **EXAMPLES**
- 5810 None.
- 5811 **APPLICATION USAGE**
- 5812 Some implementations of *catopen()* use *malloc()* to allocate space for internal buffer areas. The
- 5813 *catopen()* function may fail if there is insufficient storage space available to accommodate these
- 5814 buffers.
- 5815 Conforming applications must assume that message catalog descriptors are not valid after a call
- 5816 to one of the *exec* functions.
- 5817 Application writers should be aware that guidelines for the location of message catalogs have
- 5818 not yet been developed. Therefore they should take care to avoid conflicting with catalogs used
- 5819 by other applications and the standard utilities.
- 5820 **RATIONALE**
- 5821 None.
- 5822 **FUTURE DIRECTIONS**
- 5823 None.
- 5824 **SEE ALSO**
- 5825 *catclose()*, *catgets()*, the Base Definitions volume of IEEE Std 1003.1-2001, `<fcntl.h>`,
- 5826 `<nl_types.h>`, the Shell and Utilities volume of IEEE Std 1003.1-2001
- 5827 **CHANGE HISTORY**
- 5828 First released in Issue 2.

5829 **NAME**

5830           cbrt, cbrtf, cbrtl — cube root functions

5831 **SYNOPSIS**

5832           #include &lt;math.h&gt;

5833           double cbrt(double x);

5834           float cbrtf(float x);

5835           long double cbrtl(long double x);

5836 **DESCRIPTION**

5837 **CX**       The functionality described on this reference page is aligned with the ISO C standard. Any  
 5838 conflict between the requirements described here and the ISO C standard is unintentional. This  
 5839 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

5840           These functions shall compute the real cube root of their argument *x*.5841 **RETURN VALUE**5842           Upon successful completion, these functions shall return the cube root of *x*.5843 **MX**       If *x* is NaN, a NaN shall be returned.5844           If *x* is  $\pm 0$  or  $\pm \text{Inf}$ , *x* shall be returned.5845 **ERRORS**

5846           No errors are defined.

5847 **EXAMPLES**

5848           None.

5849 **APPLICATION USAGE**

5850           None.

5851 **RATIONALE**

5852           For some applications, a true cube root function, which returns negative results for negative  
 5853 arguments, is more appropriate than *pow(x, 1.0/3.0)*, which returns a NaN for *x* less than 0.

5854 **FUTURE DIRECTIONS**

5855           None.

5856 **SEE ALSO**

5857           The Base Definitions volume of IEEE Std 1003.1-2001, &lt;math.h&gt;

5858 **CHANGE HISTORY**

5859           First released in Issue 4, Version 2.

5860 **Issue 5**

5861           Moved from X/OPEN UNIX extension to BASE.

5862 **Issue 6**5863           The *cbrt()* function is no longer marked as an extension.5864           The *cbrtf()* and *cbrtl()* functions are added for alignment with the ISO/IEC 9899:1999 standard.

5865           The **DESCRIPTION**, **RETURN VALUE**, **ERRORS**, and **APPLICATION USAGE** sections are  
 5866 revised to align with the ISO/IEC 9899:1999 standard.

5867           IEC 60559:1989 standard floating-point extensions over the ISO/IEC 9899:1999 standard are  
 5868 marked.

5869 **NAME**

5870 ccos, ccosf, ccosl — complex cosine functions

5871 **SYNOPSIS**

5872 #include &lt;complex.h&gt;

5873 double complex ccos(double complex z);

5874 float complex ccosf(float complex z);

5875 long double complex ccosl(long double complex z);

5876 **DESCRIPTION**

5877 **CX** The functionality described on this reference page is aligned with the ISO C standard. Any  
5878 conflict between the requirements described here and the ISO C standard is unintentional. This  
5879 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

5880 These functions shall compute the complex cosine of *z*.5881 **RETURN VALUE**

5882 These functions shall return the complex cosine value.

5883 **ERRORS**

5884 No errors are defined.

5885 **EXAMPLES**

5886 None.

5887 **APPLICATION USAGE**

5888 None.

5889 **RATIONALE**

5890 None.

5891 **FUTURE DIRECTIONS**

5892 None.

5893 **SEE ALSO**5894 *cacos()*, the Base Definitions volume of IEEE Std 1003.1-2001, <complex.h>5895 **CHANGE HISTORY**

5896 First released in Issue 6. Derived from the ISO/IEC 9899:1999 standard.

5897 **NAME**

5898 ccosh, ccoshf, ccoshl — complex hyperbolic cosine functions

5899 **SYNOPSIS**

5900 #include &lt;complex.h&gt;

5901 double complex ccosh(double complex z);

5902 float complex ccoshf(float complex z);

5903 long double complex ccoshl(long double complex z);

5904 **DESCRIPTION**

5905 cx The functionality described on this reference page is aligned with the ISO C standard. Any  
5906 conflict between the requirements described here and the ISO C standard is unintentional. This  
5907 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

5908 These functions shall compute the complex hyperbolic cosine of  $z$ .5909 **RETURN VALUE**

5910 These functions shall return the complex hyperbolic cosine value.

5911 **ERRORS**

5912 No errors are defined.

5913 **EXAMPLES**

5914 None.

5915 **APPLICATION USAGE**

5916 None.

5917 **RATIONALE**

5918 None.

5919 **FUTURE DIRECTIONS**

5920 None.

5921 **SEE ALSO**5922 *cacosh()*, the Base Definitions volume of IEEE Std 1003.1-2001, <complex.h>5923 **CHANGE HISTORY**

5924 First released in Issue 6. Derived from the ISO/IEC 9899:1999 standard.

5925 **NAME**

5926       ccosl — complex cosine functions

5927 **SYNOPSIS**

5928       #include &lt;complex.h&gt;

5929       long double complex ccosl(long double complex z);

5930 **DESCRIPTION**5931       Refer to *ccos()*.

5932 **NAME**

5933           ceil, ceilf, ceill — ceiling value function

5934 **SYNOPSIS**

5935           #include &lt;math.h&gt;

5936           double ceil(double x);

5937           float ceilf(float x);

5938           long double ceill(long double x);

5939 **DESCRIPTION**

5940 **CX**       The functionality described on this reference page is aligned with the ISO C standard. Any  
 5941 conflict between the requirements described here and the ISO C standard is unintentional. This  
 5942 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

5943       These functions shall compute the smallest integral value not less than *x*.

5944       An application wishing to check for error situations should set *errno* to zero and call  
 5945 *feclearexcept*(FE\_ALL\_EXCEPT) before calling these functions. On return, if *errno* is non-zero or  
 5946 *fetestexcept*(FE\_INVALID | FE\_DIVBYZERO | FE\_OVERFLOW | FE\_UNDERFLOW) is non-  
 5947 zero, an error has occurred.

5948 **RETURN VALUE**

5949       Upon successful completion, *ceil()*, *ceilf()*, and *ceill()* shall return the smallest integral value not  
 5950 less than *x*, expressed as a type **double**, **float**, or **long double**, respectively.

5951 **MX**       If *x* is NaN, a NaN shall be returned.5952       If *x* is  $\pm 0$  or  $\pm \text{Inf}$ , *x* shall be returned.

5953 **XSI**       If the correct value would cause overflow, a range error shall occur and *ceil()*, *ceilf()*, and *ceill()*  
 5954 shall return the value of the macro HUGE\_VAL, HUGE\_VALF, and HUGE\_VALL, respectively.

5955 **ERRORS**

5956       These functions shall fail if:

5957 **XSI**       **Range Error**       The result overflows.

5958       If the integer expression (math\_errhandling & MATH\_ERRNO) is non-zero,  
 5959 then *errno* shall be set to [ERANGE]. If the integer expression  
 5960 (math\_errhandling & MATH\_ERREXCEPT) is non-zero, then the overflow  
 5961 floating-point exception shall be raised.

5962 **EXAMPLES**

5963       None.

5964 **APPLICATION USAGE**

5965       The integral value returned by these functions need not be expressible as an **int** or **long**. The  
 5966 return value should be tested before assigning it to an integer type to avoid the undefined results  
 5967 of an integer overflow.

5968       The *ceil()* function can only overflow when the floating-point representation has  
 5969 DBL\_MANT\_DIG > DBL\_MAX\_EXP.

5970       On error, the expressions (math\_errhandling & MATH\_ERRNO) and (math\_errhandling &  
 5971 MATH\_ERREXCEPT) are independent of each other, but at least one of them must be non-zero.

5972 **RATIONALE**

5973 None.

5974 **FUTURE DIRECTIONS**

5975 None.

5976 **SEE ALSO**5977 *feclearexcept()*, *fetestexcept()*, *floor()*, *isnan()*, the Base Definitions volume of IEEE Std 1003.1-2001,  
5978 Section 4.18, Treatment of Error Conditions for Mathematical Functions, <math.h>5979 **CHANGE HISTORY**

5980 First released in Issue 1. Derived from Issue 1 of the SVID.

5981 **Issue 5**5982 The DESCRIPTION is updated to indicate how an application should check for an error. This  
5983 text was previously published in the APPLICATION USAGE section.5984 **Issue 6**5985 The *ceilf()* and *ceilll()* functions are added for alignment with the ISO/IEC 9899:1999 standard.5986 The DESCRIPTION, RETURN VALUE, ERRORS, and APPLICATION USAGE sections are  
5987 revised to align with the ISO/IEC 9899:1999 standard.5988 IEC 60559:1989 standard floating-point extensions over the ISO/IEC 9899:1999 standard are  
5989 marked.

5990 **NAME**

5991 cexp, cexpf, cexpl — complex exponential functions

5992 **SYNOPSIS**

5993 #include &lt;complex.h&gt;

5994 double complex cexp(double complex z);

5995 float complex cexpf(float complex z);

5996 long double complex cexpl(long double complex z);

5997 **DESCRIPTION**5998 **CX** The functionality described on this reference page is aligned with the ISO C standard. Any  
5999 conflict between the requirements described here and the ISO C standard is unintentional. This  
6000 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.6001 These functions shall compute the complex exponent of  $z$ , defined as  $e^z$ .6002 **RETURN VALUE**6003 These functions shall return the complex exponential value of  $z$ .6004 **ERRORS**

6005 No errors are defined.

6006 **EXAMPLES**

6007 None.

6008 **APPLICATION USAGE**

6009 None.

6010 **RATIONALE**

6011 None.

6017 First released in Issue 6. Derived from the ISO/IEC 9899:1999 standard.

6018 **NAME**

6019 cfgetispeed — get input baud rate

6020 **SYNOPSIS**

6021 #include &lt;termios.h&gt;

6022 speed\_t cfgetispeed(const struct termios \*termios\_p);

6023 **DESCRIPTION**6024 The *cfgetispeed()* function shall extract the input baud rate from the **termios** structure to which  
6025 the *termios\_p* argument points.6026 This function shall return exactly the value in the **termios** data structure, without interpretation.6027 **RETURN VALUE**6028 Upon successful completion, *cfgetispeed()* shall return a value of type **speed\_t** representing the  
6029 input baud rate.6030 **ERRORS**

6031 No errors are defined.

6032 **EXAMPLES**

6033 None.

6034 **APPLICATION USAGE**

6035 None.

6036 **RATIONALE**6037 The term “baud” is used historically here, but is not technically correct. This is properly “bits  
6038 per second”, which may not be the same as baud. However, the term is used because of the  
6039 historical usage and understanding.6040 The *cfgetospeed()*, *cfgetispeed()*, *cfsetospeed()*, and *cfsetispeed()* functions do not take arguments as  
6041 numbers, but rather as symbolic names. There are two reasons for this:

- 6042 1. Historically, numbers were not used because of the way the rate was stored in the data
- 
- 6043 structure. This is retained even though a function is now used.
- 
- 6044 2. More importantly, only a limited set of possible rates is at all portable, and this constrains
- 
- 6045 the application to that set.

6046 There is nothing to prevent an implementation accepting as an extension a number (such as 126),  
6047 and since the encoding of the Bxxx symbols is not specified, this can be done to avoid  
6048 introducing ambiguity.6049 Setting the input baud rate to zero was a mechanism to allow for split baud rates. Clarifications  
6050 in this volume of IEEE Std 1003.1-2001 have made it possible to determine whether split rates are  
6051 supported and to support them without having to treat zero as a special case. Since this  
6052 functionality is also confusing, it has been declared obsolescent. The 0 argument referred to is  
6053 the literal constant 0, not the symbolic constant B0. This volume of IEEE Std 1003.1-2001 does not  
6054 preclude B0 from being defined as the value 0; in fact, implementations would likely benefit  
6055 from the two being equivalent. This volume of IEEE Std 1003.1-2001 does not fully specify  
6056 whether the previous *cfsetispeed()* value is retained after a *tcgetattr()* as the actual value or as  
6057 zero. Therefore, conforming applications should always set both the input speed and output  
6058 speed when setting either.6059 In historical implementations, the baud rate information is traditionally kept in **c\_cflag**.  
6060 Applications should be written to presume that this might be the case (and thus not blindly copy  
6061 **c\_cflag**), but not to rely on it in case it is in some other field of the structure. Setting the **c\_cflag**  
6062 field absolutely after setting a baud rate is a non-portable action because of this. In general, the

6063 unused parts of the flag fields might be used by the implementation and should not be blindly  
6064 copied from the descriptions of one terminal device to another.

6065 **FUTURE DIRECTIONS**

6066 None.

6070 **CHANGE HISTORY**

6071 First released in Issue 3. Included for alignment with the POSIX.1-1988 standard.

6072 **NAME**

6073 cfgetospeed — get output baud rate

6074 **SYNOPSIS**

6075 #include <termios.h>

6076 speed\_t cfgetospeed(const struct termios \*termios\_p);

6077 **DESCRIPTION**

6078 The *cfgetospeed()* function shall extract the output baud rate from the **termios** structure to which  
6079 the *termios\_p* argument points.

6080 This function shall return exactly the value in the **termios** data structure, without interpretation.

6081 **RETURN VALUE**

6082 Upon successful completion, *cfgetospeed()* shall return a value of type **speed\_t** representing the  
6083 output baud rate.

6084 **ERRORS**

6085 No errors are defined.

6086 **EXAMPLES**

6087 None.

6088 **APPLICATION USAGE**

6089 None.

6090 **RATIONALE**

6091 Refer to *cfgetispeed()*.

6092 **FUTURE DIRECTIONS**

6093 None.

6094 **SEE ALSO**

6095 *cfgetispeed()*, *cfsetispeed()*, *cfsetospeed()*, *tcgetattr()*, the Base Definitions volume of  
6096 IEEE Std 1003.1-2001, Chapter 11, General Terminal Interface, <**termios.h**>

6097 **CHANGE HISTORY**

6098 First released in Issue 3. Included for alignment with the POSIX.1-1988 standard.

6099 **NAME**

6100 `cfsetispeed` — set input baud rate

6101 **SYNOPSIS**

6102 `#include <termios.h>`

6103 `int cfsetispeed(struct termios *termios_p, speed_t speed);`

6104 **DESCRIPTION**

6105 The `cfsetispeed()` function shall set the input baud rate stored in the structure pointed to by  
6106 `termios_p` to `speed`.

6107 There shall be no effect on the baud rates set in the hardware until a subsequent successful call  
6108 to `tcsetattr()` with the same **termios** structure. Similarly, errors resulting from attempts to set  
6109 baud rates not supported by the terminal device need not be detected until the `tcsetattr()`  
6110 function is called.

6111 **RETURN VALUE**

6112 Upon successful completion, `cfsetispeed()` shall return 0; otherwise, -1 shall be returned, and  
6113 `errno` may be set to indicate the error.

6114 **ERRORS**

6115 The `cfsetispeed()` function may fail if:

6116 [EINVAL] The `speed` value is not a valid baud rate.

6117 [EINVAL] The value of `speed` is outside the range of possible speed values as specified in  
6118 `<termios.h>`.

6119 **EXAMPLES**

6120 None.

6121 **APPLICATION USAGE**

6122 None.

6123 **RATIONALE**

6124 Refer to `cfgetispeed()`.

6125 **FUTURE DIRECTIONS**

6126 None.

6127 **SEE ALSO**

6128 `cfgetispeed()`, `cfgetospeed()`, `cfsetospeed()`, `tcsetattr()`, the Base Definitions volume of  
6129 IEEE Std 1003.1-2001, Chapter 11, General Terminal Interface, `<termios.h>`

6130 **CHANGE HISTORY**

6131 First released in Issue 3. Included for alignment with the POSIX.1-1988 standard.

6132 **Issue 6**

6133 The following new requirements on POSIX implementations derive from alignment with the  
6134 Single UNIX Specification:

- 6135 • The optional setting of `errno` and the [EINVAL] error conditions are added.

6136 **NAME**

6137 cfsetospeed — set output baud rate

6138 **SYNOPSIS**

6139 #include &lt;termios.h&gt;

6140 int cfsetospeed(struct termios \*termios\_p, speed\_t speed);

6141 **DESCRIPTION**6142 The *cfsetospeed()* function shall set the output baud rate stored in the structure pointed to by  
6143 *termios\_p* to *speed*.6144 There shall be no effect on the baud rates set in the hardware until a subsequent successful call  
6145 to *tcsetattr()* with the same **termios** structure. Similarly, errors resulting from attempts to set  
6146 baud rates not supported by the terminal device need not be detected until the *tcsetattr()*  
6147 function is called.6148 **RETURN VALUE**6149 Upon successful completion, *cfsetospeed()* shall return 0; otherwise, it shall return -1 and *errno*  
6150 may be set to indicate the error.6151 **ERRORS**6152 The *cfsetospeed()* function may fail if:6153 [EINVAL] The *speed* value is not a valid baud rate.6154 [EINVAL] The value of *speed* is outside the range of possible speed values as specified in  
6155 <**termios.h**>.6156 **EXAMPLES**

6157 None.

6158 **APPLICATION USAGE**

6159 None.

6160 **RATIONALE**6161 Refer to *cfgetispeed()*.6162 **FUTURE DIRECTIONS**

6163 None.

6164 **SEE ALSO**6165 *cfgetispeed()*, *cfgetospeed()*, *cfsetispeed()*, *tcsetattr()*, the Base Definitions volume of  
6166 IEEE Std 1003.1-2001, Chapter 11, General Terminal Interface, <**termios.h**>6167 **CHANGE HISTORY**

6168 First released in Issue 3. Included for alignment with the POSIX.1-1988 standard.

6169 **Issue 6**6170 The following new requirements on POSIX implementations derive from alignment with the  
6171 Single UNIX Specification:

- 6172
- The optional setting of *errno* and the [EINVAL] error conditions are added.

6173 **NAME**6174 `chdir` — change working directory6175 **SYNOPSIS**6176 `#include <unistd.h>`6177 `int chdir(const char *path);`6178 **DESCRIPTION**

6179 The `chdir()` function shall cause the directory named by the pathname pointed to by the *path*  
 6180 argument to become the current working directory; that is, the starting point for path searches  
 6181 for pathnames not beginning with `'/'`.

6182 **RETURN VALUE**

6183 Upon successful completion, 0 shall be returned. Otherwise, `-1` shall be returned, the current  
 6184 working directory shall remain unchanged, and *errno* shall be set to indicate the error.

6185 **ERRORS**6186 The `chdir()` function shall fail if:

6187 [EACCES] Search permission is denied for any component of the pathname.

6188 [ELOOP] A loop exists in symbolic links encountered during resolution of the *path*  
6189 argument.

6190 [ENAMETOOLONG]

6191 The length of the *path* argument exceeds {PATH\_MAX} or a pathname  
6192 component is longer than {NAME\_MAX}.6193 [ENOENT] A component of *path* does not name an existing directory or *path* is an empty  
6194 string.

6195 [ENOTDIR] A component of the pathname is not a directory.

6196 The `chdir()` function may fail if:6197 [ELOOP] More than {SYMLOOP\_MAX} symbolic links were encountered during  
6198 resolution of the *path* argument.

6199 [ENAMETOOLONG]

6200 As a result of encountering a symbolic link in resolution of the *path* argument,  
6201 the length of the substituted pathname string exceeded {PATH\_MAX}.6202 **EXAMPLES**6203 **Changing the Current Working Directory**6204 The following example makes the value pointed to by **directory**, `/tmp`, the current working  
6205 directory.6206 `#include <unistd.h>`6207 `...`6208 `char *directory = "/tmp";`6209 `int ret;`6210 `ret = chdir (directory);`

6211 **APPLICATION USAGE**

6212       None.

6213 **RATIONALE**6214       The *chdir()* function only affects the working directory of the current process.6215 **FUTURE DIRECTIONS**

6216       None.

6217 **SEE ALSO**6218       *getcwd()*, the Base Definitions volume of IEEE Std 1003.1-2001, <**unistd.h**>6219 **CHANGE HISTORY**

6220       First released in Issue 1. Derived from Issue 1 of the SVID.

6221 **Issue 6**

6222       The APPLICATION USAGE section is added.

6223       The following new requirements on POSIX implementations derive from alignment with the  
6224       Single UNIX Specification:

- 6225           • The [ELOOP] mandatory error condition is added.
- 
- 6226           • A second [ENAMETOOLONG] is added as an optional error condition.

6227       The following changes were made to align with the IEEE P1003.1a draft standard:

- 6228           • The [ELOOP] optional error condition is added.

6229 **NAME**

6230 chmod — change mode of a file

6231 **SYNOPSIS**

6232 #include &lt;sys/stat.h&gt;

6233 int chmod(const char \*path, mode\_t mode);

6234 **DESCRIPTION**

6235 XSI The *chmod()* function shall change S\_ISUID, S\_ISGID, S\_ISVTX, and the file permission bits of  
 6236 the file named by the pathname pointed to by the *path* argument to the corresponding bits in the  
 6237 *mode* argument. The application shall ensure that the effective user ID of the process matches the  
 6238 owner of the file or the process has appropriate privileges in order to do this.

6239 XSI S\_ISUID, S\_ISGID, S\_ISVTX, and the file permission bits are described in <sys/stat.h>.

6240 If the calling process does not have appropriate privileges, and if the group ID of the file does  
 6241 not match the effective group ID or one of the supplementary group IDs and if the file is a  
 6242 regular file, bit S\_ISGID (set-group-ID on execution) in the file's mode shall be cleared upon  
 6243 successful return from *chmod()*.

6244 Additional implementation-defined restrictions may cause the S\_ISUID and S\_ISGID bits in  
 6245 *mode* to be ignored.

6246 The effect on file descriptors for files open at the time of a call to *chmod()* is implementation-  
 6247 defined.

6248 Upon successful completion, *chmod()* shall mark for update the *st\_ctime* field of the file.

6249 **RETURN VALUE**

6250 Upon successful completion, 0 shall be returned; otherwise, -1 shall be returned and *errno* set to  
 6251 indicate the error. If -1 is returned, no change to the file mode occurs.

6252 **ERRORS**

6253 The *chmod()* function shall fail if:

6254 [EACCES] Search permission is denied on a component of the path prefix.

6255 [ELOOP] A loop exists in symbolic links encountered during resolution of the *path*  
 6256 argument.

6257 [ENAMETOOLONG]

6258 The length of the *path* argument exceeds {PATH\_MAX} or a pathname  
 6259 component is longer than {NAME\_MAX}.

6260 [ENOTDIR] A component of the path prefix is not a directory.

6261 [ENOENT] A component of *path* does not name an existing file or *path* is an empty string.

6262 [EPERM] The effective user ID does not match the owner of the file and the process  
 6263 does not have appropriate privileges.

6264 [EROFS] The named file resides on a read-only file system.

6265 The *chmod()* function may fail if:

6266 [EINTR] A signal was caught during execution of the function.

6267 [EINVAL] The value of the *mode* argument is invalid.

6268 [ELOOP] More than {SYMLOOP\_MAX} symbolic links were encountered during  
 6269 resolution of the *path* argument.

6270 [ENAMETOOLONG]  
 6271 As a result of encountering a symbolic link in resolution of the *path* argument,  
 6272 the length of the substituted pathname strings exceeded {PATH\_MAX}.

## 6273 EXAMPLES

### 6274 Setting Read Permissions for User, Group, and Others

6275 The following example sets read permissions for the owner, group, and others.

```
6276 #include <sys/stat.h>
6277 const char *path;
6278 ...
6279 chmod(path, S_IRUSR|S_IRGRP|S_IROTH);
```

### 6280 Setting Read, Write, and Execute Permissions for the Owner Only

6281 The following example sets read, write, and execute permissions for the owner, and no  
 6282 permissions for group and others.

```
6283 #include <sys/stat.h>
6284 const char *path;
6285 ...
6286 chmod(path, S_IRWXU);
```

### 6287 Setting Different Permissions for Owner, Group, and Other

6288 The following example sets owner permissions for `CHANGEFILE` to read, write, and execute,  
 6289 group permissions to read and execute, and other permissions to read.

```
6290 #include <sys/stat.h>
6291 #define CHANGEFILE "/etc/myfile"
6292 ...
6293 chmod(CHANGEFILE, S_IRWXU|S_IRGRP|S_IXGRP|S_IROTH);
```

### 6294 Setting and Checking File Permissions

6295 The following example sets the file permission bits for a file named `/home/cnd/mod1`, then calls  
 6296 the `stat()` function to verify the permissions.

```
6297 #include <sys/types.h>
6298 #include <sys/stat.h>
6299 int status;
6300 struct stat buffer
6301 ...
6302 chmod("home/cnd/mod1", S_IRWXU|S_IRWXG|S_IROTH|S_IWOTH);
6303 status = stat("home/cnd/mod1", &buffer);
```

## 6304 APPLICATION USAGE

6305 In order to ensure that the `S_ISUID` and `S_ISGID` bits are set, an application requiring this should  
 6306 use `stat()` after a successful `chmod()` to verify this.

6307 Any file descriptors currently open by any process on the file could possibly become invalid if  
 6308 the mode of the file is changed to a value which would deny access to that process. One

6309 situation where this could occur is on a stateless file system. This behavior will not occur in a  
6310 conforming environment.

6311 **RATIONALE**

6312 This volume of IEEE Std 1003.1-2001 specifies that the S\_ISGID bit is cleared by *chmod()* on a  
6313 regular file under certain conditions. This is specified on the assumption that regular files may  
6314 be executed, and the system should prevent users from making executable *setgid()* files perform  
6315 with privileges that the caller does not have. On implementations that support execution of  
6316 other file types, the S\_ISGID bit should be cleared for those file types under the same  
6317 circumstances.

6318 Implementations that use the S\_ISUID bit to indicate some other function (for example,  
6319 mandatory record locking) on non-executable files need not clear this bit on writing. They  
6320 should clear the bit for executable files and any other cases where the bit grants special powers  
6321 to processes that change the file contents. Similar comments apply to the S\_ISGID bit.

6322 **FUTURE DIRECTIONS**

6323 None.

6324 **SEE ALSO**

6325 *chown()*, *mkdir()*, *mkfifo()*, *open()*, *stat()*, *statvfs()*, the Base Definitions volume of  
6326 IEEE Std 1003.1-2001, `<sys/stat.h>`, `<sys/types.h>`

6327 **CHANGE HISTORY**

6328 First released in Issue 1. Derived from Issue 1 of the SVID.

6329 **Issue 6**

6330 The following new requirements on POSIX implementations derive from alignment with the  
6331 Single UNIX Specification:

- 6332 • The requirement to include `<sys/types.h>` has been removed. Although `<sys/types.h>` was  
6333 required for conforming implementations of previous POSIX specifications, it was not  
6334 required for UNIX applications.
- 6335 • The [EINVAL] and [EINTR] optional error conditions are added.
- 6336 • A second [ENAMETOOLONG] is added as an optional error condition.

6337 The following changes were made to align with the IEEE P1003.1a draft standard:

- 6338 • The [ELOOP] optional error condition is added.

6339 The DESCRIPTION is updated to avoid use of the term “must” for application requirements.

6340 **NAME**

6341 chown — change owner and group of a file

6342 **SYNOPSIS**

6343 #include &lt;unistd.h&gt;

6344 int chown(const char \*path, uid\_t owner, gid\_t group);

6345 **DESCRIPTION**6346 The *chown()* function shall change the user and group ownership of a file.6347 The *path* argument points to a pathname naming a file. The user ID and group ID of the named  
6348 file shall be set to the numeric values contained in *owner* and *group*, respectively.6349 Only processes with an effective user ID equal to the user ID of the file or with appropriate  
6350 privileges may change the ownership of a file. If `_POSIX_CHOWN_RESTRICTED` is in effect for  
6351 *path*:

- 6352
- Changing the user ID is restricted to processes with appropriate privileges.
  - Changing the group ID is permitted to a process with an effective user ID equal to the user  
6353 ID of the file, but without appropriate privileges, if and only if *owner* is equal to the file's user  
6354 ID or `(uid_t)-1` and *group* is equal either to the calling process' effective group ID or to one of  
6355 its supplementary group IDs.
- 6356

6357 If the specified file is a regular file, one or more of the `S_IXUSR`, `S_IXGRP`, or `S_IXOTH` bits of  
6358 the file mode are set, and the process does not have appropriate privileges, the set-user-ID  
6359 (`S_ISUID`) and set-group-ID (`S_ISGID`) bits of the file mode shall be cleared upon successful  
6360 return from *chown()*. If the specified file is a regular file, one or more of the `S_IXUSR`, `S_IXGRP`,  
6361 or `S_IXOTH` bits of the file mode are set, and the process has appropriate privileges, it is  
6362 implementation-defined whether the set-user-ID and set-group-ID bits are altered. If the *chown()*  
6363 function is successfully invoked on a file that is not a regular file and one or more of the  
6364 `S_IXUSR`, `S_IXGRP`, or `S_IXOTH` bits of the file mode are set, the set-user-ID and set-group-ID  
6365 bits may be cleared.6366 If *owner* or *group* is specified as `(uid_t)-1` or `(gid_t)-1`, respectively, the corresponding ID of the  
6367 file shall not be changed. If both owner and group are `-1`, the times need not be updated.6368 Upon successful completion, *chown()* shall mark for update the *st\_ctime* field of the file.6369 **RETURN VALUE**6370 Upon successful completion, 0 shall be returned; otherwise, `-1` shall be returned and *errno* set to  
6371 indicate the error. If `-1` is returned, no changes are made in the user ID and group ID of the file.6372 **ERRORS**6373 The *chown()* function shall fail if:

- 6374 [EACCES] Search permission is denied on a component of the path prefix.
- 
- 6375 [ELOOP] A loop exists in symbolic links encountered during resolution of the
- path*
- 
- 6376 argument.
- 
- 6377 [ENAMETOOLONG]
- 
- 6378 The length of the
- path*
- argument exceeds
- `{PATH_MAX}`
- or a pathname
- 
- 6379 component is longer than
- `{NAME_MAX}`
- .
- 
- 6380 [ENOTDIR] A component of the path prefix is not a directory.
- 
- 6381 [ENOENT] A component of
- path*
- does not name an existing file or
- path*
- is an empty string.

- 6382 [EPERM] The effective user ID does not match the owner of the file, or the calling  
6383 process does not have appropriate privileges and  
6384 \_POSIX\_CHOWN\_RESTRICTED indicates that such privilege is required.
- 6385 [EROFS] The named file resides on a read-only file system.
- 6386 The *chown()* function may fail if:
- 6387 [EIO] An I/O error occurred while reading or writing to the file system.
- 6388 [EINTR] The *chown()* function was interrupted by a signal which was caught.
- 6389 [EINVAL] The owner or group ID supplied is not a value supported by the  
6390 implementation.
- 6391 [ELOOP] More than {SYMLOOP\_MAX} symbolic links were encountered during  
6392 resolution of the *path* argument.
- 6393 [ENAMETOOLONG]  
6394 As a result of encountering a symbolic link in resolution of the *path* argument,  
6395 the length of the substituted pathname string exceeded {PATH\_MAX}.

**6396 EXAMPLES**

6397 None.

**6398 APPLICATION USAGE**

6399 Although *chown()* can be used on some implementations by the file owner to change the owner  
6400 and group to any desired values, the only portable use of this function is to change the group of  
6401 a file to the effective GID of the calling process or to a member of its group set.

**6402 RATIONALE**

6403 System III and System V allow a user to give away files; that is, the owner of a file may change  
6404 its user ID to anything. This is a serious problem for implementations that are intended to meet  
6405 government security regulations. Version 7 and 4.3 BSD permit only the superuser to change the  
6406 user ID of a file. Some government agencies (usually not ones concerned directly with security)  
6407 find this limitation too confining. This volume of IEEE Std 1003.1-2001 uses *may* to permit secure  
6408 implementations while not disallowing System V.

6409 System III and System V allow the owner of a file to change the group ID to anything. Version 7  
6410 permits only the superuser to change the group ID of a file. 4.3 BSD permits the owner to  
6411 change the group ID of a file to its effective group ID or to any of the groups in the list of  
6412 supplementary group IDs, but to no others.

6413 The POSIX.1-1990 standard requires that the *chown()* function invoked by a non-appropriate  
6414 privileged process clear the S\_ISGID and the S\_ISUID bits for regular files, and permits them to  
6415 be cleared for other types of files. This is so that changes in accessibility do not accidentally  
6416 cause files to become security holes. Unfortunately, requiring these bits to be cleared on non-  
6417 executable data files also clears the mandatory file locking bit (shared with S\_ISGID), which is  
6418 an extension on many implementations (it first appeared in System V). These bits should only be  
6419 required to be cleared on regular files that have one or more of their execute bits set.

**6420 FUTURE DIRECTIONS**

6421 None.

**6422 SEE ALSO**

6423 *chmod()*, *pathconf()*, the Base Definitions volume of IEEE Std 1003.1-2001, <sys/types.h>,  
6424 <unistd.h>

6425 **CHANGE HISTORY**

6426 First released in Issue 1. Derived from Issue 1 of the SVID.

6427 **Issue 6**

6428 The following changes are made for alignment with the ISO POSIX-1: 1996 standard:

- 6429 • The wording describing the optional dependency on `_POSIX_CHOWN_RESTRICTED` is
- 6430 restored.
- 6431 • The `[EPERM]` error is restored as an error dependent on `_POSIX_CHOWN_RESTRICTED`.
- 6432 This is since its operand is a pathname and applications should be aware that the error may
- 6433 not occur for that pathname if the file system does not support
- 6434 `_POSIX_CHOWN_RESTRICTED`.

6435 The following new requirements on POSIX implementations derive from alignment with the  
6436 Single UNIX Specification:

- 6437 • The requirement to include `<sys/types.h>` has been removed. Although `<sys/types.h>` was
- 6438 required for conforming implementations of previous POSIX specifications, it was not
- 6439 required for UNIX applications.
- 6440 • The value for *owner* of `(uid_t)-1` allows the use of `-1` by the owner of a file to change the
- 6441 group ID only. A corresponding change is made for group.
- 6442 • The `[ELOOP]` mandatory error condition is added.
- 6443 • The `[EIO]` and `[EINTR]` optional error conditions are added.
- 6444 • A second `[ENAMETOOLONG]` is added as an optional error condition.

6445 The following changes were made to align with the IEEE P1003.1a draft standard:

- 6446 • Clarification is added that the `S_ISUID` and `S_ISGID` bits do not need to be cleared when the
- 6447 process has appropriate privileges.
- 6448 • The `[ELOOP]` optional error condition is added.

6449 **NAME**6450 `cimag`, `cimagf`, `cimagl` — complex imaginary functions6451 **SYNOPSIS**6452 `#include <complex.h>`6453 `double cimag(double complex z);`6454 `float cimagf(float complex z);`6455 `long double cimagl(long double complex z);`6456 **DESCRIPTION**6457 **CX** The functionality described on this reference page is aligned with the ISO C standard. Any  
6458 conflict between the requirements described here and the ISO C standard is unintentional. This  
6459 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.6460 These functions shall compute the imaginary part of  $z$ .6461 **RETURN VALUE**

6462 These functions shall return the imaginary part value (as a real).

6463 **ERRORS**

6464 No errors are defined.

6465 **EXAMPLES**

6466 None.

6467 **APPLICATION USAGE**6468 For a variable  $z$  of complex type:6469 `z == creal(z) + cimag(z)*I`6470 **RATIONALE**

6471 None.

6472 **FUTURE DIRECTIONS**

6473 None.

6477 First released in Issue 6. Derived from the ISO/IEC 9899:1999 standard.

6478 **NAME**

6479 clearerr — clear indicators on a stream

6480 **SYNOPSIS**

6481 #include <stdio.h>

6482 void clearerr(FILE \*stream);

6483 **DESCRIPTION**

6484 cx The functionality described on this reference page is aligned with the ISO C standard. Any  
6485 conflict between the requirements described here and the ISO C standard is unintentional. This  
6486 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

6487 The *clearerr()* function shall clear the end-of-file and error indicators for the stream to which  
6488 *stream* points.

6489 **RETURN VALUE**

6490 The *clearerr()* function shall not return a value.

6491 **ERRORS**

6492 No errors are defined.

6493 **EXAMPLES**

6494 None.

6495 **APPLICATION USAGE**

6496 None.

6497 **RATIONALE**

6498 None.

6499 **FUTURE DIRECTIONS**

6500 None.

6501 **SEE ALSO**

6502 The Base Definitions volume of IEEE Std 1003.1-2001, <stdio.h>

6503 **CHANGE HISTORY**

6504 First released in Issue 1. Derived from Issue 1 of the SVID.

6505 **NAME**

6506 clock — report CPU time used

6507 **SYNOPSIS**

6508 #include &lt;time.h&gt;

6509 clock\_t clock(void);

6510 **DESCRIPTION**

6511 cx The functionality described on this reference page is aligned with the ISO C standard. Any  
6512 conflict between the requirements described here and the ISO C standard is unintentional. This  
6513 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

6514 The *clock()* function shall return the implementation's best approximation to the processor time  
6515 used by the process since the beginning of an implementation-defined era related only to the  
6516 process invocation.

6517 **RETURN VALUE**

6518 To determine the time in seconds, the value returned by *clock()* should be divided by the value  
6519 xsl of the macro `CLOCKS_PER_SEC`. `CLOCKS_PER_SEC` is defined to be one million in `<time.h>`.  
6520 If the processor time used is not available or its value cannot be represented, the function shall  
6521 return the value `(clock_t)-1`.

6522 **ERRORS**

6523 No errors are defined.

6524 **EXAMPLES**

6525 None.

6526 **APPLICATION USAGE**

6527 In order to measure the time spent in a program, *clock()* should be called at the start of the  
6528 program and its return value subtracted from the value returned by subsequent calls. The value  
6529 returned by *clock()* is defined for compatibility across systems that have clocks with different  
6530 resolutions. The resolution on any particular system need not be to microsecond accuracy.

6531 The value returned by *clock()* may wrap around on some implementations. For example, on a  
6532 machine with 32-bit values for `clock_t`, it wraps after 2 147 seconds or 36 minutes.

6533 **RATIONALE**

6534 None.

6535 **FUTURE DIRECTIONS**

6536 None.

6540 **CHANGE HISTORY**

6541 First released in Issue 1. Derived from Issue 1 of the SVID.

6542 **NAME**6543 clock\_getcpuclockid — access a process CPU-time clock (**ADVANCED REALTIME**)6544 **SYNOPSIS**

6545 CPT #include &lt;time.h&gt;

6546 int clock\_getcpuclockid(pid\_t pid, clockid\_t \*clock\_id);

6547

6548 **DESCRIPTION**

6549 The *clock\_getcpuclockid()* function shall return the clock ID of the CPU-time clock of the process  
6550 specified by *pid*. If the process described by *pid* exists and the calling process has permission,  
6551 the clock ID of this clock shall be returned in *clock\_id*.

6552 If *pid* is zero, the *clock\_getcpuclockid()* function shall return the clock ID of the CPU-time clock of  
6553 the process making the call, in *clock\_id*.

6554 The conditions under which one process has permission to obtain the CPU-time clock ID of  
6555 other processes are implementation-defined.

6556 **RETURN VALUE**

6557 Upon successful completion, *clock\_getcpuclockid()* shall return zero; otherwise, an error number  
6558 shall be returned to indicate the error.

6559 **ERRORS**

6560 The *clock\_getcpuclockid()* function shall fail if:

6561 [EPERM] The requesting process does not have permission to access the CPU-time  
6562 clock for the process.

6563 The *clock\_getcpuclockid()* function may fail if:

6564 [ESRCH] No process can be found corresponding to the process specified by *pid*.

6565 **EXAMPLES**

6566 None.

6567 **APPLICATION USAGE**

6568 The *clock\_getcpuclockid()* function is part of the Process CPU-Time Clocks option and need not  
6569 be provided on all implementations.

6570 **RATIONALE**

6571 None.

6572 **FUTURE DIRECTIONS**

6573 None.

6574 **SEE ALSO**

6575 *clock\_getres()*, *timer\_create()*, the Base Definitions volume of IEEE Std 1003.1-2001, <**time.h**>

6576 **CHANGE HISTORY**

6577 First released in Issue 6. Derived from IEEE Std 1003.1d-1999.

6578 In the SYNOPSIS, the inclusion of <**sys/types.h**> is no longer required.

6579 **NAME**6580 clock\_getres, clock\_gettime, clock\_settime — clock and timer functions (**REALTIME**)6581 **SYNOPSIS**

6582 TMR #include &lt;time.h&gt;

6583 int clock\_getres(clockid\_t *clock\_id*, struct timespec \**res*);6584 int clock\_gettime(clockid\_t *clock\_id*, struct timespec \**tp*);6585 int clock\_settime(clockid\_t *clock\_id*, const struct timespec \**tp*);

6586

6587 **DESCRIPTION**

6588 The *clock\_getres()* function shall return the resolution of any clock. Clock resolutions are  
 6589 implementation-defined and cannot be set by a process. If the argument *res* is not NULL, the  
 6590 resolution of the specified clock shall be stored in the location pointed to by *res*. If *res* is NULL,  
 6591 the clock resolution is not returned. If the *time* argument of *clock\_settime()* is not a multiple of *res*,  
 6592 then the value is truncated to a multiple of *res*.

6593 The *clock\_gettime()* function shall return the current value *tp* for the specified clock, *clock\_id*.

6594 The *clock\_settime()* function shall set the specified clock, *clock\_id*, to the value specified by *tp*.  
 6595 Time values that are between two consecutive non-negative integer multiples of the resolution  
 6596 of the specified clock shall be truncated down to the smaller multiple of the resolution.

6597 A clock may be system-wide (that is, visible to all processes) or per-process (measuring time that  
 6598 is meaningful only within a process). All implementations shall support a *clock\_id* of  
 6599 CLOCK\_REALTIME as defined in <time.h>. This clock represents the realtime clock for the  
 6600 system. For this clock, the values returned by *clock\_gettime()* and specified by *clock\_settime()*  
 6601 represent the amount of time (in seconds and nanoseconds) since the Epoch. An implementation  
 6602 may also support additional clocks. The interpretation of time values for these clocks is  
 6603 unspecified.

6604 If the value of the CLOCK\_REALTIME clock is set via *clock\_settime()*, the new value of the clock  
 6605 shall be used to determine the time of expiration for absolute time services based upon the  
 6606 CLOCK\_REALTIME clock. This applies to the time at which armed absolute timers expire. If the  
 6607 absolute time requested at the invocation of such a time service is before the new value of the  
 6608 clock, the time service shall expire immediately as if the clock had reached the requested time  
 6609 normally.

6610 Setting the value of the CLOCK\_REALTIME clock via *clock\_settime()* shall have no effect on  
 6611 threads that are blocked waiting for a relative time service based upon this clock, including the  
 6612 *nanosleep()* function; nor on the expiration of relative timers based upon this clock.  
 6613 Consequently, these time services shall expire when the requested relative interval elapses,  
 6614 independently of the new or old value of the clock.

6615 MON If the Monotonic Clock option is supported, all implementations shall support a *clock\_id* of  
 6616 CLOCK\_MONOTONIC defined in <time.h>. This clock represents the monotonic clock for the  
 6617 system. For this clock, the value returned by *clock\_gettime()* represents the amount of time (in  
 6618 seconds and nanoseconds) since an unspecified point in the past (for example, system start-up  
 6619 time, or the Epoch). This point does not change after system start-up time. The value of the  
 6620 CLOCK\_MONOTONIC clock cannot be set via *clock\_settime()*. This function shall fail if it is  
 6621 invoked with a *clock\_id* argument of CLOCK\_MONOTONIC.

6622 The effect of setting a clock via *clock\_settime()* on armed per-process timers associated with a  
 6623 clock other than CLOCK\_REALTIME is implementation-defined.

6624 CS If the value of the CLOCK\_REALTIME clock is set via *clock\_settime()*, the new value of the clock  
 6625 shall be used to determine the time at which the system shall awaken a thread blocked on an

- 6626 absolute *clock\_nanosleep()* call based upon the CLOCK\_REALTIME clock. If the absolute time  
 6627 requested at the invocation of such a time service is before the new value of the clock, the call  
 6628 shall return immediately as if the clock had reached the requested time normally.
- 6629 Setting the value of the CLOCK\_REALTIME clock via *clock\_settime()* shall have no effect on any  
 6630 thread that is blocked on a relative *clock\_nanosleep()* call. Consequently, the call shall return  
 6631 when the requested relative interval elapses, independently of the new or old value of the clock.
- 6632 The appropriate privilege to set a particular clock is implementation-defined.
- 6633 CPT If `_POSIX_CPUTIME` is defined, implementations shall support clock ID values obtained by  
 6634 invoking *clock\_getcpuclockid()*, which represent the CPU-time clock of a given process.  
 6635 Implementations shall also support the special `clockid_t` value  
 6636 `CLOCK_PROCESS_CPUTIME_ID`, which represents the CPU-time clock of the calling process  
 6637 when invoking one of the *clock\_\**() or *timer\_\**() functions. For these clock IDs, the values  
 6638 returned by *clock\_gettime()* and specified by *clock\_settime()* represent the amount of execution  
 6639 time of the process associated with the clock. Changing the value of a CPU-time clock via  
 6640 *clock\_settime()* shall have no effect on the behavior of the sporadic server scheduling policy (see  
 6641 **Scheduling Policies** (on page 44)).
- 6642 TCT If `_POSIX_THREAD_CPUTIME` is defined, implementations shall support clock ID values  
 6643 obtained by invoking *pthread\_getcpuclockid()*, which represent the CPU-time clock of a given  
 6644 thread. Implementations shall also support the special `clockid_t` value  
 6645 `CLOCK_THREAD_CPUTIME_ID`, which represents the CPU-time clock of the calling thread  
 6646 when invoking one of the *clock\_\**() or *timer\_\**() functions. For these clock IDs, the values  
 6647 returned by *clock\_gettime()* and specified by *clock\_settime()* shall represent the amount of  
 6648 execution time of the thread associated with the clock. Changing the value of a CPU-time clock  
 6649 via *clock\_settime()* shall have no effect on the behavior of the sporadic server scheduling policy  
 6650 (see **Scheduling Policies** (on page 44)).
- 6651 **RETURN VALUE**
- 6652 A return value of 0 shall indicate that the call succeeded. A return value of -1 shall indicate that  
 6653 an error occurred, and *errno* shall be set to indicate the error.
- 6654 **ERRORS**
- 6655 The *clock\_getres()*, *clock\_gettime()*, and *clock\_settime()* functions shall fail if:
- 6656 [EINVAL] The *clock\_id* argument does not specify a known clock.
- 6657 The *clock\_settime()* function shall fail if:
- 6658 [EINVAL] The *tp* argument to *clock\_settime()* is outside the range for the given clock ID.
- 6659 [EINVAL] The *tp* argument specified a nanosecond value less than zero or greater than  
 6660 or equal to 1 000 million.
- 6661 MON [EINVAL] The value of the *clock\_id* argument is `CLOCK_MONOTONIC`.
- 6662 The *clock\_settime()* function may fail if:
- 6663 [EPERM] The requesting process does not have the appropriate privilege to set the  
 6664 specified clock.

6665 **EXAMPLES**

6666 None.

6667 **APPLICATION USAGE**

6668 These functions are part of the Timers option and need not be available on all implementations.

6669 Note that the absolute value of the monotonic clock is meaningless (because its origin is  
 6670 arbitrary), and thus there is no need to set it. Furthermore, realtime applications can rely on the  
 6671 fact that the value of this clock is never set and, therefore, that time intervals measured with this  
 6672 clock will not be affected by calls to *clock\_settime()*.

6673 **RATIONALE**

6674 None.

6675 **FUTURE DIRECTIONS**

6676 None.

6681 **CHANGE HISTORY**

6682 First released in Issue 5. Included for alignment with the POSIX Realtime Extension.

6683 **Issue 6**

6684 The [ENOSYS] error condition has been removed as stubs need not be provided if an  
 6685 implementation does not support the Timers option.

6686 The APPLICATION USAGE section is added.

6687 The following changes were made to align with the IEEE P1003.1a draft standard:

- 6688 • Clarification is added of the effect of resetting the clock resolution.

6689 CPU-time clocks and the *clock\_getcpuclockid()* function are added for alignment with  
 6690 IEEE Std 1003.1d-1999.

6691 The following changes are added for alignment with IEEE Std 1003.1j-2000:

- 6692 • The DESCRIPTION is updated as follows:

- 6693 — The value returned by *clock\_gettime()* for CLOCK\_MONOTONIC is specified.

- 6694 — The *clock\_settime()* function failing for CLOCK\_MONOTONIC is specified.

- 6695 — The effects of *clock\_settime()* on the *clock\_nanosleep()* function with respect to  
 6696 CLOCK\_REALTIME is specified.

- 6697 • An [EINVAL] error is added to the ERRORS section, indicating that *clock\_settime()* fails for  
 6698 CLOCK\_MONOTONIC.

- 6699 • The APPLICATION USAGE section notes that the CLOCK\_MONOTONIC clock need not  
 6700 and shall not be set by *clock\_settime()* since the absolute value of the CLOCK\_MONOTONIC  
 6701 clock is meaningless.

- 6702 • The *clock\_nanosleep()*, *mq\_timedreceive()*, *mq\_timedsend()*, *pthread\_mutex\_timedlock()*,  
 6703 *sem\_timedwait()*, *timer\_create()*, and *timer\_settime()* functions are added to the SEE ALSO  
 6704 section.

## 6705 NAME

6706 clock\_nanosleep — high resolution sleep with specifiable clock (**ADVANCED REALTIME**)

## 6707 SYNOPSIS

```
6708 cs #include <time.h>
```

```
6709 int clock_nanosleep(clockid_t clock_id, int flags,  
6710 const struct timespec *rqtp, struct timespec *rmtp);  
6711
```

## 6712 DESCRIPTION

6713 If the flag `TIMER_ABSTIME` is not set in the *flags* argument, the *clock\_nanosleep()* function shall  
6714 cause the current thread to be suspended from execution until either the time interval specified  
6715 by the *rqtp* argument has elapsed, or a signal is delivered to the calling thread and its action is to  
6716 invoke a signal-catching function, or the process is terminated. The clock used to measure the  
6717 time shall be the clock specified by *clock\_id*.

6718 If the flag `TIMER_ABSTIME` is set in the *flags* argument, the *clock\_nanosleep()* function shall  
6719 cause the current thread to be suspended from execution until either the time value of the clock  
6720 specified by *clock\_id* reaches the absolute time specified by the *rqtp* argument, or a signal is  
6721 delivered to the calling thread and its action is to invoke a signal-catching function, or the  
6722 process is terminated. If, at the time of the call, the time value specified by *rqtp* is less than or  
6723 equal to the time value of the specified clock, then *clock\_nanosleep()* shall return immediately  
6724 and the calling process shall not be suspended.

6725 The suspension time caused by this function may be longer than requested because the  
6726 argument value is rounded up to an integer multiple of the sleep resolution, or because of the  
6727 scheduling of other activity by the system. But, except for the case of being interrupted by a  
6728 signal, the suspension time for the relative *clock\_nanosleep()* function (that is, with the  
6729 `TIMER_ABSTIME` flag not set) shall not be less than the time interval specified by *rqtp*, as  
6730 measured by the corresponding clock. The suspension for the absolute *clock\_nanosleep()* function  
6731 (that is, with the `TIMER_ABSTIME` flag set) shall be in effect at least until the value of the  
6732 corresponding clock reaches the absolute time specified by *rqtp*, except for the case of being  
6733 interrupted by a signal.

6734 The use of the *clock\_nanosleep()* function shall have no effect on the action or blockage of any  
6735 signal.

6736 The *clock\_nanosleep()* function shall fail if the *clock\_id* argument refers to the CPU-time clock of  
6737 the calling thread. It is unspecified whether *clock\_id* values of other CPU-time clocks are  
6738 allowed.

## 6739 RETURN VALUE

6740 If the *clock\_nanosleep()* function returns because the requested time has elapsed, its return value  
6741 shall be zero.

6742 If the *clock\_nanosleep()* function returns because it has been interrupted by a signal, it shall return  
6743 the corresponding error value. For the relative *clock\_nanosleep()* function, if the *rmtp* argument is  
6744 non-NULL, the **timespec** structure referenced by it shall be updated to contain the amount of  
6745 time remaining in the interval (the requested time minus the time actually slept). If the *rmtp*  
6746 argument is NULL, the remaining time is not returned. The absolute *clock\_nanosleep()* function  
6747 has no effect on the structure referenced by *rmtp*.

6748 If *clock\_nanosleep()* fails, it shall return the corresponding error value.

6749 **ERRORS**

6750 The `clock_nanosleep()` function shall fail if:

- 6751 [EINTR] The `clock_nanosleep()` function was interrupted by a signal.
- 6752 [EINVAL] The `rqt` argument specified a nanosecond value less than zero or greater than  
6753 or equal to 1 000 million; or the `TIMER_ABSTIME` flag was specified in `flags`  
6754 and the `rqt` argument is outside the range for the clock specified by `clock_id`;  
6755 or the `clock_id` argument does not specify a known clock, or specifies the  
6756 CPU-time clock of the calling thread.
- 6757 [ENOTSUP] The `clock_id` argument specifies a clock for which `clock_nanosleep()` is not  
6758 supported, such as a CPU-time clock.

6759 **EXAMPLES**

6760 None.

6761 **APPLICATION USAGE**

6762 Calling `clock_nanosleep()` with the value `TIMER_ABSTIME` not set in the `flags` argument and with  
6763 a `clock_id` of `CLOCK_REALTIME` is equivalent to calling `nanosleep()` with the same `rqt` and `rmt`  
6764 arguments.

6765 **RATIONALE**

6766 The `nanosleep()` function specifies that the system-wide clock `CLOCK_REALTIME` is used to  
6767 measure the elapsed time for this time service. However, with the introduction of the monotonic  
6768 clock `CLOCK_MONOTONIC` a new relative sleep function is needed to allow an application to  
6769 take advantage of the special characteristics of this clock.

6770 There are many applications in which a process needs to be suspended and then activated  
6771 multiple times in a periodic way; for example, to poll the status of a non-interrupting device or  
6772 to refresh a display device. For these cases, it is known that precise periodic activation cannot be  
6773 achieved with a relative `sleep()` or `nanosleep()` function call. Suppose, for example, a periodic  
6774 process that is activated at time  $T_0$ , executes for a while, and then wants to suspend itself until  
6775 time  $T_0+T$ , the period being  $T$ . If this process wants to use the `nanosleep()` function, it must first  
6776 call `clock_gettime()` to get the current time, then calculate the difference between the current time  
6777 and  $T_0+T$  and, finally, call `nanosleep()` using the computed interval. However, the process could  
6778 be preempted by a different process between the two function calls, and in this case the interval  
6779 computed would be wrong; the process would wake up later than desired. This problem would  
6780 not occur with the absolute `clock_nanosleep()` function, since only one function call would be  
6781 necessary to suspend the process until the desired time. In other cases, however, a relative sleep  
6782 is needed, and that is why both functionalities are required.

6783 Although it is possible to implement periodic processes using the timers interface, this  
6784 implementation would require the use of signals, and the reservation of some signal numbers. In  
6785 this regard, the reasons for including an absolute version of the `clock_nanosleep()` function in  
6786 IEEE Std 1003.1-2001 are the same as for the inclusion of the relative `nanosleep()`.

6787 It is also possible to implement precise periodic processes using `pthread_cond_timedwait()`, in  
6788 which an absolute timeout is specified that takes effect if the condition variable involved is  
6789 never signaled. However, the use of this interface is unnatural, and involves performing other  
6790 operations on mutexes and condition variables that imply an unnecessary overhead.  
6791 Furthermore, `pthread_cond_timedwait()` is not available in implementations that do not support  
6792 threads.

6793 Although the interface of the relative and absolute versions of the new high resolution sleep  
6794 service is the same `clock_nanosleep()` function, the `rmt` argument is only used in the relative  
6795 sleep. This argument is needed in the relative `clock_nanosleep()` function to reissue the function

6796 call if it is interrupted by a signal, but it is not needed in the absolute *clock\_nanosleep()* function  
6797 call; if the call is interrupted by a signal, the absolute *clock\_nanosleep()* function can be invoked  
6798 again with the same *rqt* argument used in the interrupted call.

6799 **FUTURE DIRECTIONS**

6800 None.

6812 **DESCRIPTION**6813 Refer to *clock\_getres()*.

**6814 NAME**

6815 clog, clogf, clogl — complex natural logarithm functions

**6816 SYNOPSIS**

6817 #include <complex.h>

6818 double complex clog(double complex z);

6819 float complex clogf(float complex z);

6820 long double complex clogl(long double complex z);

**6821 DESCRIPTION**

6822 **CX** The functionality described on this reference page is aligned with the ISO C standard. Any  
6823 conflict between the requirements described here and the ISO C standard is unintentional. This  
6824 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

6825 These functions shall compute the complex natural (base *e*) logarithm of *z*, with a branch cut  
6826 along the negative real axis.

**6827 RETURN VALUE**

6828 These functions shall return the complex natural logarithm value, in the range of a strip  
6829 mathematically unbounded along the real axis and in the interval  $[-i\pi, +i\pi]$  along the imaginary  
6830 axis.

**6831 ERRORS**

6832 No errors are defined.

**6843 CHANGE HISTORY**

6844 First released in Issue 6. Derived from the ISO/IEC 9899:1999 standard.

6845 **NAME**

6846 close — close a file descriptor

6847 **SYNOPSIS**

6848 #include &lt;unistd.h&gt;

6849 int close(int *fd*);6850 **DESCRIPTION**

6851 The *close()* function shall deallocate the file descriptor indicated by *fd*. To deallocate means  
 6852 to make the file descriptor available for return by subsequent calls to *open()* or other functions  
 6853 that allocate file descriptors. All outstanding record locks owned by the process on the file  
 6854 associated with the file descriptor shall be removed (that is, unlocked).

6855 If *close()* is interrupted by a signal that is to be caught, it shall return  $-1$  with *errno* set to [EINTR]  
 6856 and the state of *fd* is unspecified. If an I/O error occurred while reading from or writing to the  
 6857 file system during *close()*, it may return  $-1$  with *errno* set to [EIO]; if this error is returned, the  
 6858 state of *fd* is unspecified.

6859 When all file descriptors associated with a pipe or FIFO special file are closed, any data  
 6860 remaining in the pipe or FIFO shall be discarded.

6861 When all file descriptors associated with an open file description have been closed, the open file  
 6862 description shall be freed.

6863 If the link count of the file is 0, when all file descriptors associated with the file are closed, the  
 6864 space occupied by the file shall be freed and the file shall no longer be accessible.

6865 **XSRR** If a STREAMS-based *fd* is closed and the calling process was previously registered to receive  
 6866 a SIGPOLL signal for events associated with that STREAM, the calling process shall be  
 6867 unregistered for events associated with the STREAM. The last *close()* for a STREAM shall cause  
 6868 the STREAM associated with *fd* to be dismantled. If O\_NONBLOCK is not set and there have  
 6869 been no signals posted for the STREAM, and if there is data on the module's write queue, *close()*  
 6870 shall wait for an unspecified time (for each module and driver) for any output to drain before  
 6871 dismantling the STREAM. The time delay can be changed via an I\_SETCLTIME *ioctl()* request. If  
 6872 the O\_NONBLOCK flag is set, or if there are any pending signals, *close()* shall not wait for  
 6873 output to drain, and shall dismantle the STREAM immediately.

6874 If the implementation supports STREAMS-based pipes, and *fd* is associated with one end of a  
 6875 pipe, the last *close()* shall cause a hangup to occur on the other end of the pipe. In addition, if the  
 6876 other end of the pipe has been named by *fattach()*, then the last *close()* shall force the named end  
 6877 to be detached by *fdetach()*. If the named end has no open file descriptors associated with it and  
 6878 gets detached, the STREAM associated with that end shall also be dismantled.

6879 **XSI** If *fd* refers to the master side of a pseudo-terminal, and this is the last close, a SIGHUP signal  
 6880 shall be sent to the process group, if any, for which the slave side of the pseudo-terminal is the  
 6881 controlling terminal. It is unspecified whether closing the master side of the pseudo-terminal  
 6882 flushes all queued input and output.

6883 **XSR** If *fd* refers to the slave side of a STREAMS-based pseudo-terminal, a zero-length message  
 6884 may be sent to the master.

6885 **AIO** When there is an outstanding cancelable asynchronous I/O operation against *fd* when *close()*  
 6886 is called, that I/O operation may be canceled. An I/O operation that is not canceled completes  
 6887 as if the *close()* operation had not yet occurred. All operations that are not canceled shall  
 6888 complete as if the *close()* blocked until the operations completed. The *close()* operation itself  
 6889 need not block awaiting such I/O completion. Whether any I/O operation is canceled, and  
 6890 which I/O operation may be canceled upon *close()*, is implementation-defined.

6891 MF|SHM If a shared memory object or a memory mapped file remains referenced at the last close (that is,  
 6892 a process has it mapped), then the entire contents of the memory object shall persist until the  
 6893 memory object becomes unreferenced. If this is the last close of a shared memory object or a  
 6894 memory mapped file and the close results in the memory object becoming unreferenced, and the  
 6895 memory object has been unlinked, then the memory object shall be removed.

6896 If *fdes* refers to a socket, *close()* shall cause the socket to be destroyed. If the socket is in  
 6897 connection-mode, and the `SO_LINGER` option is set for the socket with non-zero linger time,  
 6898 and the socket has untransmitted data, then *close()* shall block for up to the current linger  
 6899 interval until all data is transmitted.

#### 6900 RETURN VALUE

6901 Upon successful completion, 0 shall be returned; otherwise, -1 shall be returned and *errno* set to  
 6902 indicate the error.

#### 6903 ERRORS

6904 The *close()* function shall fail if:

6905 [EBADF] The *fdes* argument is not a valid file descriptor.

6906 [EINTR] The *close()* function was interrupted by a signal.

6907 The *close()* function may fail if:

6908 [EIO] An I/O error occurred while reading from or writing to the file system.

#### 6909 EXAMPLES

##### 6910 Reassigning a File Descriptor

6911 The following example closes the file descriptor associated with standard output for the current  
 6912 process, re-assigns standard output to a new file descriptor, and closes the original file  
 6913 descriptor to clean up. This example assumes that the file descriptor 0 (which is the descriptor  
 6914 for standard input) is not closed.

```
6915 #include <unistd.h>
6916 ...
6917 int pfd;
6918 ...
6919 close(1);
6920 dup(pfd);
6921 close(pfd);
6922 ...
```

6923 Incidentally, this is exactly what could be achieved using:

```
6924 dup2(pfd, 1);
6925 close(pfd);
```

##### 6926 Closing a File Descriptor

6927 In the following example, *close()* is used to close a file descriptor after an unsuccessful attempt is  
 6928 made to associate that file descriptor with a stream.

```
6929 #include <stdio.h>
6930 #include <unistd.h>
6931 #include <stdlib.h>
```

```

6932     #define LOCKFILE "/etc/ptmp"
6933     ...
6934     int pfd;
6935     FILE *fpfd;
6936     ...
6937     if ((fpfd = fdopen (pfd, "w")) == NULL) {
6938         close(pfd);
6939         unlink(LOCKFILE);
6940         exit(1);
6941     }
6942     ...

```

#### 6943 APPLICATION USAGE

6944 An application that had used the *stdio* routine *fopen()* to open a file should use the  
 6945 corresponding *fclose()* routine rather than *close()*. Once a file is closed, the file descriptor no  
 6946 longer exists, since the integer corresponding to it no longer refers to a file.

#### 6947 RATIONALE

6948 The use of interruptible device close routines should be discouraged to avoid problems with the  
 6949 implicit closes of file descriptors by *exec* and *exit()*. This volume of IEEE Std 1003.1-2001 only  
 6950 intends to permit such behavior by specifying the [EINTR] error condition.

#### 6951 FUTURE DIRECTIONS

6952 None.

#### 6953 SEE ALSO

6954 Section 2.6 (on page 38), *fattach()*, *fclose()*, *fdetach()*, *fopen()*, *ioctl()*, *open()*, the Base Definitions  
 6955 volume of IEEE Std 1003.1-2001, <*unistd.h*>

#### 6956 CHANGE HISTORY

6957 First released in Issue 1. Derived from Issue 1 of the SVID.

#### 6958 Issue 5

6959 The DESCRIPTION is updated for alignment with the POSIX Realtime Extension.

#### 6960 Issue 6

6961 The DESCRIPTION related to a STREAMS-based file or pseudo-terminal is marked as part of the  
 6962 XSI STREAMS Option Group.

6963 The following new requirements on POSIX implementations derive from alignment with the  
 6964 Single UNIX Specification:

- 6965 • The [EIO] error condition is added as an optional error.
- 6966 • The DESCRIPTION is updated to describe the state of the *fildev* file descriptor as unspecified  
 6967 if an I/O error occurs and an [EIO] error condition is returned.

6968 Text referring to sockets is added to the DESCRIPTION.

6969 The DESCRIPTION is updated for alignment with IEEE Std 1003.1j-2000 by specifying that  
 6970 shared memory objects and memory mapped files (and not typed memory objects) are the types  
 6971 of memory objects to which the paragraph on last closes applies.

6972 **NAME**

6973        closedir — close a directory stream

6974 **SYNOPSIS**

6975        #include &lt;dirent.h&gt;

6976        int closedir(DIR \*dirp);

6977 **DESCRIPTION**

6978        The *closedir()* function shall close the directory stream referred to by the argument *dirp*. Upon  
6979        return, the value of *dirp* may no longer point to an accessible object of the type **DIR**. If a file  
6980        descriptor is used to implement type **DIR**, that file descriptor shall be closed.

6981 **RETURN VALUE**

6982        Upon successful completion, *closedir()* shall return 0; otherwise, -1 shall be returned and *errno*  
6983        set to indicate the error.

6984 **ERRORS**6985        The *closedir()* function may fail if:6986        [EBADF]        The *dirp* argument does not refer to an open directory stream.6987        [EINTR]        The *closedir()* function was interrupted by a signal.6988 **EXAMPLES**6989        **Closing a Directory Stream**6990        The following program fragment demonstrates how the *closedir()* function is used.

```
6991        ...  
6992        DIR *dir;  
6993        struct dirent *dp;  
6994        ...  
6995        if ((dir = opendir(".")) == NULL) {  
6996        ...  
6997        }  
6998        while ((dp = readdir(dir)) != NULL) {  
6999        ...  
7000        }  
7001        closedir(dir);  
7002        ...
```

7003 **APPLICATION USAGE**

7004        None.

7005 **RATIONALE**

7006        None.

7007 **FUTURE DIRECTIONS**

7008        None.

7009 **SEE ALSO**7010        *opendir()*, the Base Definitions volume of IEEE Std 1003.1-2001, <**dirent.h**>

7011 **CHANGE HISTORY**

7012 First released in Issue 2.

7013 **Issue 6**7014 In the SYNOPSIS, the optional include of the `<sys/types.h>` header is removed.7015 The following new requirements on POSIX implementations derive from alignment with the  
7016 Single UNIX Specification:

- 7017 • The requirement to include `<sys/types.h>` has been removed. Although `<sys/types.h>` was  
7018 required for conforming implementations of previous POSIX specifications, it was not  
7019 required for UNIX applications.
- 7020 • The [EINTR] error condition is added as an optional error condition.

## 7021 NAME

7022 closelog, openlog, setlogmask, syslog — control system log

## 7023 SYNOPSIS

```
7024 xSI #include <syslog.h>
7025
7026 void closelog(void);
7027 void openlog(const char *ident, int logopt, int facility);
7028 int setlogmask(int maskpri);
7029 void syslog(int priority, const char *message, ... /* arguments */);
```

## 7030 DESCRIPTION

7031 The *syslog()* function shall send a message to an implementation-defined logging facility, which  
 7032 may log it in an implementation-defined system log, write it to the system console, forward it to  
 7033 a list of users, or forward it to the logging facility on another host over the network. The logged  
 7034 message shall include a message header and a message body. The message header contains at  
 7035 least a timestamp and a tag string.

7036 The message body is generated from the *message* and following arguments in the same manner  
 7037 as if these were arguments to *printf()*, except that the additional conversion specification *%m*  
 7038 shall be recognized; it shall convert no arguments, shall cause the output of the error message  
 7039 string associated with the value of *errno* on entry to *syslog()*, and may be mixed with argument  
 7040 specifications of the "*%n\$*" form. If a complete conversion specification with the *m* conversion  
 7041 specifier character is not just *%m*, the behavior is undefined. A trailing *<newline>* may be added  
 7042 if needed.

7043 Values of the *priority* argument are formed by OR'ing together a severity-level value and an  
 7044 optional facility value. If no facility value is specified, the current default facility value is used.

7045 Possible values of severity level include:

7046	LOG_EMERG	A panic condition.
7047	LOG_ALERT	A condition that should be corrected immediately, such as a corrupted system database.
7048		
7049	LOG_CRIT	Critical conditions, such as hard device errors.
7050	LOG_ERR	Errors.
7051	LOG_WARNING	
7052		Warning messages.
7053	LOG_NOTICE	Conditions that are not error conditions, but that may require special handling.
7054		
7055	LOG_INFO	Informational messages.
7056	LOG_DEBUG	Messages that contain information normally of use only when debugging a program.
7057		

7058 The facility indicates the application or system component generating the message. Possible  
 7059 facility values include:

7060	LOG_USER	Messages generated by arbitrary processes. This is the default facility identifier if none is specified.
7061		
7062	LOG_LOCAL0	Reserved for local use.

7063 LOG\_LOCAL1 Reserved for local use.  
 7064 LOG\_LOCAL2 Reserved for local use.  
 7065 LOG\_LOCAL3 Reserved for local use.  
 7066 LOG\_LOCAL4 Reserved for local use.  
 7067 LOG\_LOCAL5 Reserved for local use.  
 7068 LOG\_LOCAL6 Reserved for local use.  
 7069 LOG\_LOCAL7 Reserved for local use.

7070 The *openlog()* function shall set process attributes that affect subsequent calls to *syslog()*. The  
 7071 *ident* argument is a string that is prepended to every message. The *logopt* argument indicates  
 7072 logging options. Values for *logopt* are constructed by a bitwise-inclusive OR of zero or more of  
 7073 the following:

7074 LOG\_PID Log the process ID with each message. This is useful for identifying specific  
 7075 processes.

7076 LOG\_CONS Write messages to the system console if they cannot be sent to the logging  
 7077 facility. The *syslog()* function ensures that the process does not acquire the  
 7078 console as a controlling terminal in the process of writing the message.

7079 LOG\_NDELAY Open the connection to the logging facility immediately. Normally the open is  
 7080 delayed until the first message is logged. This is useful for programs that need  
 7081 to manage the order in which file descriptors are allocated.

7082 LOG\_ODELAY Delay open until *syslog()* is called.

7083 LOG\_NOWAIT Do not wait for child processes that may have been created during the course  
 7084 of logging the message. This option should be used by processes that enable  
 7085 notification of child termination using SIGCHLD, since *syslog()* may  
 7086 otherwise block waiting for a child whose exit status has already been  
 7087 collected.

7088 The *facility* argument encodes a default facility to be assigned to all messages that do not have  
 7089 an explicit facility already encoded. The initial default facility is LOG\_USER.

7090 The *openlog()* and *syslog()* functions may allocate a file descriptor. It is not necessary to call  
 7091 *openlog()* prior to calling *syslog()*.

7092 The *closelog()* function shall close any open file descriptors allocated by previous calls to  
 7093 *openlog()* or *syslog()*.

7094 The *setlogmask()* function shall set the log priority mask for the current process to *maskpri* and  
 7095 return the previous mask. If the *maskpri* argument is 0, the current log mask is not modified.  
 7096 Calls by the current process to *syslog()* with a priority not set in *maskpri* shall be rejected. The  
 7097 default log mask allows all priorities to be logged. A call to *openlog()* is not required prior to  
 7098 calling *setlogmask()*.

7099 Symbolic constants for use as values of the *logopt*, *facility*, *priority*, and *maskpri* arguments are  
 7100 defined in the <syslog.h> header.

#### 7101 RETURN VALUE

7102 The *setlogmask()* function shall return the previous log priority mask. The *closelog()*, *openlog()*,  
 7103 and *syslog()* functions shall not return a value.

7104 **ERRORS**

7105       None.

7106 **EXAMPLES**7107       **Using openlog()**

7108       The following example causes subsequent calls to *syslog()* to log the process ID with each message, and to write messages to the system console if they cannot be sent to the logging facility.

```
7111       #include <syslog.h>
7112       char *ident = "Process demo";
7113       int logopt = LOG_PID | LOG_CONS;
7114       int facility = LOG_USER;
7115       ...
7116       openlog(ident, logopt, facility);
```

7117       **Using setlogmask()**

7118       The following example causes subsequent calls to *syslog()* to accept error messages or messages generated by arbitrary processes, and to reject all other messages.

```
7120       #include <syslog.h>
7121       int result;
7122       int mask = LOG_MASK (LOG_ERR | LOG_USER);
7123       ...
7124       result = setlogmask(mask);
```

7125       **Using syslog**

7126       The following example sends the message "This is a message" to the default logging facility, marking the message as an error message generated by random processes.

```
7128       #include <syslog.h>
7129       char *message = "This is a message";
7130       int priority = LOG_ERR | LOG_USER;
7131       ...
7132       syslog(priority, message);
```

7133 **APPLICATION USAGE**

7134       None.

7135 **RATIONALE**

7136       None.

7137 **FUTURE DIRECTIONS**

7138       None.

7141 **CHANGE HISTORY**

7142           First released in Issue 4, Version 2.

7143 **Issue 5**

7144           Moved from X/OPEN UNIX extension to BASE.

7145 **NAME**7146 `confstr` — get configurable variables7147 **SYNOPSIS**7148 `#include <unistd.h>`7149 `size_t confstr(int name, char *buf, size_t len);`7150 **DESCRIPTION**7151 The `confstr()` function shall return configuration-defined string values. Its use and purpose are  
7152 similar to `sysconf()`, but it is used where string values rather than numeric values are returned.7153 The `name` argument represents the system variable to be queried. The implementation shall  
7154 support the following name values, defined in `<unistd.h>`. It may support others:

7155 `_CS_PATH`  
 7156 `_CS_POSIX_V6_ILP32_OFF32_CFLAGS`  
 7157 `_CS_POSIX_V6_ILP32_OFF32_LDFLAGS`  
 7158 `_CS_POSIX_V6_ILP32_OFF32_LIBS`  
 7159 `_CS_POSIX_V6_ILP32_OFFBIG_CFLAGS`  
 7160 `_CS_POSIX_V6_ILP32_OFFBIG_LDFLAGS`  
 7161 `_CS_POSIX_V6_ILP32_OFFBIG_LIBS`  
 7162 `_CS_POSIX_V6_LP64_OFF64_CFLAGS`  
 7163 `_CS_POSIX_V6_LP64_OFF64_LDFLAGS`  
 7164 `_CS_POSIX_V6_LP64_OFF64_LIBS`  
 7165 `_CS_POSIX_V6_LPBIG_OFFBIG_CFLAGS`  
 7166 `_CS_POSIX_V6_LPBIG_OFFBIG_LDFLAGS`  
 7167 `_CS_POSIX_V6_LPBIG_OFFBIG_LIBS`  
 7168 `_CS_POSIX_V6_WIDTH_RESTRICTED_ENVS`  
 7169 XSI `_CS_XBS5_ILP32_OFF32_CFLAGS (LEGACY)`  
 7170 `_CS_XBS5_ILP32_OFF32_LDFLAGS (LEGACY)`  
 7171 `_CS_XBS5_ILP32_OFF32_LIBS (LEGACY)`  
 7172 `_CS_XBS5_ILP32_OFF32_LINTFLAGS (LEGACY)`  
 7173 `_CS_XBS5_ILP32_OFFBIG_CFLAGS (LEGACY)`  
 7174 `_CS_XBS5_ILP32_OFFBIG_LDFLAGS (LEGACY)`  
 7175 `_CS_XBS5_ILP32_OFFBIG_LIBS (LEGACY)`  
 7176 `_CS_XBS5_ILP32_OFFBIG_LINTFLAGS (LEGACY)`  
 7177 `_CS_XBS5_LP64_OFF64_CFLAGS (LEGACY)`  
 7178 `_CS_XBS5_LP64_OFF64_LDFLAGS (LEGACY)`  
 7179 `_CS_XBS5_LP64_OFF64_LIBS (LEGACY)`  
 7180 `_CS_XBS5_LP64_OFF64_LINTFLAGS (LEGACY)`  
 7181 `_CS_XBS5_LPBIG_OFFBIG_CFLAGS (LEGACY)`  
 7182 `_CS_XBS5_LPBIG_OFFBIG_LDFLAGS (LEGACY)`  
 7183 `_CS_XBS5_LPBIG_OFFBIG_LIBS (LEGACY)`  
 7184 `_CS_XBS5_LPBIG_OFFBIG_LINTFLAGS (LEGACY)`

7185

7186 If `len` is not 0, and if `name` has a configuration-defined value, `confstr()` shall copy that value into  
7187 the `len`-byte buffer pointed to by `buf`. If the string to be returned is longer than `len` bytes,  
7188 including the terminating null, then `confstr()` shall truncate the string to `len-1` bytes and null-  
7189 terminate the result. The application can detect that the string was truncated by comparing the  
7190 value returned by `confstr()` with `len`.7191 If `len` is 0 and `buf` is a null pointer, then `confstr()` shall still return the integer value as defined  
7192 below, but shall not return a string. If `len` is 0 but `buf` is not a null pointer, the result is  
7193 unspecified.

7194 If the implementation supports the POSIX shell option, the string stored in *buf* after a call to:

```
7195 confstr(_CS_PATH, buf, sizeof(buf))
```

7196 can be used as a value of the *PATH* environment variable that accesses all of the standard  
7197 utilities of IEEE Std 1003.1-2001, if the return value is less than or equal to *sizeof(buf)*.

#### 7198 RETURN VALUE

7199 If *name* has a configuration-defined value, *confstr()* shall return the size of buffer that would be  
7200 needed to hold the entire configuration-defined value including the terminating null. If this  
7201 return value is greater than *len*, the string returned in *buf* is truncated.

7202 If *name* is invalid, *confstr()* shall return 0 and set *errno* to indicate the error.

7203 If *name* does not have a configuration-defined value, *confstr()* shall return 0 and leave *errno*  
7204 unchanged.

#### 7205 ERRORS

7206 The *confstr()* function shall fail if:

7207 [EINVAL] The value of the *name* argument is invalid.

#### 7208 EXAMPLES

7209 None.

#### 7210 APPLICATION USAGE

7211 An application can distinguish between an invalid *name* parameter value and one that  
7212 corresponds to a configurable variable that has no configuration-defined value by checking if  
7213 *errno* is modified. This mirrors the behavior of *sysconf()*.

7214 The original need for this function was to provide a way of finding the configuration-defined  
7215 default value for the environment variable *PATH*. Since *PATH* can be modified by the user to  
7216 include directories that could contain utilities replacing the standard utilities in the Shell and  
7217 Utilities volume of IEEE Std 1003.1-2001, applications need a way to determine the system-  
7218 supplied *PATH* environment variable value that contains the correct search path for the standard  
7219 utilities.

7220 An application could use:

```
7221 confstr(name, (char *)NULL, (size_t)0)
```

7222 to find out how big a buffer is needed for the string value; use *malloc()* to allocate a buffer to  
7223 hold the string; and call *confstr()* again to get the string. Alternately, it could allocate a fixed,  
7224 static buffer that is big enough to hold most answers (perhaps 512 or 1024 bytes), but then use  
7225 *malloc()* to allocate a larger buffer if it finds that this is too small.

#### 7226 RATIONALE

7227 Application developers can normally determine any configuration variable by means of reading  
7228 from the stream opened by a call to:

```
7229 popen("command -p getconf variable", "r");
```

7230 The *confstr()* function with a *name* argument of *\_CS\_PATH* returns a string that can be used as a  
7231 *PATH* environment variable setting that will reference the standard shell and utilities as  
7232 described in the Shell and Utilities volume of IEEE Std 1003.1-2001.

7233 The *confstr()* function copies the returned string into a buffer supplied by the application instead  
7234 of returning a pointer to a string. This allows a cleaner function in some implementations (such  
7235 as those with lightweight threads) and resolves questions about when the application must copy  
7236 the string returned.

7237 **FUTURE DIRECTIONS**

7238 None.

7239 **SEE ALSO**7240 *pathconf()*, *sysconf()*, the Base Definitions volume of IEEE Std 1003.1-2001, <**unistd.h**>, the Shell  
7241 and Utilities volume of IEEE Std 1003.1-2001, *c99*7242 **CHANGE HISTORY**

7243 First released in Issue 4. Derived from the ISO POSIX-2 standard.

7244 **Issue 5**7245 A table indicating the permissible values of *name* is added to the DESCRIPTION. All those  
7246 marked EX are new in this issue.7247 **Issue 6**7248 The Open Group Corrigendum U033/7 is applied. The return value for the case returning the  
7249 size of the buffer now explicitly states that this includes the terminating null.7250 The following new requirements on POSIX implementations derive from alignment with the  
7251 Single UNIX Specification:

- 7252
- The DESCRIPTION is updated with new arguments which can be used to determine  
7253 configuration strings for C compiler flags, linker/loader flags, and libraries for each different  
7254 supported programming environment. This is a change to support data size neutrality.

7255 The following changes were made to align with the IEEE P1003.1a draft standard:

- 7256
- The DESCRIPTION is updated to include text describing how `_CS_PATH` can be used to  
7257 obtain a *PATH* to access the standard utilities.

7258 The macros associated with the *c89* programming models are marked LEGACY and new  
7259 equivalent macros associated with *c99* are introduced.

7260 **NAME**

7261 conj, conjf, conjl — complex conjugate functions

7262 **SYNOPSIS**

7263 #include &lt;complex.h&gt;

7264 double complex conj(double complex z);

7265 float complex conjf(float complex z);

7266 long double complex conjl(long double complex z);

7267 **DESCRIPTION**

7268 cx The functionality described on this reference page is aligned with the ISO C standard. Any  
7269 conflict between the requirements described here and the ISO C standard is unintentional. This  
7270 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

7271 These functions shall compute the complex conjugate of *z*, by reversing the sign of its imaginary  
7272 part.

7273 **RETURN VALUE**

7274 These functions return the complex conjugate value.

7275 **ERRORS**

7276 No errors are defined.

7277 **EXAMPLES**

7278 None.

7279 **APPLICATION USAGE**

7280 None.

7281 **RATIONALE**

7282 None.

7283 **FUTURE DIRECTIONS**

7284 None.

7285 **SEE ALSO**

7287 <complex.h>

7288 **CHANGE HISTORY**

7289 First released in Issue 6. Derived from the ISO/IEC 9899:1999 standard.

7290 **NAME**

7291 connect — connect a socket

7292 **SYNOPSIS**

7293 #include &lt;sys/socket.h&gt;

7294 int connect(int *socket*, const struct sockaddr \**address*,  
7295 socklen\_t *address\_len*);7296 **DESCRIPTION**7297 The *connect()* function shall attempt to make a connection on a socket. The function takes the  
7298 following arguments:

- 7299 *socket* Specifies the file descriptor associated with the socket.
- 7300 *address* Points to a **sockaddr** structure containing the peer address. The length and  
7301 format of the address depend on the address family of the socket.
- 7302 *address\_len* Specifies the length of the **sockaddr** structure pointed to by the *address*  
7303 argument.

7304 If the socket has not already been bound to a local address, *connect()* shall bind it to an address  
7305 which, unless the socket's address family is AF\_UNIX, is an unused local address.7306 If the initiating socket is not connection-mode, then *connect()* shall set the socket's peer address,  
7307 and no connection is made. For SOCK\_DGRAM sockets, the peer address identifies where all  
7308 datagrams are sent on subsequent *send()* functions, and limits the remote sender for subsequent  
7309 *recv()* functions. If *address* is a null address for the protocol, the socket's peer address shall be  
7310 reset.7311 If the initiating socket is connection-mode, then *connect()* shall attempt to establish a connection  
7312 to the address specified by the *address* argument. If the connection cannot be established  
7313 immediately and O\_NONBLOCK is not set for the file descriptor for the socket, *connect()* shall  
7314 block for up to an unspecified timeout interval until the connection is established. If the timeout  
7315 interval expires before the connection is established, *connect()* shall fail and the connection  
7316 attempt shall be aborted. If *connect()* is interrupted by a signal that is caught while blocked  
7317 waiting to establish a connection, *connect()* shall fail and set *errno* to [EINTR], but the connection  
7318 request shall not be aborted, and the connection shall be established asynchronously.7319 If the connection cannot be established immediately and O\_NONBLOCK is set for the file  
7320 descriptor for the socket, *connect()* shall fail and set *errno* to [EINPROGRESS], but the connection  
7321 request shall not be aborted, and the connection shall be established asynchronously.  
7322 Subsequent calls to *connect()* for the same socket, before the connection is established, shall fail  
7323 and set *errno* to [EALREADY].7324 When the connection has been established asynchronously, *select()* and *poll()* shall indicate that  
7325 the file descriptor for the socket is ready for writing.7326 The socket in use may require the process to have appropriate privileges to use the *connect()*  
7327 function.7328 **RETURN VALUE**7329 Upon successful completion, *connect()* shall return 0; otherwise, -1 shall be returned and *errno*  
7330 set to indicate the error.7331 **ERRORS**7332 The *connect()* function shall fail if:

7333 [EADDRNOTAVAIL]

7334 The specified address is not available from the local machine.

7335	[EAFNOSUPPORT]	
7336		The specified address is not a valid address for the address family of the
7337		specified socket.
7338	[EALREADY]	A connection request is already in progress for the specified socket.
7339	[EBADF]	The <i>socket</i> argument is not a valid file descriptor.
7340	[ECONNREFUSED]	
7341		The target address was not listening for connections or refused the connection
7342		request.
7343	[EINPROGRESS]	O_NONBLOCK is set for the file descriptor for the socket and the connection
7344		cannot be immediately established; the connection shall be established
7345		asynchronously.
7346	[EINTR]	The attempt to establish a connection was interrupted by delivery of a signal
7347		that was caught; the connection shall be established asynchronously.
7348	[EISCONN]	The specified socket is connection-mode and is already connected.
7349	[ENETUNREACH]	
7350		No route to the network is present.
7351	[ENOTSOCK]	The <i>socket</i> argument does not refer to a socket.
7352	[EPROTOTYPE]	The specified address has a different type than the socket bound to the
7353		specified peer address.
7354	[ETIMEDOUT]	The attempt to connect timed out before a connection was made.
7355		If the address family of the socket is AF_UNIX, then <i>connect()</i> shall fail if:
7356	[EIO]	An I/O error occurred while reading from or writing to the file system.
7357	[ELOOP]	A loop exists in symbolic links encountered during resolution of the pathname
7358		in <i>address</i> .
7359	[ENAMETOOLONG]	
7360		A component of a pathname exceeded {NAME_MAX} characters, or an entire
7361		pathname exceeded {PATH_MAX} characters.
7362	[ENOENT]	A component of the pathname does not name an existing file or the pathname
7363		is an empty string.
7364	[ENOTDIR]	A component of the path prefix of the pathname in <i>address</i> is not a directory.
7365		The <i>connect()</i> function may fail if:
7366	[EACCES]	Search permission is denied for a component of the path prefix; or write
7367		access to the named socket is denied.
7368	[EADDRINUSE]	Attempt to establish a connection that uses addresses that are already in use.
7369	[ECONNRESET]	Remote host reset the connection request.
7370	[EHOSTUNREACH]	
7371		The destination host cannot be reached (probably because the host is down or
7372		a remote router cannot reach it).
7373	[EINVAL]	The <i>address_len</i> argument is not a valid length for the address family; or
7374		invalid address family in the <b>sockaddr</b> structure.

7375 [ELOOP] More than {SYMLOOP\_MAX} symbolic links were encountered during  
7376 resolution of the pathname in *address*.

7377 [ENAMETOOLONG]  
7378 Pathname resolution of a symbolic link produced an intermediate result  
7379 whose length exceeds {PATH\_MAX}.

7380 [ENETDOWN] The local network interface used to reach the destination is down.

7381 [ENOBUFS] No buffer space is available.

7382 [EOPNOTSUPP] The socket is listening and cannot be connected.

7383 **EXAMPLES**  
7384 None.

7385 **APPLICATION USAGE**  
7386 If *connect()* fails, the state of the socket is unspecified. Conforming applications should close the  
7387 file descriptor and create a new socket before attempting to reconnect.

7388 **RATIONALE**  
7389 None.

7390 **FUTURE DIRECTIONS**  
7391 None.

7392 **SEE ALSO**  
7393 *accept()*, *bind()*, *close()*, *getsockname()*, *poll()*, *select()*, *send()*, *shutdown()*, *socket()*, the Base  
7394 Definitions volume of IEEE Std 1003.1-2001, <**sys/socket.h**>

7395 **CHANGE HISTORY**  
7396 First released in Issue 6. Derived from the XNS, Issue 5.2 specification.  
7397 The wording of the mandatory [ELOOP] error condition is updated, and a second optional  
7398 [ELOOP] error condition is added.

7399 **NAME**

7400 copysign, copysignf, copysignl — number manipulation function

7401 **SYNOPSIS**

7402 #include &lt;math.h&gt;

7403 double copysign(double x, double y);

7404 float copysignf(float x, float y);

7405 long double copysignl(long double x, long double y);

7406 **DESCRIPTION**

7407 **CX** The functionality described on this reference page is aligned with the ISO C standard. Any  
7408 conflict between the requirements described here and the ISO C standard is unintentional. This  
7409 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

7410 These functions shall produce a value with the magnitude of *x* and the sign of *y*. On  
7411 implementations that represent a signed zero but do not treat negative zero consistently in  
7412 arithmetic operations, these functions regard the sign of zero as positive.

7413 **RETURN VALUE**

7414 Upon successful completion, these functions shall return a value with the magnitude of *x* and  
7415 the sign of *y*.

7416 **ERRORS**

7417 No errors are defined.

7418 **EXAMPLES**

7419 None.

7420 **APPLICATION USAGE**

7421 None.

7422 **RATIONALE**

7423 None.

7424 **FUTURE DIRECTIONS**

7425 None.

7426 **SEE ALSO**7427 *signbit()*, the Base Definitions volume of IEEE Std 1003.1-2001, <math.h>7428 **CHANGE HISTORY**

7429 First released in Issue 6. Derived from the ISO/IEC 9899:1999 standard.

7430 **NAME**

7431 cos, cosf, cosl — cosine function

7432 **SYNOPSIS**

7433 #include &lt;math.h&gt;

7434 double cos(double x);

7435 float cosf(float x);

7436 long double cosl(long double x);

7437 **DESCRIPTION**

7438 **CX** The functionality described on this reference page is aligned with the ISO C standard. Any  
 7439 conflict between the requirements described here and the ISO C standard is unintentional. This  
 7440 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

7441 These functions shall compute the cosine of their argument *x*, measured in radians.

7442 An application wishing to check for error situations should set *errno* to zero and call  
 7443 *feclearexcept*(FE\_ALL\_EXCEPT) before calling these functions. On return, if *errno* is non-zero or  
 7444 *fetestexcept*(FE\_INVALID | FE\_DIVBYZERO | FE\_OVERFLOW | FE\_UNDERFLOW) is non-  
 7445 zero, an error has occurred.

7446 **RETURN VALUE**7447 Upon successful completion, these functions shall return the cosine of *x*.7448 **MX** If *x* is NaN, a NaN shall be returned.7449 If *x* is  $\pm 0$ , the value 1.0 shall be returned.

7450 If *x* is  $\pm\text{Inf}$ , a domain error shall occur, and either a NaN (if supported), or an implementation-  
 7451 defined value shall be returned.

7452 **ERRORS**

7453 These functions shall fail if:

7454 **MX** **Domain Error** The *x* argument is  $\pm\text{Inf}$ .

7455 If the integer expression (math\_errhandling & MATH\_ERRNO) is non-zero,  
 7456 then *errno* shall be set to [EDOM]. If the integer expression (math\_errhandling  
 7457 & MATH\_ERREXCEPT) is non-zero, then the invalid floating-point exception  
 7458 shall be raised.

7459 **EXAMPLES**7460 **Taking the Cosine of a 45-Degree Angle**

7461 #include &lt;math.h&gt;

7462 ...

7463 double radians = 45 \* M\_PI / 180;

7464 double result;

7465 ...

7466 result = cos(radians);

7467 **APPLICATION USAGE**

7468 These functions may lose accuracy when their argument is near an odd multiple of  $\pi/2$  or is far  
 7469 from 0.

7470 On error, the expressions (math\_errhandling & MATH\_ERRNO) and (math\_errhandling &  
 7471 MATH\_ERREXCEPT) are independent of each other, but at least one of them must be non-zero.

7472 **RATIONALE**

7473 None.

7474 **FUTURE DIRECTIONS**

7475 None.

7476 **SEE ALSO**

7477 *acos()*, *feclearexcept()*, *fetetestexcept()*, *isnan()*, *sin()*, *tan()*, the Base Definitions volume of  
7478 IEEE Std 1003.1-2001, Section 4.18, Treatment of Error Conditions for Mathematical Functions,  
7479 **<math.h>**

7480 **CHANGE HISTORY**

7481 First released in Issue 1. Derived from Issue 1 of the SVID.

7482 **Issue 5**

7483 The DESCRIPTION is updated to indicate how an application should check for an error. This  
7484 text was previously published in the APPLICATION USAGE section.

7485 **Issue 6**7486 The *cosf()* and *cosl()* functions are added for alignment with the ISO/IEC 9899:1999 standard.

7487 The DESCRIPTION, RETURN VALUE, ERRORS, and APPLICATION USAGE sections are  
7488 revised to align with the ISO/IEC 9899:1999 standard.

7489 IEC 60559:1989 standard floating-point extensions over the ISO/IEC 9899:1999 standard are  
7490 marked.

7491 **NAME**

7492 cosh, coshf, coshl — hyperbolic cosine functions

7493 **SYNOPSIS**

7494 #include &lt;math.h&gt;

7495 double cosh(double x);

7496 float coshf(float x);

7497 long double coshl(long double x);

7498 **DESCRIPTION**7499 **CX** The functionality described on this reference page is aligned with the ISO C standard. Any  
7500 conflict between the requirements described here and the ISO C standard is unintentional. This  
7501 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.7502 These functions shall compute the hyperbolic cosine of their argument  $x$ .7503 An application wishing to check for error situations should set *errno* to zero and call  
7504 *feclearexcept*(FE\_ALL\_EXCEPT) before calling these functions. On return, if *errno* is non-zero or  
7505 *fetestexcept*(FE\_INVALID | FE\_DIVBYZERO | FE\_OVERFLOW | FE\_UNDERFLOW) is non-  
7506 zero, an error has occurred.7507 **RETURN VALUE**7508 Upon successful completion, these functions shall return the hyperbolic cosine of  $x$ .7509 If the correct value would cause overflow, a range error shall occur and *cosh()*, *coshf()*, and  
7510 *coshl()* shall return the value of the macro HUGE\_VAL, HUGE\_VALF, and HUGE\_VALL,  
7511 respectively.7512 **MX** If  $x$  is NaN, a NaN shall be returned.7513 If  $x$  is  $\pm 0$ , the value 1.0 shall be returned.7514 If  $x$  is  $\pm\text{Inf}$ ,  $+\text{Inf}$  shall be returned.7515 **ERRORS**

7516 These functions shall fail if:

7517 **Range Error** The result would cause an overflow.7518 If the integer expression (math\_errhandling & MATH\_ERRNO) is non-zero,  
7519 then *errno* shall be set to [ERANGE]. If the integer expression  
7520 (math\_errhandling & MATH\_ERREXCEPT) is non-zero, then the overflow  
7521 floating-point exception shall be raised.7522 **EXAMPLES**

7523 None.

7524 **APPLICATION USAGE**7525 On error, the expressions (math\_errhandling & MATH\_ERRNO) and (math\_errhandling &  
7526 MATH\_ERREXCEPT) are independent of each other, but at least one of them must be non-zero.7527 For IEEE Std 754-1985 **double**,  $710.5 < |x|$  implies that *cosh*( $x$ ) has overflowed.7528 **RATIONALE**

7529 None.

7530 **FUTURE DIRECTIONS**

7531 None.

7532 **SEE ALSO**

7533 *acosh()*, *feclearexcept()*, *fetestexcept()*, *isnan()*, *sinh()*, *tanh()*, the Base Definitions volume of  
7534 IEEE Std 1003.1-2001, Section 4.18, Treatment of Error Conditions for Mathematical Functions,  
7535 <math.h>

7536 **CHANGE HISTORY**

7537 First released in Issue 1. Derived from Issue 1 of the SVID.

7538 **Issue 5**

7539 The DESCRIPTION is updated to indicate how an application should check for an error. This  
7540 text was previously published in the APPLICATION USAGE section.

7541 **Issue 6**

7542 The *coshf()* and *coshl()* functions are added for alignment with the ISO/IEC 9899:1999 standard.

7543 The DESCRIPTION, RETURN VALUE, ERRORS, and APPLICATION USAGE sections are  
7544 revised to align with the ISO/IEC 9899:1999 standard.

7545 IEC 60559:1989 standard floating-point extensions over the ISO/IEC 9899:1999 standard are  
7546 marked.

7547 **NAME**

7548        cosl — cosine function

7549 **SYNOPSIS**

7550        #include &lt;math.h&gt;

7551        long double cosl(long double x);

7552 **DESCRIPTION**7553        Refer to *cos()*.

7554 **NAME**

7555           cpow, cpowf, cpowl — complex power functions

7556 **SYNOPSIS**

7557           #include &lt;complex.h&gt;

7558           double complex cpow(double complex *x*, double complex *y*);7559           float complex cpowf(float complex *x*, float complex *y*);7560           long double complex cpowl(long double complex *x*,7561           long double complex *y*);7562 **DESCRIPTION**7563 **CX**       The functionality described on this reference page is aligned with the ISO C standard. Any  
7564       conflict between the requirements described here and the ISO C standard is unintentional. This  
7565       volume of IEEE Std 1003.1-2001 defers to the ISO C standard.7566       These functions shall compute the complex power function  $x^y$ , with a branch cut for the first  
7567       parameter along the negative real axis.7568 **RETURN VALUE**

7569       These functions shall return the complex power function value.

7570 **ERRORS**

7571       No errors are defined.

7572 **EXAMPLES**

7573       None.

7574 **APPLICATION USAGE**

7575       None.

7576 **RATIONALE**

7577       None.

7578 **FUTURE DIRECTIONS**

7579       None.

7580 **SEE ALSO**7581       *cabs()*, *csqrt()*, the Base Definitions volume of IEEE Std 1003.1-2001, <complex.h>7582 **CHANGE HISTORY**

7583       First released in Issue 6. Derived from the ISO/IEC 9899:1999 standard.

7584 **NAME**

7585 cproj, cprojf, cprojl — complex projection functions

7586 **SYNOPSIS**

7587 #include &lt;complex.h&gt;

7588 double complex cproj(double complex z);

7589 float complex cprojf(float complex z);

7590 long double complex cprojl(long double complex z);

7591 **DESCRIPTION**

7592 **CX** The functionality described on this reference page is aligned with the ISO C standard. Any  
 7593 conflict between the requirements described here and the ISO C standard is unintentional. This  
 7594 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

7595 These functions shall compute a projection of  $z$  onto the Riemann sphere:  $z$  projects to  $z$ , except  
 7596 that all complex infinities (even those with one infinite part and one NaN part) project to  
 7597 positive infinity on the real axis. If  $z$  has an infinite part, then  $cproj(z)$  shall be equivalent to:

7598  $\text{INFINITY} + \text{I} * \text{copysign}(0.0, \text{cimag}(z))$ 7599 **RETURN VALUE**

7600 These functions shall return the value of the projection onto the Riemann sphere.

7601 **ERRORS**

7602 No errors are defined.

7603 **EXAMPLES**

7604 None.

7605 **APPLICATION USAGE**

7606 None.

7607 **RATIONALE**

7608 Two topologies are commonly used in complex mathematics: the complex plane with its  
 7609 continuum of infinities, and the Riemann sphere with its single infinity. The complex plane is  
 7610 better suited for transcendental functions, the Riemann sphere for algebraic functions. The  
 7611 complex types with their multiplicity of infinities provide a useful (though imperfect) model for  
 7612 the complex plane. The  $cproj()$  function helps model the Riemann sphere by mapping all  
 7613 infinities to one, and should be used just before any operation, especially comparisons, that  
 7614 might give spurious results for any of the other infinities. Note that a complex value with one  
 7615 infinite part and one NaN part is regarded as an infinity, not a NaN, because if one part is  
 7616 infinite, the complex value is infinite independent of the value of the other part. For the same  
 7617 reason,  $cabs()$  returns an infinity if its argument has an infinite part and a NaN part.

7618 **FUTURE DIRECTIONS**

7619 None.

7620 **SEE ALSO**7621  $carg()$ ,  $cimag()$ ,  $conj()$ ,  $creal()$ , the Base Definitions volume of IEEE Std 1003.1-2001, <complex.h>7622 **CHANGE HISTORY**

7623 First released in Issue 6. Derived from the ISO/IEC 9899:1999 standard.

7624 **NAME**

7625 creal, crealf, creall — complex real functions

7626 **SYNOPSIS**

7627 #include &lt;complex.h&gt;

7628 double creal(double complex z);

7629 float crealf(float complex z);

7630 long double creall(long double complex z);

7631 **DESCRIPTION**

7632 cx The functionality described on this reference page is aligned with the ISO C standard. Any  
7633 conflict between the requirements described here and the ISO C standard is unintentional. This  
7634 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

7635 These functions shall compute the real part of *z*.7636 **RETURN VALUE**

7637 These functions shall return the real part value.

7638 **ERRORS**

7639 No errors are defined.

7640 **EXAMPLES**

7641 None.

7642 **APPLICATION USAGE**7643 For a variable *z* of type **complex**:7644 `z == creal(z) + cimag(z)*I`7645 **RATIONALE**

7646 None.

7647 **FUTURE DIRECTIONS**

7648 None.

7649 **SEE ALSO**

7650 *carg()*, *cimag()*, *conj()*, *cproj()*, the Base Definitions volume of IEEE Std 1003.1-2001,  
7651 <complex.h>

7652 **CHANGE HISTORY**

7653 First released in Issue 6. Derived from the ISO/IEC 9899:1999 standard.

7654 **NAME**

7655         creat — create a new file or rewrite an existing one

7656 **SYNOPSIS**

7657 OH         #include &lt;sys/stat.h&gt;

7658         #include &lt;fcntl.h&gt;

7659         int creat(const char \*path, mode\_t mode);

7660 **DESCRIPTION**

7661         The function call:

7662         creat(path, mode)

7663         shall be equivalent to:

7664         open(path, O\_WRONLY|O\_CREAT|O\_TRUNC, mode)

7665 **RETURN VALUE**7666         Refer to *open()*.7667 **ERRORS**7668         Refer to *open()*.7669 **EXAMPLES**7670         **Creating a File**7671         The following example creates the file **/tmp/file** with read and write permissions for the file  
7672         owner and read permission for group and others. The resulting file descriptor is assigned to the  
7673         *fd* variable.

7674         #include &lt;fcntl.h&gt;

7675         ...

7676         int fd;

7677         mode\_t mode = S\_IRUSR | S\_IWUSR | S\_IRGRP | S\_IROTH;

7678         char \*filename = "/tmp/file";

7679         ...

7680         fd = creat(filename, mode);

7681         ...

7682 **APPLICATION USAGE**

7683         None.

7684 **RATIONALE**7685         The *creat()* function is redundant. Its services are also provided by the *open()* function. It has  
7686         been included primarily for historical purposes since many existing applications depend on it. It  
7687         is best considered a part of the C binding rather than a function that should be provided in other  
7688         languages.7689 **FUTURE DIRECTIONS**

7690         None.

7691 **SEE ALSO**7692         *open()*, the Base Definitions volume of IEEE Std 1003.1-2001, <fcntl.h>, <sys/stat.h>,  
7693         <sys/types.h>

7694 **CHANGE HISTORY**

7695 First released in Issue 1. Derived from Issue 1 of the SVID.

7696 **Issue 6**

7697 In the SYNOPSIS, the optional include of the `<sys/types.h>` header is removed.

7698 The following new requirements on POSIX implementations derive from alignment with the  
7699 Single UNIX Specification:

- 7700 • The requirement to include `<sys/types.h>` has been removed. Although `<sys/types.h>` was  
7701 required for conforming implementations of previous POSIX specifications, it was not  
7702 required for UNIX applications.

7703 **NAME**7704 crypt — string encoding function (**CRYPT**)7705 **SYNOPSIS**7706 xSI `#include <unistd.h>`7707 `char *crypt(const char *key, const char *salt);`

7708

7709 **DESCRIPTION**7710 The *crypt()* function is a string encoding function. The algorithm is implementation-defined.7711 The *key* argument points to a string to be encoded. The *salt* argument is a string chosen from the  
7712 set:

7713 a b c d e f g h i j k l m n o p q r s t u v w x y z

7714 A B C D E F G H I J K L M N O P Q R S T U V W X Y Z

7715 0 1 2 3 4 5 6 7 8 9 . /

7716 The first two characters of this string may be used to perturb the encoding algorithm.

7717 The return value of *crypt()* points to static data that is overwritten by each call.7718 The *crypt()* function need not be reentrant. A function that is not required to be reentrant is not  
7719 required to be thread-safe.7720 **RETURN VALUE**7721 Upon successful completion, *crypt()* shall return a pointer to the encoded string. The first two  
7722 characters of the returned value shall be those of the *salt* argument. Otherwise, it shall return a  
7723 null pointer and set *errno* to indicate the error.7724 **ERRORS**7725 The *crypt()* function shall fail if:

7726 [ENOSYS] The functionality is not supported on this implementation.

7727 **EXAMPLES**7728 **Encoding Passwords**7729 The following example finds a user database entry matching a particular user name and changes  
7730 the current password to a new password. The *crypt()* function generates an encoded version of  
7731 each password. The first call to *crypt()* produces an encoded version of the old password; that  
7732 encoded password is then compared to the password stored in the user database. The second  
7733 call to *crypt()* encodes the new password before it is stored.7734 The *putpwent()* function, used in the following example, is not part of IEEE Std 1003.1-2001.7735 `#include <unistd.h>`7736 `#include <pwd.h>`7737 `#include <string.h>`7738 `#include <stdio.h>`7739 `...`7740 `int valid_change;`7741 `int pfd; /* Integer for file descriptor returned by open(). */`7742 `FILE *fpfd; /* File pointer for use in putpwent(). */`7743 `struct passwd *p;`7744 `char user[100];`7745 `char oldpasswd[100];`7746 `char newpasswd[100];`

```
7747     char savepasswd[100];
7748     ...
7749     valid_change = 0;
7750     while ((p = getpwent()) != NULL) {
7751         /* Change entry if found. */
7752         if (strcmp(p->pw_name, user) == 0) {
7753             if (strcmp(p->pw_passwd, crypt(oldpasswd, p->pw_passwd)) == 0) {
7754                 strcpy(savepasswd, crypt(newpasswd, user));
7755                 p->pw_passwd = savepasswd;
7756                 valid_change = 1;
7757             }
7758             else {
7759                 fprintf(stderr, "Old password is not valid\n");
7760             }
7761         }
7762         /* Put passwd entry into ptmp. */
7763         putpwent(p, fpfd);
7764     }
```

7765 **APPLICATION USAGE**

7766 The values returned by this function need not be portable among XSI-conformant systems.

7767 **RATIONALE**

7768 None.

7769 **FUTURE DIRECTIONS**

7770 None.

7834 **NAME**

7835       csinl — complex sine functions

7836 **SYNOPSIS**

7837       #include &lt;complex.h&gt;

7838       long double complex csinl(long double complex z);

7839 **DESCRIPTION**7840       Refer to *csin()*.

7841 **NAME**

7842 csqrt, csqrtf, csqrtl — complex square root functions

7843 **SYNOPSIS**

7844 #include &lt;complex.h&gt;

7845 double complex csqrt(double complex z);

7846 float complex csqrtf(float complex z);

7847 long double complex csqrtl(long double complex z);

7848 **DESCRIPTION**

7849 **CX** The functionality described on this reference page is aligned with the ISO C standard. Any  
7850 conflict between the requirements described here and the ISO C standard is unintentional. This  
7851 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

7852 These functions shall compute the complex square root of  $z$ , with a branch cut along the  
7853 negative real axis.

7854 **RETURN VALUE**

7855 These functions shall return the complex square root value, in the range of the right half-plane  
7856 (including the imaginary axis).

7857 **ERRORS**

7858 No errors are defined.

7859 **EXAMPLES**

7860 None.

7861 **APPLICATION USAGE**

7862 None.

7898           First released in Issue 6. Derived from the ISO/IEC 9899:1999 standard.

7899 **NAME**

7900 ctanh, ctanhf, ctanhl — complex hyperbolic tangent functions

7901 **SYNOPSIS**

7902 #include &lt;complex.h&gt;

7903 double complex ctanh(double complex z);

7904 float complex ctanhf(float complex z);

7905 long double complex ctanhl(long double complex z);

7906 **DESCRIPTION**7907 cx The functionality described on this reference page is aligned with the ISO C standard. Any  
7908 conflict between the requirements described here and the ISO C standard is unintentional. This  
7909 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.7910 These functions shall compute the complex hyperbolic tangent of  $z$ .7911 **RETURN VALUE**

7912 These functions shall return the complex hyperbolic tangent value.

7913 **ERRORS**

7914 No errors are defined.

7915 **EXAMPLES**

7916 None.

7917 **APPLICATION USAGE**

7918 None.

7919 **RATIONALE**

7920 None.

7921 **FUTURE DIRECTIONS**

7922 None.

7923 **SEE ALSO**7924 *catanh()*, the Base Definitions volume of IEEE Std 1003.1-2001, <complex.h>7925 **CHANGE HISTORY**

7926 First released in Issue 6. Derived from the ISO/IEC 9899:1999 standard.

7927 **NAME**

7928           ctanl — complex tangent functions

7929 **SYNOPSIS**

7930           #include &lt;complex.h&gt;

7931           long double complex ctanl(long double complex z);

7932 **DESCRIPTION**7933           Refer to *ctan()*.

7934 **NAME**7935 `ctermid` — generate a pathname for the controlling terminal7936 **SYNOPSIS**7937 `cx` `#include <stdio.h>`7938 `char *ctermid(char *s);`

7939

7940 **DESCRIPTION**7941 The `ctermid()` function shall generate a string that, when used as a pathname, refers to the  
7942 current controlling terminal for the current process. If `ctermid()` returns a pathname, access to the  
7943 file is not guaranteed.7944 If the application uses any of the `_POSIX_THREAD_SAFE_FUNCTIONS` or `_POSIX_THREADS`  
7945 functions, it shall ensure that the `ctermid()` function is called with a non-NULL parameter.7946 **RETURN VALUE**7947 If `s` is a null pointer, the string shall be generated in an area that may be static (and therefore may  
7948 be overwritten by each call), the address of which shall be returned. Otherwise, `s` is assumed to  
7949 point to a character array of at least `L_ctermid` bytes; the string is placed in this array and the  
7950 value of `s` shall be returned. The symbolic constant `L_ctermid` is defined in `<stdio.h>`, and shall  
7951 have a value greater than 0.7952 The `ctermid()` function shall return an empty string if the pathname that would refer to the  
7953 controlling terminal cannot be determined, or if the function is unsuccessful.7954 **ERRORS**

7955 No errors are defined.

7956 **EXAMPLES**7957 **Determining the Controlling Terminal for the Current Process**7958 The following example returns a pointer to a string that identifies the controlling terminal for the  
7959 current process. The pathname for the terminal is stored in the array pointed to by the `ptr`  
7960 argument, which has a size of `L_ctermid` bytes, as indicated by the `term` argument.7961 `#include <stdio.h>`7962 `...`7963 `char term[L_ctermid];`7964 `char *ptr;`7965 `ptr = ctermid(term);`7966 **APPLICATION USAGE**7967 The difference between `ctermid()` and `ttyname()` is that `ttyname()` must be handed a file  
7968 descriptor and return a path of the terminal associated with that file descriptor, while `ctermid()`  
7969 returns a string (such as `"/dev/tty"`) that refers to the current controlling terminal if used as a  
7970 pathname.7971 **RATIONALE**7972 `L_ctermid` must be defined appropriately for a given implementation and must be greater than  
7973 zero so that array declarations using it are accepted by the compiler. The value includes the  
7974 terminating null byte.7975 Conforming applications that use threads cannot call `ctermid()` with `NULL` as the parameter if  
7976 either `_POSIX_THREAD_SAFE_FUNCTIONS` or `_POSIX_THREADS` is defined. If `s` is not  
7977 `NULL`, the `ctermid()` function generates a string that, when used as a pathname, refers to the

7978 current controlling terminal for the current process. If *s* is NULL, the return value of *ctermid()* is  
7979 undefined.

7980 There is no additional burden on the programmer—changing to use a hypothetical thread-safe  
7981 version of *ctermid()* along with allocating a buffer is more of a burden than merely allocating a  
7982 buffer. Application code should not assume that the returned string is short, as some  
7983 implementations have more than two pathname components before reaching a logical device  
7984 name.

7985 **FUTURE DIRECTIONS**

7986 None.

7987 **SEE ALSO**

7988 *ttyname()*, the Base Definitions volume of IEEE Std 1003.1-2001, <**stdio.h**>

7989 **CHANGE HISTORY**

7990 First released in Issue 1. Derived from Issue 1 of the SVID.

7991 **Issue 5**

7992 The DESCRIPTION is updated for alignment with the POSIX Threads Extension.

7993 **Issue 6**

7994 The DESCRIPTION is updated to avoid use of the term “must” for application requirements.

7995 **NAME**

7996 ctime, ctime\_r — convert a time value to a date and time string

7997 **SYNOPSIS**

7998 #include &lt;time.h&gt;

7999 char \*ctime(const time\_t \*clock);

8000 TSF char \*ctime\_r(const time\_t \*clock, char \*buf);

8001

8002 **DESCRIPTION**8003 CX For *ctime()*: The functionality described on this reference page is aligned with the ISO C  
8004 standard. Any conflict between the requirements described here and the ISO C standard is  
8005 unintentional. This volume of IEEE Std 1003.1-2001 defers to the ISO C standard.8006 The *ctime()* function shall convert the time pointed to by *clock*, representing time in seconds  
8007 since the Epoch, to local time in the form of a string. It shall be equivalent to:

8008 asctime(localtime(clock))

8009 CX The *asctime()*, *ctime()*, *gmtime()*, and *localtime()* functions shall return values in one of two static  
8010 objects: a broken-down time structure and an array of **char**. Execution of any of the functions  
8011 may overwrite the information returned in either of these objects by any of the other functions.8012 The *ctime()* function need not be reentrant. A function that is not required to be reentrant is not  
8013 required to be thread-safe.8014 TSF The *ctime\_r()* function shall convert the calendar time pointed to by *clock* to local time in exactly  
8015 the same form as *ctime()* and put the string into the array pointed to by *buf* (which shall be at  
8016 least 26 bytes in size) and return *buf*.8017 Unlike *ctime()*, the thread-safe version *ctime\_r()* is not required to set *tzname*.8018 **RETURN VALUE**8019 The *ctime()* function shall return the pointer returned by *asctime()* with that broken-down time  
8020 as an argument.8021 TSF Upon successful completion, *ctime\_r()* shall return a pointer to the string pointed to by *buf*.  
8022 When an error is encountered, a null pointer shall be returned.8023 **ERRORS**

8024 No errors are defined.

8025 **EXAMPLES**

8026 None.

8027 **APPLICATION USAGE**8028 Values for the broken-down time structure can be obtained by calling *gmtime()* or *localtime()*.  
8029 The *ctime()* function is included for compatibility with older implementations, and does not  
8030 support localized date and time formats. Applications should use the *strptime()* function to  
8031 achieve maximum portability.8032 The *ctime\_r()* function is thread-safe and shall return values in a user-supplied buffer instead of  
8033 possibly using a static data area that may be overwritten by each call.8034 **RATIONALE**

8035 None.

8036 **FUTURE DIRECTIONS**

8037 None.

8038 **SEE ALSO**8039 *asctime()*, *clock()*, *difftime()*, *gmtime()*, *localtime()*, *mktime()*, *strftime()*, *strptime()*, *time()*, *utime()*,  
8040 the Base Definitions volume of IEEE Std 1003.1-2001, <**time.h**>8041 **CHANGE HISTORY**

8042 First released in Issue 1. Derived from Issue 1 of the SVID.

8043 **Issue 5**8044 Normative text previously in the APPLICATION USAGE section is moved to the  
8045 DESCRIPTION.8046 The *ctime\_r()* function is included for alignment with the POSIX Threads Extension.8047 A note indicating that the *ctime()* function need not be reentrant is added to the DESCRIPTION.8048 **Issue 6**

8049 Extensions beyond the ISO C standard are marked.

8050 In the DESCRIPTION, the note about reentrancy is expanded to cover thread-safety.

8051 The APPLICATION USAGE section is updated to include a note on the thread-safe function and  
8052 its avoidance of possibly using a static data area.

8053 **NAME**

8054 daylight — daylight savings time flag

8055 **SYNOPSIS**

8056 xSI #include &lt;time.h&gt;

8057 extern int daylight;

8058

8059 **DESCRIPTION**8060 Refer to *tzset()*.

## 8061 NAME

8062 dbm\_clearerr, dbm\_close, dbm\_delete, dbm\_error, dbm\_fetch, dbm\_firstkey, dbm\_nextkey,  
8063 dbm\_open, dbm\_store — database functions

## 8064 SYNOPSIS

```
8065 xSI #include <ndbm.h>
8066
8066 int dbm_clearerr(DBM *db);
8067 void dbm_close(DBM *db);
8068 int dbm_delete(DBM *db, datum key);
8069 int dbm_error(DBM *db);
8070 datum dbm_fetch(DBM *db, datum key);
8071 datum dbm_firstkey(DBM *db);
8072 datum dbm_nextkey(DBM *db);
8073 DBM *dbm_open(const char *file, int open_flags, mode_t file_mode);
8074 int dbm_store(DBM *db, datum key, datum content, int store_mode);
8075
```

## 8076 DESCRIPTION

8077 These functions create, access, and modify a database.

8078 A **datum** consists of at least two members, *dptr* and *dsize*. The *dptr* member points to an object  
8079 that is *dsize* bytes in length. Arbitrary binary data, as well as character strings, may be stored in  
8080 the object pointed to by *dptr*.

8081 The database is stored in two files. One file is a directory containing a bitmap of keys and has  
8082 **.dir** as its suffix. The second file contains all data and has **.pag** as its suffix.

8083 The *dbm\_open()* function shall open a database. The *file* argument to the function is the  
8084 pathname of the database. The function opens two files named *file.dir* and *file.pag*. The  
8085 *open\_flags* argument has the same meaning as the *flags* argument of *open()* except that a database  
8086 opened for write-only access opens the files for read and write access and the behavior of the  
8087 O\_APPEND flag is unspecified. The *file\_mode* argument has the same meaning as the third  
8088 argument of *open()*.

8089 The *dbm\_close()* function shall close a database. The application shall ensure that argument *db* is  
8090 a pointer to a **dbm** structure that has been returned from a call to *dbm\_open()*.

8091 These database functions shall support an internal block size large enough to support  
8092 key/content pairs of at least 1 023 bytes.

8093 The *dbm\_fetch()* function shall read a record from a database. The argument *db* is a pointer to a  
8094 database structure that has been returned from a call to *dbm\_open()*. The argument *key* is a  
8095 **datum** that has been initialized by the application to the value of the key that matches the key of  
8096 the record the program is fetching.

8097 The *dbm\_store()* function shall write a record to a database. The argument *db* is a pointer to a  
8098 database structure that has been returned from a call to *dbm\_open()*. The argument *key* is a  
8099 **datum** that has been initialized by the application to the value of the key that identifies (for  
8100 subsequent reading, writing, or deleting) the record the application is writing. The argument  
8101 *content* is a **datum** that has been initialized by the application to the value of the record the  
8102 program is writing. The argument *store\_mode* controls whether *dbm\_store()* replaces any pre-  
8103 existing record that has the same key that is specified by the *key* argument. The application shall  
8104 set *store\_mode* to either DBM\_INSERT or DBM\_REPLACE. If the database contains a record that  
8105 matches the *key* argument and *store\_mode* is DBM\_REPLACE, the existing record shall be  
8106 replaced with the new record. If the database contains a record that matches the *key* argument  
8107 and *store\_mode* is DBM\_INSERT, the existing record shall be left unchanged and the new record

8108 ignored. If the database does not contain a record that matches the *key* argument and *store\_mode*  
8109 is either DBM\_INSERT or DBM\_REPLACE, the new record shall be inserted in the database.

8110 If the sum of a key/content pair exceeds the internal block size, the result is unspecified.  
8111 Moreover, the application shall ensure that all key/content pairs that hash together fit on a  
8112 single block. The *dbm\_store()* function shall return an error in the event that a disk block fills  
8113 with inseparable data.

8114 The *dbm\_delete()* function shall delete a record and its key from the database. The argument *db* is  
8115 a pointer to a database structure that has been returned from a call to *dbm\_open()*. The argument  
8116 *key* is a **datum** that has been initialized by the application to the value of the key that identifies  
8117 the record the program is deleting.

8118 The *dbm\_firstkey()* function shall return the first key in the database. The argument *db* is a  
8119 pointer to a database structure that has been returned from a call to *dbm\_open()*.

8120 The *dbm\_nextkey()* function shall return the next key in the database. The argument *db* is a  
8121 pointer to a database structure that has been returned from a call to *dbm\_open()*. The application  
8122 shall ensure that the *dbm\_firstkey()* function is called before calling *dbm\_nextkey()*. Subsequent  
8123 calls to *dbm\_nextkey()* return the next key until all of the keys in the database have been  
8124 returned.

8125 The *dbm\_error()* function shall return the error condition of the database. The argument *db* is a  
8126 pointer to a database structure that has been returned from a call to *dbm\_open()*.

8127 The *dbm\_clearerr()* function shall clear the error condition of the database. The argument *db* is a  
8128 pointer to a database structure that has been returned from a call to *dbm\_open()*.

8129 The *dptr* pointers returned by these functions may point into static storage that may be changed  
8130 by subsequent calls.

8131 These functions need not be reentrant. A function that is not required to be reentrant is not  
8132 required to be thread-safe.

### 8133 RETURN VALUE

8134 The *dbm\_store()* and *dbm\_delete()* functions shall return 0 when they succeed and a negative  
8135 value when they fail.

8136 The *dbm\_store()* function shall return 1 if it is called with a *flags* value of DBM\_INSERT and the  
8137 function finds an existing record with the same key.

8138 The *dbm\_error()* function shall return 0 if the error condition is not set and return a non-zero  
8139 value if the error condition is set.

8140 The return value of *dbm\_clearerr()* is unspecified.

8141 The *dbm\_firstkey()* and *dbm\_nextkey()* functions shall return a key **datum**. When the end of the  
8142 database is reached, the *dptr* member of the key is a null pointer. If an error is detected, the *dptr*  
8143 member of the key shall be a null pointer and the error condition of the database shall be set.

8144 The *dbm\_fetch()* function shall return a content **datum**. If no record in the database matches the  
8145 key or if an error condition has been detected in the database, the *dptr* member of the content  
8146 shall be a null pointer.

8147 The *dbm\_open()* function shall return a pointer to a database structure. If an error is detected  
8148 during the operation, *dbm\_open()* shall return a **(DBM \*)0**.

8149 **ERRORS**

8150 No errors are defined.

8151 **EXAMPLES**

8152 None.

8153 **APPLICATION USAGE**

8154 The following code can be used to traverse the database:

```
8155 for(key = dbm_firstkey(db); key.dptr != NULL; key = dbm_nextkey(db))
```

8156 The *dbm\_\** functions provided in this library should not be confused in any way with those of a  
8157 general-purpose database management system. These functions do not provide for multiple  
8158 search keys per entry, they do not protect against multi-user access (in other words they do not  
8159 lock records or files), and they do not provide the many other useful database functions that are  
8160 found in more robust database management systems. Creating and updating databases by use of  
8161 these functions is relatively slow because of data copies that occur upon hash collisions. These  
8162 functions are useful for applications requiring fast lookup of relatively static information that is  
8163 to be indexed by a single key.

8164 Note that a strictly conforming application is extremely limited by these functions: since there is  
8165 no way to determine that the keys in use do not all hash to the same value (although that would  
8166 be rare), a strictly conforming application cannot be guaranteed that it can store more than one  
8167 block's worth of data in the database. As long as a key collision does not occur, additional data  
8168 may be stored, but because there is no way to determine whether an error is due to a key  
8169 collision or some other error condition (*dbm\_error()* being effectively a Boolean), once an error is  
8170 detected, the application is effectively limited to guessing what the error might be if it wishes to  
8171 continue using these functions.

8172 The *dbm\_delete()* function need not physically reclaim file space, although it does make it  
8173 available for reuse by the database.

8174 After calling *dbm\_store()* or *dbm\_delete()* during a pass through the keys by *dbm\_firstkey()* and  
8175 *dbm\_nextkey()*, the application should reset the database by calling *dbm\_firstkey()* before again  
8176 calling *dbm\_nextkey()*. The contents of these files are unspecified and may not be portable.

8177 **RATIONALE**

8178 None.

8179 **FUTURE DIRECTIONS**

8180 None.

8181 **SEE ALSO**

8182 *open()*, the Base Definitions volume of IEEE Std 1003.1-2001, <**ndbm.h**>

8183 **CHANGE HISTORY**

8184 First released in Issue 4, Version 2.

8185 **Issue 5**

8186 Moved from X/OPEN UNIX extension to BASE.

8187 Normative text previously in the APPLICATION USAGE section is moved to the  
8188 DESCRIPTION.

8189 A note indicating that these functions need not be reentrant is added to the DESCRIPTION.

8190 **Issue 6**

8191 The DESCRIPTION is updated to avoid use of the term “must” for application requirements.

8192 **NAME**

8193         difftime — compute the difference between two calendar time values

8194 **SYNOPSIS**

8195         #include <time.h>

8196         double difftime(time\_t *time1*, time\_t *time0*);

8197 **DESCRIPTION**

8198 **CX**         The functionality described on this reference page is aligned with the ISO C standard. Any  
8199 conflict between the requirements described here and the ISO C standard is unintentional. This  
8200 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

8201         The *difftime()* function shall compute the difference between two calendar times (as returned by  
8202 *time()*): *time1*– *time0*.

8203 **RETURN VALUE**

8204         The *difftime()* function shall return the difference expressed in seconds as a type **double**.

8205 **ERRORS**

8206         No errors are defined.

8207 **EXAMPLES**

8208         None.

8209 **APPLICATION USAGE**

8210         None.

8211 **RATIONALE**

8212         None.

8213 **FUTURE DIRECTIONS**

8214         None.

8215 **SEE ALSO**

8216         *asctime()*, *clock()*, *ctime()*, *gmtime()*, *localtime()*, *mktime()*, *strftime()*, *strptime()*, *time()*, *utime()*,  
8217 the Base Definitions volume of IEEE Std 1003.1-2001, <**time.h**>

8218 **CHANGE HISTORY**

8219         First released in Issue 4. Derived from the ISO C standard.

8220 **NAME**

8221           dirname — report the parent directory name of a file pathname

8222 **SYNOPSIS**

8223 XSI       #include &lt;libgen.h&gt;

8224           char \*dirname(char \*path);

8225

8226 **DESCRIPTION**8227           The *dirname()* function shall take a pointer to a character string that contains a pathname, and  
8228           return a pointer to a string that is a pathname of the parent directory of that file. Trailing '/'  
8229           characters in the path are not counted as part of the path.8230           If *path* does not contain a '/', then *dirname()* shall return a pointer to the string ".". If *path* is a  
8231           null pointer or points to an empty string, *dirname()* shall return a pointer to the string ".".8232           The *dirname()* function need not be reentrant. A function that is not required to be reentrant is  
8233           not required to be thread-safe.8234 **RETURN VALUE**8235           The *dirname()* function shall return a pointer to a string that is the parent directory of *path*. If  
8236           *path* is a null pointer or points to an empty string, a pointer to a string "." is returned.8237           The *dirname()* function may modify the string pointed to by *path*, and may return a pointer to  
8238           static storage that may then be overwritten by subsequent calls to *dirname()*.8239 **ERRORS**

8240           No errors are defined.

8241 **EXAMPLES**8242           The following code fragment reads a pathname, changes the current working directory to the  
8243           parent directory, and opens the file.8244           char path[PATH\_MAX], \*pathcopy;  
8245           int fd;  
8246           fgets(path, PATH\_MAX, stdin);  
8247           pathcopy = strdup(path);  
8248           chdir(dirname(pathcopy));  
8249           fd = open(basename(path), O\_RDONLY);8250 **Sample Input and Output Strings for dirname()**8251           In the following table, the input string is the value pointed to by *path*, and the output string is  
8252           the return value of the *dirname()* function.

Input String	Output String
"/usr/lib"	"/usr"
"/usr/"	"/"
"usr"	."
"/"	"/"
."	."
".."	."

8260 **Changing the Current Directory to the Parent Directory**

8261 The following program fragment reads a pathname, changes the current working directory to  
8262 the parent directory, and opens the file.

```
8263 #include <unistd.h>
8264 #include <limits.h>
8265 #include <stdio.h>
8266 #include <fcntl.h>
8267 #include <string.h>
8268 #include <libgen.h>
8269 ...
8270 char path[PATH_MAX], *pathcopy;
8271 int fd;
8272 ...
8273 fgets(path, PATH_MAX, stdin);
8274 pathcopy = strdup(path);
8275 chdir(dirname(pathcopy));
8276 fd = open(basename(path), O_RDONLY);
```

8277 **APPLICATION USAGE**

8278 The *dirname()* and *basename()* functions together yield a complete pathname. The expression  
8279 *dirname(path)* obtains the pathname of the directory where *basename(path)* is found.

8280 Since the meaning of the leading `"/"` is implementation-defined, *dirname("/foo)* may return  
8281 either `"/"` or `'/'` (but nothing else).

8282 **RATIONALE**

8283 None.

8284 **FUTURE DIRECTIONS**

8285 None.

8286 **SEE ALSO**

8287 *basename()*, the Base Definitions volume of IEEE Std 1003.1-2001, `<libgen.h>`

8288 **CHANGE HISTORY**

8289 First released in Issue 4, Version 2.

8290 **Issue 5**

8291 Moved from X/OPEN UNIX extension to BASE.

8292 Normative text previously in the APPLICATION USAGE section is moved to the  
8293 DESCRIPTION.

8294 A note indicating that this function need not be reentrant is added to the DESCRIPTION.

8295 **NAME**8296 `div` — compute the quotient and remainder of an integer division8297 **SYNOPSIS**8298 `#include <stdlib.h>`8299 `div_t div(int numer, int denom);`8300 **DESCRIPTION**

8301 `CX` The functionality described on this reference page is aligned with the ISO C standard. Any  
8302 conflict between the requirements described here and the ISO C standard is unintentional. This  
8303 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

8304 The `div()` function shall compute the quotient and remainder of the division of the numerator  
8305 `numer` by the denominator `denom`. If the division is inexact, the resulting quotient is the integer  
8306 of lesser magnitude that is the nearest to the algebraic quotient. If the result cannot be  
8307 represented, the behavior is undefined; otherwise, `quot*denom+rem` shall equal `numer`.

8308 **RETURN VALUE**

8309 The `div()` function shall return a structure of type `div_t`, comprising both the quotient and the  
8310 remainder. The structure includes the following members, in any order:

8311 `int quot; /* quotient */`8312 `int rem; /* remainder */`8313 **ERRORS**

8314 No errors are defined.

8315 **EXAMPLES**

8316 None.

8317 **APPLICATION USAGE**

8318 None.

8326 First released in Issue 4. Derived from the ISO C standard.

8327 **NAME**8328           dldclose — close a *dlopen()* object8329 **SYNOPSIS**

8330 XSI       #include &lt;dldfcn.h&gt;

8331           int dldclose(void \*handle);

8332

8333 **DESCRIPTION**8334           The *dldclose()* function shall inform the system that the object referenced by a *handle* returned  
8335 from a previous *dlopen()* invocation is no longer needed by the application.8336           The use of *dldclose()* reflects a statement of intent on the part of the process, but does not create  
8337 any requirement upon the implementation, such as removal of the code or symbols referenced  
8338 by *handle*. Once an object has been closed using *dldclose()* an application should assume that its  
8339 symbols are no longer available to *dlsym()*. All objects loaded automatically as a result of  
8340 invoking *dlopen()* on the referenced object shall also be closed if this is the last reference to it.8341           Although a *dldclose()* operation is not required to remove structures from an address space,  
8342 neither is an implementation prohibited from doing so. The only restriction on such a removal is  
8343 that no object shall be removed to which references have been relocated, until or unless all such  
8344 references are removed. For instance, an object that had been loaded with a *dlopen()* operation  
8345 specifying the RTLD\_GLOBAL flag might provide a target for dynamic relocations performed in  
8346 the processing of other objects—in such environments, an application may assume that no  
8347 relocation, once made, shall be undone or remade unless the object requiring the relocation has  
8348 itself been removed.8349 **RETURN VALUE**8350           If the referenced object was successfully closed, *dldclose()* shall return 0. If the object could not be  
8351 closed, or if *handle* does not refer to an open object, *dldclose()* shall return a non-zero value. More  
8352 detailed diagnostic information shall be available through *dlderror()*.8353 **ERRORS**

8354           No errors are defined.

8355 **EXAMPLES**8356           The following example illustrates use of *dlopen()* and *dldclose()*:8357           ...  
8358           /\* Open a dynamic library and then close it ... \*/  
8359           #include <dldfcn.h>  
8360           void \*mylib;  
8361           int eret;  
8362           mylib = dlopen("mylib.so", RTLD\_LOCAL | RTLD\_LAZY);  
8363           ...  
8364           eret = dldclose(mylib);  
8365           ...8366 **APPLICATION USAGE**8367           A conforming application should employ a *handle* returned from a *dlopen()* invocation only  
8368 within a given scope bracketed by the *dlopen()* and *dldclose()* operations. Implementations are  
8369 free to use reference counting or other techniques such that multiple calls to *dlopen()* referencing  
8370 the same object may return the same object for *handle*. Implementations are also free to reuse a  
8371 *handle*. For these reasons, the value of a *handle* must be treated as an opaque object by the  
8372 application, used only in calls to *dlsym()* and *dldclose()*.

8373 **RATIONALE**

8374       None.

8375 **FUTURE DIRECTIONS**

8376       None.

8377 **SEE ALSO**8378       *derror()*, *dlopen()*, *dlsym()*, the Base Definitions volume of IEEE Std 1003.1-2001, <dlfcn.h>8379 **CHANGE HISTORY**

8380       First released in Issue 5.

8381 **Issue 6**8382       The DESCRIPTION is updated to say that the referenced object is closed “if this is the last  
8383       reference to it”.

8384 **NAME**8385 `dlderror` — get diagnostic information8386 **SYNOPSIS**8387 XSI `#include <dldfcn.h>`8388 `char *dlderror(void);`

8389

8390 **DESCRIPTION**

8391 The `dlderror()` function shall return a null-terminated character string (with no trailing <newline>)  
8392 that describes the last error that occurred during dynamic linking processing. If no dynamic  
8393 linking errors have occurred since the last invocation of `dlderror()`, `dlderror()` shall return NULL.  
8394 Thus, invoking `dlderror()` a second time, immediately following a prior invocation, shall result in  
8395 NULL being returned.

8396 The `dlderror()` function need not be reentrant. A function that is not required to be reentrant is not  
8397 required to be thread-safe.

8398 **RETURN VALUE**

8399 If successful, `dlderror()` shall return a null-terminated character string; otherwise, NULL shall be  
8400 returned.

8401 **ERRORS**

8402 No errors are defined.

8403 **EXAMPLES**

8404 The following example prints out the last dynamic linking error:

```
8405 ...  
8406 #include <dldfcn.h>  
8407 char *errstr;  
8408 errstr = dlderror();  
8409 if (errstr != NULL)  
8410 printf ("A dynamic linking error occurred: (%s)\n", errstr);  
8411 ...
```

8412 **APPLICATION USAGE**

8413 The messages returned by `dlderror()` may reside in a static buffer that is overwritten on each call  
8414 to `dlderror()`. Application code should not write to this buffer. Programs wishing to preserve an  
8415 error message should make their own copies of that message. Depending on the application  
8416 environment with respect to asynchronous execution events, such as signals or other  
8417 asynchronous computation sharing the address space, conforming applications should use a  
8418 critical section to retrieve the error pointer and buffer.

8419 **RATIONALE**

8420 None.

8421 **FUTURE DIRECTIONS**

8422 None.

8423 **SEE ALSO**8424 `dldclose()`, `dldopen()`, `dldsym()`, the Base Definitions volume of IEEE Std 1003.1-2001, <dldfcn.h>

8425 **CHANGE HISTORY**

8426 First released in Issue 5.

8427 **Issue 6**

8428 In the DESCRIPTION the note about reentrancy and thread-safety is added.

8429 **NAME**8430 `dlopen` — gain access to an executable object file8431 **SYNOPSIS**8432 XSI `#include <dlfcn.h>`8433 `void *dlopen(const char *file, int mode);`

8434

8435 **DESCRIPTION**

8436 The `dlopen()` function shall make an executable object file specified by *file* available to the calling  
 8437 program. The class of files eligible for this operation and the manner of their construction are  
 8438 implementation-defined, though typically such files are executable objects such as shared  
 8439 libraries, relocatable files, or programs. Note that some implementations permit the construction  
 8440 of dependencies between such objects that are embedded within files. In such cases, a `dlopen()`  
 8441 operation shall load such dependencies in addition to the object referenced by *file*.  
 8442 Implementations may also impose specific constraints on the construction of programs that can  
 8443 employ `dlopen()` and its related services.

8444 A successful `dlopen()` shall return a *handle* which the caller may use on subsequent calls to  
 8445 `dlsym()` and `dlclose()`. The value of this *handle* should not be interpreted in any way by the caller.

8446 The *file* argument is used to construct a pathname to the object file. If *file* contains a slash  
 8447 character, the *file* argument is used as the pathname for the file. Otherwise, *file* is used in an  
 8448 implementation-defined manner to yield a pathname.

8449 If the value of *file* is 0, `dlopen()` shall provide a *handle* on a global symbol object. This object shall  
 8450 provide access to the symbols from an ordered set of objects consisting of the original program  
 8451 image file, together with any objects loaded at program start-up as specified by that process  
 8452 image file (for example, shared libraries), and the set of objects loaded using a `dlopen()` operation  
 8453 together with the `RTLD_GLOBAL` flag. As the latter set of objects can change during execution,  
 8454 the set identified by *handle* can also change dynamically.

8455 Only a single copy of an object file is brought into the address space, even if `dlopen()` is invoked  
 8456 multiple times in reference to the file, and even if different pathnames are used to reference the  
 8457 file.

8458 The *mode* parameter describes how `dlopen()` shall operate upon *file* with respect to the processing  
 8459 of relocations and the scope of visibility of the symbols provided within *file*. When an object is  
 8460 brought into the address space of a process, it may contain references to symbols whose  
 8461 addresses are not known until the object is loaded. These references shall be relocated before the  
 8462 symbols can be accessed. The *mode* parameter governs when these relocations take place and  
 8463 may have the following values:

8464 **RTLD\_LAZY** Relocations shall be performed at an implementation-defined time,  
 8465 ranging from the time of the `dlopen()` call until the first reference to a  
 8466 given symbol occurs. Specifying `RTLD_LAZY` should improve  
 8467 performance on implementations supporting dynamic symbol binding as  
 8468 a process may not reference all of the functions in any given object. And,  
 8469 for systems supporting dynamic symbol resolution for normal process  
 8470 execution, this behavior mimics the normal handling of process  
 8471 execution.

8472 **RTLD\_NOW** All necessary relocations shall be performed when the object is first  
 8473 loaded. This may waste some processing if relocations are performed for  
 8474 functions that are never referenced. This behavior may be useful for  
 8475 applications that need to know as soon as an object is loaded that all

8476 symbols referenced during execution are available.

8477 Any object loaded by *dlopen()* that requires relocations against global symbols can reference the  
 8478 symbols in the original process image file, any objects loaded at program start-up, from the  
 8479 object itself as well as any other object included in the same *dlopen()* invocation, and any objects  
 8480 that were loaded in any *dlopen()* invocation and which specified the RTLD\_GLOBAL flag. To  
 8481 determine the scope of visibility for the symbols loaded with a *dlopen()* invocation, the *mode*  
 8482 parameter should be a bitwise-inclusive OR with one of the following values:

8483 RTLD\_GLOBAL The object's symbols shall be made available for the relocation processing  
 8484 of any other object. In addition, symbol lookup using *dlopen(0, mode)* and  
 8485 an associated *dlsym()* allows objects loaded with this *mode* to be searched.

8486 RTLD\_LOCAL The object's symbols shall not be made available for the relocation  
 8487 processing of any other object.

8488 If neither RTLD\_GLOBAL nor RTLD\_LOCAL are specified, then an implementation-defined  
 8489 default behavior shall be applied.

8490 If a *file* is specified in multiple *dlopen()* invocations, *mode* is interpreted at each invocation. Note,  
 8491 however, that once RTLD\_NOW has been specified all relocations shall have been completed  
 8492 rendering further RTLD\_NOW operations redundant and any further RTLD\_LAZY operations  
 8493 irrelevant. Similarly, note that once RTLD\_GLOBAL has been specified the object shall maintain  
 8494 the RTLD\_GLOBAL status regardless of any previous or future specification of RTLD\_LOCAL,  
 8495 as long as the object remains in the address space (see *dlclose()*).

8496 Symbols introduced into a program through calls to *dlopen()* may be used in relocation  
 8497 activities. Symbols so introduced may duplicate symbols already defined by the program or  
 8498 previous *dlopen()* operations. To resolve the ambiguities such a situation might present, the  
 8499 resolution of a symbol reference to symbol definition is based on a symbol resolution order. Two  
 8500 such resolution orders are defined: *load* or *dependency* ordering. Load order establishes an  
 8501 ordering among symbol definitions, such that the definition first loaded (including definitions  
 8502 from the image file and any dependent objects loaded with it) has priority over objects added  
 8503 later (via *dlopen()*). Load ordering is used in relocation processing. Dependency ordering uses a  
 8504 breadth-first order starting with a given object, then all of its dependencies, then any dependents  
 8505 of those, iterating until all dependencies are satisfied. With the exception of the global symbol  
 8506 object obtained via a *dlopen()* operation on a *file* of 0, dependency ordering is used by the  
 8507 *dlsym()* function. Load ordering is used in *dlsym()* operations upon the global symbol object.

8508 When an object is first made accessible via *dlopen()* it and its dependent objects are added in  
 8509 dependency order. Once all the objects are added, relocations are performed using load order.  
 8510 Note that if an object or its dependencies had been previously loaded, the load and dependency  
 8511 orders may yield different resolutions.

8512 The symbols introduced by *dlopen()* operations and available through *dlsym()* are at a minimum  
 8513 those which are exported as symbols of global scope by the object. Typically such symbols shall  
 8514 be those that were specified in (for example) C source code as having *extern* linkage. The precise  
 8515 manner in which an implementation constructs the set of exported symbols for a *dlopen()* object  
 8516 is specified by that implementation.

8517 **RETURN VALUE**

8518 If *file* cannot be found, cannot be opened for reading, is not of an appropriate object format for  
 8519 processing by *dlopen()*, or if an error occurs during the process of loading *file* or relocating its  
 8520 symbolic references, *dlopen()* shall return NULL. More detailed diagnostic information shall be  
 8521 available through *dlerror()*.

8522 **ERRORS**

8523 No errors are defined.

8524 **EXAMPLES**

8525 None.

8526 **APPLICATION USAGE**

8527 None.

8528 **RATIONALE**

8529 None.

8534 **CHANGE HISTORY**

8535 First released in Issue 5.

8536 **NAME**8537 dlsym — obtain the address of a symbol from a *dlopen()* object8538 **SYNOPSIS**8539 XSI 

```
#include <dlfcn.h>
```

8540 

```
void *dlsym(void *restrict handle, const char *restrict name);
```

8541

8542 **DESCRIPTION**

8543 The *dlsym()* function shall obtain the address of a symbol defined within an object made  
 8544 accessible through a *dlopen()* call. The *handle* argument is the value returned from a call to  
 8545 *dlopen()* (and which has not since been released via a call to *dlclose()*), and *name* is the symbol's  
 8546 name as a character string.

8547 The *dlsym()* function shall search for the named symbol in all objects loaded automatically as a  
 8548 result of loading the object referenced by *handle* (see *dlopen()*). Load ordering is used in *dlsym()*  
 8549 operations upon the global symbol object. The symbol resolution algorithm used shall be  
 8550 dependency order as described in *dlopen()*.

8551 The RTLD\_DEFAULT and RTLD\_NEXT flags are reserved for future use.

8552 **RETURN VALUE**

8553 If *handle* does not refer to a valid object opened by *dlopen()*, or if the named symbol cannot be  
 8554 found within any of the objects associated with *handle*, *dlsym()* shall return NULL. More  
 8555 detailed diagnostic information shall be available through *dlerror()*.

8556 **ERRORS**

8557 No errors are defined.

8558 **EXAMPLES**

8559 The following example shows how *dlopen()* and *dlsym()* can be used to access either function or  
 8560 data objects. For simplicity, error checking has been omitted.

```
8561 void *handle;
8562 int *iptr, (*fptr)(int);

8563 /* open the needed object */
8564 handle = dlopen("/usr/home/me/libfoo.so", RTLD_LOCAL | RTLD_LAZY);

8565 /* find the address of function and data objects */
8566 fptr = (int (*)(int))dlsym(handle, "my_function");
8567 iptr = (int *)dlsym(handle, "my_object");

8568 /* invoke function, passing value of integer as a parameter */
8569 (*fptr)(*iptr);
```

8570 **APPLICATION USAGE**

8571 Special purpose values for *handle* are reserved for future use. These values and their meanings  
 8572 are:

8573 RTLD\_DEFAULT The symbol lookup happens in the normal global scope; that is, a search for a  
 8574 symbol using this handle would find the same definition as a direct use of this  
 8575 symbol in the program code.

8576 RTLD\_NEXT Specifies the next object after this one that defines *name*. *This one* refers to the  
 8577 object containing the invocation of *dlsym()*. The *next* object is the one found  
 8578 upon the application of a load order symbol resolution algorithm (see  
 8579 *dlopen()*). The next object is either one of global scope (because it was  
 8580 introduced as part of the original process image or because it was added with

8581 a *dlopen()* operation including the RTLD\_GLOBAL flag), or is an object that  
8582 was included in the same *dlopen()* operation that loaded this one.

8583 The RTLD\_NEXT flag is useful to navigate an intentionally created hierarchy  
8584 of multiply-defined symbols created through *interposition*. For example, if a  
8585 program wished to create an implementation of *malloc()* that embedded some  
8586 statistics gathering about memory allocations, such an implementation could  
8587 use the real *malloc()* definition to perform the memory allocation—and itself  
8588 only embed the necessary logic to implement the statistics gathering function.

8589 **RATIONALE**  
8590 None.

8591 **FUTURE DIRECTIONS**  
8592 None.

8593 **SEE ALSO**  
8594 *dlclose()*, *dlderror()*, *dlopen()*, the Base Definitions volume of IEEE Std 1003.1-2001, <**dlfcn.h**>

8595 **CHANGE HISTORY**  
8596 First released in Issue 5.

8597 **Issue 6**  
8598 The **restrict** keyword is added to the *dlsym()* prototype for alignment with the  
8599 ISO/IEC 9899:1999 standard.

8600 The RTLD\_DEFAULT and RTLD\_NEXT flags are reserved for future use.

## 8601 NAME

8602 drand48, erand48, jrand48, lcong48, lrand48, mrand48, nrand48, seed48, srand48 — generate  
8603 uniformly distributed pseudo-random numbers

## 8604 SYNOPSIS

```
8605 xSI #include <stdlib.h>
8606
8606 double drand48(void);
8607 double erand48(unsigned short xsubi[3]);
8608 long jrand48(unsigned short xsubi[3]);
8609 void lcong48(unsigned short param[7]);
8610 long lrand48(void);
8611 long mrand48(void);
8612 long nrand48(unsigned short xsubi[3]);
8613 unsigned short *seed48(unsigned short seed16v[3]);
8614 void srand48(long seedval);
8615
```

## 8616 DESCRIPTION

8617 This family of functions shall generate pseudo-random numbers using a linear congruential  
8618 algorithm and 48-bit integer arithmetic.

8619 The *drand48()* and *erand48()* functions shall return non-negative, double-precision, floating-  
8620 point values, uniformly distributed over the interval [0.0,1.0).

8621 The *lrnd48()* and *nrnd48()* functions shall return non-negative, long integers, uniformly  
8622 distributed over the interval  $[0, 2^{31})$ .

8623 The *mrnd48()* and *jrnd48()* functions shall return signed long integers uniformly distributed  
8624 over the interval  $[-2^{31}, 2^{31})$ .

8625 The *srand48()*, *seed48()*, and *lcong48()* functions are initialization entry points, one of which  
8626 should be invoked before either *drand48()*, *lrnd48()*, or *mrnd48()* is called. (Although it is not  
8627 recommended practice, constant default initializer values shall be supplied automatically if  
8628 *drand48()*, *lrnd48()*, or *mrnd48()* is called without a prior call to an initialization entry point.)  
8629 The *erand48()*, *nrnd48()*, and *jrnd48()* functions do not require an initialization entry point to  
8630 be called first.

8631 All the routines work by generating a sequence of 48-bit integer values,  $X_i$ , according to the  
8632 linear congruential formula:

$$8633 \quad X_{n+1} = (aX_n + c)_{\text{mod } m} \quad n \geq 0$$

8634 The parameter  $m = 2^{48}$ ; hence 48-bit integer arithmetic is performed. Unless *lcong48()* is invoked,  
8635 the multiplier value  $a$  and the addend value  $c$  are given by:

$$8636 \quad a = 5\text{DEECE66D}_{16} = 273673163155_8$$

$$8637 \quad c = \text{B}_{16} = 13_8$$

8638 The value returned by any of the *drand48()*, *erand48()*, *jrnd48()*, *lrnd48()*, *mrnd48()*, or  
8639 *nrnd48()* functions is computed by first generating the next 48-bit  $X_i$  in the sequence. Then the  
8640 appropriate number of bits, according to the type of data item to be returned, are copied from  
8641 the high-order (leftmost) bits of  $X_i$  and transformed into the returned value.

8642 The *drand48()*, *lrnd48()*, and *mrnd48()* functions store the last 48-bit  $X_i$  generated in an  
8643 internal buffer; that is why the application shall ensure that these are initialized prior to being  
8644 invoked. The *erand48()*, *nrnd48()*, and *jrnd48()* functions require the calling program to  
8645 provide storage for the successive  $X_i$  values in the array specified as an argument when the

8646 functions are invoked. That is why these routines do not have to be initialized; the calling  
 8647 program merely has to place the desired initial value of  $X_i$  into the array and pass it as an  
 8648 argument. By using different arguments, *erand48()*, *rand48()*, and *jrand48()* allow separate  
 8649 modules of a large program to generate several *independent* streams of pseudo-random numbers;  
 8650 that is, the sequence of numbers in each stream shall *not* depend upon how many times the  
 8651 routines are called to generate numbers for the other streams.

8652 The initializer function *srand48()* sets the high-order 32 bits of  $X_i$  to the low-order 32 bits  
 8653 contained in its argument. The low-order 16 bits of  $X_i$  are set to the arbitrary value  $330E_{16}$ .

8654 The initializer function *seed48()* sets the value of  $X_i$  to the 48-bit value specified in the argument  
 8655 array. The low-order 16 bits of  $X_i$  are set to the low-order 16 bits of *seed16v[0]*. The mid-order 16  
 8656 bits of  $X_i$  are set to the low-order 16 bits of *seed16v[1]*. The high-order 16 bits of  $X_i$  are set to the  
 8657 low-order 16 bits of *seed16v[2]*. In addition, the previous value of  $X_i$  is copied into a 48-bit  
 8658 internal buffer, used only by *seed48()*, and a pointer to this buffer is the value returned by  
 8659 *seed48()*. This returned pointer, which can just be ignored if not needed, is useful if a program is  
 8660 to be restarted from a given point at some future time—use the pointer to get at and store the  
 8661 last  $X_i$  value, and then use this value to reinitialize via *seed48()* when the program is restarted.

8662 The initializer function *lcg48()* allows the user to specify the initial  $X_i$ , the multiplier value  $a$ ,  
 8663 and the addend value  $c$ . Argument array elements *param[0-2]* specify  $X_i$ , *param[3-5]* specify the  
 8664 multiplier  $a$ , and *param[6]* specifies the 16-bit addend  $c$ . After *lcg48()* is called, a subsequent  
 8665 call to either *srand48()* or *seed48()* shall restore the standard multiplier and addend values,  $a$  and  
 8666  $c$ , specified above.

8667 The *drand48()*, *lrnd48()*, and *mrnd48()* functions need not be reentrant. A function that is not  
 8668 required to be reentrant is not required to be thread-safe.

#### 8669 RETURN VALUE

8682 *rand()*, the Base Definitions volume of IEEE Std 1003.1-2001, <stdlib.h>

#### 8683 CHANGE HISTORY

8684 First released in Issue 1. Derived from Issue 1 of the SVID.

#### 8685 Issue 5

8686 A note indicating that these functions need not be reentrant is added to the DESCRIPTION.

#### 8687 Issue 6

8688 The DESCRIPTION is updated to avoid use of the term “must” for application requirements.

8689 **NAME**

8690 dup, dup2 — duplicate an open file descriptor

8691 **SYNOPSIS**

8692 #include &lt;unistd.h&gt;

8693 int dup(int *fildes*);8694 int dup2(int *fildes*, int *fildes2*);8695 **DESCRIPTION**8696 The *dup()* and *dup2()* functions provide an alternative interface to the service provided by  
8697 *fcntl()* using the F\_DUPFD command. The call:8698 *fid* = dup(*fildes*);

8699 shall be equivalent to:

8700 *fid* = fcntl(*fildes*, F\_DUPFD, 0);

8701 The call:

8702 *fid* = dup2(*fildes*, *fildes2*);

8703 shall be equivalent to:

8704 close(*fildes2*);8705 *fid* = fcntl(*fildes*, F\_DUPFD, *fildes2*);

8706 except for the following:

- 8707 • If *fildes2* is less than 0 or greater than or equal to {OPEN\_MAX}, *dup2()* shall return -1 with  
8708 *errno* set to [EBADF].
- 8709 • If *fildes* is a valid file descriptor and is equal to *fildes2*, *dup2()* shall return *fildes2* without  
8710 closing it.
- 8711 • If *fildes* is not a valid file descriptor, *dup2()* shall return -1 and shall not close *fildes2*.
- 8712 • The value returned shall be equal to the value of *fildes2* upon successful completion, or -1  
8713 upon failure.

8714 **RETURN VALUE**8715 Upon successful completion a non-negative integer, namely the file descriptor, shall be returned;  
8716 otherwise, -1 shall be returned and *errno* set to indicate the error.8717 **ERRORS**8718 The *dup()* function shall fail if:8719 [EBADF] The *fildes* argument is not a valid open file descriptor.8720 [EMFILE] The number of file descriptors in use by this process would exceed  
8721 {OPEN\_MAX}.8722 The *dup2()* function shall fail if:8723 [EBADF] The *fildes* argument is not a valid open file descriptor or the argument *fildes2* is  
8724 negative or greater than or equal to {OPEN\_MAX}.8725 [EINTR] The *dup2()* function was interrupted by a signal.

8726 **EXAMPLES**8727 **Redirecting Standard Output to a File**

8728 The following example closes standard output for the current processes, re-assigns standard  
8729 output to go to the file referenced by *pfid*, and closes the original file descriptor to clean up.

```
8730 #include <unistd.h>  
8731 ...  
8732 int pfd;  
8733 ...  
8734 close(1);  
8735 dup(pfd);  
8736 close(pfd);  
8737 ...
```

8738 **Redirecting Error Messages**

8739 The following example redirects messages from *stderr* to *stdout*.

```
8740 #include <unistd.h>  
8741 ...  
8742 dup2(1, 2);  
8743 ...
```

8744 **APPLICATION USAGE**

8745 None.

8746 **RATIONALE**

8747 The *dup()* and *dup2()* functions are redundant. Their services are also provided by the *fcntl()*  
8748 function. They have been included in this volume of IEEE Std 1003.1-2001 primarily for historical  
8749 reasons, since many existing applications use them.

8750 While the brief code segment shown is very similar in behavior to *dup2()*, a conforming  
8751 implementation based on other functions defined in this volume of IEEE Std 1003.1-2001 is  
8752 significantly more complex. Least obvious is the possible effect of a signal-catching function that  
8753 could be invoked between steps and allocate or deallocate file descriptors. This could be avoided  
8754 by blocking signals.

8755 The *dup2()* function is not marked obsolescent because it presents a type-safe version of  
8756 functionality provided in a type-unsafe version by *fcntl()*. It is used in the POSIX Ada binding.

8757 The *dup2()* function is not intended for use in critical regions as a synchronization mechanism.

8758 In the description of [EBADF], the case of *fildes* being out of range is covered by the given case of  
8759 *fildes* not being valid. The descriptions for *fildes* and *fildes2* are different because the only kind of  
8760 invalidity that is relevant for *fildes2* is whether it is out of range; that is, it does not matter  
8761 whether *fildes2* refers to an open file when the *dup2()* call is made.

8762 **FUTURE DIRECTIONS**

8763 None.

8764 **SEE ALSO**

8765 *close()*, *fcntl()*, *open()*, the Base Definitions volume of IEEE Std 1003.1-2001, <**unistd.h**>

8766 **CHANGE HISTORY**

8767 First released in Issue 1. Derived from Issue 1 of the SVID.

8768 **NAME**8769           ecvt, fcvt, gcvt — convert a floating-point number to a string (**LEGACY**)8770 **SYNOPSIS**

8771 xSI       #include &lt;stdlib.h&gt;

8772           char \*ecvt(double value, int ndigit, int \*restrict decpt,  
8773                   int \*restrict sign);8774           char \*fcvt(double value, int ndigit, int \*restrict decpt,  
8775                   int \*restrict sign);

8776           char \*gcvt(double value, int ndigit, char \*buf);

8777

8778 **DESCRIPTION**8779           The *ecvt()*, *fcvt()*, and *gcvt()* functions shall convert floating-point numbers to null-terminated strings.8781           The *ecvt()* function shall convert *value* to a null-terminated string of *ndigit* digits (where *ndigit* is reduced to an unspecified limit determined by the precision of a **double**) and return a pointer to the string. The high-order digit shall be non-zero, unless the value is 0. The low-order digit shall be rounded in an implementation-defined manner. The position of the radix character relative to the beginning of the string shall be stored in the integer pointed to by *decpt* (negative means to the left of the returned digits). If *value* is zero, it is unspecified whether the integer pointed to by *decpt* would be 0 or 1. The radix character shall not be included in the returned string. If the sign of the result is negative, the integer pointed to by *sign* shall be non-zero; otherwise, it shall be 0.

8789           If the converted value is out of range or is not representable, the contents of the returned string are unspecified.

8791           The *fcvt()* function shall be equivalent to *ecvt()*, except that *ndigit* specifies the number of digits desired after the radix character. The total number of digits in the result string is restricted to an unspecified limit as determined by the precision of a **double**.8794           The *gcvt()* function shall convert *value* to a null-terminated string (similar to that of the %g conversion specification format of *printf()*) in the array pointed to by *buf* and shall return *buf*. It shall produce *ndigit* significant digits (limited to an unspecified value determined by the precision of a **double**) in the %E conversion specification format of *printf()* if possible, or the %e conversion specification format of *printf()* (scientific notation) otherwise. A minus sign shall be included in the returned string if *value* is less than 0. A radix character shall be included in the returned string if *value* is not a whole number. Trailing zeros shall be suppressed where *value* is not a whole number. The radix character is determined by the current locale. If *setlocale()* has not been called successfully, the default locale, POSIX, is used. The default locale specifies a period ( '.' ) as the radix character. The *LC\_NUMERIC* category determines the value of the radix character within the current locale.

8805           These functions need not be reentrant. A function that is not required to be reentrant is not required to be thread-safe.

8807 **RETURN VALUE**8808           The *ecvt()* and *fcvt()* functions shall return a pointer to a null-terminated string of digits.8809           The *gcvt()* function shall return *buf*.8810           The return values from *ecvt()* and *fcvt()* may point to static data which may be overwritten by subsequent calls to these functions.

8811

8812 **ERRORS**

8813 No errors are defined.

8814 **EXAMPLES**

8815 None.

8816 **APPLICATION USAGE**8817 The *sprintf()* function is preferred over this function.8818 **RATIONALE**

8819 None.

8820 **FUTURE DIRECTIONS**

8821 These functions may be withdrawn in a future version.

8822 **SEE ALSO**8823 *printf()*, *setlocale()*, the Base Definitions volume of IEEE Std 1003.1-2001, <stdlib.h>8824 **CHANGE HISTORY**

8825 First released in Issue 4, Version 2.

8826 **Issue 5**

8827 Moved from X/OPEN UNIX extension to BASE.

8828 Normative text previously in the APPLICATION USAGE section is moved to the  
8829 DESCRIPTION.

8830 A note indicating that these functions need not be reentrant is added to the DESCRIPTION.

8831 **Issue 6**

8832 In the DESCRIPTION, the note about reentrancy is expanded to cover thread-safety.

8833 This function is marked LEGACY.

8834 The **restrict** keyword is added to the *ecvt()* and *fcvt()* prototypes for alignment with the  
8835 ISO/IEC 9899:1999 standard.8836 The DESCRIPTION is updated to explicitly use “conversion specification” to describe %g, %f,  
8837 and %e.

8838 **NAME**8839 encrypt — encoding function (**CRYPT**)8840 **SYNOPSIS**8841 XSI `#include <unistd.h>`8842 `void encrypt(char block[64], int edflag);`

8843

8844 **DESCRIPTION**8845 The *encrypt()* function shall provide access to an implementation-defined encoding algorithm.  
8846 The key generated by *setkey()* is used to encrypt the string *block* with *encrypt()*.8847 The *block* argument to *encrypt()* shall be an array of length 64 bytes containing only the bytes  
8848 with values of 0 and 1. The array is modified in place to a similar array using the key set by  
8849 *setkey()*. If *edflag* is 0, the argument is encoded. If *edflag* is 1, the argument may be decoded (see  
8850 the APPLICATION USAGE section); if the argument is not decoded, *errno* shall be set to  
8851 [ENOSYS].8852 The *encrypt()* function shall not change the setting of *errno* if successful. An application wishing  
8853 to check for error situations should set *errno* to 0 before calling *encrypt()*. If *errno* is non-zero on  
8854 return, an error has occurred.8855 The *encrypt()* function need not be reentrant. A function that is not required to be reentrant is  
8856 not required to be thread-safe.8857 **RETURN VALUE**8858 The *encrypt()* function shall not return a value.8859 **ERRORS**8860 The *encrypt()* function shall fail if:

8861 [ENOSYS] The functionality is not supported on this implementation.

8862 **EXAMPLES**

8863 None.

8864 **APPLICATION USAGE**8865 Historical implementations of the *encrypt()* function used a rather primitive encoding algorithm.8866 In some environments, decoding might not be implemented. This is related to some Government  
8867 restrictions on encryption and decryption routines. Historical practice has been to ship a  
8868 different version of the encryption library without the decryption feature in the routines  
8869 supplied. Thus the exported version of *encrypt()* does encoding but not decoding.8870 **RATIONALE**

8871 None.

8872 **FUTURE DIRECTIONS**

8873 None.

8874 **SEE ALSO**8875 *crypt()*, *setkey()*, the Base Definitions volume of IEEE Std 1003.1-2001, <**unistd.h**>8876 **CHANGE HISTORY**

8877 First released in Issue 1. Derived from Issue 1 of the SVID.

8878 **Issue 5**

8879 A note indicating that this function need not be reentrant is added to the DESCRIPTION.

8880 **Issue 6**

8881 In the DESCRIPTION, the note about reentrancy is expanded to cover thread-safety.

## 8882 NAME

8883 endgrent, getgrent, setgrent — group database entry functions

## 8884 SYNOPSIS

```
8885 xSI #include <grp.h>
8886 void endgrent(void);
8887 struct group *getgrent(void);
8888 void setgrent(void);
8889
```

## 8890 DESCRIPTION

8891 The *getgrent()* function shall return a pointer to a structure containing the broken-out fields of an  
8892 entry in the group database. When first called, *getgrent()* shall return a pointer to a **group**  
8893 structure containing the first entry in the group database. Thereafter, it shall return a pointer to a  
8894 **group** structure containing the next group structure in the group database, so successive calls  
8895 may be used to search the entire database.

8896 An implementation that provides extended security controls may impose further  
8897 implementation-defined restrictions on accessing the group database. In particular, the system  
8898 may deny the existence of some or all of the group database entries associated with groups other  
8899 than those groups associated with the caller and may omit users other than the caller from the  
8900 list of members of groups in database entries that are returned.

8901 The *setgrent()* function shall rewind the group database to allow repeated searches.

8902 The *endgrent()* function may be called to close the group database when processing is complete.

8903 These functions need not be reentrant. A function that is not required to be reentrant is not  
8904 required to be thread-safe.

## 8905 RETURN VALUE

8906 When first called, *getgrent()* shall return a pointer to the first group structure in the group  
8907 database. Upon subsequent calls it shall return the next group structure in the group database.  
8908 The *getgrent()* function shall return a null pointer on end-of-file or an error and *errno* may be set  
8909 to indicate the error.

8910 The return value may point to a static area which is overwritten by a subsequent call to  
8911 *getgrgid()*, *getgrnam()*, or *getgrent()*.

## 8912 ERRORS

8913 The *getgrent()* function may fail if:

- |      |          |                                                                        |
|------|----------|------------------------------------------------------------------------|
| 8914 | [EINTR]  | A signal was caught during the operation.                              |
| 8915 | [EIO]    | An I/O error has occurred.                                             |
| 8916 | [EMFILE] | {OPEN_MAX} file descriptors are currently open in the calling process. |
| 8917 | [ENFILE] | The maximum allowable number of files is currently open in the system. |

8918 **EXAMPLES**

8919 None.

8920 **APPLICATION USAGE**

8921 These functions are provided due to their historical usage. Applications should avoid  
8922 dependencies on fields in the group database, whether the database is a single file, or where in  
8923 the file system name space the database resides. Applications should use *getgrnam()* and  
8924 *getgrgid()* whenever possible because it avoids these dependencies.

8925 **RATIONALE**

8926 None.

8927 **FUTURE DIRECTIONS**

8928 None.

8929 **SEE ALSO**

8930 *getgrgid()*, *getgrnam()*, *getlogin()*, *getpwent()*, the Base Definitions volume of  
8931 IEEE Std 1003.1-2001, <grp.h>

8932 **CHANGE HISTORY**

8933 First released in Issue 4, Version 2.

8934 **Issue 5**

8935 Moved from X/OPEN UNIX extension to BASE.

8936 Normative text previously in the APPLICATION USAGE section is moved to the RETURN  
8937 VALUE section.

8938 A note indicating that these functions need not be reentrant is added to the DESCRIPTION.

8939 **Issue 6**

8940 In the DESCRIPTION, the note about reentrancy is expanded to cover thread-safety.

8941 **NAME**

8942 endhostent, gethostent, sethostent — network host database functions

8943 **SYNOPSIS**

8944 #include <netdb.h>

8945 void endhostent(void);

8946 struct hostent \*gethostent(void);

8947 void sethostent(int *stayopen*);

8948 **DESCRIPTION**

8949 These functions shall retrieve information about hosts. This information is considered to be  
8950 stored in a database that can be accessed sequentially or randomly. The implementation of this  
8951 database is unspecified.

8952 **Note:** In many cases this database is implemented by the Domain Name System, as documented in  
8953 RFC 1034, RFC 1035, and RFC 1886.

8954 The *sethostent()* function shall open a connection to the database and set the next entry for  
8955 retrieval to the first entry in the database. If the *stayopen* argument is non-zero, the connection  
8956 shall not be closed by a call to *gethostent()*, *gethostbyname()*, or *gethostbyaddr()*, and the  
8957 implementation may maintain an open file descriptor.

8958 The *gethostent()* function shall read the next entry in the database, opening and closing a  
8959 connection to the database as necessary.

8960 Entries shall be returned in **hostent** structures. Refer to *gethostbyaddr()* for a definition of the  
8961 **hostent** structure.

8962 The *endhostent()* function shall close the connection to the database, releasing any open file  
8963 descriptor.

8964 These functions need not be reentrant. A function that is not required to be reentrant is not  
8965 required to be thread-safe.

8966 **RETURN VALUE**

8967 Upon successful completion, the *gethostent()* function shall return a pointer to a **hostent**  
8968 structure if the requested entry was found, and a null pointer if the end of the database was  
8969 reached or the requested entry was not found.

8970 **ERRORS**

8971 No errors are defined for *endhostent()*, *gethostent()*, and *sethostent()*.

8972 **EXAMPLES**

8973 None.

8974 **APPLICATION USAGE**

8975 The *gethostent()* function may return pointers to static data, which may be overwritten by  
8976 subsequent calls to any of these functions.

8977 **RATIONALE**

8978 None.

8979 **FUTURE DIRECTIONS**

8980 None.

8981 **SEE ALSO**

8982 *endservent()*, *gethostbyaddr()*, the Base Definitions volume of IEEE Std 1003.1-2001, <netdb.h>

8983 **CHANGE HISTORY**

8984 First released in Issue 6. Derived from the XNS, Issue 5.2 specification.

8985 **NAME**

8986 endnetent, getnetbyaddr, getnetbyname, getnetent, setnetent — network database functions

8987 **SYNOPSIS**

8988 #include &lt;netdb.h&gt;

8989 void endnetent(void);

8990 struct netent \*getnetbyaddr(uint32\_t net, int type);

8991 struct netent \*getnetbyname(const char \*name);

8992 struct netent \*getnetent(void);

8993 void setnetent(int stayopen);

8994 **DESCRIPTION**8995 These functions shall retrieve information about networks. This information is considered to be  
8996 stored in a database that can be accessed sequentially or randomly. The implementation of this  
8997 database is unspecified.8998 The *setnetent()* function shall open and rewind the database. If the *stayopen* argument is non-  
8999 zero, the connection to the *net* database shall not be closed after each call to *getnetent()* (either  
9000 directly, or indirectly through one of the other *getnet\**(*)* functions), and the implementation may  
9001 maintain an open file descriptor to the database.9002 The *getnetent()* function shall read the next entry of the database, opening and closing a  
9003 connection to the database as necessary.9004 The *getnetbyaddr()* function shall search the database from the beginning, and find the first entry  
9005 for which the address family specified by *type* matches the *n\_addrtype* member and the network  
9006 number *net* matches the *n\_net* member, opening and closing a connection to the database as  
9007 necessary. The *net* argument shall be the network number in host byte order.9008 The *getnetbyname()* function shall search the database from the beginning and find the first entry  
9009 for which the network name specified by *name* matches the *n\_name* member, opening and  
9010 closing a connection to the database as necessary.9011 The *getnetbyaddr()*, *getnetbyname()*, and *getnetent()* functions shall each return a pointer to a  
9012 **netent** structure, the members of which shall contain the fields of an entry in the network  
9013 database.9014 The *endnetent()* function shall close the database, releasing any open file descriptor.9015 These functions need not be reentrant. A function that is not required to be reentrant is not  
9016 required to be thread-safe.9017 **RETURN VALUE**9018 Upon successful completion, *getnetbyaddr()*, *getnetbyname()*, and *getnetent()* shall return a  
9019 pointer to a **netent** structure if the requested entry was found, and a null pointer if the end of the  
9020 database was reached or the requested entry was not found. Otherwise, a null pointer shall be  
9021 returned.9022 **ERRORS**

9023 No errors are defined.

9024 **EXAMPLES**

9025           None.

9026 **APPLICATION USAGE**

9027           The *getnetbyaddr()*, *getnetbyname()*, and *getnetent()* functions may return pointers to static data,  
9028           which may be overwritten by subsequent calls to any of these functions.

9029 **RATIONALE**

9030           None.

9031 **FUTURE DIRECTIONS**

9032           None.

9033 **SEE ALSO**9034           The Base Definitions volume of IEEE Std 1003.1-2001, <**netdb.h**>9035 **CHANGE HISTORY**

9036           First released in Issue 6. Derived from the XNS, Issue 5.2 specification.

9037 **NAME**

9038 endprotoent, getprotobyname, getprotobynumber, getprotoent, setprotoent — network protocol  
9039 database functions

9040 **SYNOPSIS**

```
9041 #include <netdb.h>
9042 void endprotoent(void);
9043 struct protoent *getprotobyname(const char *name);
9044 struct protoent *getprotobynumber(int proto);
9045 struct protoent *getprotoent(void);
9046 void setprotoent(int stayopen);
```

9047 **DESCRIPTION**

9048 These functions shall retrieve information about protocols. This information is considered to be  
9049 stored in a database that can be accessed sequentially or randomly. The implementation of this  
9050 database is unspecified.

9051 The *setprotoent()* function shall open a connection to the database, and set the next entry to the  
9052 first entry. If the *stayopen* argument is non-zero, the connection to the network protocol database  
9053 shall not be closed after each call to *getprotoent()* (either directly, or indirectly through one of the  
9054 other *getproto\**() functions), and the implementation may maintain an open file descriptor for  
9055 the database.

9056 The *getprotobyname()* function shall search the database from the beginning and find the first  
9057 entry for which the protocol name specified by *name* matches the *p\_name* member, opening and  
9058 closing a connection to the database as necessary.

9059 The *getprotobynumber()* function shall search the database from the beginning and find the first  
9060 entry for which the protocol number specified by *proto* matches the *p\_proto* member, opening  
9061 and closing a connection to the database as necessary.

9062 The *getprotoent()* function shall read the next entry of the database, opening and closing a  
9063 connection to the database as necessary.

9064 The *getprotobyname()*, *getprotobynumber()*, and *getprotoent()* functions shall each return a pointer  
9065 to a **protoent** structure, the members of which shall contain the fields of an entry in the network  
9066 protocol database.

9067 The *endprotoent()* function shall close the connection to the database, releasing any open file  
9068 descriptor.

9069 These functions need not be reentrant. A function that is not required to be reentrant is not  
9070 required to be thread-safe.

9071 **RETURN VALUE**

9072 Upon successful completion, *getprotobyname()*, *getprotobynumber()*, and *getprotoent()* return a  
9073 pointer to a **protoent** structure if the requested entry was found, and a null pointer if the end of  
9074 the database was reached or the requested entry was not found. Otherwise, a null pointer is  
9075 returned.

9076 **ERRORS**

9077 No errors are defined.

9078 **EXAMPLES**

9079       None.

9080 **APPLICATION USAGE**9081       The *getprotobyname()*, *getprotobynumber()*, and *getprotoent()* functions may return pointers to  
9082       static data, which may be overwritten by subsequent calls to any of these functions.9083 **RATIONALE**

9084       None.

9085 **FUTURE DIRECTIONS**

9086       None.

9087 **SEE ALSO**9088       The Base Definitions volume of IEEE Std 1003.1-2001, <**netdb.h**>9089 **CHANGE HISTORY**

9090       First released in Issue 6. Derived from the XNS, Issue 5.2 specification.

9091 **NAME**

9092 endpwent, getpwent, setpwent — user database functions

9093 **SYNOPSIS**

```
9094 xSI #include <pwd.h>
9095 void endpwent(void);
9096 struct passwd *getpwent(void);
9097 void setpwent(void);
9098
```

9099 **DESCRIPTION**

9100 These functions shall retrieve information about users.

9101 The *getpwent()* function shall return a pointer to a structure containing the broken-out fields of  
9102 an entry in the user database. Each entry in the user database contains a **passwd** structure. When  
9103 first called, *getpwent()* shall return a pointer to a **passwd** structure containing the first entry in  
9104 the user database. Thereafter, it shall return a pointer to a **passwd** structure containing the next  
9105 entry in the user database. Successive calls can be used to search the entire user database.

9106 If an end-of-file or an error is encountered on reading, *getpwent()* shall return a null pointer.

9107 An implementation that provides extended security controls may impose further  
9108 implementation-defined restrictions on accessing the user database. In particular, the system  
9109 may deny the existence of some or all of the user database entries associated with users other  
9110 than the caller.

9111 The *setpwent()* function effectively rewinds the user database to allow repeated searches.9112 The *endpwent()* function may be called to close the user database when processing is complete.

9113 These functions need not be reentrant. A function that is not required to be reentrant is not  
9114 required to be thread-safe.

9115 **RETURN VALUE**9116 The *getpwent()* function shall return a null pointer on end-of-file or error.9117 **ERRORS**9118 The *getpwent()*, *setpwent()*, and *endpwent()* functions may fail if:

9119 [EIO] An I/O error has occurred.

9120 In addition, *getpwent()* and *setpwent()* may fail if:

9121 [EMFILE] {OPEN\_MAX} file descriptors are currently open in the calling process.

9122 [ENFILE] The maximum allowable number of files is currently open in the system.

9123 The return value may point to a static area which is overwritten by a subsequent call to  
9124 *getpwuid()*, *getpwnam()*, or *getpwent()*.

9125 **EXAMPLES**9126 **Searching the User Database**

9127 The following example uses the *getpwent()* function to get successive entries in the user  
 9128 database, returning a pointer to a **passwd** structure that contains information about each user.  
 9129 The call to *endpwent()* closes the user database and cleans up.

```
9130 #include <pwd.h>
9131 ...
9132 struct passwd *p;
9133 ...
9134 while ((p = getpwent ()) != NULL) {
9135     ...
9136 }
9137 endpwent();
9138 ...
```

9139 **APPLICATION USAGE**

9140 These functions are provided due to their historical usage. Applications should avoid  
 9141 dependencies on fields in the password database, whether the database is a single file, or where  
 9142 in the file system name space the database resides. Applications should use *getpwuid()*  
 9143 whenever possible because it avoids these dependencies.

9144 **RATIONALE**

9145 None.

9146 **FUTURE DIRECTIONS**

9147 None.

9148 **SEE ALSO**

9149 *endgrent()*, *getlogin()*, *getpwnam()*, *getpwuid()*, the Base Definitions volume of  
 9150 IEEE Std 1003.1-2001, <**pwd.h**>

9151 **CHANGE HISTORY**

9152 First released in Issue 4, Version 2.

9153 **Issue 5**

9154 Moved from X/OPEN UNIX extension to BASE.

9155 Normative text previously in the APPLICATION USAGE section is moved to the RETURN  
 9156 VALUE section.

9157 A note indicating that these functions need not be reentrant is added to the DESCRIPTION.

9158 **Issue 6**

9159 In the DESCRIPTION, the note about reentrancy is expanded to cover thread-safety.

9160 **NAME**

9161 endservent, getservbyname, getservbyport, getservent, setservent — network services database  
9162 functions

9163 **SYNOPSIS**

```
9164 #include <netdb.h>

9165 void endservent(void);
9166 struct servent *getservbyname(const char *name, const char *proto);
9167 struct servent *getservbyport(int port, const char *proto);
9168 struct servent *getservent(void);
9169 void setservent(int stayopen);
```

9170 **DESCRIPTION**

9171 These functions shall retrieve information about network services. This information is  
9172 considered to be stored in a database that can be accessed sequentially or randomly. The  
9173 implementation of this database is unspecified.

9174 The *setservent()* function shall open a connection to the database, and set the next entry to the  
9175 first entry. If the *stayopen* argument is non-zero, the *net* database shall not be closed after each  
9176 call to the *getservent()* function (either directly, or indirectly through one of the other *getserv\*()*  
9177 functions), and the implementation may maintain an open file descriptor for the database.

9178 The *getservent()* function shall read the next entry of the database, opening and closing a  
9179 connection to the database as necessary.

9180 The *getservbyname()* function shall search the database from the beginning and find the first  
9181 entry for which the service name specified by *name* matches the *s\_name* member and the protocol  
9182 name specified by *proto* matches the *s\_proto* member, opening and closing a connection to the  
9183 database as necessary. If *proto* is a null pointer, any value of the *s\_proto* member shall be  
9184 matched.

9185 The *getservbyport()* function shall search the database from the beginning and find the first entry  
9186 for which the port specified by *port* matches the *s\_port* member and the protocol name specified  
9187 by *proto* matches the *s\_proto* member, opening and closing a connection to the database as  
9188 necessary. If *proto* is a null pointer, any value of the *s\_proto* member shall be matched. The *port*  
9189 argument shall be in network byte order.

9190 The *getservbyname()*, *getservbyport()*, and *getservent()* functions shall each return a pointer to a  
9191 **servent** structure, the members of which shall contain the fields of an entry in the network  
9192 services database.

9193 The *endservent()* function shall close the database, releasing any open file descriptor.

9194 These functions need not be reentrant. A function that is not required to be reentrant is not  
9195 required to be thread-safe.

9196 **RETURN VALUE**

9197 Upon successful completion, *getservbyname()*, *getservbyport()*, and *getservent()* return a pointer to  
9198 a **servent** structure if the requested entry was found, and a null pointer if the end of the database  
9199 was reached or the requested entry was not found. Otherwise, a null pointer is returned.

9200 **ERRORS**

9201 No errors are defined.

9202 **EXAMPLES**

9203       None.

9204 **APPLICATION USAGE**9205       The *port* argument of *getservbyport()* need not be compatible with the port values of all address  
9206       families.9207       The *getservbyname()*, *getservbyport()*, and *getservent()* functions may return pointers to static  
9208       data, which may be overwritten by subsequent calls to any of these functions.9209 **RATIONALE**

9210       None.

9211 **FUTURE DIRECTIONS**

9212       None.

9213 **SEE ALSO**9214       *endhostent()*, *endprotoent()*, *htonl()*, *inet\_addr()*, the Base Definitions volume of  
9215       IEEE Std 1003.1-2001, <**netdb.h**>9216 **CHANGE HISTORY**

9217       First released in Issue 6. Derived from the XNS, Issue 5.2 specification.

## 9218 NAME

9219 endutxent, getutxent, getutxid, getutxline, pututxline, setutxent — user accounting database  
 9220 functions

## 9221 SYNOPSIS

```
9222 xSI #include <utmpx.h>
9223
9224 void endutxent(void);
9225 struct utmpx *getutxent(void);
9226 struct utmpx *getutxid(const struct utmpx *id);
9227 struct utmpx *getutxline(const struct utmpx *line);
9228 struct utmpx *pututxline(const struct utmpx *utmpx);
9229 void setutxent(void);
```

## 9230 DESCRIPTION

9231 These functions shall provide access to the user accounting database.

9232 The *getutxent()* function shall read the next entry from the user accounting database. If the  
 9233 database is not already open, it shall open it. If it reaches the end of the database, it shall fail.

9234 The *getutxid()* function shall search forward from the current point in the database. If the  
 9235 *ut\_type* value of the **utmpx** structure pointed to by *id* is *BOOT\_TIME*, *OLD\_TIME*, or  
 9236 *NEW\_TIME*, then it shall stop when it finds an entry with a matching *ut\_type* value. If the  
 9237 *ut\_type* value is *INIT\_PROCESS*, *LOGIN\_PROCESS*, *USER\_PROCESS*, or *DEAD\_PROCESS*,  
 9238 then it shall stop when it finds an entry whose type is one of these four and whose *ut\_id* member  
 9239 matches the *ut\_id* member of the **utmpx** structure pointed to by *id*. If the end of the database is  
 9240 reached without a match, *getutxid()* shall fail.

9241 The *getutxline()* function shall search forward from the current point in the database until it  
 9242 finds an entry of the type *LOGIN\_PROCESS* or *USER\_PROCESS* which also has a *ut\_line* value  
 9243 matching that in the **utmpx** structure pointed to by *line*. If the end of the database is reached  
 9244 without a match, *getutxline()* shall fail.

9245 The *getutxid()* or *getutxline()* function may cache data. For this reason, to use *getutxline()* to  
 9246 search for multiple occurrences, the application shall zero out the static data after each success,  
 9247 or *getutxline()* may return a pointer to the same **utmpx** structure.

9248 There is one exception to the rule about clearing the structure before further reads are done. The  
 9249 implicit read done by *pututxline()* (if it finds that it is not already at the correct place in the user  
 9250 accounting database) shall not modify the static structure returned by *getutxent()*, *getutxid()*, or  
 9251 *getutxline()*, if the application has modified this structure and passed the pointer back to  
 9252 *pututxline()*.

9253 For all entries that match a request, the *ut\_type* member indicates the type of the entry. Other  
 9254 members of the entry shall contain meaningful data based on the value of the *ut\_type* member as  
 9255 follows:

9256  
9257  
9258  
9259  
9260  
9261  
9262  
9263  
9264  
9265  
9266

<b>ut_type Member</b>	<b>Other Members with Meaningful Data</b>
EMPTY	No others
BOOT_TIME	<i>ut_tv</i>
OLD_TIME	<i>ut_tv</i>
NEW_TIME	<i>ut_tv</i>
USER_PROCESS	<i>ut_id</i> , <i>ut_user</i> (login name of the user), <i>ut_line</i> , <i>ut_pid</i> , <i>ut_tv</i>
INIT_PROCESS	<i>ut_id</i> , <i>ut_pid</i> , <i>ut_tv</i>
LOGIN_PROCESS	<i>ut_id</i> , <i>ut_user</i> (implementation-defined name of the login process), <i>ut_pid</i> , <i>ut_tv</i>
DEAD_PROCESS	<i>ut_id</i> , <i>ut_pid</i> , <i>ut_tv</i>

9267  
9268  
9269  
9270

An implementation that provides extended security controls may impose implementation-defined restrictions on accessing the user accounting database. In particular, the system may deny the existence of some or all of the user accounting database entries associated with users other than the caller.

9271  
9272  
9273  
9274

If the process has appropriate privileges, the *pututxline()* function shall write out the structure into the user accounting database. It shall use *getutxid()* to search for a record that satisfies the request. If this search succeeds, then the entry shall be replaced. Otherwise, a new entry shall be made at the end of the user accounting database.

9275

The *endutxent()* function shall close the user accounting database.

9276  
9277

The *setutxent()* function shall reset the input to the beginning of the database. This should be done before each search for a new entry if it is desired that the entire database be examined.

9278  
9279

These functions need not be reentrant. A function that is not required to be reentrant is not required to be thread-safe.

#### 9280 RETURN VALUE

9281  
9282  
9283

Upon successful completion, *getutxent()*, *getutxid()*, and *getutxline()* shall return a pointer to a **utmpx** structure containing a copy of the requested entry in the user accounting database. Otherwise, a null pointer shall be returned.

9284  
9285

The return value may point to a static area which is overwritten by a subsequent call to *getutxid()* or *getutxline()*.

9286  
9287  
9288

Upon successful completion, *pututxline()* shall return a pointer to a **utmpx** structure containing a copy of the entry added to the user accounting database. Otherwise, a null pointer shall be returned.

9289

The *endutxent()* and *setutxent()* functions shall not return a value.

#### 9290 ERRORS

9291  
9292

No errors are defined for the *endutxent()*, *getutxent()*, *getutxid()*, *getutxline()*, and *setutxent()* functions.

9293

The *pututxline()* function may fail if:

9294

[EPERM]           The process does not have appropriate privileges.

9295 **EXAMPLES**

9296       None.

9297 **APPLICATION USAGE**9298       The sizes of the arrays in the structure can be found using the *sizeof* operator.9299 **RATIONALE**

9300       None.

9301 **FUTURE DIRECTIONS**

9302       None.

9303 **SEE ALSO**

9304       The Base Definitions volume of IEEE Std 1003.1-2001, &lt;utmpx.h&gt;

9305 **CHANGE HISTORY**

9306       First released in Issue 4, Version 2.

9307 **Issue 5**

9308       Moved from X/OPEN UNIX extension to BASE.

9309       Normative text previously in the APPLICATION USAGE section is moved to the  
9310       DESCRIPTION.

9311       A note indicating that these functions need not be reentrant is added to the DESCRIPTION.

9312 **Issue 6**

9313       In the DESCRIPTION, the note about reentrancy is expanded to cover thread-safety.

9314 **NAME**

9315        **environ** — array of character pointers to the environment strings

9316 **SYNOPSIS**

9317        extern char \*\*environ;

9318 **DESCRIPTION**

9319        Refer to the Base Definitions volume of IEEE Std 1003.1-2001, Chapter 8, Environment Variables  
9320        and *exec*.

9321 **NAME**9322        **erand48** — generate uniformly distributed pseudo-random numbers9323 **SYNOPSIS**9324 **XSI**        #include <stdlib.h>9325        double erand48(unsigned short *xsubi*[3]);

9326

9327 **DESCRIPTION**9328        Refer to *drand48()*.

9329 **NAME**

9330 erf, erff, erfl — error functions

9331 **SYNOPSIS**

9332 #include &lt;math.h&gt;

9333 double erf(double x);

9334 float erff(float x);

9335 long double erfl(long double x);

9336 **DESCRIPTION**

9337 **CX** The functionality described on this reference page is aligned with the ISO C standard. Any  
 9338 conflict between the requirements described here and the ISO C standard is unintentional. This  
 9339 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

9340 These functions shall compute the error function of their argument *x*, defined as:

$$9341 \frac{2}{\sqrt{\pi}} \int_0^x e^{-t^2} dt$$

9342 An application wishing to check for error situations should set *errno* to zero and call  
 9343 *feclearexcept*(FE\_ALL\_EXCEPT) before calling these functions. On return, if *errno* is non-zero or  
 9344 *fetestexcept*(FE\_INVALID | FE\_DIVBYZERO | FE\_OVERFLOW | FE\_UNDERFLOW) is non-  
 9345 zero, an error has occurred.

9346 **RETURN VALUE**

9347 Upon successful completion, these functions shall return the value of the error function.

9348 **MX** If *x* is NaN, a NaN shall be returned.9349 If *x* is ±0, ±0 shall be returned.9350 If *x* is ±Inf, ±1 shall be returned.9351 If *x* is subnormal, a range error may occur, and  $2 * x / \sqrt{\pi}$  should be returned.9352 **ERRORS**

9353 These functions may fail if:

9354 **MX** **Range Error** The result underflows.

9355 If the integer expression (math\_errhandling & MATH\_ERRNO) is non-zero,  
 9356 then *errno* shall be set to [ERANGE]. If the integer expression  
 9357 (math\_errhandling & MATH\_ERREXCEPT) is non-zero, then the underflow  
 9358 floating-point exception shall be raised.

9359 **EXAMPLES**

9360 None.

9361 **APPLICATION USAGE**9362 Underflow occurs when  $|x| < \text{DBL\_MIN} * (\sqrt{\pi}/2)$ .

9363 On error, the expressions (math\_errhandling & MATH\_ERRNO) and (math\_errhandling &  
 9364 MATH\_ERREXCEPT) are independent of each other, but at least one of them must be non-zero.

9365 **RATIONALE**

9366 None.

9367 **FUTURE DIRECTIONS**

9368 None.

9369 **SEE ALSO**9370 *erfc()*, *feclearexcept()*, *fetestexcept()*, *isnan()*, the Base Definitions volume of IEEE Std 1003.1-2001,  
9371 Section 4.18, Treatment of Error Conditions for Mathematical Functions, <math.h>9372 **CHANGE HISTORY**

9373 First released in Issue 1. Derived from Issue 1 of the SVID.

9374 **Issue 5**9375 The DESCRIPTION is updated to indicate how an application should check for an error. This  
9376 text was previously published in the APPLICATION USAGE section.9377 **Issue 6**9378 The *erf()* function is no longer marked as an extension.9379 The *erfc()* function is now split out onto its own reference page.9380 The *erff()* and *erfl()* functions are added for alignment with the ISO/IEC 9899:1999 standard.9381 The DESCRIPTION, RETURN VALUE, ERRORS, and APPLICATION USAGE sections are  
9382 revised to align with the ISO/IEC 9899:1999 standard.9383 IEC 60559:1989 standard floating-point extensions over the ISO/IEC 9899:1999 standard are  
9384 marked.

9385 **NAME**  
 9386       erfc, erfcf, erfcl — complementary error functions

9387 **SYNOPSIS**

9388       #include <math.h>  
 9389       double erfc(double x);  
 9390       float erfcf(float x);  
 9391       long double erfcl(long double x);

9392 **DESCRIPTION**

9393 **CX**     The functionality described on this reference page is aligned with the ISO C standard. Any  
 9394 conflict between the requirements described here and the ISO C standard is unintentional. This  
 9395 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

9396       These functions shall compute the complementary error function  $1.0 - \operatorname{erf}(x)$ .

9397       An application wishing to check for error situations should set *errno* to zero and call  
 9398 *feclearexcept*(FE\_ALL\_EXCEPT) before calling these functions. On return, if *errno* is non-zero or  
 9399 *fetestexcept*(FE\_INVALID | FE\_DIVBYZERO | FE\_OVERFLOW | FE\_UNDERFLOW) is non-  
 9400 zero, an error has occurred.

9401 **RETURN VALUE**

9402       Upon successful completion, these functions shall return the value of the complementary error  
 9403 function.

9404       If the correct value would cause underflow and is not representable, a range error may occur  
 9405 **MX**     and either 0.0 (if representable), or an implementation-defined value shall be returned.

9406 **MX**     If *x* is NaN, a NaN shall be returned.

9407       If *x* is  $\pm 0$ , +1 shall be returned.

9408       If *x* is  $-\operatorname{Inf}$ , +2 shall be returned.

9409       If *x* is  $+\operatorname{Inf}$ , +0 shall be returned.

9410       If the correct value would cause underflow and is representable, a range error may occur and the  
 9411 correct value shall be returned.

9412 **ERRORS**

9413       These functions may fail if:

9414       Range Error       The result underflows.

9415       If the integer expression (math\_errhandling & MATH\_ERRNO) is non-zero,  
 9416 then *errno* shall be set to [ERANGE]. If the integer expression  
 9417 (math\_errhandling & MATH\_ERREXCEPT) is non-zero, then the underflow  
 9418 floating-point exception shall be raised.

9419 **EXAMPLES**

9420       None.

9421 **APPLICATION USAGE**

9422       The *erfc()* function is provided because of the extreme loss of relative accuracy if *erf(x)* is called  
 9423 for large *x* and the result subtracted from 1.0.

9424       Note for IEEE Std 754-1985 **double**,  $26.55 < x$  implies *erfc(x)* has underflowed.

9425       On error, the expressions (math\_errhandling & MATH\_ERRNO) and (math\_errhandling &  
 9426 MATH\_ERREXCEPT) are independent of each other, but at least one of them must be non-zero.

9427 **RATIONALE**

9428       None.

9429 **FUTURE DIRECTIONS**

9430       None.

9431 **SEE ALSO**9432       *erf()*, *feclearexcept()*, *fetetestexcept()*, *isnan()*, the Base Definitions volume of IEEE Std 1003.1-2001,  
9433       Section 4.18, Treatment of Error Conditions for Mathematical Functions, <math.h>9434 **CHANGE HISTORY**

9435       First released in Issue 1. Derived from Issue 1 of the SVID.

9436 **Issue 5**9437       The DESCRIPTION is updated to indicate how an application should check for an error. This  
9438       text was previously published in the APPLICATION USAGE section.9439 **Issue 6**9440       The *erfc()* function is no longer marked as an extension.9441       These functions are split out from the *erf()* reference page.9442       The DESCRIPTION, RETURN VALUE, ERRORS, and APPLICATION USAGE sections are  
9443       revised to align with the ISO/IEC 9899:1999 standard.9444       IEC 60559:1989 standard floating-point extensions over the ISO/IEC 9899:1999 standard are  
9445       marked.

9446 **NAME**

9447       erff, erfl — error functions

9448 **SYNOPSIS**

9449       #include &lt;math.h&gt;

9450       float erff(float x);

9451       long double erfl(long double x);

9452 **DESCRIPTION**9453       Refer to *erf()*.

9454 **NAME**

9455            errno — error return value

9456 **SYNOPSIS**

9457            #include &lt;errno.h&gt;

9458 **DESCRIPTION**9459            The lvalue *errno* is used by many functions to return error values.

9460            Many functions provide an error number in *errno*, which has type **int** and is defined in  
9461            <**errno.h**>. The value of *errno* shall be defined only after a call to a function for which it is  
9462            explicitly stated to be set and until it is changed by the next function call or if the application  
9463            assigns it a value. The value of *errno* should only be examined when it is indicated to be valid by  
9464            a function's return value. Applications shall obtain the definition of *errno* by the inclusion of  
9465            <**errno.h**>. No function in this volume of IEEE Std 1003.1-2001 shall set *errno* to 0.

9466            It is unspecified whether *errno* is a macro or an identifier declared with external linkage. If a  
9467            macro definition is suppressed in order to access an actual object, or a program defines an  
9468            identifier with the name *errno*, the behavior is undefined.

9469            The symbolic values stored in *errno* are documented in the ERRORS sections on all relevant  
9470            pages.

9471 **RETURN VALUE**

9472            None.

9473 **ERRORS**

9474            None.

9475 **EXAMPLES**

9476            None.

9477 **APPLICATION USAGE**

9478            Previously both POSIX and X/Open documents were more restrictive than the ISO C standard  
9479            in that they required *errno* to be defined as an external variable, whereas the ISO C standard  
9480            required only that *errno* be defined as a modifiable lvalue with type **int**.

9481            An application that needs to examine the value of *errno* to determine the error should set it to 0  
9482            before a function call, then inspect it before a subsequent function call.

9483 **RATIONALE**

9484            None.

9485 **FUTURE DIRECTIONS**

9486            None.

9487 **SEE ALSO**9488            Section 2.3, the Base Definitions volume of IEEE Std 1003.1-2001, <**errno.h**>9489 **CHANGE HISTORY**

9490            First released in Issue 1. Derived from Issue 1 of the SVID.

9491 **Issue 5**

9492            The following sentence is deleted from the DESCRIPTION: "The value of *errno* is 0 at program  
9493            start-up, but is never set to 0 by any XSI function". The DESCRIPTION also no longer states that  
9494            conforming implementations may support the declaration:

9495            extern int errno;

9496 **Issue 6**

9497        Obsolescent text regarding defining *errno* as:

9498        extern int errno

9499        is removed.

9500        Text regarding no function setting *errno* to zero to indicate an error is changed to no function  
9501        shall set *errno* to zero. This is for alignment with the ISO/IEC 9899:1999 standard.

9502 **NAME**

9503 environ, execl, execv, execl, execve, execlp, execvp — execute a file

9504 **SYNOPSIS**

```

9505     #include <unistd.h>

9506     extern char **environ;
9507     int execl(const char *path, const char *arg0, ... /*, (char *)0 */);
9508     int execv(const char *path, char *const argv[]);
9509     int execl(const char *path, const char *arg0, ... /*,
9510             (char *)0, char *const envp[] */);
9511     int execve(const char *path, char *const argv[], char *const envp[]);
9512     int execlp(const char *file, const char *arg0, ... /*, (char *)0 */);
9513     int execvp(const char *file, char *const argv[]);

```

9514 **DESCRIPTION**

9515 The *exec* family of functions shall replace the current process image with a new process image.  
 9516 The new image shall be constructed from a regular, executable file called the *new process image*  
 9517 *file*. There shall be no return from a successful *exec*, because the calling process image is overlaid  
 9518 by the new process image.

9519 When a C-language program is executed as a result of this call, it shall be entered as a C-  
 9520 language function call as follows:

```

9521     int main (int argc, char *argv[]);

```

9522 where *argc* is the argument count and *argv* is an array of character pointers to the arguments  
 9523 themselves. In addition, the following variable:

```

9524     extern char **environ;

```

9525 is initialized as a pointer to an array of character pointers to the environment strings. The *argv*  
 9526 and *environ* arrays are each terminated by a null pointer. The null pointer terminating the *argv*  
 9527 array is not counted in *argc*.

9528 **THR** Conforming multi-threaded applications shall not use the *environ* variable to access or modify  
 9529 any environment variable while any other thread is concurrently modifying any environment  
 9530 variable. A call to any function dependent on any environment variable shall be considered a use  
 9531 of the *environ* variable to access that environment variable.

9532 The arguments specified by a program with one of the *exec* functions shall be passed on to the  
 9533 new process image in the corresponding *main()* arguments.

9534 The argument *path* points to a pathname that identifies the new process image file.

9535 The argument *file* is used to construct a pathname that identifies the new process image file. If  
 9536 the *file* argument contains a slash character, the *file* argument shall be used as the pathname for  
 9537 this file. Otherwise, the path prefix for this file is obtained by a search of the directories passed  
 9538 as the environment variable *PATH* (see the Base Definitions volume of IEEE Std 1003.1-2001,  
 9539 Chapter 8, Environment Variables). If this environment variable is not present, the results of the  
 9540 search are implementation-defined.

9541 There are two distinct ways in which the contents of the process image file may cause the  
 9542 execution to fail, distinguished by the setting of *errno* to either [ENOEXEC] or [EINVAL] (see the  
 9543 ERRORS section). In the cases where the other members of the *exec* family of functions would  
 9544 fail and set *errno* to [ENOEXEC], the *execlp()* and *execvp()* functions shall execute a command  
 9545 interpreter and the environment of the executed command shall be as if the process invoked the  
 9546 *sh* utility using *execl()* as follows:

9547 `execl(<shell path>, arg0, file, arg1, ..., (char *)0);`

9548 where *<shell path>* is an unspecified pathname for the *sh* utility, *file* is the process image file, and  
9549 for *execvp()*, where *arg0*, *arg1*, and so on correspond to the values passed to *execvp()* in *argv[0]*,  
9550 *argv[1]*, and so on.

9551 The arguments represented by *arg0*,... are pointers to null-terminated character strings. These  
9552 strings shall constitute the argument list available to the new process image. The list is  
9553 terminated by a null pointer. The argument *arg0* should point to a filename that is associated  
9554 with the process being started by one of the *exec* functions.

9555 The argument *argv* is an array of character pointers to null-terminated strings. The application  
9556 shall ensure that the last member of this array is a null pointer. These strings shall constitute the  
9557 argument list available to the new process image. The value in *argv[0]* should point to a filename  
9558 that is associated with the process being started by one of the *exec* functions.

9559 The argument *envp* is an array of character pointers to null-terminated strings. These strings  
9560 shall constitute the environment for the new process image. The *envp* array is terminated by a  
9561 null pointer.

9562 For those forms not containing an *envp* pointer (*execl()*, *execv()*, *execlp()*, and *execvp()*), the  
9563 environment for the new process image shall be taken from the external variable *environ* in the  
9564 calling process.

9565 The number of bytes available for the new process' combined argument and environment lists is  
9566 {ARG\_MAX}. It is implementation-defined whether null terminators, pointers, and/or any  
9567 alignment bytes are included in this total.

9568 File descriptors open in the calling process image shall remain open in the new process image,  
9569 except for those whose close-on-exec flag *FD\_CLOEXEC* is set. For those file descriptors that  
9570 remain open, all attributes of the open file description remain unchanged. For any file descriptor  
9571 that is closed for this reason, file locks are removed as a result of the close as described in *close()*.  
9572 Locks that are not removed by closing of file descriptors remain unchanged.

9573 Directory streams open in the calling process image shall be closed in the new process image.

9574 The state of the floating-point environment in the new process image shall be set to the default.

9575 XSI The state of conversion descriptors and message catalog descriptors in the new process image is  
9576 undefined. For the new process image, the equivalent of:

9577 `setlocale(LC_ALL, "C")`

9578 shall be executed at start-up.

9579 Signals set to the default action (*SIG\_DFL*) in the calling process image shall be set to the default  
9580 action in the new process image. Except for *SIGCHLD*, signals set to be ignored (*SIG\_IGN*) by  
9581 the calling process image shall be set to be ignored by the new process image. Signals set to be  
9582 caught by the calling process image shall be set to the default action in the new process image  
9583 (see *<signal.h>*). If the *SIGCHLD* signal is set to be ignored by the calling process image, it is  
9584 unspecified whether the *SIGCHLD* signal is set to be ignored or to the default action in the new  
9585 XSI process image. After a successful call to any of the *exec* functions, alternate signal stacks are not  
9586 preserved and the *SA\_ONSTACK* flag shall be cleared for all signals.

9587 After a successful call to any of the *exec* functions, any functions previously registered by *atexit()*  
9588 are no longer registered.

9589 XSI If the *ST\_NOSUID* bit is set for the file system containing the new process image file, then the  
9590 effective user ID, effective group ID, saved set-user-ID, and saved set-group-ID are unchanged  
9591 in the new process image. Otherwise, if the set-user-ID mode bit of the new process image file is

9592		set, the effective user ID of the new process image shall be set to the user ID of the new process
9593		image file. Similarly, if the set-group-ID mode bit of the new process image file is set, the
9594		effective group ID of the new process image shall be set to the group ID of the new process
9595		image file. The real user ID, real group ID, and supplementary group IDs of the new process
9596		image shall remain the same as those of the calling process image. The effective user ID and
9597		effective group ID of the new process image shall be saved (as the saved set-user-ID and the
9598		saved set-group-ID) for use by <i>setuid()</i> .
9599	XSI	Any shared memory segments attached to the calling process image shall not be attached to the
9600		new process image.
9601	SEM	Any named semaphores open in the calling process shall be closed as if by appropriate calls to
9602		<i>sem_close()</i> .
9603	TYM	Any blocks of typed memory that were mapped in the calling process are unmapped, as if
9604		<i>munmap()</i> was implicitly called to unmap them.
9605	ML	Memory locks established by the calling process via calls to <i>mlockall()</i> or <i>mlock()</i> shall be
9606		removed. If locked pages in the address space of the calling process are also mapped into the
9607		address spaces of other processes and are locked by those processes, the locks established by the
9608		other processes shall be unaffected by the call by this process to the <i>exec</i> function. If the <i>exec</i>
9609		function fails, the effect on memory locks is unspecified.
9610	MF SHM	Memory mappings created in the process are unmapped before the address space is rebuilt for
9611		the new process image.
9612	PS	For the SCHED_FIFO and SCHED_RR scheduling policies, the policy and priority settings shall
9613		not be changed by a call to an <i>exec</i> function. For other scheduling policies, the policy and priority
9614		settings on <i>exec</i> are implementation-defined.
9615	TMR	Per-process timers created by the calling process shall be deleted before replacing the current
9616		process image with the new process image.
9617	MSG	All open message queue descriptors in the calling process shall be closed, as described in
9618		<i>mq_close()</i> .
9619	AIO	Any outstanding asynchronous I/O operations may be canceled. Those asynchronous I/O
9620		operations that are not canceled shall complete as if the <i>exec</i> function had not yet occurred, but
9621		any associated signal notifications shall be suppressed. It is unspecified whether the <i>exec</i>
9622		function itself blocks awaiting such I/O completion. In no event, however, shall the new process
9623		image created by the <i>exec</i> function be affected by the presence of outstanding asynchronous I/O
9624		operations at the time the <i>exec</i> function is called. Whether any I/O is canceled, and which I/O
9625		may be canceled upon <i>exec</i> , is implementation-defined.
9626	CPT	The new process image shall inherit the CPU-time clock of the calling process image. This
9627		inheritance means that the process CPU-time clock of the process being <i>exec</i> -ed shall not be
9628		reinitialized or altered as a result of the <i>exec</i> function other than to reflect the time spent by the
9629		process executing the <i>exec</i> function itself.
9630	TCT	The initial value of the CPU-time clock of the initial thread of the new process image shall be set
9631		to zero.
9632	TRC	If the calling process is being traced, the new process image shall continue to be traced into the
9633		same trace stream as the original process image, but the new process image shall not inherit the
9634		mapping of trace event names to trace event type identifiers that was defined by calls to the
9635		<i>posix_trace_eventid_open()</i> or the <i>posix_trace_trid_eventid_open()</i> functions in the calling process
9636		image.

9637 If the calling process is a trace controller process, any trace streams that were created by the  
 9638 calling process shall be shut down as described in the *posix\_trace\_shutdown()* function.

9639 The new process shall inherit at least the following attributes from the calling process image:

- 9640 XSI • Nice value (see *nice()*)
- 9641 XSI • *semadj* values (see *semop()*)
- 9642 • Process ID
- 9643 • Parent process ID
- 9644 • Process group ID
- 9645 • Session membership
- 9646 • Real user ID
- 9647 • Real group ID
- 9648 • Supplementary group IDs
- 9649 • Time left until an alarm clock signal (see *alarm()*)
- 9650 • Current working directory
- 9651 • Root directory
- 9652 • File mode creation mask (see *umask()*)
- 9653 XSI • File size limit (see *ulimit()*)
- 9654 • Process signal mask (see *sigprocmask()*)
- 9655 • Pending signal (see *sigpending()*)
- 9656 • *tms\_utime*, *tms\_stime*, *tms\_cutime*, and *tms\_cstime* (see *times()*)
- 9657 XSI • Resource limits
- 9658 XSI • Controlling terminal
- 9659 XSI • Interval timers

9660 All other process attributes defined in this volume of IEEE Std 1003.1-2001 shall be the same in  
 9661 the new and old process images. The inheritance of process attributes not defined by this  
 9662 volume of IEEE Std 1003.1-2001 is implementation-defined.

9663 A call to any *exec* function from a process with more than one thread shall result in all threads  
 9664 being terminated and the new executable image being loaded and executed. No destructor  
 9665 functions shall be called.

9666 Upon successful completion, the *exec* functions shall mark for update the *st\_atime* field of the file.  
 9667 If an *exec* function failed but was able to locate the process image file, whether the *st\_atime* field  
 9668 is marked for update is unspecified. Should the *exec* function succeed, the process image file  
 9669 shall be considered to have been opened with *open()*. The corresponding *close()* shall be  
 9670 considered to occur at a time after this open, but before process termination or successful  
 9671 completion of a subsequent call to one of the *exec* functions, *posix\_spawn()*, or *posix\_spawnp()*.  
 9672 The *argv[]* and *envp[]* arrays of pointers and the strings to which those arrays point shall not be  
 9673 modified by a call to one of the *exec* functions, except as a consequence of replacing the process  
 9674 image.

9675 XSI The saved resource limits in the new process image are set to be a copy of the process'  
 9676 corresponding hard and soft limits.

9677 **RETURN VALUE**

9678 If one of the *exec* functions returns to the calling process image, an error has occurred; the return  
 9679 value shall be  $-1$ , and *errno* shall be set to indicate the error.

9680 **ERRORS**

9681 The *exec* functions shall fail if:

9682 [E2BIG] The number of bytes used by the new process image's argument list and  
 9683 environment list is greater than the system-imposed limit of {ARG\_MAX}  
 9684 bytes.

9685 [EACCES] Search permission is denied for a directory listed in the new process image  
 9686 file's path prefix, or the new process image file denies execution permission,  
 9687 or the new process image file is not a regular file and the implementation does  
 9688 not support execution of files of its type.

9689 [EINVAL] The new process image file has the appropriate permission and has a  
 9690 recognized executable binary format, but the system does not support  
 9691 execution of a file with this format.

9692 [ELOOP] A loop exists in symbolic links encountered during resolution of the *path* or *file*  
 9693 argument.

9694 [ENAMETOOLONG] The length of the *path* or *file* arguments exceeds {PATH\_MAX} or a pathname  
 9695 component is longer than {NAME\_MAX}.  
 9696

9697 [ENOENT] A component of *path* or *file* does not name an existing file or *path* or *file* is an  
 9698 empty string.

9699 [ENOTDIR] A component of the new process image file's path prefix is not a directory.

9700 The *exec* functions, except for *execlp()* and *execvp()*, shall fail if:

9701 [ENOEXEC] The new process image file has the appropriate access permission but has an  
 9702 unrecognized format.

9703 The *exec* functions may fail if:

9704 [ELOOP] More than {SYMLOOP\_MAX} symbolic links were encountered during  
 9705 resolution of the *path* or *file* argument.

9706 [ENAMETOOLONG] As a result of encountering a symbolic link in resolution of the *path* argument,  
 9707 the length of the substituted pathname string exceeded {PATH\_MAX}.  
 9708

9709 [ENOMEM] The new process image requires more memory than is allowed by the  
 9710 hardware or system-imposed memory management constraints.

9711 [ETXTBSY] The new process image file is a pure procedure (shared text) file that is  
 9712 currently open for writing by some process.

9713 **EXAMPLES**9714 **Using execl()**

9715 The following example executes the *ls* command, specifying the pathname of the executable  
9716 (**/bin/ls**) and using arguments supplied directly to the command to produce single-column  
9717 output.

```
9718 #include <unistd.h>
9719 int ret;
9720 ...
9721 ret = execl ("/bin/ls", "ls", "-l", (char *)0);
```

9722 **Using execl\_e()**

9723 The following example is similar to **Using execl()**. In addition, it specifies the environment for  
9724 the new process image using the *env* argument.

```
9725 #include <unistd.h>
9726 int ret;
9727 char *env[] = { "HOME=/usr/home", "LOGNAME=home", (char *)0 };
9728 ...
9729 ret = execl_e ("/bin/ls", "ls", "-l", (char *)0, env);
```

9730 **Using execl\_p()**

9731 The following example searches for the location of the *ls* command among the directories  
9732 specified by the *PATH* environment variable.

```
9733 #include <unistd.h>
9734 int ret;
9735 ...
9736 ret = execl_p ("ls", "ls", "-l", (char *)0);
```

9737 **Using execv()**

9738 The following example passes arguments to the *ls* command in the *cmd* array.

```
9739 #include <unistd.h>
9740 int ret;
9741 char *cmd[] = { "ls", "-l", (char *)0 };
9742 ...
9743 ret = execv ("/bin/ls", cmd);
```

9744 **Using `execve()`**

9745 The following example passes arguments to the `ls` command in the `cmd` array, and specifies the  
 9746 environment for the new process image using the `env` argument.

```
9747 #include <unistd.h>
9748 int ret;
9749 char *cmd[] = { "ls", "-l", (char *)0 };
9750 char *env[] = { "HOME=/usr/home", "LOGNAME=home", (char *)0 };
9751 ...
9752 ret = execve ("/bin/ls", cmd, env);
```

9753 **Using `execvp()`**

9754 The following example searches for the location of the `ls` command among the directories  
 9755 specified by the `PATH` environment variable, and passes arguments to the `ls` command in the  
 9756 `cmd` array.

```
9757 #include <unistd.h>
9758 int ret;
9759 char *cmd[] = { "ls", "-l", (char *)0 };
9760 ...
9761 ret = execvp ("ls", cmd);
```

9762 **APPLICATION USAGE**

9763 As the state of conversion descriptors and message catalog descriptors in the new process image  
 9764 is undefined, conforming applications should not rely on their use and should close them prior  
 9765 to calling one of the `exec` functions.

9766 Applications that require other than the default POSIX locale should call `setlocale()` with the  
 9767 appropriate parameters to establish the locale of the new process.

9768 The `environ` array should not be accessed directly by the application.

9769 **RATIONALE**

9770 Early proposals required that the value of `argc` passed to `main()` be “one or greater”. This was  
 9771 driven by the same requirement in drafts of the ISO C standard. In fact, historical  
 9772 implementations have passed a value of zero when no arguments are supplied to the caller of  
 9773 the `exec` functions. This requirement was removed from the ISO C standard and subsequently  
 9774 removed from this volume of IEEE Std 1003.1-2001 as well. The wording, in particular the use of  
 9775 the word *should*, requires a Strictly Conforming POSIX Application to pass at least one argument  
 9776 to the `exec` function, thus guaranteeing that `argc` be one or greater when invoked by such an  
 9777 application. In fact, this is good practice, since many existing applications reference `argv[0]`  
 9778 without first checking the value of `argc`.

9779 The requirement on a Strictly Conforming POSIX Application also states that the value passed  
 9780 as the first argument be a filename associated with the process being started. Although some  
 9781 existing applications pass a pathname rather than a filename in some circumstances, a filename  
 9782 is more generally useful, since the common usage of `argv[0]` is in printing diagnostics. In some  
 9783 cases the filename passed is not the actual filename of the file; for example, many  
 9784 implementations of the `login` utility use a convention of prefixing a hyphen (‘-’) to the actual  
 9785 filename, which indicates to the command interpreter being invoked that it is a “login shell”.

9786 Historically there have been two ways that implementations can `exec` shell scripts.

9787 One common historical implementation is that the *execl()*, *execv()*, *execle()*, and *execve()*  
9788 functions return an [ENOEXEC] error for any file not recognizable as executable, including a  
9789 shell script. When the *execlp()* and *execvp()* functions encounter such a file, they assume the file  
9790 to be a shell script and invoke a known command interpreter to interpret such files. This is now  
9791 required by IEEE Std 1003.1-2001. These implementations of *execvp()* and *execlp()* only give the  
9792 [ENOEXEC] error in the rare case of a problem with the command interpreter's executable file.  
9793 Because of these implementations, the [ENOEXEC] error is not mentioned for *execlp()* or  
9794 *execvp()*, although implementations can still give it.

9795 Another way that some historical implementations handle shell scripts is by recognizing the first  
9796 two bytes of the file as the character string "#!" and using the remainder of the first line of the  
9797 file as the name of the command interpreter to execute.

9798 One potential source of confusion noted by the standard developers is over how the contents of  
9799 a process image file affect the behavior of the *exec* family of functions. The following is a  
9800 description of the actions taken:

- 9801 1. If the process image file is a valid executable (in a format that is executable and valid and  
9802 having appropriate permission) for this system, then the system executes the file.
- 9803 2. If the process image file has appropriate permission and is in a format that is executable  
9804 but not valid for this system (such as a recognized binary for another architecture), then  
9805 this is an error and *errno* is set to [EINVAL] (see later RATIONALE on [EINVAL]).
- 9806 3. If the process image file has appropriate permission but is not otherwise recognized:
  - 9807 a. If this is a call to *execlp()* or *execvp()*, then they invoke a command interpreter  
9808 assuming that the process image file is a shell script.
  - 9809 b. If this is not a call to *execlp()* or *execvp()*, then an error occurs and *errno* is set to  
9810 [ENOEXEC].

9811 Applications that do not require to access their arguments may use the form:

9812 `main(void)`

9813 as specified in the ISO C standard. However, the implementation will always provide the two  
9814 arguments *argc* and *argv*, even if they are not used.

9815 Some implementations provide a third argument to *main()* called *envp*. This is defined as a  
9816 pointer to the environment. The ISO C standard specifies invoking *main()* with two arguments,  
9817 so implementations must support applications written this way. Since this volume of  
9818 IEEE Std 1003.1-2001 defines the global variable *environ*, which is also provided by historical  
9819 implementations and can be used anywhere that *envp* could be used, there is no functional need  
9820 for the *envp* argument. Applications should use the *getenv()* function rather than accessing the  
9821 environment directly via either *envp* or *environ*. Implementations are required to support the  
9822 two-argument calling sequence, but this does not prohibit an implementation from supporting  
9823 *envp* as an optional third argument.

9824 This volume of IEEE Std 1003.1-2001 specifies that signals set to SIG\_IGN remain set to  
9825 SIG\_IGN, and that the process signal mask be unchanged across an *exec*. This is consistent with  
9826 historical implementations, and it permits some useful functionality, such as the *nohup*  
9827 command. However, it should be noted that many existing applications wrongly assume that  
9828 they start with certain signals set to the default action and/or unblocked. In particular,  
9829 applications written with a simpler signal model that does not include blocking of signals, such  
9830 as the one in the ISO C standard, may not behave properly if invoked with some signals blocked.  
9831 Therefore, it is best not to block or ignore signals across *execs* without explicit reason to do so,  
9832 and especially not to block signals across *execs* of arbitrary (not closely co-operating) programs.

9833 The *exec* functions always save the value of the effective user ID and effective group ID of the  
 9834 process at the completion of the *exec*, whether or not the set-user-ID or the set-group-ID bit of  
 9835 the process image file is set.

9836 The statement about *argv[]* and *envp[]* being constants is included to make explicit to future  
 9837 writers of language bindings that these objects are completely constant. Due to a limitation of  
 9838 the ISO C standard, it is not possible to state that idea in standard C. Specifying two levels of  
 9839 *const-qualification* for the *argv[]* and *envp[]* parameters for the *exec* functions may seem to be the  
 9840 natural choice, given that these functions do not modify either the array of pointers or the  
 9841 characters to which the function points, but this would disallow existing correct code. Instead,  
 9842 only the array of pointers is noted as constant. The table of assignment compatibility for *dst=src*  
 9843 derived from the ISO C standard summarizes the compatibility:

9844	<i>dst:</i>	<b>char *[]</b>	<b>const char *[]</b>	<b>char *const[]</b>	<b>const char *const[]</b>
9845	<i>src:</i>				
9846	<b>char *[]</b>	VALID	—	VALID	—
9847	<b>const char *[]</b>	—	VALID	—	VALID
9848	<b>char * const []</b>	—	—	VALID	—
9849	<b>const char *const[]</b>	—	—	—	VALID

9850 Since all existing code has a source type matching the first row, the column that gives the most  
 9851 valid combinations is the third column. The only other possibility is the fourth column, but  
 9852 using it would require a cast on the *argv* or *envp* arguments. It is unfortunate that the fourth  
 9853 column cannot be used, because the declaration a non-expert would naturally use would be that  
 9854 in the second row.

9855 The ISO C standard and this volume of IEEE Std 1003.1-2001 do not conflict on the use of  
 9856 *environ*, but some historical implementations of *environ* may cause a conflict. As long as *environ*  
 9857 is treated in the same way as an entry point (for example, *fork()*), it conforms to both standards.  
 9858 A library can contain *fork()*, but if there is a user-provided *fork()*, that *fork()* is given precedence  
 9859 and no problem ensues. The situation is similar for *environ*: the definition in this volume of  
 9860 IEEE Std 1003.1-2001 is to be used if there is no user-provided *environ* to take precedence. At  
 9861 least three implementations are known to exist that solve this problem.

9862 [E2BIG] The limit {ARG\_MAX} applies not just to the size of the argument list, but to  
 9863 the sum of that and the size of the environment list.

9864 [EFAULT] Some historical systems return [EFAULT] rather than [ENOEXEC] when the  
 9865 new process image file is corrupted. They are non-conforming.

9866 [EINVAL] This error condition was added to IEEE Std 1003.1-2001 to allow an  
 9867 implementation to detect executable files generated for different architectures,  
 9868 and indicate this situation to the application. Historical implementations of  
 9869 shells, *execvp()*, and *execlp()* that encounter an [ENOEXEC] error will execute  
 9870 a shell on the assumption that the file is a shell script. This will not produce  
 9871 the desired effect when the file is a valid executable for a different  
 9872 architecture. An implementation may now choose to avoid this problem by  
 9873 returning [EINVAL] when a valid executable for a different architecture is  
 9874 encountered. Some historical implementations return [EINVAL] to indicate  
 9875 that the *path* argument contains a character with the high order bit set. The  
 9876 standard developers chose to deviate from historical practice for the following  
 9877 reasons:

- 9878 1. The new utilization of [EINVAL] will provide some measure of utility to  
 9879 the user community.

9880                   2. Historical use of [EINVAL] is not acceptable in an internationalized  
9881                   operating environment.

9882           [ENAMETOOLONG]

9883                   Since the file pathname may be constructed by taking elements in the *PATH*  
9884                   variable and putting them together with the filename, the  
9885                   [ENAMETOOLONG] error condition could also be reached this way.

9886           [ETXTBSY]

9887                   System V returns this error when the executable file is currently open for  
9888                   writing by some process. This volume of IEEE Std 1003.1-2001 neither requires  
                  nor prohibits this behavior.

9889           Other systems (such as System V) may return [EINTR] from *exec*. This is not addressed by this  
9890           volume of IEEE Std 1003.1-2001, but implementations may have a window between the call to  
9891           *exec* and the time that a signal could cause one of the *exec* calls to return with [EINTR].

9892           An explicit statement regarding the floating-point environment (as defined in the `<fenv.h>`  
9893           header) was added to make it clear that the floating-point environment is set to its default when  
9894           a call to one of the *exec* functions succeeds. The requirements for inheritance or setting to the  
9895           default for other process and thread start-up functions is covered by more generic statements in  
9896           their descriptions and can be summarized as follows:

9897           *posix\_spawn()*           Set to default.

9898           *fork()*                    Inherit.

9899           *pthread\_create()*        Inherit.

## 9900 FUTURE DIRECTIONS

## 9908 CHANGE HISTORY

9909           First released in Issue 1. Derived from Issue 1 of the SVID.

### 9910 Issue 5

9911           The DESCRIPTION is updated for alignment with the POSIX Realtime Extension and the POSIX  
9912           Threads Extension.

9913           Large File Summit extensions are added.

### 9914 Issue 6

9915           The following new requirements on POSIX implementations derive from alignment with the  
9916           Single UNIX Specification:

9917           • In the DESCRIPTION, behavior is defined for when the process image file is not a valid  
9918           executable.

9919           • In this issue, `_POSIX_SAVED_IDS` is mandated, thus the effective user ID and effective group  
9920           ID of the new process image shall be saved (as the saved set-user-ID and the saved set-  
9921           group-ID) for use by the *setuid()* function.

9922           • The [ELOOP] mandatory error condition is added.

- 9923
  - A second [ENAMETOOLONG] is added as an optional error condition.
- 9924
  - The [ETXTBSY] optional error condition is added.
- 9925 The following changes were made to align with the IEEE P1003.1a draft standard:
- 9926
  - The [EINVAL] mandatory error condition is added.
- 9927
  - The [ELOOP] optional error condition is added.
- 9928 The description of CPU-time clock semantics is added for alignment with IEEE Std 1003.1d-1999.
- 9929 The DESCRIPTION is updated for alignment with IEEE Std 1003.1j-2000 by adding semantics for
- 9930 typed memory.
- 9931 The DESCRIPTION is updated to avoid use of the term “must” for application requirements.
- 9932 The description of tracing semantics is added for alignment with IEEE Std 1003.1q-2000.
- 9933 IEEE PASC Interpretation 1003.1 #132 is applied.
- 9934 The DESCRIPTION is updated to make it explicit that the floating-point environment in the new
- 9935 process image is set to the default.
- 9936 The DESCRIPTION and RATIONALE are updated to include clarifications of how the contents
- 9937 of a process image file affect the behavior of the *exec* functions.

## 9938 NAME

9939 exit, \_Exit, \_exit — terminate a process

## 9940 SYNOPSIS

9941 #include &lt;stdlib.h&gt;

9942 void exit(int status);

9943 void \_Exit(int status);

9944 #include &lt;unistd.h&gt;

9945 void \_exit(int status);

## 9946 DESCRIPTION

9947 CX For *exit()* and *\_Exit()*: The functionality described on this reference page is aligned with the  
 9948 ISO C standard. Any conflict between the requirements described here and the ISO C standard is  
 9949 unintentional. This volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

9950 CX The value of *status* may be 0, EXIT\_SUCCESS, EXIT\_FAILURE, or any other value, though only  
 9951 the least significant 8 bits (that is, *status* & 0377) shall be available to a waiting parent process.

9952 The *exit()* function shall first call all functions registered by *atexit()*, in the reverse order of their  
 9953 registration, except that a function is called after any previously registered functions that had  
 9954 already been called at the time it was registered. Each function is called as many times as it was  
 9955 registered. If, during the call to any such function, a call to the *longjmp()* function is made that  
 9956 would terminate the call to the registered function, the behavior is undefined.

9957 If a function registered by a call to *atexit()* fails to return, the remaining registered functions shall  
 9958 not be called and the rest of the *exit()* processing shall not be completed. If *exit()* is called more  
 9959 than once, the behavior is undefined.

9960 The *exit()* function shall then flush all open streams with unwritten buffered data, close all open  
 9961 streams, and remove all files created by *tmpfile()*. Finally, control shall be terminated with the  
 9962 consequences described below.

9963 CX The *\_Exit()* and *\_exit()* functions shall be functionally equivalent.

9964 CX The *\_Exit()* and *\_exit()* functions shall not call functions registered with *atexit()* nor any  
 9965 registered signal handlers. Whether open streams are flushed or closed, or temporary files are  
 9966 removed is implementation-defined. Finally, the calling process is terminated with the  
 9967 consequences described below.

9968 CX These functions shall terminate the calling process with the following consequences:

9969 **Note:** These consequences are all extensions to the ISO C standard and are not further CX shaded.  
 9970 However, XSI extensions are shaded.

9971 XSI • All of the file descriptors, directory streams, conversion descriptors, and message catalog  
 9972 descriptors open in the calling process shall be closed.

9973 XSI • If the parent process of the calling process is executing a *wait()* or *waitpid()*, and has neither  
 9974 set its SA\_NOCLDWAIT flag nor set SIGCHLD to SIG\_IGN, it shall be notified of the calling  
 9975 process' termination and the low-order eight bits (that is, bits 0377) of *status* are made  
 9976 available to it. If the parent is not waiting, the child's status shall be made available to it  
 9977 when the parent subsequently executes *wait()* or *waitpid()*.

9978 XSI The semantics of the *waitid()* function shall be equivalent to *wait()*.

9979 XSI • If the parent process of the calling process is not executing a *wait()* or *waitpid()*, and has  
 9980 neither set its SA\_NOCLDWAIT flag nor set SIGCHLD to SIG\_IGN, the calling process shall  
 9981 be transformed into a *zombie process*. A *zombie process* is an inactive process and it shall be

- 9982 deleted at some later time when its parent process executes `wait()` or `waitpid()`.
- 9983 XSI The semantics of the `waitid()` function shall be equivalent to `wait()`.
- 9984 • Termination of a process does not directly terminate its children. The sending of a SIGHUP  
9985 signal as described below indirectly terminates children in some circumstances.
- 9986 • Either:
- 9987 If the implementation supports the SIGCHLD signal, a SIGCHLD shall be sent to the parent  
9988 process.
- 9989 Or:
- 9990 XSI If the parent process has set its SA\_NOCLDWAIT flag, or set SIGCHLD to SIG\_IGN, the  
9991 status shall be discarded, and the lifetime of the calling process shall end immediately. If  
9992 SA\_NOCLDWAIT is set, it is implementation-defined whether a SIGCHLD signal is sent to  
9993 the parent process.
- 9994 • The parent process ID of all of the calling process' existing child processes and zombie  
9995 processes shall be set to the process ID of an implementation-defined system process. That is,  
9996 these processes shall be inherited by a special system process.
- 9997 XSI • Each attached shared-memory segment is detached and the value of `shm_nattch` (see  
9998 `shmget()`) in the data structure associated with its shared memory ID shall be decremented by  
9999 1.
- 10000 XSI • For each semaphore for which the calling process has set a `semadj` value (see `semop()`), that  
10001 value shall be added to the `semval` of the specified semaphore.
- 10002 • If the process is a controlling process, the SIGHUP signal shall be sent to each process in the  
10003 foreground process group of the controlling terminal belonging to the calling process.
- 10004 • If the process is a controlling process, the controlling terminal associated with the session  
10005 shall be disassociated from the session, allowing it to be acquired by a new controlling  
10006 process.
- 10007 • If the exit of the process causes a process group to become orphaned, and if any member of  
10008 the newly-orphaned process group is stopped, then a SIGHUP signal followed by a  
10009 SIGCONT signal shall be sent to each process in the newly-orphaned process group.
- 10010 SEM • All open named semaphores in the calling process shall be closed as if by appropriate calls to  
10011 `sem_close()`.
- 10012 ML • Any memory locks established by the process via calls to `mlockall()` or `mlock()` shall be  
10013 removed. If locked pages in the address space of the calling process are also mapped into the  
10014 address spaces of other processes and are locked by those processes, the locks established by  
10015 the other processes shall be unaffected by the call by this process to `_Exit()` or `_exit()`.
- 10016 MF|SHM • Memory mappings that were created in the process shall be unmapped before the process is  
10017 destroyed.
- 10018 TYM • Any blocks of typed memory that were mapped in the calling process shall be unmapped, as  
10019 if `munmap()` was implicitly called to unmap them.
- 10020 MSG • All open message queue descriptors in the calling process shall be closed as if by appropriate  
10021 calls to `mq_close()`.
- 10022 AIO • Any outstanding cancelable asynchronous I/O operations may be canceled. Those  
10023 asynchronous I/O operations that are not canceled shall complete as if the `_Exit()` or `_exit()`  
10024 operation had not yet occurred, but any associated signal notifications shall be suppressed.

10025 The `_Exit()` or `_exit()` operation may block awaiting such I/O completion. Whether any I/O  
 10026 is canceled, and which I/O may be canceled upon `_Exit()` or `_exit()`, is implementation-  
 10027 defined.

10028 • Threads terminated by a call to `_Exit()` or `_exit()` shall not invoke their cancelation cleanup  
 10029 handlers or per-thread data destructors.

10030 TRC • If the calling process is a trace controller process, any trace streams that were created by the  
 10031 calling process shall be shut down as described by the `posix_trace_shutdown()` function, and  
 10032 any process' mapping of trace event names to trace event type identifiers built for these trace  
 10033 streams may be deallocated.

#### 10034 RETURN VALUE

10035 These functions do not return.

#### 10036 ERRORS

10037 No errors are defined.

#### 10038 EXAMPLES

10039 None.

#### 10040 APPLICATION USAGE

10041 Normally applications should use `exit()` rather than `_Exit()` or `_exit()`.

#### 10042 RATIONALE

##### 10043 Process Termination

10044 Early proposals drew a distinction between normal and abnormal process termination.  
 10045 Abnormal termination was caused only by certain signals and resulted in implementation-  
 10046 defined “actions”, as discussed below. Subsequent proposals distinguished three types of  
 10047 termination: *normal termination* (as in the current specification), *simple abnormal termination*, and  
 10048 *abnormal termination with actions*. Again the distinction between the two types of abnormal  
 10049 termination was that they were caused by different signals and that implementation-defined  
 10050 actions would result in the latter case. Given that these actions were completely  
 10051 implementation-defined, the early proposals were only saying when the actions could occur and  
 10052 how their occurrence could be detected, but not what they were. This was of little or no use to  
 10053 conforming applications, and thus the distinction is not made in this volume of  
 10054 IEEE Std 1003.1-2001.

10055 The implementation-defined actions usually include, in most historical implementations, the  
 10056 creation of a file named **core** in the current working directory of the process. This file contains an  
 10057 image of the memory of the process, together with descriptive information about the process,  
 10058 perhaps sufficient to reconstruct the state of the process at the receipt of the signal.

10059 There is a potential security problem in creating a **core** file if the process was set-user-ID and the  
 10060 current user is not the owner of the program, if the process was set-group-ID and none of the  
 10061 user's groups match the group of the program, or if the user does not have permission to write in  
 10062 the current directory. In this situation, an implementation either should not create a **core** file or  
 10063 should make it unreadable by the user.

10064 Despite the silence of this volume of IEEE Std 1003.1-2001 on this feature, applications are  
 10065 advised not to create files named **core** because of potential conflicts in many implementations.  
 10066 Some implementations use a name other than **core** for the file; for example, by appending the  
 10067 process ID to the filename.

10068 **Terminating a Process**

10069 It is important that the consequences of process termination as described occur regardless of  
10070 whether the process called `_exit()` (perhaps indirectly through `exit()`) or instead was terminated  
10071 due to a signal or for some other reason. Note that in the specific case of `exit()` this means that  
10072 the *status* argument to `exit()` is treated in the same way as the *status* argument to `_exit()`.

10073 A language other than C may have other termination primitives than the C-language `exit()`  
10074 function, and programs written in such a language should use its native termination primitives,  
10075 but those should have as part of their function the behavior of `_exit()` as described.  
10076 Implementations in languages other than C are outside the scope of this version of this volume  
10077 of IEEE Std 1003.1-2001, however.

10078 As required by the ISO C standard, using **return** from `main()` has the same behavior (other than  
10079 with respect to language scope issues) as calling `exit()` with the returned value. Reaching the end  
10080 of the `main()` function has the same behavior as calling `exit(0)`.

10081 A value of zero (or `EXIT_SUCCESS`, which is required to be zero) for the argument *status*  
10082 conventionally indicates successful termination. This corresponds to the specification for `exit()`  
10083 in the ISO C standard. The convention is followed by utilities such as *make* and various shells,  
10084 which interpret a zero status from a child process as success. For this reason, applications should  
10085 not call `exit(0)` or `_exit(0)` when they terminate unsuccessfully; for example, in signal-catching  
10086 functions.

10087 Historically, the implementation-defined process that inherits children whose parents have  
10088 terminated without waiting on them is called *init* and has a process ID of 1.

10089 The sending of a `SIGHUP` to the foreground process group when a controlling process  
10090 terminates corresponds to somewhat different historical implementations. In System V, the  
10091 kernel sends a `SIGHUP` on termination of (essentially) a controlling process. In 4.2 BSD, the  
10092 kernel does not send `SIGHUP` in a case like this, but the termination of a controlling process is  
10093 usually noticed by a system daemon, which arranges to send a `SIGHUP` to the foreground  
10094 process group with the `vhangup()` function. However, in 4.2 BSD, due to the behavior of the  
10095 shells that support job control, the controlling process is usually a shell with no other processes  
10096 in its process group. Thus, a change to make `_exit()` behave this way in such systems should not  
10097 cause problems with existing applications.

10098 The termination of a process may cause a process group to become orphaned in either of two  
10099 ways. The connection of a process group to its parent(s) outside of the group depends on both  
10100 the parents and their children. Thus, a process group may be orphaned by the termination of the  
10101 last connecting parent process outside of the group or by the termination of the last direct  
10102 descendant of the parent process(es). In either case, if the termination of a process causes a  
10103 process group to become orphaned, processes within the group are disconnected from their job  
10104 control shell, which no longer has any information on the existence of the process group.  
10105 Stopped processes within the group would languish forever. In order to avoid this problem,  
10106 newly orphaned process groups that contain stopped processes are sent a `SIGHUP` signal and a  
10107 `SIGCONT` signal to indicate that they have been disconnected from their session. The `SIGHUP`  
10108 signal causes the process group members to terminate unless they are catching or ignoring  
10109 `SIGHUP`. Under most circumstances, all of the members of the process group are stopped if any  
10110 of them are stopped.

10111 The action of sending a `SIGHUP` and a `SIGCONT` signal to members of a newly orphaned  
10112 process group is similar to the action of 4.2 BSD, which sends `SIGHUP` and `SIGCONT` to each  
10113 stopped child of an exiting process. If such children exit in response to the `SIGHUP`, any  
10114 additional descendants receive similar treatment at that time. In this volume of  
10115 IEEE Std 1003.1-2001, the signals are sent to the entire process group at the same time. Also, in

10116 this volume of IEEE Std 1003.1-2001, but not in 4.2 BSD, stopped processes may be orphaned, but  
10117 may be members of a process group that is not orphaned; therefore, the action taken at `_exit()`  
10118 must consider processes other than child processes.

10119 It is possible for a process group to be orphaned by a call to `setpgid()` or `setsid()`, as well as by  
10120 process termination. This volume of IEEE Std 1003.1-2001 does not require sending `SIGHUP` and  
10121 `SIGCONT` in those cases, because, unlike process termination, those cases are not caused  
10122 accidentally by applications that are unaware of job control. An implementation can choose to  
10123 send `SIGHUP` and `SIGCONT` in those cases as an extension; such an extension must be  
10124 documented as required in `<signal.h>`.

10125 The ISO/IEC 9899:1999 standard adds the `_Exit()` function that results in immediate program  
10126 termination without triggering signals or `atexit()`-registered functions. In IEEE Std 1003.1-2001,  
10127 this is equivalent to the `_exit()` function.

#### 10128 FUTURE DIRECTIONS

10129 None.

10133 IEEE Std 1003.1-2001, `<stdlib.h>`, `<unistd.h>`

#### 10134 CHANGE HISTORY

10135 First released in Issue 1. Derived from Issue 1 of the SVID.

#### 10136 Issue 5

10137 The DESCRIPTION is updated for alignment with the POSIX Realtime Extension and the POSIX  
10138 Threads Extension.

10139 Interactions with the `SA_NOCLDWAIT` flag and `SIGCHLD` signal are further clarified.

10140 The values of `status` from `exit()` are better described.

#### 10141 Issue 6

10142 Extensions beyond the ISO C standard are marked.

10143 The DESCRIPTION is updated for alignment with IEEE Std 1003.1j-2000 by adding semantics for  
10144 typed memory.

10145 The following changes are made for alignment with the ISO/IEC 9899:1999 standard:

- 10146 • The `_Exit()` function is included.
- 10147 • The DESCRIPTION is updated.

10148 The description of tracing semantics is added for alignment with IEEE Std 1003.1q-2000.

10149 References to the `wait3()` function are removed.

## 10150 NAME

10151 exp, expf, expl — exponential function

## 10152 SYNOPSIS

```
10153 #include <math.h>

10154 double exp(double x);
10155 float expf(float x);
10156 long double expl(long double x);
```

## 10157 DESCRIPTION

10158 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
10159 conflict between the requirements described here and the ISO C standard is unintentional. This  
10160 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

10161 These functions shall compute the base-*e* exponential of *x*.

10162 An application wishing to check for error situations should set *errno* to zero and call  
10163 *feclearexcept*(FE\_ALL\_EXCEPT) before calling these functions. On return, if *errno* is non-zero or  
10164 *fetestexcept*(FE\_INVALID | FE\_DIVBYZERO | FE\_OVERFLOW | FE\_UNDERFLOW) is non-  
10165 zero, an error has occurred.

## 10166 RETURN VALUE

10167 Upon successful completion, these functions shall return the exponential value of *x*.

10168 If the correct value would cause overflow, a range error shall occur and *exp()*, *expf()*, and *expl()*  
10169 shall return the value of the macro HUGE\_VAL, HUGE\_VALF, and HUGE\_VALL, respectively.

10170 If the correct value would cause underflow, and is not representable, a range error may occur,  
10171 MX and either 0.0 (if supported), or an implementation-defined value shall be returned.

10172 MX If *x* is NaN, a NaN shall be returned.

10173 If *x* is ±0, 1 shall be returned.

10174 If *x* is -Inf, +0 shall be returned.

10175 If *x* is +Inf, *x* shall be returned.

10176 If the correct value would cause underflow, and is representable, a range error may occur and  
10177 the correct value shall be returned.

## 10178 ERRORS

10179 These functions shall fail if:

10180 Range Error The result overflows.

10181 If the integer expression (math\_errhandling & MATH\_ERRNO) is non-zero,  
10182 then *errno* shall be set to [ERANGE]. If the integer expression  
10183 (math\_errhandling & MATH\_ERREXCEPT) is non-zero, then the overflow  
10184 floating-point exception shall be raised.

10185 These functions may fail if:

10186 Range Error The result underflows.

10187 If the integer expression (math\_errhandling & MATH\_ERRNO) is non-zero,  
10188 then *errno* shall be set to [ERANGE]. If the integer expression  
10189 (math\_errhandling & MATH\_ERREXCEPT) is non-zero, then the underflow  
10190 floating-point exception shall be raised.

10191 **EXAMPLES**

10192 None.

10193 **APPLICATION USAGE**

10194 Note that for IEEE Std 754-1985 **double**,  $709.8 < x$  implies  $\exp(x)$  has overflowed. The value  
10195  $x < -708.4$  implies  $\exp(x)$  has underflowed.

10196 On error, the expressions `(math_errhandling & MATH_ERRNO)` and `(math_errhandling &`  
10197 `MATH_ERREXCEPT)` are independent of each other, but at least one of them must be non-zero.

10198 **RATIONALE**

10199 None.

10200 **FUTURE DIRECTIONS**

10201 None.

10202 **SEE ALSO**

10203 `feclearexcept()`, `fetestexcept()`, `isnan()`, `log()`, the Base Definitions volume of IEEE Std 1003.1-2001,  
10204 Section 4.18, Treatment of Error Conditions for Mathematical Functions, `<math.h>`

10205 **CHANGE HISTORY**

10206 First released in Issue 1. Derived from Issue 1 of the SVID.

10207 **Issue 5**

10208 The DESCRIPTION is updated to indicate how an application should check for an error. This  
10209 text was previously published in the APPLICATION USAGE section.

10210 **Issue 6**10211 The `expf()` and `expl()` functions are added for alignment with the ISO/IEC 9899:1999 standard.

10212 The DESCRIPTION, RETURN VALUE, ERRORS, and APPLICATION USAGE sections are  
10213 revised to align with the ISO/IEC 9899:1999 standard.

10214 IEC 60559:1989 standard floating-point extensions over the ISO/IEC 9899:1999 standard are  
10215 marked.

10216 **NAME**

10217 exp2, exp2f, exp2l — exponential base 2 functions

10218 **SYNOPSIS**

10219 #include &lt;math.h&gt;

10220 double exp2(double x);

10221 float exp2f(float x);

10222 long double exp2l(long double x);

10223 **DESCRIPTION**

10224 **CX** The functionality described on this reference page is aligned with the ISO C standard. Any  
 10225 conflict between the requirements described here and the ISO C standard is unintentional. This  
 10226 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

10227 These functions shall compute the base-2 exponential of  $x$ .

10228 An application wishing to check for error situations should set *errno* to zero and call  
 10229 *feclearexcept*(FE\_ALL\_EXCEPT) before calling these functions. On return, if *errno* is non-zero or  
 10230 *fetestexcept*(FE\_INVALID | FE\_DIVBYZERO | FE\_OVERFLOW | FE\_UNDERFLOW) is non-  
 10231 zero, an error has occurred.

10232 **RETURN VALUE**10233 Upon successful completion, these functions shall return  $2^x$ .

10234 If the correct value would cause overflow, a range error shall occur and *exp2()*, *exp2f()*, and  
 10235 *exp2l()* shall return the value of the macro HUGE\_VAL, HUGE\_VALF, and HUGE\_VALL,  
 10236 respectively.

10237 If the correct value would cause underflow, and is not representable, a range error may occur,  
 10238 **MX** and either 0.0 (if supported), or an implementation-defined value shall be returned.

10239 **MX** If  $x$  is NaN, a NaN shall be returned.10240 If  $x$  is  $\pm 0$ , 1 shall be returned.10241 If  $x$  is  $-\text{Inf}$ , +0 shall be returned.10242 If  $x$  is  $+\text{Inf}$ ,  $x$  shall be returned.

10243 If the correct value would cause underflow, and is representable, a range error may occur and  
 10244 the correct value shall be returned.

10245 **ERRORS**

10246 These functions shall fail if:

10247 **Range Error** The result overflows.

10248 If the integer expression (math\_errhandling & MATH\_ERRNO) is non-zero,  
 10249 then *errno* shall be set to [ERANGE]. If the integer expression  
 10250 (math\_errhandling & MATH\_ERREXCEPT) is non-zero, then the overflow  
 10251 floating-point exception shall be raised.

10252 These functions may fail if:

10253 **Range Error** The result underflows.

10254 If the integer expression (math\_errhandling & MATH\_ERRNO) is non-zero,  
 10255 then *errno* shall be set to [ERANGE]. If the integer expression  
 10256 (math\_errhandling & MATH\_ERREXCEPT) is non-zero, then the underflow  
 10257 floating-point exception shall be raised.

10258 **EXAMPLES**

10259 None.

10260 **APPLICATION USAGE**

10261 For IEEE Std 754-1985 **double**,  $1024 \leq x$  implies  $\text{exp2}(x)$  has overflowed. The value  $x < -1022$   
10262 implies  $\text{exp}(x)$  has underflowed.

10263 On error, the expressions  $(\text{math\_errhandling} \ \& \ \text{MATH\_ERRNO})$  and  $(\text{math\_errhandling} \ \& \ \text{MATH\_ERREXCEPT})$   
10264 are independent of each other, but at least one of them must be non-zero.

10265 **RATIONALE**

10266 None.

10267 **FUTURE DIRECTIONS**

10268 None.

10269 **SEE ALSO**

10270 *exp()*, *feclearexcept()*, *fetetestexcept()*, *isnan()*, *log()*, the Base Definitions volume of  
10271 IEEE Std 1003.1-2001, Section 4.18, Treatment of Error Conditions for Mathematical Functions,  
10272 <math.h>

10273 **CHANGE HISTORY**

10274 First released in Issue 6. Derived from the ISO/IEC 9899:1999 standard.

10275 **NAME**

10276 expm1, expm1f, expm1l — compute exponential functions

10277 **SYNOPSIS**

10278 #include &lt;math.h&gt;

10279 double expm1(double x);

10280 float expm1f(float x);

10281 long double expm1l(long double x);

10282 **DESCRIPTION**

10283 **CX** The functionality described on this reference page is aligned with the ISO C standard. Any  
 10284 conflict between the requirements described here and the ISO C standard is unintentional. This  
 10285 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

10286 These functions shall compute  $e^x-1.0$ .

10287 An application wishing to check for error situations should set *errno* to zero and call  
 10288 *feclearexcept*(FE\_ALL\_EXCEPT) before calling these functions. On return, if *errno* is non-zero or  
 10289 *fetestexcept*(FE\_INVALID | FE\_DIVBYZERO | FE\_OVERFLOW | FE\_UNDERFLOW) is non-  
 10290 zero, an error has occurred.

10291 **RETURN VALUE**10292 Upon successful completion, these functions return  $e^x-1.0$ .

10293 If the correct value would cause overflow, a range error shall occur and *expm1()*, *expm1f()*, and  
 10294 *expm1l()* shall return the value of the macro HUGE\_VAL, HUGE\_VALF, and HUGE\_VALL,  
 10295 respectively.

10296 **MX** If *x* is NaN, a NaN shall be returned.10297 If *x* is  $\pm 0$ ,  $\pm 0$  shall be returned.10298 If *x* is  $-\text{Inf}$ ,  $-1$  shall be returned.10299 If *x* is  $+\text{Inf}$ , *x* shall be returned.10300 If *x* is subnormal, a range error may occur and *x* should be returned.10301 **ERRORS**

10302 These functions shall fail if:

10303 **Range Error** The result overflows.

10304 If the integer expression (math\_errhandling & MATH\_ERRNO) is non-zero,  
 10305 then *errno* shall be set to [ERANGE]. If the integer expression  
 10306 (math\_errhandling & MATH\_ERREXCEPT) is non-zero, then the overflow  
 10307 floating-point exception shall be raised.

10308 These functions may fail if:

10309 **MX** **Range Error** The value of *x* is subnormal.

10310 If the integer expression (math\_errhandling & MATH\_ERRNO) is non-zero,  
 10311 then *errno* shall be set to [ERANGE]. If the integer expression  
 10312 (math\_errhandling & MATH\_ERREXCEPT) is non-zero, then the underflow  
 10313 floating-point exception shall be raised.

10314 **EXAMPLES**

10315           None.

10316 **APPLICATION USAGE**10317           The value of *expm1(x)* may be more accurate than *exp(x)*-1.0 for small values of *x*.10318           The *expm1()* and *log1p()* functions are useful for financial calculations of  $((1+x)^n-1)/x$ , namely:10319            $\text{expm1}(n * \text{log1p}(x)) / x$ 10320           when *x* is very small (for example, when calculating small daily interest rates). These functions  
10321           also simplify writing accurate inverse hyperbolic functions.10322           For IEEE Std 754-1985 **double**,  $709.8 < x$  implies *expm1(x)* has overflowed.10323           On error, the expressions (math\_errhandling & MATH\_ERRNO) and (math\_errhandling &  
10324           MATH\_ERREXCEPT) are independent of each other, but at least one of them must be non-zero.10325 **RATIONALE**

10326           None.

10327 **FUTURE DIRECTIONS**

10328           None.

10329 **SEE ALSO**10330           *exp()*, *feclearexcept()*, *fetestexcept()*, *ilogb()*, *log1p()*, the Base Definitions volume of  
10331           IEEE Std 1003.1-2001, Section 4.18, Treatment of Error Conditions for Mathematical Functions,  
10332           <math.h>10333 **CHANGE HISTORY**

10334           First released in Issue 4, Version 2.

10335 **Issue 5**

10336           Moved from X/OPEN UNIX extension to BASE.

10337 **Issue 6**10338           The *expm1f()* and *expm1l()* functions are added for alignment with the ISO/IEC 9899:1999  
10339           standard.10340           The *expm1()* function is no longer marked as an extension.10341           The DESCRIPTION, RETURN VALUE, ERRORS, and APPLICATION USAGE sections are  
10342           revised to align with the ISO/IEC 9899:1999 standard.10343           IEC 60559:1989 standard floating-point extensions over the ISO/IEC 9899:1999 standard are  
10344           marked.

10345 **NAME**

10346 fabs, fabsf, fabsl — absolute value function

10347 **SYNOPSIS**

10348 #include <math.h>

10349 double fabs(double x);

10350 float fabsf(float x);

10351 long double fabsl(long double x);

10352 **DESCRIPTION**

10353 **CX** The functionality described on this reference page is aligned with the ISO C standard. Any  
10354 conflict between the requirements described here and the ISO C standard is unintentional. This  
10355 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

10356 These functions shall compute the absolute value of their argument  $x$ ,  $|x|$ .

10357 **RETURN VALUE**

10358 Upon successful completion, these functions shall return the absolute value of  $x$ .

10359 **MX** If  $x$  is NaN, a NaN shall be returned.

10360 If  $x$  is  $\pm 0$ ,  $+0$  shall be returned.

10361 If  $x$  is  $\pm\text{Inf}$ ,  $+\text{Inf}$  shall be returned.

10362 **ERRORS**

10363 No errors are defined.

10364 **EXAMPLES**

10365 None.

10366 **APPLICATION USAGE**

10367 None.

10368 **RATIONALE**

10369 None.

10370 **FUTURE DIRECTIONS**

10371 None.

10372 **SEE ALSO**

10373 *isnan()*, the Base Definitions volume of IEEE Std 1003.1-2001, <math.h>

10374 **CHANGE HISTORY**

10375 First released in Issue 1. Derived from Issue 1 of the SVID.

10376 **Issue 5**

10377 The DESCRIPTION is updated to indicate how an application should check for an error. This  
10378 text was previously published in the APPLICATION USAGE section.

10379 **Issue 6**

10380 The *fabsf()* and *fabsl()* functions are added for alignment with the ISO/IEC 9899:1999 standard.

10381 The DESCRIPTION, RETURN VALUE, ERRORS, and APPLICATION USAGE sections are  
10382 revised to align with the ISO/IEC 9899:1999 standard.

10383 IEC 60559:1989 standard floating-point extensions over the ISO/IEC 9899:1999 standard are  
10384 marked.

10385 **NAME**

10386 fattach — attach a STREAMS-based file descriptor to a file in the file system name space  
 10387 (STREAMS)

10388 **SYNOPSIS**

```
10389 XSR #include <stropts.h>
10390 int fattach(int fildev, const char *path);
```

10391

10392 **DESCRIPTION**

10393 The *fattach()* function shall attach a STREAMS-based file descriptor to a file, effectively  
 10394 associating a pathname with *fildev*. The application shall ensure that the *fildev* argument is a  
 10395 valid open file descriptor associated with a STREAMS file. The *path* argument points to a  
 10396 pathname of an existing file. The application shall have the appropriate privileges or be the  
 10397 owner of the file named by *path* and have write permission. A successful call to *fattach()* shall  
 10398 cause all pathnames that name the file named by *path* to name the STREAMS file associated with  
 10399 *fildev*, until the STREAMS file is detached from the file. A STREAMS file can be attached to more  
 10400 than one file and can have several pathnames associated with it.

10401 The attributes of the named STREAMS file shall be initialized as follows: the permissions, user  
 10402 ID, group ID, and times are set to those of the file named by *path*, the number of links is set to 1,  
 10403 and the size and device identifier are set to those of the STREAMS file associated with *fildev*. If  
 10404 any attributes of the named STREAMS file are subsequently changed (for example, by *chmod()*),  
 10405 neither the attributes of the underlying file nor the attributes of the STREAMS file to which *fildev*  
 10406 refers shall be affected.

10407 File descriptors referring to the underlying file, opened prior to an *fattach()* call, shall continue to  
 10408 refer to the underlying file.

10409 **RETURN VALUE**

10410 Upon successful completion, *fattach()* shall return 0. Otherwise,  $-1$  shall be returned and *errno*  
 10411 set to indicate the error.

10412 **ERRORS**

10413 The *fattach()* function shall fail if:

10414 [EACCES] Search permission is denied for a component of the path prefix, or the process  
 10415 is the owner of *path* but does not have write permissions on the file named by  
 10416 *path*.

10417 [EBADF] The *fildev* argument is not a valid open file descriptor.

10418 [EBUSY] The file named by *path* is currently a mount point or has a STREAMS file  
 10419 attached to it.

10420 [ELOOP] A loop exists in symbolic links encountered during resolution of the *path*  
 10421 argument.

10422 [ENAMETOOLONG] The size of *path* exceeds {PATH\_MAX} or a component of *path* is longer than  
 10423 {NAME\_MAX}.  
 10424

10425 [ENOENT] A component of *path* does not name an existing file or *path* is an empty string.

10426 [ENOTDIR] A component of the path prefix is not a directory.

10427 [EPERM] The effective user ID of the process is not the owner of the file named by *path*  
 10428 and the process does not have appropriate privilege.

- 10429 The *fattach()* function may fail if:
- 10430 [EINVAL] The *files* argument does not refer to a STREAMS file.
  - 10431 [ELOOP] More than {SYMLOOP\_MAX} symbolic links were encountered during  
10432 resolution of the *path* argument.
  - 10433 [ENAMETOOLONG]  
10434 Pathname resolution of a symbolic link produced an intermediate result  
10435 whose length exceeds {PATH\_MAX}.
  - 10436 [EXDEV] A link to a file on another file system was attempted.

10437 **EXAMPLES**10438 **Attaching a File Descriptor to a File**

10439 In the following example, *fd* refers to an open STREAMS file. The call to *fattach()* associates this  
10440 STREAM with the file **/tmp/named-STREAM**, such that any future calls to open **/tmp/named-**  
10441 **STREAM**, prior to breaking the attachment via a call to *fdetach()*, will instead create a new file  
10442 handle referring to the STREAMS file associated with *fd*.

```
10443 #include <stropts.h>
10444 ...
10445     int fd;
10446     char *filename = "/tmp/named-STREAM";
10447     int ret;
10448
10449     ret = fattach(fd, filename);
```

10449 **APPLICATION USAGE**

10450 The *fattach()* function behaves similarly to the traditional *mount()* function in the way a file is  
10451 temporarily replaced by the root directory of the mounted file system. In the case of *fattach()*, the  
10452 replaced file need not be a directory and the replacing file is a STREAMS file.

10453 **RATIONALE**

10454 The file attributes of a file which has been the subject of an *fattach()* call are specifically set  
10455 because of an artefact of the original implementation. The internal mechanism was the same as  
10456 for the *mount()* function. Since *mount()* is typically only applied to directories, the effects when  
10457 applied to a regular file are a little surprising, especially as regards the link count which rigidly  
10458 remains one, even if there were several links originally and despite the fact that all original links  
10459 refer to the STREAM as long as the *fattach()* remains in effect.

10460 **FUTURE DIRECTIONS**

10461 None.

10462 **SEE ALSO**

10463 *fdetach()*, *isastream()*, the Base Definitions volume of IEEE Std 1003.1-2001, <**stropts.h**>

10464 **CHANGE HISTORY**

10465 First released in Issue 4, Version 2.

10466 **Issue 5**

10467 Moved from X/OPEN UNIX extension to BASE.

10468 The [EXDEV] error is added to the list of optional errors in the ERRORS section.

10469 **Issue 6**

10470 This function is marked as part of the XSI STREAMS Option Group.

10471 The DESCRIPTION is updated to avoid use of the term “must” for application requirements.

10472 The wording of the mandatory [ELOOP] error condition is updated, and a second optional

10473 [ELOOP] error condition is added.

10474 **NAME**

10475 fchdir — change working directory

10476 **SYNOPSIS**

10477 XSI #include &lt;unistd.h&gt;

10478 int fchdir(int *fildev*);

10479

10480 **DESCRIPTION**10481 The *fchdir()* function shall be equivalent to *chdir()* except that the directory that is to be the new  
10482 current working directory is specified by the file descriptor *fildev*.10483 A conforming application can obtain a file descriptor for a file of type directory using *open()*,  
10484 provided that the file status flags and access modes do not contain O\_WRONLY or O\_RDWR.10485 **RETURN VALUE**10486 Upon successful completion, *fchdir()* shall return 0. Otherwise, it shall return -1 and set *errno* to  
10487 indicate the error. On failure the current working directory shall remain unchanged.10488 **ERRORS**10489 The *fchdir()* function shall fail if:10490 [EACCES] Search permission is denied for the directory referenced by *fildev*.10491 [EBADF] The *fildev* argument is not an open file descriptor.10492 [ENOTDIR] The open file descriptor *fildev* does not refer to a directory.10493 The *fchdir()* may fail if:10494 [EINTR] A signal was caught during the execution of *fchdir()*.

10495 [EIO] An I/O error occurred while reading from or writing to the file system.

10507 First released in Issue 4, Version 2.

10508 **Issue 5**

10509 Moved from X/OPEN UNIX extension to BASE.

10510 **NAME**

10511 fchmod — change mode of a file

10512 **SYNOPSIS**

10513 #include &lt;sys/stat.h&gt;

10514 int fchmod(int *fildev*, mode\_t *mode*);10515 **DESCRIPTION**10516 The *fchmod()* function shall be equivalent to *chmod()* except that the file whose permissions are  
10517 changed is specified by the file descriptor *fildev*.10518 SHM If *fildev* references a shared memory object, the *fchmod()* function need only affect the S\_IRUSR,  
10519 S\_IWUSR, S\_IRGRP, S\_IWGRP, S\_IROTH, and S\_IWOTH file permission bits.10520 TYM If *fildev* references a typed memory object, the behavior of *fchmod()* is unspecified.10521 If *fildev* refers to a socket, the behavior of *fchmod()* is unspecified.10522 XSR If *fildev* refers to a STREAM (which is *fattach()*-ed into the file system name space) the call  
10523 returns successfully, doing nothing.10524 **RETURN VALUE**10525 Upon successful completion, *fchmod()* shall return 0. Otherwise, it shall return -1 and set *errno* to  
10526 indicate the error.10527 **ERRORS**10528 The *fchmod()* function shall fail if:10529 [EBADF] The *fildev* argument is not an open file descriptor.10530 [EPERM] The effective user ID does not match the owner of the file and the process  
10531 does not have appropriate privilege.10532 [EROFS] The file referred to by *fildev* resides on a read-only file system.10533 The *fchmod()* function may fail if:10534 XSI [EINTR] The *fchmod()* function was interrupted by a signal.10535 XSI [EINVAL] The value of the *mode* argument is invalid.10536 [EINVAL] The *fildev* argument refers to a pipe and the implementation disallows  
10537 execution of *fchmod()* on a pipe.10538 **EXAMPLES**10539 **Changing the Current Permissions for a File**10540 The following example shows how to change the permissions for a file named */home/cnd/mod1*  
10541 so that the owner and group have read/write/execute permissions, but the world only has  
10542 read/write permissions.

10543 #include &lt;sys/stat.h&gt;

10544 #include &lt;fcntl.h&gt;

10545 mode\_t mode;

10546 int fildev;

10547 ...

10548 fildev = open("/home/cnd/mod1", O\_RDWR);

10549 fchmod(fildev, S\_IRWXU | S\_IRWXG | S\_IROTH | S\_IWOTH);

**10550 APPLICATION USAGE**

10551 None.

**10552 RATIONALE**

10553 None.

**10554 FUTURE DIRECTIONS**

10555 None.

**10556 SEE ALSO**

10557 *chmod()*, *chown()*, *creat()*, *fcntl()*, *fstatvfs()*, *mknod()*, *open()*, *read()*, *stat()*, *write()*, the Base  
10558 Definitions volume of IEEE Std 1003.1-2001, <sys/stat.h>

**10559 CHANGE HISTORY**

10560 First released in Issue 4, Version 2.

**10561 Issue 5**

10562 Moved from X/OPEN UNIX extension to BASE and aligned with *fchmod()* in the POSIX  
10563 Realtime Extension. Specifically, the second paragraph of the DESCRIPTION is added and a  
10564 second instance of [EINVAL] is defined in the list of optional errors.

**10565 Issue 6**

10566 The DESCRIPTION is updated for alignment with IEEE Std 1003.1j-2000 by stating that *fchmod()*  
10567 behavior is unspecified for typed memory objects.

10568 **NAME**

10569 fchown — change owner and group of a file

10570 **SYNOPSIS**

10571 #include &lt;unistd.h&gt;

10572 int fchown(int *fildev*, uid\_t *owner*, gid\_t *group*);10573 **DESCRIPTION**10574 The *fchown()* function shall be equivalent to *chown()* except that the file whose owner and group  
10575 are changed is specified by the file descriptor *fildev*.10576 **RETURN VALUE**10577 Upon successful completion, *fchown()* shall return 0. Otherwise, it shall return -1 and set *errno* to  
10578 indicate the error.10579 **ERRORS**10580 The *fchown()* function shall fail if:10581 [EBADF] The *fildev* argument is not an open file descriptor.10582 [EPERM] The effective user ID does not match the owner of the file or the process does  
10583 not have appropriate privilege and `_POSIX_CHOWN_RESTRICTED` indicates  
10584 that such privilege is required.10585 [EROFS] The file referred to by *fildev* resides on a read-only file system.10586 The *fchown()* function may fail if:10587 [EINVAL] The owner or group ID is not a value supported by the implementation. The  
10588 XSR *fildev* argument refers to a pipe or socket or an *fcntl()*-ed STREAM and the  
10589 implementation disallows execution of *fchown()* on a pipe.

10590 [EIO] A physical I/O error has occurred.

10591 [EINTR] The *fchown()* function was interrupted by a signal which was caught.10592 **EXAMPLES**10593 **Changing the Current Owner of a File**10594 The following example shows how to change the owner of a file named `/home/cnd/mod1` to  
10595 “jones” and the group to “cnd”.10596 The numeric value for the user ID is obtained by extracting the user ID from the user database  
10597 entry associated with “jones”. Similarly, the numeric value for the group ID is obtained by  
10598 extracting the group ID from the group database entry associated with “cnd”. This example  
10599 assumes the calling program has appropriate privileges.10600 #include <sys/types.h>  
10601 #include <unistd.h>  
10602 #include <fcntl.h>  
10603 #include <pwd.h>  
10604 #include <grp.h>  
  
10605 struct passwd \*pwd;  
10606 struct group \*grp;  
10607 int fildev;  
10608 ...  
10609 fildev = open("/home/cnd/mod1", O\_RDWR);  
10610 pwd = getpwnam("jones");

```
10611     grp = getgrnam("cnd");
10612     fchown(fildes, pwd->pw_uid, grp->gr_gid);
```

## 10613 APPLICATION USAGE

## 10621 CHANGE HISTORY

10622 First released in Issue 4, Version 2.

### 10623 Issue 5

10624 Moved from X/OPEN UNIX extension to BASE.

### 10625 Issue 6

10626 The following changes were made to align with the IEEE P1003.1a draft standard:

10627 • Clarification is added that a call to *fchown()* may not be allowed on a pipe.

10628 The *fchown()* function is now defined as mandatory.

10629 **NAME**

10630            fclose — close a stream

10631 **SYNOPSIS**

10632            #include &lt;stdio.h&gt;

10633            int fclose(FILE \*stream);

10634 **DESCRIPTION**

10635 CX        The functionality described on this reference page is aligned with the ISO C standard. Any  
 10636            conflict between the requirements described here and the ISO C standard is unintentional. This  
 10637            volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

10638            The *fclose()* function shall cause the stream pointed to by *stream* to be flushed and the associated  
 10639            file to be closed. Any unwritten buffered data for the stream shall be written to the file; any  
 10640            unread buffered data shall be discarded. Whether or not the call succeeds, the stream shall be  
 10641            disassociated from the file and any buffer set by the *setbuf()* or *setvbuf()* function shall be  
 10642            disassociated from the stream. If the associated buffer was automatically allocated, it shall be  
 10643            deallocated.

10644 CX        The *fclose()* function shall mark for update the *st\_ctime* and *st\_mtime* fields of the underlying file,  
 10645            if the stream was writable, and if buffered data remains that has not yet been written to the file.  
 10646            The *fclose()* function shall perform the equivalent of a *close()* on the file descriptor that is  
 10647            associated with the stream pointed to by *stream*.

10648            After the call to *fclose()*, any use of *stream* results in undefined behavior.

10649 **RETURN VALUE**

10650 CX        Upon successful completion, *fclose()* shall return 0; otherwise, it shall return EOF and set *errno* to  
 10651            indicate the error.

10652 **ERRORS**

10653            The *fclose()* function shall fail if:

10654 CX        [EAGAIN]        The O\_NONBLOCK flag is set for the file descriptor underlying *stream* and the  
 10655            process would be delayed in the write operation.

10656 CX        [EBADF]        The file descriptor underlying stream is not valid.

10657 CX        [EFBIG]        An attempt was made to write a file that exceeds the maximum file size.

10658 XSI       [EFBIG]        An attempt was made to write a file that exceeds the process' file size limit.

10659 CX        [EFBIG]        The file is a regular file and an attempt was made to write at or beyond the  
 10660            offset maximum associated with the corresponding stream.

10661 CX        [EINTR]        The *fclose()* function was interrupted by a signal.

10662 CX        [EIO]           The process is a member of a background process group attempting to write  
 10663            to its controlling terminal, TOSTOP is set, the process is neither ignoring nor  
 10664            blocking SIGTTOU, and the process group of the process is orphaned. This  
 10665            error may also be returned under implementation-defined conditions.

10666 CX        [ENOSPC]        There was no free space remaining on the device containing the file.

10667 CX        [EPIPE]        An attempt is made to write to a pipe or FIFO that is not open for reading by  
 10668            any process. A SIGPIPE signal shall also be sent to the thread.

10669            The *fclose()* function may fail if:

10670 CX        [ENXIO]        A request was made of a nonexistent device, or the request was outside the  
 10671            capabilities of the device.

10672 **EXAMPLES**

10673           None.

10674 **APPLICATION USAGE**

10675           None.

10676 **RATIONALE**

10677           None.

10678 **FUTURE DIRECTIONS**

10679           None.

10680 **SEE ALSO**

10681           *close()*, *fopen()*, *getrlimit()*, *ulimit()*, the Base Definitions volume of IEEE Std 1003.1-2001,  
10682           <**stdio.h**>

10683 **CHANGE HISTORY**

10684           First released in Issue 1. Derived from Issue 1 of the SVID.

10685 **Issue 5**

10686           Large File Summit extensions are added.

10687 **Issue 6**

10688           Extensions beyond the ISO C standard are marked.

10689           The following new requirements on POSIX implementations derive from alignment with the  
10690           Single UNIX Specification:

- 10691
  - The [EFBIG] error is added as part of the large file support extensions.
  - The [ENXIO] optional error condition is added.

10693           The DESCRIPTION is updated to note that the stream and any buffer are disassociated whether  
10694           or not the call succeeds. This is for alignment with the ISO/IEC 9899:1999 standard.

10695 **NAME**

10696       fcntl — file control

10697 **SYNOPSIS**

10698 OH       #include &lt;unistd.h&gt;

10699       #include &lt;fcntl.h&gt;

10700       int fcntl(int *fildes*, int *cmd*, ...);10701 **DESCRIPTION**10702       The *fcntl()* function shall perform the operations described below on open files. The *fildes*  
10703 argument is a file descriptor.10704       The available values for *cmd* are defined in <fcntl.h> and are as follows:

- |       |                 |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|-------|-----------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 10705 | <b>F_DUPFD</b>  | Return a new file descriptor which shall be the lowest numbered available (that is, not already open) file descriptor greater than or equal to the third argument, <i>arg</i> , taken as an integer of type <b>int</b> . The new file descriptor shall refer to the same open file description as the original file descriptor, and shall share any locks. The FD_CLOEXEC flag associated with the new file descriptor shall be cleared to keep the file open across calls to one of the <i>exec</i> functions. |
| 10706 |                 |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| 10707 |                 |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| 10708 |                 |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| 10709 |                 |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| 10710 |                 |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

| 10740 |                 |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

10741 The following values for *cmd* are available for advisory record locking. Record locking shall be  
 10742 supported for regular files, and may be supported for other files.

10743 **F\_GETLK** Get the first lock which blocks the lock description pointed to by the third  
 10744 argument, *arg*, taken as a pointer to type **struct flock**, defined in `<fcntl.h>`.  
 10745 The information retrieved shall overwrite the information passed to *fcntl()* in  
 10746 the structure **flock**. If no lock is found that would prevent this lock from  
 10747 being created, then the structure shall be left unchanged except for the lock  
 10748 type which shall be set to **F\_UNLCK**.

10749 **F\_SETLK** Set or clear a file segment lock according to the lock description pointed to by  
 10750 the third argument, *arg*, taken as a pointer to type **struct flock**, defined in  
 10751 `<fcntl.h>`. **F\_SETLK** can establish shared (or read) locks (**F\_RDLCK**) or  
 10752 exclusive (or write) locks (**F\_WRLCK**), as well as to remove either type of lock  
 10753 (**F\_UNLCK**). **F\_RDLCK**, **F\_WRLCK**, and **F\_UNLCK** are defined in `<fcntl.h>`.  
 10754 If a shared or exclusive lock cannot be set, *fcntl()* shall return immediately  
 10755 with a return value of `-1`.

10756 **F\_SETLKW** This command shall be equivalent to **F\_SETLK** except that if a shared or  
 10757 exclusive lock is blocked by other locks, the thread shall wait until the request  
 10758 can be satisfied. If a signal that is to be caught is received while *fcntl()* is  
 10759 waiting for a region, *fcntl()* shall be interrupted. Upon return from the signal  
 10760 handler, *fcntl()* shall return `-1` with *errno* set to `[EINTR]`, and the lock  
 10761 operation shall not be done.

10762 Additional implementation-defined values for *cmd* may be defined in `<fcntl.h>`. Their names  
 10763 shall start with **F\_**.

10764 When a shared lock is set on a segment of a file, other processes shall be able to set shared locks  
 10765 on that segment or a portion of it. A shared lock prevents any other process from setting an  
 10766 exclusive lock on any portion of the protected area. A request for a shared lock shall fail if the  
 10767 file descriptor was not opened with read access.

10768 An exclusive lock shall prevent any other process from setting a shared lock or an exclusive lock  
 10769 on any portion of the protected area. A request for an exclusive lock shall fail if the file  
 10770 descriptor was not opened with write access.

10771 The structure **flock** describes the type (*l\_type*), starting offset (*l\_whence*), relative offset (*l\_start*),  
 10772 size (*l\_len*), and process ID (*l\_pid*) of the segment of the file to be affected.

10773 The value of *l\_whence* is **SEEK\_SET**, **SEEK\_CUR**, or **SEEK\_END**, to indicate that the relative  
 10774 offset *l\_start* bytes shall be measured from the start of the file, current position, or end of the file,  
 10775 respectively. The value of *l\_len* is the number of consecutive bytes to be locked. The value of  
 10776 *l\_len* may be negative (where the definition of **off\_t** permits negative values of *l\_len*). The *l\_pid*  
 10777 field is only used with **F\_GETLK** to return the process ID of the process holding a blocking lock.  
 10778 After a successful **F\_GETLK** request, when a blocking lock is found, the values returned in the  
 10779 **flock** structure shall be as follows:

10780 *l\_type* Type of blocking lock found.

10781 *l\_whence* **SEEK\_SET**.

10782 *l\_start* Start of the blocking lock.

10783 *l\_len* Length of the blocking lock.

10784 *l\_pid* Process ID of the process that holds the blocking lock.

- 10785 If the command is F\_SETLKW and the process must wait for another process to release a lock,  
 10786 then the range of bytes to be locked shall be determined before the *fcntl()* function blocks. If the  
 10787 file size or file descriptor seek offset change while *fcntl()* is blocked, this shall not affect the  
 10788 range of bytes locked.
- 10789 If *l\_len* is positive, the area affected shall start at *l\_start* and end at *l\_start+l\_len-1*. If *l\_len* is  
 10790 negative, the area affected shall start at *l\_start+l\_len* and end at *l\_start-1*. Locks may start and  
 10791 extend beyond the current end of a file, but shall not extend before the beginning of the file. A  
 10792 lock shall be set to extend to the largest possible value of the file offset for that file by setting  
 10793 *l\_len* to 0. If such a lock also has *l\_start* set to 0 and *l\_whence* is set to SEEK\_SET, the whole file  
 10794 shall be locked.
- 10795 There shall be at most one type of lock set for each byte in the file. Before a successful return  
 10796 from an F\_SETLK or an F\_SETLKW request when the calling process has previously existing  
 10797 locks on bytes in the region specified by the request, the previous lock type for each byte in the  
 10798 specified region shall be replaced by the new lock type. As specified above under the  
 10799 descriptions of shared locks and exclusive locks, an F\_SETLK or an F\_SETLKW request  
 10800 (respectively) shall fail or block when another process has existing locks on bytes in the specified  
 10801 region and the type of any of those locks conflicts with the type specified in the request.
- 10802 All locks associated with a file for a given process shall be removed when a file descriptor for  
 10803 that file is closed by that process or the process holding that file descriptor terminates. Locks are  
 10804 not inherited by a child process.
- 10805 A potential for deadlock occurs if a process controlling a locked region is put to sleep by  
 10806 attempting to lock another process' locked region. If the system detects that sleeping until a  
 10807 locked region is unlocked would cause a deadlock, *fcntl()* shall fail with an [EDEADLK] error.
- 10808 An unlock (F\_UNLCK) request in which *l\_len* is non-zero and the offset of the last byte of the  
 10809 requested segment is the maximum value for an object of type *off\_t*, when the process has an  
 10810 existing lock in which *l\_len* is 0 and which includes the last byte of the requested segment, shall  
 10811 be treated as a request to unlock from the start of the requested segment with an *l\_len* equal to 0.  
 10812 Otherwise, an unlock (F\_UNLCK) request shall attempt to unlock only the requested segment.
- 10813 SHM When the file descriptor *fd* refers to a shared memory object, the behavior of *fcntl()* shall be  
 10814 the same as for a regular file except the effect of the following values for the argument *cmd* shall  
 10815 be unspecified: F\_SETFL, F\_GETLK, F\_SETLK, and F\_SETLKW.
- 10816 TYM If *fd* refers to a typed memory object, the result of the *fcntl()* function is unspecified.
- 10817 **RETURN VALUE**
- 10818 Upon successful completion, the value returned shall depend on *cmd* as follows:
- |       |          |                                                                                |
|-------|----------|--------------------------------------------------------------------------------|
| 10819 | F_DUPFD  | A new file descriptor.                                                         |
| 10820 | F_GETFD  | Value of flags defined in <fcntl.h>. The return value shall not be negative.   |
| 10821 | F_SETFD  | Value other than -1.                                                           |
| 10822 | F_GETFL  | Value of file status flags and access modes. The return value is not negative. |
| 10823 | F_SETFL  | Value other than -1.                                                           |
| 10824 | F_GETLK  | Value other than -1.                                                           |
| 10825 | F_SETLK  | Value other than -1.                                                           |
| 10826 | F_SETLKW | Value other than -1.                                                           |
| 10827 | F_GETOWN | Value of the socket owner process or process group; this will not be -1.       |

- 10828           F\_SETOWN        Value other than `-1`.
- 10829           Otherwise, `-1` shall be returned and *errno* set to indicate the error.
- 10830 **ERRORS**
- 10831           The *fcntl()* function shall fail if:
- 10832           [EACCES] or [EAGAIN]
- 10833                    The *cmd* argument is `F_SETLK`; the type of lock (*l\_type*) is a shared (`F_RDLCK`) or exclusive (`F_WRLCK`) lock and the segment of a file to be locked is already exclusive-locked by another process, or the type is an exclusive lock and some portion of the segment of a file to be locked is already shared-locked or exclusive-locked by another process.
- 10834
- 10835
- 10836
- 10837
- 10838           [EBADF]        The *fildev* argument is not a valid open file descriptor, or the argument *cmd* is `F_SETLK` or `F_SETLKW`, the type of lock, *l\_type*, is a shared lock (`F_RDLCK`), and *fildev* is not a valid file descriptor open for reading, or the type of lock, *l\_type*, is an exclusive lock (`F_WRLCK`), and *fildev* is not a valid file descriptor open for writing.
- 10839
- 10840
- 10841
- 10842
- 10843           [EINTR]        The *cmd* argument is `F_SETLKW` and the function was interrupted by a signal.
- 10844           [EINVAL]       The *cmd* argument is invalid, or the *cmd* argument is `F_DUPFD` and *arg* is negative or greater than or equal to `{OPEN_MAX}`, or the *cmd* argument is `F_GETLK`, `F_SETLK`, or `F_SETLKW` and the data pointed to by *arg* is not valid, or *fildev* refers to a file that does not support locking.
- 10845
- 10846
- 10847
- 10848           [EMFILE]       The argument *cmd* is `F_DUPFD` and `{OPEN_MAX}` file descriptors are currently open in the calling process, or no file descriptors greater than or equal to *arg* are available.
- 10849
- 10850
- 10851           [ENOLCK]       The argument *cmd* is `F_SETLK` or `F_SETLKW` and satisfying the lock or unlock request would result in the number of locked regions in the system exceeding a system-imposed limit.
- 10852
- 10853
- 10854           [EOVERFLOW]   One of the values to be returned cannot be represented correctly.
- 10855           [EOVERFLOW]   The *cmd* argument is `F_GETLK`, `F_SETLK`, or `F_SETLKW` and the smallest or, if *l\_len* is non-zero, the largest offset of any byte in the requested segment cannot be represented correctly in an object of type `off_t`.
- 10856
- 10857
- 10858           The *fcntl()* function may fail if:
- 10859           [EDEADLK]       The *cmd* argument is `F_SETLKW`, the lock is blocked by a lock from another process, and putting the calling process to sleep to wait for that lock to become free would cause a deadlock.
- 10860
- 10861
- 10862 **EXAMPLES**
- 10863           None.
- 10864 **APPLICATION USAGE**
- 10865           None.
- 10866 **RATIONALE**
- 10867           The ellipsis in the SYNOPSIS is the syntax specified by the ISO C standard for a variable number of arguments. It is used because System V uses pointers for the implementation of file locking functions.
- 10868
- 10869
- 10870           The *arg* values to `F_GETFD`, `F_SETFD`, `F_GETFL`, and `F_SETFL` all represent flag values to allow for future growth. Applications using these functions should do a read-modify-write operation
- 10871

10872 on them, rather than assuming that only the values defined by this volume of  
10873 IEEE Std 1003.1-2001 are valid. It is a common error to forget this, particularly in the case of  
10874 F\_SETFD.

10875 This volume of IEEE Std 1003.1-2001 permits concurrent read and write access to file data using  
10876 the *fcntl()* function; this is a change from the 1984 /usr/group standard and early proposals.  
10877 Without concurrency controls, this feature may not be fully utilized without occasional loss of  
10878 data.

10879 Data losses occur in several ways. One case occurs when several processes try to update the  
10880 same record, without sequencing controls; several updates may occur in parallel and the last  
10881 writer “wins”. Another case is a bit-tree or other internal list-based database that is undergoing  
10882 reorganization. Without exclusive use to the tree segment by the updating process, other reading  
10883 processes chance getting lost in the database when the index blocks are split, condensed,  
10884 inserted, or deleted. While *fcntl()* is useful for many applications, it is not intended to be overly  
10885 general and does not handle the bit-tree example well.

10886 This facility is only required for regular files because it is not appropriate for many devices such  
10887 as terminals and network connections.

10888 Since *fcntl()* works with “any file descriptor associated with that file, however it is obtained”,  
10889 the file descriptor may have been inherited through a *fork()* or *exec* operation and thus may  
10890 affect a file that another process also has open.

10891 The use of the open file description to identify what to lock requires extra calls and presents  
10892 problems if several processes are sharing an open file description, but there are too many  
10893 implementations of the existing mechanism for this volume of IEEE Std 1003.1-2001 to use  
10894 different specifications.

10895 Another consequence of this model is that closing any file descriptor for a given file (whether or  
10896 not it is the same open file description that created the lock) causes the locks on that file to be  
10897 relinquished for that process. Equivalently, any close for any file/process pair relinquishes the  
10898 locks owned on that file for that process. But note that while an open file description may be  
10899 shared through *fork()*, locks are not inherited through *fork()*. Yet locks may be inherited through  
10900 one of the *exec* functions.

10901 The identification of a machine in a network environment is outside the scope of this volume of  
10902 IEEE Std 1003.1-2001. Thus, an *L\_sysid* member, such as found in System V, is not included in the  
10903 locking structure.

10904 Changing of lock types can result in a previously locked region being split into smaller regions.

10905 Mandatory locking was a major feature of the 1984 /usr/group standard.

10906 For advisory file record locking to be effective, all processes that have access to a file must  
10907 cooperate and use the advisory mechanism before doing I/O on the file. Enforcement-mode  
10908 record locking is important when it cannot be assumed that all processes are cooperating. For  
10909 example, if one user uses an editor to update a file at the same time that a second user executes  
10910 another process that updates the same file and if only one of the two processes is using advisory  
10911 locking, the processes are not cooperating. Enforcement-mode record locking would protect  
10912 against accidental collisions.

10913 Secondly, advisory record locking requires a process using locking to bracket each I/O operation  
10914 with lock (or test) and unlock operations. With enforcement-mode file and record locking, a  
10915 process can lock the file once and unlock when all I/O operations have been completed.  
10916 Enforcement-mode record locking provides a base that can be enhanced; for example, with  
10917 sharable locks. That is, the mechanism could be enhanced to allow a process to lock a file so  
10918 other processes could read it, but none of them could write it.

- 10919 Mandatory locks were omitted for several reasons:
- 10920 1. Mandatory lock setting was done by multiplexing the set-group-ID bit in most  
10921 implementations; this was confusing, at best.
  - 10922 2. The relationship to file truncation as supported in 4.2 BSD was not well specified.
  - 10923 3. Any publicly readable file could be locked by anyone. Many historical implementations  
10924 keep the password database in a publicly readable file. A malicious user could thus  
10925 prohibit logins. Another possibility would be to hold open a long-distance telephone line.
  - 10926 4. Some demand-paged historical implementations offer memory mapped files, and  
10927 enforcement cannot be done on that type of file.
- 10928 Since sleeping on a region is interrupted with any signal, *alarm()* may be used to provide a  
10929 timeout facility in applications requiring it. This is useful in deadlock detection. Since  
10930 implementation of full deadlock detection is not always feasible, the [EDEADLK] error was  
10931 made optional.
- 10932 **FUTURE DIRECTIONS**
- 10933 None.
- 10934 **SEE ALSO**
- 10935 *alarm()*, *close()*, *exec*, *open()*, *sigaction()*, the Base Definitions volume of IEEE Std 1003.1-2001,  
10936 `<fcntl.h>`, `<signal.h>`, `<unistd.h>`
- 10937 **CHANGE HISTORY**
- 10938 First released in Issue 1. Derived from Issue 1 of the SVID.
- 10939 **Issue 5**
- 10940 The DESCRIPTION is updated for alignment with the POSIX Realtime Extension and the POSIX  
10941 Threads Extension.
- 10942 Large File Summit extensions are added.
- 10943 **Issue 6**
- 10944 In the SYNOPSIS, the optional include of the `<sys/types.h>` header is removed.
- 10945 The following new requirements on POSIX implementations derive from alignment with the  
10946 Single UNIX Specification:
- 10947 • The requirement to include `<sys/types.h>` has been removed. Although `<sys/types.h>` was  
10948 required for conforming implementations of previous POSIX specifications, it was not  
10949 required for UNIX applications.
  - 10950 • In the DESCRIPTION, sentences describing behavior when *L\_len* is negative are now  
10951 mandated, and the description of unlock (F\_UNLOCK) when *L\_len* is non-negative is  
10952 mandated.
  - 10953 • In the ERRORS section, the [EINVAL] error condition has the case mandated when the *cmd* is  
10954 invalid, and two [E\_OVERFLOW] error conditions are added.
- 10955 The F\_GETOWN and F\_SETOWN values are added for sockets.
- 10956 The following changes were made to align with the IEEE P1003.1a draft standard:
- 10957 • Clarification is added that the extent of the bytes locked is determined prior to the blocking  
10958 action.
- 10959 The DESCRIPTION is updated for alignment with IEEE Std 1003.1j-2000 by specifying that  
10960 *fcntl()* results are unspecified for typed memory objects.

10961

The DESCRIPTION is updated to avoid use of the term “must” for application requirements.

10962 **NAME**10963       fcvt — convert a floating-point number to a string (**LEGACY**)10964 **SYNOPSIS**

10965 xSI       #include &lt;stdlib.h&gt;

10966       char \*fcvt(double *value*, int *ndigit*, int \*restrict *decpt*,  
10967               int \*restrict *sign*);

10968

10969 **DESCRIPTION**10970       Refer to *ecvt()*.

10971 **NAME**10972 fdatasync — synchronize the data of a file (**REALTIME**)10973 **SYNOPSIS**

10974 SIO #include &lt;unistd.h&gt;

10975 int fdatasync(int *fil*des);

10976

10977 **DESCRIPTION**10978 The *fdatasync()* function shall force all currently queued I/O operations associated with the file  
10979 indicated by file descriptor *fil*des to the synchronized I/O completion state.10980 The functionality shall be equivalent to *fsync()* with the symbol `_POSIX_SYNCHRONIZED_IO`  
10981 defined, with the exception that all I/O operations shall be completed as defined for  
10982 synchronized I/O data integrity completion.10983 **RETURN VALUE**10984 If successful, the *fdatasync()* function shall return the value 0; otherwise, the function shall return  
10985 the value `-1` and set *errno* to indicate the error. If the *fdatasync()* function fails, outstanding I/O  
10986 operations are not guaranteed to have been completed.10987 **ERRORS**10988 The *fdatasync()* function shall fail if:10989 [EBADF] The *fil*des argument is not a valid file descriptor open for writing.

10990 [EINVAL] This implementation does not support synchronized I/O for this file.

10991 In the event that any of the queued I/O operations fail, *fdatasync()* shall return the error  
10992 conditions defined for *read()* and *write()*.10993 **EXAMPLES**

10994 None.

10995 **APPLICATION USAGE**

10996 None.

10997 **RATIONALE**

10998 None.

10999 **FUTURE DIRECTIONS**

11000 None.

11001 **SEE ALSO**11002 *ai*o\_11003 *fsync()*, *fcntl()*, *fsync()*, *open()*, *read()*, *write()*, the Base Definitions volume of  
IEEE Std 1003.1-2001, <unistd.h>11004 **CHANGE HISTORY**

11005 First released in Issue 5. Included for alignment with the POSIX Realtime Extension.

11006 **Issue 6**11007 The [ENOSYS] error condition has been removed as stubs need not be provided if an  
11008 implementation does not support the Synchronized Input and Output option.11009 The *fdatasync()* function is marked as part of the Synchronized Input and Output option.

## 11010 NAME

11011 fdetach — detach a name from a STREAMS-based file descriptor (**STREAMS**)

## 11012 SYNOPSIS

11013 XSR #include &lt;stropts.h&gt;

11014 int fdetach(const char \*path);

11015

## 11016 DESCRIPTION

11017 The *fdetach()* function shall detach a STREAMS-based file from the file to which it was attached  
 11018 by a previous call to *fattach()*. The *path* argument points to the pathname of the attached  
 11019 STREAMS file. The process shall have appropriate privileges or be the owner of the file. A  
 11020 successful call to *fdetach()* shall cause all pathnames that named the attached STREAMS file to  
 11021 again name the file to which the STREAMS file was attached. All subsequent operations on *path*  
 11022 shall operate on the underlying file and not on the STREAMS file.

11023 All open file descriptions established while the STREAMS file was attached to the file referenced  
 11024 by *path* shall still refer to the STREAMS file after the *fdetach()* has taken effect.

11025 If there are no open file descriptors or other references to the STREAMS file, then a successful  
 11026 call to *fdetach()* shall be equivalent to performing the last *close()* on the attached file.

## 11027 RETURN VALUE

11028 Upon successful completion, *fdetach()* shall return 0; otherwise, it shall return -1 and set *errno* to  
 11029 indicate the error.

## 11030 ERRORS

11031 The *fdetach()* function shall fail if:

11032 [EACCES] Search permission is denied on a component of the path prefix.

11033 [EINVAL] The *path* argument names a file that is not currently attached.

11034 [ELOOP] A loop exists in symbolic links encountered during resolution of the *path*  
 11035 argument.

11036 [ENAMETOOLONG]

11037 The size of a pathname exceeds {PATH\_MAX} or a pathname component is  
 11038 longer than {NAME\_MAX}.

11039 [ENOENT] A component of *path* does not name an existing file or *path* is an empty string.

11040 [ENOTDIR] A component of the path prefix is not a directory.

11041 [EPERM] The effective user ID is not the owner of *path* and the process does not have  
 11042 appropriate privileges.

11043 The *fdetach()* function may fail if:

11044 [ELOOP] More than {SYMLOOP\_MAX} symbolic links were encountered during  
 11045 resolution of the *path* argument.

11046 [ENAMETOOLONG]

11047 Pathname resolution of a symbolic link produced an intermediate result  
 11048 whose length exceeds {PATH\_MAX}.

11049 **EXAMPLES**11050 **Detaching a File**

11051 The following example detaches the STREAMS-based file **/tmp/named-STREAM** from the file to  
11052 which it was attached by a previous, successful call to *fattach()*. Subsequent calls to open this  
11053 file refer to the underlying file, not to the STREAMS file.

```
11054 #include <stropts.h>
11055 ...
11056     char *filename = "/tmp/named-STREAM";
11057     int ret;
11058     ret = fdetach(filename);
```

11059 **APPLICATION USAGE**

11060 None.

11061 **RATIONALE**

11062 None.

11063 **FUTURE DIRECTIONS**

11064 None.

11065 **SEE ALSO**

11066 *fattach()*, the Base Definitions volume of IEEE Std 1003.1-2001, <stropts.h>

11067 **CHANGE HISTORY**

11068 First released in Issue 4, Version 2.

11069 **Issue 5**

11070 Moved from X/OPEN UNIX extension to BASE.

11071 **Issue 6**

11072 The DESCRIPTION is updated to avoid use of the term “must” for application requirements.

11073 The wording of the mandatory [ELOOP] error condition is updated, and a second optional  
11074 [ELOOP] error condition is added.

11075 **NAME**

11076 `fdim`, `fdimf`, `fdiml` — compute positive difference between two floating-point numbers

11077 **SYNOPSIS**

11078 `#include <math.h>`

11079 `double fdim(double x, double y);`

11080 `float fdimf(float x, float y);`

11081 `long double fdiml(long double x, long double y);`

11082 **DESCRIPTION**

11083 **CX** The functionality described on this reference page is aligned with the ISO C standard. Any  
 11084 conflict between the requirements described here and the ISO C standard is unintentional. This  
 11085 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

11086 These functions shall determine the positive difference between their arguments. If  $x$  is greater  
 11087 than  $y$ ,  $x-y$  is returned. If  $x$  is less than or equal to  $y$ ,  $+0$  is returned.

11088 An application wishing to check for error situations should set *errno* to zero and call  
 11089 *feclearexcept*(`FE_ALL_EXCEPT`) before calling these functions. On return, if *errno* is non-zero or  
 11090 *fetestexcept*(`FE_INVALID` | `FE_DIVBYZERO` | `FE_OVERFLOW` | `FE_UNDERFLOW`) is non-  
 11091 zero, an error has occurred.

11092 **RETURN VALUE**

11093 Upon successful completion, these functions shall return the positive difference value.

11094 If  $x-y$  is positive and overflows, a range error shall occur and *fdim*(), *fdimf*(), and *fdiml*() shall  
 11095 return the value of the macro `HUGE_VAL`, `HUGE_VALF`, and `HUGE_VALL`, respectively.

11096 **XSI** If  $x-y$  is positive and underflows, a range error may occur, and either  $(x-y)$  (if representable), or  
 11097 `0.0` (if supported), or an implementation-defined value shall be returned.

11098 **MX** If  $x$  or  $y$  is NaN, a NaN shall be returned.

11099 **ERRORS**

11100 The *fdim*() function shall fail if:

11101 **Range Error** The result overflows.

11102 If the integer expression (`math_errhandling` & `MATH_ERRNO`) is non-zero,  
 11103 then *errno* shall be set to `[ERANGE]`. If the integer expression  
 11104 (`math_errhandling` & `MATH_ERREXCEPT`) is non-zero, then the overflow  
 11105 floating-point exception shall be raised.

11106 The *fdim*() function may fail if:

11107 **Range Error** The result underflows.

11108 If the integer expression (`math_errhandling` & `MATH_ERRNO`) is non-zero,  
 11109 then *errno* shall be set to `[ERANGE]`. If the integer expression  
 11110 (`math_errhandling` & `MATH_ERREXCEPT`) is non-zero, then the underflow  
 11111 floating-point exception shall be raised.

11112 **EXAMPLES**

11113           None.

11114 **APPLICATION USAGE**

11115           On implementations supporting IEEE Std 754-1985,  $x-y$  cannot underflow, and hence the 0.0  
11116           return value is shaded as an extension for implementations supporting the XSI extension rather  
11117           than an MX extension.

11118           On error, the expressions `(math_errhandling & MATH_ERRNO)` and `(math_errhandling &`  
11119           `MATH_ERREXCEPT)` are independent of each other, but at least one of them must be non-zero.

11120 **RATIONALE**

11121           None.

11122 **FUTURE DIRECTIONS**

11123           None.

11124 **SEE ALSO**

11125           *feclearexcept()*, *fetestexcept()*, *fmax()*, *fmin()*, the Base Definitions volume of IEEE Std 1003.1-2001,  
11126           Section 4.18, Treatment of Error Conditions for Mathematical Functions, <math.h>

11127 **CHANGE HISTORY**

11128           First released in Issue 6. Derived from the ISO/IEC 9899:1999 standard.

11129 **NAME**

11130 fdopen — associate a stream with a file descriptor

11131 **SYNOPSIS**

11132 cx #include &lt;stdio.h&gt;

11133 FILE \*fdopen(int *fil-des*, const char \**mode*);

11134

11135 **DESCRIPTION**11136 The *fdopen()* function shall associate a stream with a file descriptor.11137 The *mode* argument is a character string having one of the following values:11138 *r* or *rb* Open a file for reading.11139 *w* or *wb* Open a file for writing.11140 *a* or *ab* Open a file for writing at end-of-file.11141 *r+* or *rb+* or *r+b* Open a file for update (reading and writing).11142 *w+* or *wb+* or *w+b* Open a file for update (reading and writing).11143 *a+* or *ab+* or *a+b* Open a file for update (reading and writing) at end-of-file.11144 The meaning of these flags is exactly as specified in *fopen()*, except that modes beginning with *w*  
11145 shall not cause truncation of the file.11146 Additional values for the *mode* argument may be supported by an implementation.11147 The application shall ensure that the mode of the stream as expressed by the *mode* argument is  
11148 allowed by the file access mode of the open file description to which *fil-des* refers. The file  
11149 position indicator associated with the new stream is set to the position indicated by the file  
11150 offset associated with the file descriptor.11151 The error and end-of-file indicators for the stream shall be cleared. The *fdopen()* function may  
11152 cause the *st\_atime* field of the underlying file to be marked for update.11153 SHM If *fil-des* refers to a shared memory object, the result of the *fdopen()* function is unspecified.11154 TYM If *fil-des* refers to a typed memory object, the result of the *fdopen()* function is unspecified.11155 The *fdopen()* function shall preserve the offset maximum previously set for the open file  
11156 description corresponding to *fil-des*.11157 **RETURN VALUE**11158 Upon successful completion, *fdopen()* shall return a pointer to a stream; otherwise, a null pointer  
11159 shall be returned and *errno* set to indicate the error.11160 **ERRORS**11161 The *fdopen()* function may fail if:11162 [EBADF] The *fil-des* argument is not a valid file descriptor.11163 [EINVAL] The *mode* argument is not a valid mode.

11164 [EMFILE] {FOPEN\_MAX} streams are currently open in the calling process.

11165 [EMFILE] {STREAM\_MAX} streams are currently open in the calling process.

11166 [ENOMEM] Insufficient space to allocate a buffer.

11167 **EXAMPLES**

11168 None.

11169 **APPLICATION USAGE**11170 File descriptors are obtained from calls like *open()*, *dup()*, *creat()*, or *pipe()*, which open files but  
11171 do not return streams.11172 **RATIONALE**11173 The file descriptor may have been obtained from *open()*, *creat()*, *pipe()*, *dup()*, or *fcntl()*;  
11174 inherited through *fork()* or *exec*; or perhaps obtained by implementation-defined means, such as  
11175 the 4.3 BSD *socket()* call.11176 The meanings of the *mode* arguments of *fdopen()* and *fopen()* differ. With *fdopen()*, open for write  
11177 (*w* or *w+*) does not truncate, and append (*a* or *a+*) cannot create for writing. The *mode* argument  
11178 formats that include *a b* are allowed for consistency with the ISO C standard function *fopen()*.  
11179 The *b* has no effect on the resulting stream. Although not explicitly required by this volume of  
11180 IEEE Std 1003.1-2001, a good implementation of append (*a*) mode would cause the O\_APPEND  
11181 flag to be set.11182 **FUTURE DIRECTIONS**

11183 None.

11184 **SEE ALSO**11185 Section 2.5.1 (on page 35), *fclose()*, *fopen()*, *open()*, the Base Definitions volume of  
11186 IEEE Std 1003.1-2001, <stdio.h>11187 **CHANGE HISTORY**

11188 First released in Issue 1. Derived from Issue 1 of the SVID.

11189 **Issue 5**

11190 The DESCRIPTION is updated for alignment with the POSIX Realtime Extension.

11191 Large File Summit extensions are added.

11192 **Issue 6**11193 The following new requirements on POSIX implementations derive from alignment with the  
11194 Single UNIX Specification:

- 11195 • In the DESCRIPTION, the use and setting of the *mode* argument are changed to include  
11196 binary streams.
- 11197 • In the DESCRIPTION, text is added for large file support to indicate setting of the offset  
11198 maximum in the open file description.
- 11199 • All errors identified in the ERRORS section are added.
- 11200 • In the DESCRIPTION, text is added that the *fdopen()* function may cause *st\_atime* to be  
11201 updated.

11202 The following changes were made to align with the IEEE P1003.1a draft standard:

- 11203 • Clarification is added that it is the responsibility of the application to ensure that the mode is  
11204 compatible with the open file descriptor.

11205 The DESCRIPTION is updated for alignment with IEEE Std 1003.1j-2000 by specifying that  
11206 *fdopen()* results are unspecified for typed memory objects.

11207 **NAME**

11208        `feclearexcept` — clear floating-point exception

11209 **SYNOPSIS**

11210        `#include <fenv.h>`

11211        `int feclearexcept(int excepts);`

11212 **DESCRIPTION**

11213 **CX**        The functionality described on this reference page is aligned with the ISO C standard. Any  
11214        conflict between the requirements described here and the ISO C standard is unintentional. This  
11215        volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

11216        The `feclearexcept()` function shall attempt to clear the supported floating-point exceptions  
11217        represented by *excepts*.

11218 **RETURN VALUE**

11219        If the argument is zero or if all the specified exceptions were successfully cleared, `feclearexcept()`  
11220        shall return zero. Otherwise, it shall return a non-zero value.

11221 **ERRORS**

11222        No errors are defined.

11223 **EXAMPLES**

11224        None.

11225 **APPLICATION USAGE**

11226        None.

11227 **RATIONALE**

11228        None.

11229 **FUTURE DIRECTIONS**

11230        None.

11231 **SEE ALSO**

11232        `fegetexceptflag()`, `feraiseexcept()`, `fesetexceptflag()`, `fetestexcept()`, the Base Definitions volume of  
11233        IEEE Std 1003.1-2001, `<fenv.h>`

11234 **CHANGE HISTORY**

11235        First released in Issue 6. Derived from the ISO/IEC 9899:1999 standard.

11236        ISO/IEC 9899:1999 standard, Technical Corrigendum No. 1 is incorporated.

11237 **NAME**

11238 fegetenv, fesetenv — get and set current floating-point environment

11239 **SYNOPSIS**

11240 #include <fenv.h>

11241 int fegetenv(fenv\_t \*envp);

11242 int fesetenv(const fenv\_t \*envp);

11243 **DESCRIPTION**

11244 **CX** The functionality described on this reference page is aligned with the ISO C standard. Any  
11245 conflict between the requirements described here and the ISO C standard is unintentional. This  
11246 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

11247 The *fegetenv()* function shall attempt to store the current floating-point environment in the object  
11248 pointed to by *envp*.

11249 The *fesetenv()* function shall attempt to establish the floating-point environment represented by  
11250 the object pointed to by *envp*. The argument *envp* shall point to an object set by a call to  
11251 *fegetenv()* or *feholdexcept()*, or equal a floating-point environment macro. The *fesetenv()* function  
11252 does not raise floating-point exceptions, but only installs the state of the floating-point status  
11253 flags represented through its argument.

11254 **RETURN VALUE**

11255 If the representation was successfully stored, *fegetenv()* shall return zero. Otherwise, it shall  
11256 return a non-zero value. If the environment was successfully established, *fesetenv()* shall return  
11257 zero. Otherwise, it shall return a non-zero value.

11258 **ERRORS**

11259 No errors are defined.

11260 **EXAMPLES**

11261 None.

11262 **APPLICATION USAGE**

11263 None.

11264 **RATIONALE**

11265 None.

11266 **FUTURE DIRECTIONS**

11267 None.

11268 **SEE ALSO**

11269 *feholdexcept()*, *feupdateenv()*, the Base Definitions volume of IEEE Std 1003.1-2001, <fenv.h>

11270 **CHANGE HISTORY**

11271 First released in Issue 6. Derived from the ISO/IEC 9899:1999 standard.

11272 ISO/IEC 9899:1999 standard, Technical Corrigendum No. 1 is incorporated.

11273 **NAME**

11274 fegetexceptflag, fesetexceptflag — get and set floating-point status flags

11275 **SYNOPSIS**

11276 #include <fenv.h>

11277 int fegetexceptflag(fexcept\_t \*flagp, int excepts);

11278 int fesetexceptflag(const fexcept\_t \*flagp, int excepts);

11279 **DESCRIPTION**

11280 **CX** The functionality described on this reference page is aligned with the ISO C standard. Any  
11281 conflict between the requirements described here and the ISO C standard is unintentional. This  
11282 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

11283 The *fegetexceptflag()* function shall attempt to store an implementation-defined representation of  
11284 the states of the floating-point status flags indicated by the argument *excepts* in the object  
11285 pointed to by the argument *flagp*.

11286 The *fesetexceptflag()* function shall attempt to set the floating-point status flags indicated by the  
11287 argument *excepts* to the states stored in the object pointed to by *flagp*. The value pointed to by  
11288 *flagp* shall have been set by a previous call to *fegetexceptflag()* whose second argument  
11289 represented at least those floating-point exceptions represented by the argument *excepts*. This  
11290 function does not raise floating-point exceptions, but only sets the state of the flags.

11291 **RETURN VALUE**

11292 If the representation was successfully stored, *fegetexceptflag()* shall return zero. Otherwise, it  
11293 shall return a non-zero value. If the *excepts* argument is zero or if all the specified exceptions  
11294 were successfully set, *fesetexceptflag()* shall return zero. Otherwise, it shall return a non-zero  
11295 value.

11296 **ERRORS**

11297 No errors are defined.

11298 **EXAMPLES**

11299 None.

11300 **APPLICATION USAGE**

11301 None.

11302 **RATIONALE**

11303 None.

11304 **FUTURE DIRECTIONS**

11305 None.

11306 **SEE ALSO**

11307 *feclearexcept()*, *feraiseexcept()*, *fetestexcept()*, the Base Definitions volume of IEEE Std 1003.1-2001,  
11308 <fenv.h>

11309 **CHANGE HISTORY**

11310 First released in Issue 6. Derived from the ISO/IEC 9899:1999 standard.

11311 ISO/IEC 9899:1999 standard, Technical Corrigendum No. 1 is incorporated.

11312 **NAME**

11313 fegetround, fesetround — get and set current rounding direction

11314 **SYNOPSIS**

```
11315 #include <fenv.h>
11316 int fegetround(void);
11317 int fesetround(int round);
```

11318 **DESCRIPTION**

11319 **CX** The functionality described on this reference page is aligned with the ISO C standard. Any  
 11320 conflict between the requirements described here and the ISO C standard is unintentional. This  
 11321 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

11322 The *fegetround()* function shall get the current rounding direction.

11323 The *fesetround()* function shall establish the rounding direction represented by its argument  
 11324 *round*. If the argument is not equal to the value of a rounding direction macro, the rounding  
 11325 direction is not changed.

11326 **RETURN VALUE**

11327 The *fegetround()* function shall return the value of the rounding direction macro representing the  
 11328 current rounding direction or a negative value if there is no such rounding direction macro or  
 11329 the current rounding direction is not determinable.

11330 The *fesetround()* function shall return a zero value if and only if the requested rounding direction  
 11331 was established.

11332 **ERRORS**

11333 No errors are defined.

11334 **EXAMPLES**

11335 The following example saves, sets, and restores the rounding direction, reporting an error and  
 11336 aborting if setting the rounding direction fails:

```
11337 #include <fenv.h>
11338 #include <assert.h>
11339 void f(int round_dir)
11340 {
11341     #pragma STDC FENV_ACCESS ON
11342     int save_round;
11343     int setround_ok;
11344     save_round = fegetround();
11345     setround_ok = fesetround(round_dir);
11346     assert(setround_ok == 0);
11347     /* ... */
11348     fesetround(save_round);
11349     /* ... */
11350 }
```

11351 **APPLICATION USAGE**

11352 None.

11353 **RATIONALE**

11354 None.

11355 **FUTURE DIRECTIONS**

11356           None.

11357 **SEE ALSO**

11358           The Base Definitions volume of IEEE Std 1003.1-2001, <fenv.h>

11359 **CHANGE HISTORY**

11360           First released in Issue 6. Derived from the ISO/IEC 9899: 1999 standard.

11361           ISO/IEC 9899: 1999 standard, Technical Corrigendum No. 1 is incorporated.

11362 **NAME**

11363 feholdexcept — save current floating-point environment

11364 **SYNOPSIS**

11365 #include <fenv.h>

11366 int feholdexcept(fenv\_t \*envp);

11367 **DESCRIPTION**

11368 **CX** The functionality described on this reference page is aligned with the ISO C standard. Any  
11369 conflict between the requirements described here and the ISO C standard is unintentional. This  
11370 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

11371 The *feholdexcept()* function shall save the current floating-point environment in the object  
11372 pointed to by *envp*, clear the floating-point status flags, and then install a non-stop (continue on  
11373 floating-point exceptions) mode, if available, for all floating-point exceptions.

11374 **RETURN VALUE**

11375 The *feholdexcept()* function shall return zero if and only if non-stop floating-point exception  
11376 handling was successfully installed.

11377 **ERRORS**

11378 No errors are defined.

11379 **EXAMPLES**

11380 None.

11381 **APPLICATION USAGE**

11382 None.

11383 **RATIONALE**

11384 The *feholdexcept()* function should be effective on typical IEC 60559:1989 standard  
11385 implementations which have the default non-stop mode and at least one other mode for trap  
11386 handling or aborting. If the implementation provides only the non-stop mode, then installing the  
11387 non-stop mode is trivial.

11388 **FUTURE DIRECTIONS**

11389 None.

11390 **SEE ALSO**

11391 *fegetenv()*, *fesetenv()*, *feupdateenv()*, the Base Definitions volume of IEEE Std 1003.1-2001,  
11392 <fenv.h>

11393 **CHANGE HISTORY**

11394 First released in Issue 6. Derived from the ISO/IEC 9899:1999 standard.

11395 **NAME**

11396 feof — test end-of-file indicator on a stream

11397 **SYNOPSIS**

11398 #include &lt;stdio.h&gt;

11399 int feof(FILE \*stream);

11400 **DESCRIPTION**

11401 cx The functionality described on this reference page is aligned with the ISO C standard. Any  
11402 conflict between the requirements described here and the ISO C standard is unintentional. This  
11403 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

11404 The *feof()* function shall test the end-of-file indicator for the stream pointed to by *stream*.11405 **RETURN VALUE**11406 The *feof()* function shall return non-zero if and only if the end-of-file indicator is set for *stream*.11407 **ERRORS**

11408 No errors are defined.

11409 **EXAMPLES**

11410 None.

11411 **APPLICATION USAGE**

11412 None.

11413 **RATIONALE**

11414 None.

11415 **FUTURE DIRECTIONS**

11416 None.

11417 **SEE ALSO**11418 *clearerr()*, *ferror()*, *fopen()*, the Base Definitions volume of IEEE Std 1003.1-2001, <stdio.h>11419 **CHANGE HISTORY**

11420 First released in Issue 1. Derived from Issue 1 of the SVID.

11421 **NAME**11422        `feraiseexcept` — raise floating-point exception11423 **SYNOPSIS**11424        `#include <fenv.h>`11425        `int feraiseexcept(int excepts);`11426 **DESCRIPTION**

11427 *cx*     The functionality described on this reference page is aligned with the ISO C standard. Any  
11428 conflict between the requirements described here and the ISO C standard is unintentional. This  
11429 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

11430     The `feraiseexcept()` function shall attempt to raise the supported floating-point exceptions  
11431 represented by the argument `excepts`. The order in which these floating-point exceptions are  
11432 raised is unspecified. Whether the `feraiseexcept()` function additionally raises the inexact  
11433 floating-point exception whenever it raises the overflow or underflow floating-point exception is  
11434 implementation-defined.

11435 **RETURN VALUE**

11436     If the argument is zero or if all the specified exceptions were successfully raised, `feraiseexcept()`  
11437 shall return zero. Otherwise, it shall return a non-zero value.

11438 **ERRORS**

11439     No errors are defined.

11440 **EXAMPLES**

11441     None.

11442 **APPLICATION USAGE**

11443     The effect is intended to be similar to that of floating-point exceptions raised by arithmetic  
11444 operations. Hence, enabled traps for floating-point exceptions raised by this function are taken.

11445 **RATIONALE**

11446     Raising overflow or underflow is allowed to also raise inexact because on some architectures the  
11447 only practical way to raise an exception is to execute an instruction that has the exception as a  
11448 side effect. The function is not restricted to accept only valid coincident expressions for atomic  
11449 operations, so the function can be used to raise exceptions accrued over several operations.

11450 **FUTURE DIRECTIONS**

11451     None.

11452 **SEE ALSO**

11453     `feclearexcept()`, `fegetexceptflag()`, `fesetexceptflag()`, `fetestexcept()`, the Base Definitions volume of  
11454 IEEE Std 1003.1-2001, `<fenv.h>`

11455 **CHANGE HISTORY**

11456     First released in Issue 6. Derived from the ISO/IEC 9899:1999 standard.

11457     ISO/IEC 9899:1999 standard, Technical Corrigendum No. 1 is incorporated.

11458 **NAME**

11459           ferror — test error indicator on a stream

11460 **SYNOPSIS**

11461           #include <stdio.h>

11462           int ferror(FILE \**stream*);

11463 **DESCRIPTION**

11464 **CX**       The functionality described on this reference page is aligned with the ISO C standard. Any  
11465           conflict between the requirements described here and the ISO C standard is unintentional. This  
11466           volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

11467           The *ferror()* function shall test the error indicator for the stream pointed to by *stream*.

11468 **RETURN VALUE**

11469           The *ferror()* function shall return non-zero if and only if the error indicator is set for *stream*.

11470 **ERRORS**

11471           No errors are defined.

11472 **EXAMPLES**

11473           None.

11474 **APPLICATION USAGE**

11475           None.

11476 **RATIONALE**

11477           None.

11478 **FUTURE DIRECTIONS**

11479           None.

11480 **SEE ALSO**

11481           *clearerr()*, *feof()*, *fopen()*, the Base Definitions volume of IEEE Std 1003.1-2001, <stdio.h>

11482 **CHANGE HISTORY**

11483           First released in Issue 1. Derived from Issue 1 of the SVID.

11484 **NAME**

11485       fesetenv — set current floating-point environment

11486 **SYNOPSIS**

11487       #include &lt;fenv.h&gt;

11488       int fesetenv(const fenv\_t \*envp);

11489 **DESCRIPTION**11490       Refer to *fegetenv()*.

11491 **NAME**

11492       fesetexceptflag — set floating-point status flags

11493 **SYNOPSIS**

11494       #include <fenv.h>

11495       int fesetexceptflag(const fexcept\_t \*flagp, int excepts);

11496 **DESCRIPTION**

11497       Refer to *fegetexceptflag()*.

11498 **NAME**

11499       fesetround — set current rounding direction

11500 **SYNOPSIS**

11501       #include <fenv.h>

11502       int fesetround(int *round*);

11503 **DESCRIPTION**

11504       Refer to *fegetround()*.

11505 **NAME**11506        `fetestexcept` — test floating-point exception flags11507 **SYNOPSIS**11508        `#include <fenv.h>`11509        `int fetestexcept(int excepts);`11510 **DESCRIPTION**

11511 *cx*     The functionality described on this reference page is aligned with the ISO C standard. Any  
 11512 conflict between the requirements described here and the ISO C standard is unintentional. This  
 11513 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

11514     The `fetestexcept()` function shall determine which of a specified subset of the floating-point  
 11515 exception flags are currently set. The *excepts* argument specifies the floating-point status flags to  
 11516 be queried.

11517 **RETURN VALUE**

11518     The `fetestexcept()` function shall return the value of the bitwise-inclusive OR of the floating-point  
 11519 exception macros corresponding to the currently set floating-point exceptions included in  
 11520 *excepts*.

11521 **ERRORS**

11522     No errors are defined.

11523 **EXAMPLES**

11524     The following example calls function *f()* if an invalid exception is set, and then function *g()* if an  
 11525 overflow exception is set:

```

11526     #include <fenv.h>
11527     /* ... */
11528     {
11529        # pragma STDC FENV_ACCESS ON
11530        int set_excepts;
11531        feclearexcept(FE_INVALID | FE_OVERFLOW);
11532        // maybe raise exceptions
11533        set_excepts = fetestexcept(FE_INVALID | FE_OVERFLOW);
11534        if (set_excepts & FE_INVALID) f();
11535        if (set_excepts & FE_OVERFLOW) g();
11536        /* ... */
11537     }
```

11538 **APPLICATION USAGE**

11539     None.

11540 **RATIONALE**

11541     None.

11542 **FUTURE DIRECTIONS**

11543     None.

11544 **SEE ALSO**

11545     `feclearexcept()`, `fegetexceptflag()`, `feraiseexcept()`, the Base Definitions volume of  
 11546 IEEE Std 1003.1-2001, `<fenv.h>`

11547 **CHANGE HISTORY**

11548 First released in Issue 6. Derived from the ISO/IEC 9899:1999 standard.

11549 **NAME**

11550 feupdateenv — update floating-point environment

11551 **SYNOPSIS**

11552 #include &lt;fenv.h&gt;

11553 int feupdateenv(const fenv\_t \*envp);

11554 **DESCRIPTION**

11555 cx The functionality described on this reference page is aligned with the ISO C standard. Any  
11556 conflict between the requirements described here and the ISO C standard is unintentional. This  
11557 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

11558 The *feupdateenv()* function shall attempt to save the currently raised floating-point exceptions in  
11559 its automatic storage, attempt to install the floating-point environment represented by the object  
11560 pointed to by *envp*, and then attempt to raise the saved floating-point exceptions. The argument  
11561 *envp* shall point to an object set by a call to *feholdexcept()* or *fegetenv()*, or equal a floating-point  
11562 environment macro.

11563 **RETURN VALUE**

11564 The *feupdateenv()* function shall return a zero value if and only if all the required actions were  
11565 successfully carried out.

11566 **ERRORS**

11567 No errors are defined.

11568 **EXAMPLES**

11569 The following example shows sample code to hide spurious underflow floating-point  
11570 exceptions:

```
11571 #include <fenv.h>
11572 double f(double x)
11573 {
11574     # pragma STDC FENV_ACCESS ON
11575     double result;
11576     fenv_t save_env;
11577     feholdexcept(&save_env);
11578     // compute result
11579     if (/* test spurious underflow */)
11580         feclearexcept(FE_UNDERFLOW);
11581     feupdateenv(&save_env);
11582     return result;
11583 }
```

11584 **APPLICATION USAGE**

11585 None.

11586 **RATIONALE**

11587 None.

11588 **FUTURE DIRECTIONS**

11589 None.

11590 **SEE ALSO**11591 *fegetenv()*, *feholdexcept()*, the Base Definitions volume of IEEE Std 1003.1-2001, <fenv.h>

11592 **CHANGE HISTORY**

- 11593 First released in Issue 6. Derived from the ISO/IEC 9899: 1999 standard.
- 11594 ISO/IEC 9899: 1999 standard, Technical Corrigendum No. 1 is incorporated.

## 11595 NAME

11596 fflush — flush a stream

## 11597 SYNOPSIS

11598 #include &lt;stdio.h&gt;

11599 int fflush(FILE \*stream);

## 11600 DESCRIPTION

11601 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
 11602 conflict between the requirements described here and the ISO C standard is unintentional. This  
 11603 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

11604 If *stream* points to an output stream or an update stream in which the most recent operation was  
 11605 CX not input, *fflush()* shall cause any unwritten data for that stream to be written to the file, and the  
 11606 *st\_ctime* and *st\_mtime* fields of the underlying file shall be marked for update.

11607 If *stream* is a null pointer, *fflush()* shall perform this flushing action on all streams for which the  
 11608 behavior is defined above.

## 11609 RETURN VALUE

11610 Upon successful completion, *fflush()* shall return 0; otherwise, it shall set the error indicator for  
 11611 CX the stream, return EOF, and set *errno* to indicate the error.

## 11612 ERRORS

11613 The *fflush()* function shall fail if:

11614 CX [EAGAIN] The O\_NONBLOCK flag is set for the file descriptor underlying *stream* and the  
 11615 process would be delayed in the write operation.

11616 CX [EBADF] The file descriptor underlying *stream* is not valid.

11617 CX [EFBIG] An attempt was made to write a file that exceeds the maximum file size.

11618 XSI [EFBIG] An attempt was made to write a file that exceeds the process' file size limit.

11619 CX [EFBIG] The file is a regular file and an attempt was made to write at or beyond the  
 11620 offset maximum associated with the corresponding stream.

11621 CX [EINTR] The *fflush()* function was interrupted by a signal.

11622 CX [EIO] The process is a member of a background process group attempting to write  
 11623 to its controlling terminal, TOSTOP is set, the process is neither ignoring nor  
 11624 blocking SIGTTOU, and the process group of the process is orphaned. This  
 11625 error may also be returned under implementation-defined conditions.

11626 CX [ENOSPC] There was no free space remaining on the device containing the file.

11627 CX [EPIPE] An attempt is made to write to a pipe or FIFO that is not open for reading by  
 11628 any process. A SIGPIPE signal shall also be sent to the thread.

11629 The *fflush()* function may fail if:

11630 CX [ENXIO] A request was made of a nonexistent device, or the request was outside the  
 11631 capabilities of the device.

11632 **EXAMPLES**11633 **Sending Prompts to Standard Output**

11634 The following example uses *printf()* calls to print a series of prompts for information the user  
 11635 must enter from standard input. The *fflush()* calls force the output to standard output. The  
 11636 *fflush()* function is used because standard output is usually buffered and the prompt may not  
 11637 immediately be printed on the output or terminal. The *gets()* calls read strings from standard  
 11638 input and place the results in variables, for use later in the program.

```
11639 #include <stdio.h>
11640 ...
11641 char user[100];
11642 char oldpasswd[100];
11643 char newpasswd[100];
11644 ...
11645 printf("User name: ");
11646 fflush(stdout);
11647 gets(user);

11648 printf("Old password: ");
11649 fflush(stdout);
11650 gets(oldpasswd);

11651 printf("New password: ");
11652 fflush(stdout);
11653 gets(newpasswd);
11654 ...
```

11655 **APPLICATION USAGE**

11656 None.

11657 **RATIONALE**

11658 Data buffered by the system may make determining the validity of the position of the current  
 11659 file descriptor impractical. Thus, enforcing the repositioning of the file descriptor after *fflush()*  
 11660 on streams open for *read()* is not mandated by IEEE Std 1003.1-2001.

11661 **FUTURE DIRECTIONS**

11662 None.

11663 **SEE ALSO**

11664 *getrlimit()*, *ulimit()*, the Base Definitions volume of IEEE Std 1003.1-2001, *<stdio.h>*

11665 **CHANGE HISTORY**

11666 First released in Issue 1. Derived from Issue 1 of the SVID.

11667 **Issue 5**

11668 Large File Summit extensions are added.

11669 **Issue 6**

11670 Extensions beyond the ISO C standard are marked.

11671 The following new requirements on POSIX implementations derive from alignment with the  
 11672 Single UNIX Specification:

- 11673 • The [EFBIG] error is added as part of the large file support extensions.
- 11674 • The [ENXIO] optional error condition is added.

11675  
11676

The RETURN VALUE section is updated to note that the error indicator shall be set for the stream. This is for alignment with the ISO/IEC 9899:1999 standard.

11677 **NAME**

11678       ffs — find first set bit

11679 **SYNOPSIS**

11680 xSI       #include &lt;strings.h&gt;

11681       int ffs(int i);

11682

11683 **DESCRIPTION**11684       The *ffs()* function shall find the first bit set (beginning with the least significant bit) in *i*, and  
11685       return the index of that bit. Bits are numbered starting at one (the least significant bit).11686 **RETURN VALUE**11687       The *ffs()* function shall return the index of the first bit set. If *i* is 0, then *ffs()* shall return 0.11688 **ERRORS**

11689       No errors are defined.

11690 **EXAMPLES**

11691       None.

11692 **APPLICATION USAGE**

11693       None.

11694 **RATIONALE**

11695       None.

11696 **FUTURE DIRECTIONS**

11697       None.

11698 **SEE ALSO**

11699       The Base Definitions volume of IEEE Std 1003.1-2001, &lt;strings.h&gt;

11700 **CHANGE HISTORY**

11701       First released in Issue 4, Version 2.

11702 **Issue 5**

11703       Moved from X/OPEN UNIX extension to BASE.

## 11704 NAME

11705 fgetc — get a byte from a stream

## 11706 SYNOPSIS

11707 #include <stdio.h>

11708 int fgetc(FILE \*stream);

## 11709 DESCRIPTION

11710 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
11711 conflict between the requirements described here and the ISO C standard is unintentional. This  
11712 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

11713 If the end-of-file indicator for the input stream pointed to by *stream* is not set and a next byte is  
11714 present, the *fgetc()* function shall obtain the next byte as an **unsigned char** converted to an **int**,  
11715 from the input stream pointed to by *stream*, and advance the associated file position indicator for  
11716 the stream (if defined). Since *fgetc()* operates on bytes, reading a character consisting of multiple  
11717 bytes (or “a multi-byte character”) may require multiple calls to *fgetc()*.

11718 CX The *fgetc()* function may mark the *st\_atime* field of the file associated with *stream* for update. The  
11719 *st\_atime* field shall be marked for update by the first successful execution of *fgetc()*, *fgets()*,  
11720 *fgetwc()*, *fgetws()*, *fread()*, *fscanf()*, *getc()*, *getchar()*, *gets()*, or *scanf()* using *stream* that returns  
11721 data not supplied by a prior call to *ungetc()* or *ungetwc()*.

## 11722 RETURN VALUE

11723 Upon successful completion, *fgetc()* shall return the next byte from the input stream pointed to  
11724 by *stream*. If the end-of-file indicator for the stream is set, or if the stream is at end-of-file, the  
11725 end-of-file indicator for the stream shall be set and *fgetc()* shall return EOF. If a read error occurs,  
11726 CX the error indicator for the stream shall be set, *fgetc()* shall return EOF, and shall set *errno* to  
11727 indicate the error.

## 11728 ERRORS

11729 The *fgetc()* function shall fail if data needs to be read and:

11730 CX [EAGAIN] The O\_NONBLOCK flag is set for the file descriptor underlying *stream* and the  
11731 process would be delayed in the *fgetc()* operation.

11732 CX [EBADF] The file descriptor underlying *stream* is not a valid file descriptor open for  
11733 reading.

11734 CX [EINTR] The read operation was terminated due to the receipt of a signal, and no data  
11735 was transferred.

11736 CX [EIO] A physical I/O error has occurred, or the process is in a background process  
11737 group attempting to read from its controlling terminal, and either the process  
11738 is ignoring or blocking the SIGTTIN signal or the process group is orphaned.  
11739 This error may also be generated for implementation-defined reasons.

11740 CX [E\_OVERFLOW] The file is a regular file and an attempt was made to read at or beyond the  
11741 offset maximum associated with the corresponding stream.

11742 The *fgetc()* function may fail if:

11743 CX [ENOMEM] Insufficient storage space is available.

11744 CX [ENXIO] A request was made of a nonexistent device, or the request was outside the  
11745 capabilities of the device.

11746 **EXAMPLES**

11747 None.

11748 **APPLICATION USAGE**

11749 If the integer value returned by *fgetc()* is stored into a variable of type **char** and then compared  
11750 against the integer constant EOF, the comparison may never succeed, because sign-extension of  
11751 a variable of type **char** on widening to integer is implementation-defined.

11752 The *ferror()* or *feof()* functions must be used to distinguish between an error condition and an  
11753 end-of-file condition.

11754 **RATIONALE**

11755 None.

11756 **FUTURE DIRECTIONS**

11757 None.

11758 **SEE ALSO**

11759 *feof()*, *ferror()*, *fopen()*, *getchar()*, *getc()*, the Base Definitions volume of IEEE Std 1003.1-2001,  
11760 **<stdio.h>**

11761 **CHANGE HISTORY**

11762 First released in Issue 1. Derived from Issue 1 of the SVID.

11763 **Issue 5**

11764 Large File Summit extensions are added.

11765 **Issue 6**

11766 Extensions beyond the ISO C standard are marked.

11767 The following new requirements on POSIX implementations derive from alignment with the  
11768 Single UNIX Specification:

- 11769 • The [EIO] and [EOVERFLOW] mandatory error conditions are added.
- 11770 • The [ENOMEM] and [ENXIO] optional error conditions are added.

11771 The following changes are made for alignment with the ISO/IEC 9899:1999 standard:

- 11772 • The DESCRIPTION is updated to clarify the behavior when the end-of-file indicator for the  
11773 input stream is not set.
- 11774 • The RETURN VALUE section is updated to note that the error indicator shall be set for the  
11775 stream.

11776 **NAME**

11777 fgetpos — get current file position information

11778 **SYNOPSIS**

11779 #include &lt;stdio.h&gt;

11780 int fgetpos(FILE \*restrict stream, fpos\_t \*restrict pos);

11781 **DESCRIPTION**

11782 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
 11783 conflict between the requirements described here and the ISO C standard is unintentional. This  
 11784 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

11785 The *fgetpos()* function shall store the current values of the parse state (if any) and file position  
 11786 indicator for the stream pointed to by *stream* in the object pointed to by *pos*. The value stored  
 11787 contains unspecified information usable by *fsetpos()* for repositioning the stream to its position  
 11788 at the time of the call to *fgetpos()*.

11789 **RETURN VALUE**

11790 Upon successful completion, *fgetpos()* shall return 0; otherwise, it shall return a non-zero value  
 11791 and set *errno* to indicate the error.

11792 **ERRORS**11793 The *fgetpos()* function shall fail if:

11794 CX [EOVERFLOW] The current value of the file position cannot be represented correctly in an  
 11795 object of type **fpos\_t**.

11796 The *fgetpos()* function may fail if:

11797 CX [EBADF] The file descriptor underlying *stream* is not valid.

11798 CX [ESPIPE] The file descriptor underlying *stream* is associated with a pipe, FIFO, or socket.  
 11799

11800 **EXAMPLES**

11801 None.

11802 **APPLICATION USAGE**

11803 None.

11804 **RATIONALE**

11805 None.

11806 **FUTURE DIRECTIONS**

11807 None.

11808 **SEE ALSO**11809 *fopen()*, *ftell()*, *rewind()*, *ungetc()*, the Base Definitions volume of IEEE Std 1003.1-2001, <stdio.h>11810 **CHANGE HISTORY**

11811 First released in Issue 4. Derived from the ISO C standard.

11812 **Issue 5**

11813 Large File Summit extensions are added.

11814 **Issue 6**

11815 Extensions beyond the ISO C standard are marked.

11816 The following new requirements on POSIX implementations derive from alignment with the  
 11817 Single UNIX Specification:

- 11818 • The [EBADF] and [ESPIPE] optional error conditions are added.
- 11819 An additional [ESPIPE] error condition is added for sockets.
- 11820 The prototype for *fgetpos()* is changed for alignment with the ISO/IEC 9899:1999 standard.

## 11821 NAME

11822 fgets — get a string from a stream

## 11823 SYNOPSIS

11824 #include &lt;stdio.h&gt;

11825 char \*fgets(char \*restrict s, int n, FILE \*restrict stream);

## 11826 DESCRIPTION

11827 cx The functionality described on this reference page is aligned with the ISO C standard. Any  
 11828 conflict between the requirements described here and the ISO C standard is unintentional. This  
 11829 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

11830 The *fgets()* function shall read bytes from *stream* into the array pointed to by *s*, until *n*–1 bytes  
 11831 are read, or a <newline> is read and transferred to *s*, or an end-of-file condition is encountered.  
 11832 The string is then terminated with a null byte.

11833 cx The *fgets()* function may mark the *st\_atime* field of the file associated with *stream* for update. The  
 11834 *st\_atime* field shall be marked for update by the first successful execution of *fgetc()*, *fgets()*,  
 11835 *fgetwc()*, *fgetws()*, *fread()*, *fscanf()*, *getc()*, *getchar()*, *gets()*, or *scanf()* using *stream* that returns  
 11836 data not supplied by a prior call to *ungetc()* or *ungetwc()*.

## 11837 RETURN VALUE

11838 Upon successful completion, *fgets()* shall return *s*. If the stream is at end-of-file, the end-of-file  
 11839 indicator for the stream shall be set and *fgets()* shall return a null pointer. If a read error occurs,  
 11840 cx the error indicator for the stream shall be set, *fgets()* shall return a null pointer, and shall set  
 11841 *errno* to indicate the error.

## 11842 ERRORS

11843 Refer to *fgetc()*.

## 11844 EXAMPLES

## 11845 Reading Input

11846 The following example uses *fgets()* to read each line of input. {LINE\_MAX}, which defines the  
 11847 maximum size of the input line, is defined in the <limits.h> header.

```
11848 #include <stdio.h>
11849 ...
11850 char line[LINE_MAX];
11851 ...
11852 while (fgets(line, LINE_MAX, fp) != NULL) {
11853     ...
11854 }
11855 ...
```

## 11856 APPLICATION USAGE

11857 None.

## 11858 RATIONALE

11859 None.

## 11860 FUTURE DIRECTIONS

11861 None.

11862 **SEE ALSO**

11863 *fopen()*, *fread()*, *gets()*, the Base Definitions volume of IEEE Std 1003.1-2001, <stdio.h>

11864 **CHANGE HISTORY**

11865 First released in Issue 1. Derived from Issue 1 of the SVID.

11866 **Issue 6**

11867 Extensions beyond the ISO C standard are marked.

11868 The prototype for *fgets()* is changed for alignment with the ISO/IEC 9899:1999 standard.

11869 **NAME**

11870 fgetwc — get a wide-character code from a stream

11871 **SYNOPSIS**

11872 #include &lt;stdio.h&gt;

11873 #include &lt;wchar.h&gt;

11874 wint\_t fgetwc(FILE \*stream);

11875 **DESCRIPTION**

11876 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
 11877 conflict between the requirements described here and the ISO C standard is unintentional. This  
 11878 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

11879 The *fgetwc()* function shall obtain the next character (if present) from the input stream pointed to  
 11880 by *stream*, convert that to the corresponding wide-character code, and advance the associated  
 11881 file position indicator for the stream (if defined).

11882 If an error occurs, the resulting value of the file position indicator for the stream is unspecified.

11883 CX The *fgetwc()* function may mark the *st\_atime* field of the file associated with *stream* for update.  
 11884 The *st\_atime* field shall be marked for update by the first successful execution of *fgetc()*, *fgets()*,  
 11885 *fgetwc()*, *fgetws()*, *fread()*, *fscanf()*, *getc()*, *getchar()*, *gets()*, or *scanf()* using *stream* that returns  
 11886 data not supplied by a prior call to *ungetc()* or *ungetwc()*.

11887 **RETURN VALUE**

11888 Upon successful completion, the *fgetwc()* function shall return the wide-character code of the  
 11889 character read from the input stream pointed to by *stream* converted to a type **wint\_t**. If the  
 11890 stream is at end-of-file, the end-of-file indicator for the stream shall be set and *fgetwc()* shall  
 11891 return WEOF. If a read error occurs, the error indicator for the stream shall be set, *fgetwc()* shall  
 11892 CX return WEOF, and shall set *errno* to indicate the error. If an encoding error occurs, the error  
 11893 indicator for the stream shall be set, *fgetwc()* shall return WEOF, and shall set *errno* to indicate  
 11894 the error.

11895 **ERRORS**

11896 The *fgetwc()* function shall fail if data needs to be read and:

11897 CX [EAGAIN] The O\_NONBLOCK flag is set for the file descriptor underlying *stream* and the  
 11898 process would be delayed in the *fgetwc()* operation.

11899 CX [EBADF] The file descriptor underlying *stream* is not a valid file descriptor open for  
 11900 reading.

11901 [EILSEQ] The data obtained from the input stream does not form a valid character.

11902 CX [EINTR] The read operation was terminated due to the receipt of a signal, and no data  
 11903 was transferred.

11904 CX [EIO] A physical I/O error has occurred, or the process is in a background process  
 11905 group attempting to read from its controlling terminal, and either the process  
 11906 is ignoring or blocking the SIGTTIN signal or the process group is orphaned.  
 11907 This error may also be generated for implementation-defined reasons.

11908 CX [EOVERFLOW] The file is a regular file and an attempt was made to read at or beyond the  
 11909 offset maximum associated with the corresponding stream.

11910 The *fgetwc()* function may fail if:

11911 CX [ENOMEM] Insufficient storage space is available.

11912 CX [ENXIO] A request was made of a nonexistent device, or the request was outside the  
11913 capabilities of the device.

#### 11914 EXAMPLES

11915 None.

#### 11916 APPLICATION USAGE

11917 The *ferror()* or *feof()* functions must be used to distinguish between an error condition and an  
11918 end-of-file condition.

#### 11919 RATIONALE

11920 None.

#### 11921 FUTURE DIRECTIONS

11922 None.

#### 11923 SEE ALSO

11924 *feof()*, *ferror()*, *fopen()*, the Base Definitions volume of IEEE Std 1003.1-2001, `<stdio.h>`,  
11925 `<wchar.h>`

#### 11926 CHANGE HISTORY

11927 First released in Issue 4. Derived from the MSE working draft.

#### 11928 Issue 5

11929 The Optional Header (OH) marking is removed from `<stdio.h>`.

11930 Large File Summit extensions are added.

#### 11931 Issue 6

11932 Extensions beyond the ISO C standard are marked.

11933 The following new requirements on POSIX implementations derive from alignment with the  
11934 Single UNIX Specification:

- 11935 • The [EIO] and [EOVERFLOW] mandatory error conditions are added.
- 11936 • The [ENOMEM] and [ENXIO] optional error conditions are added.

11937 **NAME**

11938 fgetws — get a wide-character string from a stream

11939 **SYNOPSIS**

11940 #include &lt;stdio.h&gt;

11941 #include &lt;wchar.h&gt;

11942 wchar\_t \*fgetws(wchar\_t \*restrict ws, int n,

11943 FILE \*restrict stream);

11944 **DESCRIPTION**

11945 **CX** The functionality described on this reference page is aligned with the ISO C standard. Any  
 11946 conflict between the requirements described here and the ISO C standard is unintentional. This  
 11947 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

11948 The *fgetws()* function shall read characters from the *stream*, convert these to the corresponding  
 11949 wide-character codes, place them in the **wchar\_t** array pointed to by *ws*, until *n*−1 characters are  
 11950 read, or a <newline> is read, converted, and transferred to *ws*, or an end-of-file condition is  
 11951 encountered. The wide-character string, *ws*, shall then be terminated with a null wide-character  
 11952 code.

11953 If an error occurs, the resulting value of the file position indicator for the stream is unspecified.

11954 **CX** The *fgetws()* function may mark the *st\_atime* field of the file associated with *stream* for update.  
 11955 The *st\_atime* field shall be marked for update by the first successful execution of *fgetc()*, *fgets()*,  
 11956 *fgetwc()*, *fgetws()*, *fread()*, *fscanf()*, *getc()*, *getchar()*, *gets()*, or *scanf()* using *stream* that returns  
 11957 data not supplied by a prior call to *ungetc()* or *ungetwc()*.

11958 **RETURN VALUE**

11959 Upon successful completion, *fgetws()* shall return *ws*. If the stream is at end-of-file, the end-of-  
 11960 file indicator for the stream shall be set and *fgetws()* shall return a null pointer. If a read error  
 11961 **CX** occurs, the error indicator for the stream shall be set, *fgetws()* shall return a null pointer, and  
 11962 shall set *errno* to indicate the error.

11963 **ERRORS**11964 Refer to *fgetwc()*.11965 **EXAMPLES**

11966 None.

11967 **APPLICATION USAGE**

11968 None.

11969 **RATIONALE**

11970 None.

11971 **FUTURE DIRECTIONS**

11972 None.

11973 **SEE ALSO**11974 *fopen()*, *fread()*, the Base Definitions volume of IEEE Std 1003.1-2001, <stdio.h>, <wchar.h>11975 **CHANGE HISTORY**

11976 First released in Issue 4. Derived from the MSE working draft.

11977 **Issue 5**

11978 The Optional Header (OH) marking is removed from &lt;stdio.h&gt;.

11979 **Issue 6**

11980 Extensions beyond the ISO C standard are marked.

11981 The prototype for *fgetws()* is changed for alignment with the ISO/IEC 9899:1999 standard.

11982 **NAME**

11983 fileno — map a stream pointer to a file descriptor

11984 **SYNOPSIS**

```
11985 cx #include <stdio.h>
```

```
11986 int fileno(FILE *stream);
```

11987

11988 **DESCRIPTION**

11989 The *fileno()* function shall return the integer file descriptor associated with the stream pointed to  
11990 by *stream*.

11991 **RETURN VALUE**

11992 Upon successful completion, *fileno()* shall return the integer value of the file descriptor  
11993 associated with *stream*. Otherwise, the value  $-1$  shall be returned and *errno* set to indicate the  
11994 error.

11995 **ERRORS**

11996 The *fileno()* function may fail if:

11997 [EBADF] The *stream* argument is not a valid stream.

11998 **EXAMPLES**

11999 None.

12000 **APPLICATION USAGE**

12001 None.

12002 **RATIONALE**

12003 Without some specification of which file descriptors are associated with these streams, it is  
12004 impossible for an application to set up the streams for another application it starts with *fork()*  
12005 and *exec*. In particular, it would not be possible to write a portable version of the *sh* command  
12006 interpreter (although there may be other constraints that would prevent that portability).

12007 **FUTURE DIRECTIONS**

12008 None.

12009 **SEE ALSO**

12010 Section 2.5.1 (on page 35), *fdopen()*, *fopen()*, *stdin*, the Base Definitions volume of  
12011 IEEE Std 1003.1-2001, <stdio.h>

12012 **CHANGE HISTORY**

12013 First released in Issue 1. Derived from Issue 1 of the SVID.

12014 **Issue 6**

12015 The following new requirements on POSIX implementations derive from alignment with the  
12016 Single UNIX Specification:

- 12017 • The [EBADF] optional error condition is added.

12018 **NAME**

12019 flockfile, ftrylockfile, funlockfile — stdio locking functions

12020 **SYNOPSIS**

```
12021 TSF      #include <stdio.h>
12022          void flockfile(FILE *file);
12023          int ftrylockfile(FILE *file);
12024          void funlockfile(FILE *file);
12025
```

12026 **DESCRIPTION**

12027 These functions shall provide for explicit application-level locking of stdio (**FILE** \*) objects.  
 12028 These functions can be used by a thread to delineate a sequence of I/O statements that are  
 12029 executed as a unit.

12030 The *flockfile()* function shall acquire for a thread ownership of a (**FILE** \*) object.

12031 The *ftrylockfile()* function shall acquire for a thread ownership of a (**FILE** \*) object if the object is  
 12032 available; *ftrylockfile()* is a non-blocking version of *flockfile()*.

12033 The *funlockfile()* function shall relinquish the ownership granted to the thread. The behavior is  
 12034 undefined if a thread other than the current owner calls the *funlockfile()* function.

12035 The functions shall behave as if there is a lock count associated with each (**FILE** \*) object. This  
 12036 count is implicitly initialized to zero when the (**FILE** \*) object is created. The (**FILE** \*) object is  
 12037 unlocked when the count is zero. When the count is positive, a single thread owns the (**FILE** \*)  
 12038 object. When the *flockfile()* function is called, if the count is zero or if the count is positive and  
 12039 the caller owns the (**FILE** \*) object, the count shall be incremented. Otherwise, the calling thread  
 12040 shall be suspended, waiting for the count to return to zero. Each call to *funlockfile()* shall  
 12041 decrement the count. This allows matching calls to *flockfile()* (or successful calls to *ftrylockfile()*)  
 12042 and *funlockfile()* to be nested.

12043 All functions that reference (**FILE** \*) objects shall behave as if they use *flockfile()* and *funlockfile()*  
 12044 internally to obtain ownership of these (**FILE** \*) objects.

12045 **RETURN VALUE**

12046 None for *flockfile()* and *funlockfile()*.

12047 The *ftrylockfile()* function shall return zero for success and non-zero to indicate that the lock  
 12048 cannot be acquired.

12049 **ERRORS**

12050 No errors are defined.

12051 **EXAMPLES**

12052 None.

12053 **APPLICATION USAGE**

12054 Applications using these functions may be subject to priority inversion, as discussed in the Base  
 12055 Definitions volume of IEEE Std 1003.1-2001, Section 3.285, Priority Inversion.

12056 **RATIONALE**

12057 The *flockfile()* and *funlockfile()* functions provide an orthogonal mutual-exclusion lock for each  
 12058 **FILE**. The *ftrylockfile()* function provides a non-blocking attempt to acquire a file lock,  
 12059 analogous to *pthread\_mutex\_trylock()*.

12060 These locks behave as if they are the same as those used internally by *stdio* for thread-safety.  
 12061 This both provides thread-safety of these functions without requiring a second level of internal  
 12062 locking and allows functions in *stdio* to be implemented in terms of other *stdio* functions.

12063 Application writers and implementors should be aware that there are potential deadlock  
12064 problems on **FILE** objects. For example, the line-buffered flushing semantics of *stdio* (requested  
12065 via `{_IOLBF}`) require that certain input operations sometimes cause the buffered contents of  
12066 implementation-defined line-buffered output streams to be flushed. If two threads each hold the  
12067 lock on the other's **FILE**, deadlock ensues. This type of deadlock can be avoided by acquiring  
12068 **FILE** locks in a consistent order. In particular, the line-buffered output stream deadlock can  
12069 typically be avoided by acquiring locks on input streams before locks on output streams if a  
12070 thread would be acquiring both.

12071 In summary, threads sharing *stdio* streams with other threads can use *flockfile()* and *funlockfile()*  
12072 to cause sequences of I/O performed by a single thread to be kept bundled. The only case where  
12073 the use of *flockfile()* and *funlockfile()* is required is to provide a scope protecting uses of the  
12074 `*_unlocked()` functions/macros. This moves the cost/performance tradeoff to the optimal point.

#### 12075 **FUTURE DIRECTIONS**

12076 None.

#### 12077 **SEE ALSO**

12078 *getc\_unlocked()*, *putc\_unlocked()*, the Base Definitions volume of IEEE Std 1003.1-2001, `<stdio.h>`

#### 12079 **CHANGE HISTORY**

12080 First released in Issue 5. Included for alignment with the POSIX Threads Extension.

#### 12081 **Issue 6**

12082 These functions are marked as part of the Thread-Safe Functions option.

## 12083 NAME

12084 floor, floorf, floorl — floor function

## 12085 SYNOPSIS

12086 #include &lt;math.h&gt;

12087 double floor(double x);

12088 float floorf(float x);

12089 long double floorl(long double x);

## 12090 DESCRIPTION

12091 **CX** The functionality described on this reference page is aligned with the ISO C standard. Any  
 12092 conflict between the requirements described here and the ISO C standard is unintentional. This  
 12093 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

12094 These functions shall compute the largest integral value not greater than *x*.

12095 An application wishing to check for error situations should set *errno* to zero and call  
 12096 *feclearexcept*(FE\_ALL\_EXCEPT) before calling these functions. On return, if *errno* is non-zero or  
 12097 *fetestexcept*(FE\_INVALID | FE\_DIVBYZERO | FE\_OVERFLOW | FE\_UNDERFLOW) is non-  
 12098 zero, an error has occurred.

## 12099 RETURN VALUE

12100 Upon successful completion, these functions shall return the largest integral value not greater  
 12101 than *x*, expressed as a **double**, **float**, or **long double**, as appropriate for the return type of the  
 12102 function.

12103 **MX** If *x* is NaN, a NaN shall be returned.12104 If *x* is  $\pm 0$  or  $\pm \text{Inf}$ , *x* shall be returned.

12105 **XSI** If the correct value would cause overflow, a range error shall occur and *floor*(), *floorf*(), and  
 12106 *floorl*() shall return the value of the macro `-HUGE_VAL`, `-HUGE_VALF`, and `-HUGE_VALL`,  
 12107 respectively.

## 12108 ERRORS

12109 These functions shall fail if:

12110 **XSI** Range Error The result would cause an overflow.

12111 If the integer expression (math\_errhandling & MATH\_ERRNO) is non-zero,  
 12112 then *errno* shall be set to [ERANGE]. If the integer expression  
 12113 (math\_errhandling & MATH\_ERREXCEPT) is non-zero, then the overflow  
 12114 floating-point exception shall be raised.

## 12115 EXAMPLES

12116 None.

## 12117 APPLICATION USAGE

12118 The integral value returned by these functions might not be expressible as an **int** or **long**. The  
 12119 return value should be tested before assigning it to an integer type to avoid the undefined results  
 12120 of an integer overflow.

12121 The *floor*() function can only overflow when the floating-point representation has  
 12122 `DBL_MANT_DIG > DBL_MAX_EXP`.

12123 On error, the expressions (math\_errhandling & MATH\_ERRNO) and (math\_errhandling &  
 12124 MATH\_ERREXCEPT) are independent of each other, but at least one of them must be non-zero.

12125 **RATIONALE**

12126 None.

12127 **FUTURE DIRECTIONS**

12128 None.

12129 **SEE ALSO**12130 *ceil()*, *feclearexcept()*, *fetestexcept()*, *isnan()*, the Base Definitions volume of IEEE Std 1003.1-2001,  
12131 Section 4.18, Treatment of Error Conditions for Mathematical Functions, <math.h>12132 **CHANGE HISTORY**

12133 First released in Issue 1. Derived from Issue 1 of the SVID.

12134 **Issue 5**12135 The DESCRIPTION is updated to indicate how an application should check for an error. This  
12136 text was previously published in the APPLICATION USAGE section.12137 **Issue 6**12138 The *floorf()* and *floorl()* functions are added for alignment with the ISO/IEC 9899:1999 standard.12139 The DESCRIPTION, RETURN VALUE, ERRORS, and APPLICATION USAGE sections are  
12140 revised to align with the ISO/IEC 9899:1999 standard.12141 IEC 60559:1989 standard floating-point extensions over the ISO/IEC 9899:1999 standard are  
12142 marked.

12143 **NAME**

12144 fma, fmaf, fmal — floating-point multiply-add

12145 **SYNOPSIS**

12146 #include &lt;math.h&gt;

12147 double fma(double x, double y, double z);

12148 float fmaf(float x, float y, float z);

12149 long double fmal(long double x, long double y, long double z);

12150 **DESCRIPTION**

12151 **CX** The functionality described on this reference page is aligned with the ISO C standard. Any  
 12152 conflict between the requirements described here and the ISO C standard is unintentional. This  
 12153 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

12154 These functions shall compute  $(x * y) + z$ , rounded as one ternary operation: they shall compute  
 12155 the value (as if) to infinite precision and round once to the result format, according to the  
 12156 rounding mode characterized by the value of FLT\_ROUNDS.

12157 An application wishing to check for error situations should set *errno* to zero and call  
 12158 *feclearexcept*(FE\_ALL\_EXCEPT) before calling these functions. On return, if *errno* is non-zero or  
 12159 *fetestexcept*(FE\_INVALID | FE\_DIVBYZERO | FE\_OVERFLOW | FE\_UNDERFLOW) is non-  
 12160 zero, an error has occurred.

12161 **RETURN VALUE**

12162 Upon successful completion, these functions shall return  $(x * y) + z$ , rounded as one ternary  
 12163 operation.

12164 **MX** If *x* or *y* are NaN, a NaN shall be returned.

12165 If *x* multiplied by *y* is an exact infinity and *z* is also an infinity but with the opposite sign, a  
 12166 domain error shall occur, and either a NaN (if supported), or an implementation-defined value  
 12167 shall be returned.

12168 If one of *x* and *y* is infinite, the other is zero, and *z* is not a NaN, a domain error shall occur, and  
 12169 either a NaN (if supported), or an implementation-defined value shall be returned.

12170 If one of *x* and *y* is infinite, the other is zero, and *z* is a NaN, a NaN shall be returned and a  
 12171 domain error may occur.

12172 If  $x * y$  is not  $0 * \text{Inf}$  nor  $\text{Inf} * 0$  and *z* is a NaN, a NaN shall be returned.

12173 **ERRORS**

12174 These functions shall fail if:

12175 **MX** **Domain Error** The value of  $x * y + z$  is invalid, or the value  $x * y$  is invalid and *z* is not a NaN.

12176 If the integer expression (math\_errhandling & MATH\_ERRNO) is non-zero,  
 12177 then *errno* shall be set to [EDOM]. If the integer expression (math\_errhandling  
 12178 & MATH\_ERREXCEPT) is non-zero, then the invalid floating-point exception  
 12179 shall be raised.

12180 **MX** **Range Error** The result overflows.

12181 If the integer expression (math\_errhandling & MATH\_ERRNO) is non-zero,  
 12182 then *errno* shall be set to [ERANGE]. If the integer expression  
 12183 (math\_errhandling & MATH\_ERREXCEPT) is non-zero, then the overflow  
 12184 floating-point exception shall be raised.

12185 These functions may fail if:

12186	MX	<b>Domain Error</b>	The value $x*y$ is invalid and $z$ is a NaN.
12187			If the integer expression ( <code>math_errhandling</code> & <code>MATH_ERRNO</code> ) is non-zero, then <code>errno</code> shall be set to [EDOM]. If the integer expression ( <code>math_errhandling</code> & <code>MATH_ERREXCEPT</code> ) is non-zero, then the invalid floating-point exception shall be raised.
12188			
12189			
12190			
12191	MX	<b>Range Error</b>	The result underflows.
12192			If the integer expression ( <code>math_errhandling</code> & <code>MATH_ERRNO</code> ) is non-zero, then <code>errno</code> shall be set to [ERANGE]. If the integer expression ( <code>math_errhandling</code> & <code>MATH_ERREXCEPT</code> ) is non-zero, then the underflow floating-point exception shall be raised.
12193			
12194			
12195			
12196		<b>EXAMPLES</b>	
12197			None.
12198		<b>APPLICATION USAGE</b>	
12199			On error, the expressions ( <code>math_errhandling</code> & <code>MATH_ERRNO</code> ) and ( <code>math_errhandling</code> &
12200			<code>MATH_ERREXCEPT</code> ) are independent of each other, but at least one of them must be non-zero.
12201		<b>RATIONALE</b>	
12202			In many cases, clever use of floating ( <i>fused</i> ) multiply-add leads to much improved code; but its
12203			unexpected use by the compiler can undermine carefully written code. The <code>FP_CONTRACT</code>
12204			macro can be used to disallow use of floating multiply-add; and the <code>fma()</code> function guarantees
12205			its use where desired. Many current machines provide hardware floating multiply-add
12206			instructions; software implementation can be used for others.
12207		<b>FUTURE DIRECTIONS</b>	
12208			None.
12209		<b>SEE ALSO</b>	
12210			<code>feclearexcept()</code> , <code>fetestexcept()</code> , the Base Definitions volume of IEEE Std 1003.1-2001, Section 4.18,
12211			Treatment of Error Conditions for Mathematical Functions, < <b>math.h</b> >
12212		<b>CHANGE HISTORY</b>	
12213			First released in Issue 6. Derived from the ISO/IEC 9899:1999 standard.

12214 **NAME**

12215 fmax, fmaxf, fmaxl — determine maximum numeric value of two floating-point numbers

12216 **SYNOPSIS**

12217 #include <math.h>

12218 double fmax(double x, double y);

12219 float fmaxf(float x, float y);

12220 long double fmaxl(long double x, long double y);

12221 **DESCRIPTION**

12222 **CX** The functionality described on this reference page is aligned with the ISO C standard. Any  
12223 conflict between the requirements described here and the ISO C standard is unintentional. This  
12224 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

12225 These functions shall determine the maximum numeric value of their arguments. NaN  
12226 arguments shall be treated as missing data: if one argument is a NaN and the other numeric,  
12227 then these functions shall choose the numeric value.

12228 **RETURN VALUE**

12229 Upon successful completion, these functions shall return the maximum numeric value of their  
12230 arguments.

12231 If just one argument is a NaN, the other argument shall be returned.

12232 **MX** If *x* and *y* are NaN, a NaN shall be returned.

12233 **ERRORS**

12234 No errors are defined.

12235 **EXAMPLES**

12236 None.

12237 **APPLICATION USAGE**

12238 None.

12239 **RATIONALE**

12240 None.

12241 **FUTURE DIRECTIONS**

12242 None.

12243 **SEE ALSO**

12244 *fdim()*, *fmin()*, the Base Definitions volume of IEEE Std 1003.1-2001, <math.h>

12245 **CHANGE HISTORY**

12246 First released in Issue 6. Derived from the ISO/IEC 9899:1999 standard.

12247 **NAME**

12248 fmin, fminf, fminl — determine minimum numeric value of two floating-point numbers

12249 **SYNOPSIS**

12250 #include <math.h>

12251 double fmin(double x, double y);

12252 float fminf(float x, float y);

12253 long double fminl(long double x, long double y);

12254 **DESCRIPTION**

12255 **CX** The functionality described on this reference page is aligned with the ISO C standard. Any  
12256 conflict between the requirements described here and the ISO C standard is unintentional. This  
12257 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

12258 These functions shall determine the minimum numeric value of their arguments. NaN  
12259 arguments shall be treated as missing data: if one argument is a NaN and the other numeric,  
12260 then these functions shall choose the numeric value.

12261 **RETURN VALUE**

12262 Upon successful completion, these functions shall return the minimum numeric value of their  
12263 arguments.

12264 If just one argument is a NaN, the other argument shall be returned.

12265 **MX** If *x* and *y* are NaN, a NaN shall be returned.

12266 **ERRORS**

12267 No errors are defined.

12268 **EXAMPLES**

12269 None.

12270 **APPLICATION USAGE**

12271 None.

12272 **RATIONALE**

12273 None.

12274 **FUTURE DIRECTIONS**

12275 None.

12276 **SEE ALSO**

12277 *fdim()*, *fmax()*, the Base Definitions volume of IEEE Std 1003.1-2001, <math.h>

12278 **CHANGE HISTORY**

12279 First released in Issue 6. Derived from the ISO/IEC 9899:1999 standard.

12280 **NAME**

12281 fmod, fmodf, fmodl — floating-point remainder value function

12282 **SYNOPSIS**

12283 #include &lt;math.h&gt;

12284 double fmod(double x, double y);

12285 float fmodf(float x, float y);

12286 long double fmodl(long double x, long double y);

12287 **DESCRIPTION**

12288 **CX** The functionality described on this reference page is aligned with the ISO C standard. Any  
 12289 conflict between the requirements described here and the ISO C standard is unintentional. This  
 12290 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

12291 These functions shall return the floating-point remainder of the division of  $x$  by  $y$ .

12292 An application wishing to check for error situations should set *errno* to zero and call  
 12293 *feclearexcept*(FE\_ALL\_EXCEPT) before calling these functions. On return, if *errno* is non-zero or  
 12294 *fetestexcept*(FE\_INVALID | FE\_DIVBYZERO | FE\_OVERFLOW | FE\_UNDERFLOW) is non-  
 12295 zero, an error has occurred.

12296 **RETURN VALUE**

12297 These functions shall return the value  $x-i*y$ , for some integer  $i$  such that, if  $y$  is non-zero, the  
 12298 result has the same sign as  $x$  and magnitude less than the magnitude of  $y$ .

12299 If the correct value would cause underflow, and is not representable, a range error may occur,  
 12300 **MX** and either 0.0 (if supported), or an implementation-defined value shall be returned.

12301 **MX** If  $x$  or  $y$  is NaN, a NaN shall be returned.

12302 If  $y$  is zero, a domain error shall occur, and either a NaN (if supported), or an implementation-  
 12303 defined value shall be returned.

12304 If  $x$  is infinite, a domain error shall occur, and either a NaN (if supported), or an  
 12305 implementation-defined value shall be returned.

12306 If  $x$  is  $\pm 0$  and  $y$  is not zero,  $\pm 0$  shall be returned.12307 If  $x$  is not infinite and  $y$  is  $\pm\text{Inf}$ ,  $x$  shall be returned.

12308 If the correct value would cause underflow, and is representable, a range error may occur and  
 12309 the correct value shall be returned.

12310 **ERRORS**

12311 These functions shall fail if:

12312 **MX** **Domain Error** The  $x$  argument is infinite or  $y$  is zero.

12313 If the integer expression (math\_errhandling & MATH\_ERRNO) is non-zero,  
 12314 then *errno* shall be set to [EDOM]. If the integer expression (math\_errhandling  
 12315 & MATH\_ERREXCEPT) is non-zero, then the invalid floating-point exception  
 12316 shall be raised.

12317 These functions may fail if:

12318 **Range Error** The result underflows.

12319 If the integer expression (math\_errhandling & MATH\_ERRNO) is non-zero,  
 12320 then *errno* shall be set to [ERANGE]. If the integer expression  
 12321 (math\_errhandling & MATH\_ERREXCEPT) is non-zero, then the underflow  
 12322 floating-point exception shall be raised.

12323 **EXAMPLES**

12324 None.

12325 **APPLICATION USAGE**

12326 On error, the expressions (math\_errhandling & MATH\_ERRNO) and (math\_errhandling &  
12327 MATH\_ERREXCEPT) are independent of each other, but at least one of them must be non-zero.

12328 **RATIONALE**

12329 None.

12330 **FUTURE DIRECTIONS**

12331 None.

12332 **SEE ALSO**

12333 *feclearexcept()*, *fetestexcept()*, *isnan()*, the Base Definitions volume of IEEE Std 1003.1-2001,

12335 **CHANGE HISTORY**

12336 First released in Issue 1. Derived from Issue 1 of the SVID.

12337 **Issue 5**

12338 The DESCRIPTION is updated to indicate how an application should check for an error. This  
12339 text was previously published in the APPLICATION USAGE section.

12340 **Issue 6**12341 The behavior for when the *y* argument is zero is now defined.

12342 The *fmodf()* and *fmodl()* functions are added for alignment with the ISO/IEC 9899:1999  
12343 standard.

12344 The DESCRIPTION, RETURN VALUE, ERRORS, and APPLICATION USAGE sections are  
12345 revised to align with the ISO/IEC 9899:1999 standard.

12346 IEC 60559:1989 standard floating-point extensions over the ISO/IEC 9899:1999 standard are  
12347 marked.

12348 **NAME**12349 `fmtmsg` — display a message in the specified format on standard error and/or a system console12350 **SYNOPSIS**

```
12351 xSI #include <fmtmsg.h>
12352
12352 int fmtmsg(long classification, const char *label, int severity,
12353           const char *text, const char *action, const char *tag);
12354
```

12355 **DESCRIPTION**12356 The `fmtmsg()` function shall display messages in a specified format instead of the traditional  
12357 `printf()` function.12358 Based on a message's classification component, `fmtmsg()` shall write a formatted message either  
12359 to standard error, to the console, or to both.12360 A formatted message consists of up to five components as defined below. The component  
12361 *classification* is not part of a message displayed to the user, but defines the source of the message  
12362 and directs the display of the formatted message.

12363 *classification* Contains the sum of identifying values constructed from the constants defined  
12364 below. Any one identifier from a subclass may be used in combination with a  
12365 single identifier from a different subclass. Two or more identifiers from the  
12366 same subclass should not be used together, with the exception of identifiers  
12367 from the display subclass. (Both display subclass identifiers may be used so  
12368 that messages can be displayed to both standard error and the system  
12369 console.)

12370 **Major Classifications**12371 Identifies the source of the condition. Identifiers are: MM\_HARD  
12372 (hardware), MM\_SOFT (software), and MM\_FIRM (firmware).12373 **Message Source Subclassifications**12374 Identifies the type of software in which the problem is detected.  
12375 Identifiers are: MM\_APPL (application), MM\_UTIL (utility), and  
12376 MM\_OP SYS (operating system).12377 **Display Subclassifications**12378 Indicates where the message is to be displayed. Identifiers are:  
12379 MM\_PRINT to display the message on the standard error stream,  
12380 MM\_CONSOLE to display the message on the system console. One or  
12381 both identifiers may be used.12382 **Status Subclassifications**12383 Indicates whether the application can recover from the condition.  
12384 Identifiers are: MM\_RECOVER (recoverable) and MM\_NRECOV (non-  
12385 recoverable).12386 An additional identifier, MM\_NULLMC, indicates that no classification  
12387 component is supplied for the message.12388 *label* Identifies the source of the message. The format is two fields separated by a  
12389 colon. The first field is up to 10 bytes, the second is up to 14 bytes.12390 *severity* Indicates the seriousness of the condition. Identifiers for the levels of *severity*  
12391 are:

12392		MM_HALT	Indicates that the application has encountered a severe fault and is halting. Produces the string "HALT".
12393			
12394		MM_ERROR	Indicates that the application has detected a fault. Produces the string "ERROR".
12395			
12396		MM_WARNING	Indicates a condition that is out of the ordinary, that might be a problem, and should be watched. Produces the string "WARNING".
12397			
12398			
12399		MM_INFO	Provides information about a condition that is not in error. Produces the string "INFO".
12400			
12401		MM_NOSEV	Indicates that no severity level is supplied for the message.
12402	<i>text</i>		Describes the error condition that produced the message. The character string is not limited to a specific size. If the character string is empty, then the text produced is unspecified.
12403			
12404			
12405	<i>action</i>		Describes the first step to be taken in the error-recovery process. The <i>fntmsg()</i> function precedes the action string with the prefix: "TO FIX:". The <i>action</i> string is not limited to a specific size.
12406			
12407			
12408	<i>tag</i>		An identifier that references on-line documentation for the message. Suggested usage is that <i>tag</i> includes the <i>label</i> and a unique identifying number. A sample <i>tag</i> is "XSI:cat:146".
12409			
12410			
12411			The <i>MSGVERB</i> environment variable (for message verbosity) shall determine for <i>fntmsg()</i> which message components it is to select when writing messages to standard error. The value of <i>MSGVERB</i> shall be a colon-separated list of optional keywords. Valid keywords are: <i>label</i> , <i>severity</i> , <i>text</i> , <i>action</i> , and <i>tag</i> . If <i>MSGVERB</i> contains a keyword for a component and the component's value is not the component's null value, <i>fntmsg()</i> shall include that component in the message when writing the message to standard error. If <i>MSGVERB</i> does not include a keyword for a message component, that component shall not be included in the display of the message. The keywords may appear in any order. If <i>MSGVERB</i> is not defined, if its value is the null string, if its value is not of the correct format, or if it contains keywords other than the valid ones listed above, <i>fntmsg()</i> shall select all components.
12412			
12413			
12414			
12415			
12416			
12417			
12418			
12419			
12420			
12421			<i>MSGVERB</i> shall determine which components are selected for display to standard error. All message components shall be included in console messages.
12422			
12423	<b>RETURN VALUE</b>		
12424			The <i>fntmsg()</i> function shall return one of the following values:
12425	MM_OK		The function succeeded.
12426	MM_NOTOK		The function failed completely.
12427	MM_NOMSG		The function was unable to generate a message on standard error, but otherwise succeeded.
12428			
12429	MM_NOCON		The function was unable to generate a console message, but otherwise succeeded.
12430			
12431	<b>ERRORS</b>		
12432			None.

12433 **EXAMPLES**

12434 1. The following example of *fmtmsg()*:

```
12435     fmtmsg(MM_PRINT, "XSI:cat", MM_ERROR, "illegal option",  
12436     "refer to cat in user's reference manual", "XSI:cat:001")
```

12437 produces a complete message in the specified message format:

```
12438     XSI:cat: ERROR: illegal option  
12439     TO FIX: refer to cat in user's reference manual XSI:cat:001
```

12440 2. When the environment variable *MSGVERB* is set as follows:

```
12441     MSGVERB=severity:text:action
```

12442 and Example 1 is used, *fmtmsg()* produces:

```
12443     ERROR: illegal option  
12444     TO FIX: refer to cat in user's reference manual
```

12445 **APPLICATION USAGE**

12446 One or more message components may be systematically omitted from messages generated by  
12447 an application by using the null value of the argument for that component.

12448 **RATIONALE**

12449 None.

12450 **FUTURE DIRECTIONS**

12451 None.

12452 **SEE ALSO**

12453 *printf()*, the Base Definitions volume of IEEE Std 1003.1-2001, <*fmtmsg.h*>

12454 **CHANGE HISTORY**

12455 First released in Issue 4, Version 2.

12456 **Issue 5**

12457 Moved from X/OPEN UNIX extension to BASE.

12458 **NAME**

12459 fnmatch — match a filename or a pathname

12460 **SYNOPSIS**

12461 #include &lt;fnmatch.h&gt;

12462 int fnmatch(const char \*pattern, const char \*string, int flags);

12463 **DESCRIPTION**

12464 The *fnmatch()* function shall match patterns as described in the Shell and Utilities volume of  
 12465 IEEE Std 1003.1-2001, Section 2.13.1, Patterns Matching a Single Character, and Section 2.13.2,  
 12466 Patterns Matching Multiple Characters. It checks the string specified by the *string* argument to  
 12467 see if it matches the pattern specified by the *pattern* argument.

12468 The *flags* argument shall modify the interpretation of *pattern* and *string*. It is the bitwise-inclusive  
 12469 OR of zero or more of the flags defined in <fnmatch.h>. If the FNM\_PATHNAME flag is set in  
 12470 *flags*, then a slash character ( '/' ) in *string* shall be explicitly matched by a slash in *pattern*; it shall  
 12471 not be matched by either the asterisk or question-mark special characters, nor by a bracket  
 12472 expression. If the FNM\_PATHNAME flag is not set, the slash character shall be treated as an  
 12473 ordinary character.

12474 If FNM\_NOESCAPE is not set in *flags*, a backslash character ( '\ ' ) in *pattern* followed by any  
 12475 other character shall match that second character in *string*. In particular, "\\\" shall match a  
 12476 backslash in *string*. If FNM\_NOESCAPE is set, a backslash character shall be treated as an  
 12477 ordinary character.

12478 If FNM\_PERIOD is set in *flags*, then a leading period ( ' . ' ) in *string* shall match a period in  
 12479 *pattern*; as described by rule 2 in the Shell and Utilities volume of IEEE Std 1003.1-2001, Section  
 12480 2.13.3, Patterns Used for Filename Expansion where the location of “leading” is indicated by the  
 12481 value of FNM\_PATHNAME:

- 12482 • If FNM\_PATHNAME is set, a period is “leading” if it is the first character in *string* or if it  
 12483 immediately follows a slash.
- 12484 • If FNM\_PATHNAME is not set, a period is “leading” only if it is the first character of *string*.

12485 If FNM\_PERIOD is not set, then no special restrictions are placed on matching a period.

12486 **RETURN VALUE**

12487 If *string* matches the pattern specified by *pattern*, then *fnmatch()* shall return 0. If there is no  
 12488 match, *fnmatch()* shall return FNM\_NOMATCH, which is defined in <fnmatch.h>. If an error  
 12489 occurs, *fnmatch()* shall return another non-zero value.

12490 **ERRORS**

12491 No errors are defined.

12492 **EXAMPLES**

12493 None.

12494 **APPLICATION USAGE**

12495 The *fnmatch()* function has two major uses. It could be used by an application or utility that  
 12496 needs to read a directory and apply a pattern against each entry. The *find* utility is an example of  
 12497 this. It can also be used by the *pax* utility to process its *pattern* operands, or by applications that  
 12498 need to match strings in a similar manner.

12499 The name *fnmatch()* is intended to imply *filename* match, rather than *pathname* match. The default  
 12500 action of this function is to match filenames, rather than pathnames, since it gives no special  
 12501 significance to the slash character. With the FNM\_PATHNAME flag, *fnmatch()* does match  
 12502 pathnames, but without tilde expansion, parameter expansion, or special treatment for a period

12503 at the beginning of a filename.

12504 **RATIONALE**

12505 This function replaced the REG\_FILENAME flag of *regcomp()* in early proposals of this volume  
12506 of IEEE Std 1003.1-2001. It provides virtually the same functionality as the *regcomp()* and  
12507 *regexexec()* functions using the REG\_FILENAME and REG\_FSLASH flags (the REG\_FSLASH flag  
12508 was proposed for *regcomp()*, and would have had the opposite effect from FNM\_PATHNAME),  
12509 but with a simpler function and less system overhead.

12510 **FUTURE DIRECTIONS**

12511 None.

12512 **SEE ALSO**

12513 *glob()*, *wordexp()*, the Base Definitions volume of IEEE Std 1003.1-2001, <fnmatch.h>, the Shell  
12514 and Utilities volume of IEEE Std 1003.1-2001

12515 **CHANGE HISTORY**

12516 First released in Issue 4. Derived from the ISO POSIX-2 standard.

12517 **Issue 5**

12518 Moved from POSIX2 C-language Binding to BASE.

## 12519 NAME

12520 fopen — open a stream

## 12521 SYNOPSIS

12522 #include &lt;stdio.h&gt;

12523 FILE \*fopen(const char \*restrict filename, const char \*restrict mode);

## 12524 DESCRIPTION

12525 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
 12526 conflict between the requirements described here and the ISO C standard is unintentional. This  
 12527 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

12528 The *fopen()* function shall open the file whose pathname is the string pointed to by *filename*, and  
 12529 associates a stream with it.

12530 The *mode* argument points to a string. If the string is one of the following, the file shall be opened  
 12531 in the indicated mode. Otherwise, the behavior is undefined.

12532 *r* or *rb* Open file for reading.

12533 *w* or *wb* Truncate to zero length or create file for writing.

12534 *a* or *ab* Append; open or create file for writing at end-of-file.

12535 *r+* or *rb+* or *r+b* Open file for update (reading and writing).

12536 *w+* or *wb+* or *w+b* Truncate to zero length or create file for update.

12537 *a+* or *ab+* or *a+b* Append; open or create file for update, writing at end-of-file.

12538 CX The character 'b' shall have no effect, but is allowed for ISO C standard conformance. Opening  
 12539 a file with read mode (*r* as the first character in the *mode* argument) shall fail if the file does not  
 12540 exist or cannot be read.

12541 Opening a file with append mode (*a* as the first character in the *mode* argument) shall cause all  
 12542 subsequent writes to the file to be forced to the then current end-of-file, regardless of intervening  
 12543 calls to *fseek()*.

12544 When a file is opened with update mode ('+' as the second or third character in the *mode*  
 12545 argument), both input and output may be performed on the associated stream. However, the  
 12546 application shall ensure that output is not directly followed by input without an intervening call  
 12547 to *fflush()* or to a file positioning function (*fseek()*, *fsetpos()*, or *rewind()*), and input is not directly  
 12548 followed by output without an intervening call to a file positioning function, unless the input  
 12549 operation encounters end-of-file.

12550 When opened, a stream is fully buffered if and only if it can be determined not to refer to an  
 12551 interactive device. The error and end-of-file indicators for the stream shall be cleared.

12552 CX If *mode* is *w*, *wb*, *a*, *ab*, *w+*, *wb+*, *w+b*, *a+*, *ab+*, or *a+b*, and the file did not previously exist, upon  
 12553 successful completion, the *fopen()* function shall mark for update the *st\_atime*, *st\_ctime*, and  
 12554 *st\_mtime* fields of the file and the *st\_ctime* and *st\_mtime* fields of the parent directory.

12555 If *mode* is *w*, *wb*, *w+*, *wb+*, or *w+b*, and the file did previously exist, upon successful completion,  
 12556 *fopen()* shall mark for update the *st\_ctime* and *st\_mtime* fields of the file. The *fopen()* function  
 12557 shall allocate a file descriptor as *open()* does.

12558 XSI After a successful call to the *fopen()* function, the orientation of the stream shall be cleared, the  
 12559 encoding rule shall be cleared, and the associated *mbstate\_t* object shall be set to describe an  
 12560 initial conversion state.

12561 CX The largest value that can be represented correctly in an object of type `off_t` shall be established  
12562 as the offset maximum in the open file description.

#### 12563 RETURN VALUE

12564 Upon successful completion, `fopen()` shall return a pointer to the object controlling the stream.  
12565 CX Otherwise, a null pointer shall be returned, and `errno` shall be set to indicate the error.

#### 12566 ERRORS

12567 The `fopen()` function shall fail if:

12568 CX [EACCES] Search permission is denied on a component of the path prefix, or the file  
12569 exists and the permissions specified by `mode` are denied, or the file does not  
12570 exist and write permission is denied for the parent directory of the file to be  
12571 created.

12572 CX [EINTR] A signal was caught during `fopen()`.

12573 CX [EISDIR] The named file is a directory and `mode` requires write access.

12574 CX [ELOOP] A loop exists in symbolic links encountered during resolution of the `path`  
12575 argument.

12576 CX [EMFILE] {OPEN\_MAX} file descriptors are currently open in the calling process.

12577 CX [ENAMETOOLONG]  
12578 The length of the `filename` argument exceeds {PATH\_MAX} or a pathname  
12579 component is longer than {NAME\_MAX}.

12580 CX [ENFILE] The maximum allowable number of files is currently open in the system.

12581 CX [ENOENT] A component of `filename` does not name an existing file or `filename` is an empty  
12582 string.

12583 CX [ENOSPC] The directory or file system that would contain the new file cannot be  
12584 expanded, the file does not exist, and the file was to be created.

12585 CX [ENOTDIR] A component of the path prefix is not a directory.

12586 CX [ENXIO] The named file is a character special or block special file, and the device  
12587 associated with this special file does not exist.

12588 CX [EOVERFLOW] The named file is a regular file and the size of the file cannot be represented  
12589 correctly in an object of type `off_t`.

12590 CX [EROFS] The named file resides on a read-only file system and `mode` requires write  
12591 access.

12592 The `fopen()` function may fail if:

12593 CX [EINVAL] The value of the `mode` argument is not valid.

12594 CX [ELOOP] More than {SYMLOOP\_MAX} symbolic links were encountered during  
12595 resolution of the `path` argument.

12596 CX [EMFILE] {FOPEN\_MAX} streams are currently open in the calling process.

12597 CX [EMFILE] {STREAM\_MAX} streams are currently open in the calling process.

12598 CX [ENAMETOOLONG]  
12599 Pathname resolution of a symbolic link produced an intermediate result  
12600 whose length exceeds {PATH\_MAX}.

- 12601 CX [ENOMEM] Insufficient storage space is available.
- 12602 CX [ETXTBSY] The file is a pure procedure (shared text) file that is being executed and *mode* requires write access.
- 12603

12604 **EXAMPLES**12605 **Opening a File**

12606 The following example tries to open the file named **file** for reading. The *fopen()* function returns  
 12607 a file pointer that is used in subsequent *fgets()* and *fclose()* calls. If the program cannot open the  
 12608 file, it just ignores it.

```
12609 #include <stdio.h>
12610 ...
12611 FILE *fp;
12612 ...
12613 void rgrep(const char *file)
12614 {
12615     ...
12616     if ((fp = fopen(file, "r")) == NULL)
12617         return;
12618     ...
12619 }
```

12620 **APPLICATION USAGE**

12621 None.

12622 **RATIONALE**

12623 None.

12624 **FUTURE DIRECTIONS**

12625 None.

12626 **SEE ALSO**

12627 *fclose()*, *fdopen()*, *freopen()*, the Base Definitions volume of IEEE Std 1003.1-2001, <stdio.h>

12628 **CHANGE HISTORY**

12629 First released in Issue 1. Derived from Issue 1 of the SVID.

12630 **Issue 5**

12631 Large File Summit extensions are added.

12632 **Issue 6**

12633 Extensions beyond the ISO C standard are marked.

12634 The following new requirements on POSIX implementations derive from alignment with the  
 12635 Single UNIX Specification:

- 12636 • In the DESCRIPTION, text is added to indicate setting of the offset maximum in the open file  
 12637 description. This change is to support large files.
- 12638 • In the ERRORS section, the [Eoverflow] condition is added. This change is to support  
 12639 large files.
- 12640 • The [ELOOP] mandatory error condition is added.
- 12641 • The [EINVAL], [EMFILE], [ENAMETOOLONG], [ENOMEM], and [ETXTBSY] optional error  
 12642 conditions are added.

- 12643 The DESCRIPTION is updated to avoid use of the term “must” for application requirements.
- 12644 The following changes are made for alignment with the ISO/IEC 9899: 1999 standard:
- 12645 • The prototype for *fopen()* is updated.
  - 12646 • The DESCRIPTION is updated to note that if the argument *mode* points to a string other than  
12647 those listed, then the behavior is undefined.
- 12648 The wording of the mandatory [ELOOP] error condition is updated, and a second optional  
12649 [ELOOP] error condition is added.

## 12650 NAME

12651 fork — create a new process

## 12652 SYNOPSIS

12653 #include &lt;unistd.h&gt;

12654 pid\_t fork(void);

## 12655 DESCRIPTION

12656 The *fork()* function shall create a new process. The new process (child process) shall be an exact  
 12657 copy of the calling process (parent process) except as detailed below:

- 12658 • The child process shall have a unique process ID.
- 12659 • The child process ID also shall not match any active process group ID.
- 12660 • The child process shall have a different parent process ID, which shall be the process ID of  
 12661 the calling process.
- 12662 • The child process shall have its own copy of the parent's file descriptors. Each of the child's  
 12663 file descriptors shall refer to the same open file description with the corresponding file  
 12664 descriptor of the parent.
- 12665 • The child process shall have its own copy of the parent's open directory streams. Each open  
 12666 directory stream in the child process may share directory stream positioning with the  
 12667 corresponding directory stream of the parent.
- 12668 XSI • The child process shall have its own copy of the parent's message catalog descriptors.
- 12669 • The child process' values of *tms\_utime*, *tms\_stime*, *tms\_cutime*, and *tms\_cstime* shall be set to 0.
- 12670 • The time left until an alarm clock signal shall be reset to zero, and the alarm, if any, shall be  
 12671 canceled; see *alarm()*.
- 12672 XSI • All *semadj* values shall be cleared.
- 12673 • File locks set by the parent process shall not be inherited by the child process.
- 12674 • The set of signals pending for the child process shall be initialized to the empty set.
- 12675 XSI • Interval timers shall be reset in the child process.
- 12676 SEM • Any semaphores that are open in the parent process shall also be open in the child process.
- 12677 ML • The child process shall not inherit any address space memory locks established by the parent  
 12678 process via calls to *mlockall()* or *mlock()*.
- 12679 MF|SHM • Memory mappings created in the parent shall be retained in the child process.  
 12680 MAP\_PRIVATE mappings inherited from the parent shall also be MAP\_PRIVATE mappings  
 12681 in the child, and any modifications to the data in these mappings made by the parent prior to  
 12682 calling *fork()* shall be visible to the child. Any modifications to the data in MAP\_PRIVATE  
 12683 mappings made by the parent after *fork()* returns shall be visible only to the parent.  
 12684 Modifications to the data in MAP\_PRIVATE mappings made by the child shall be visible only  
 12685 to the child.
- 12686 PS • For the SCHED\_FIFO and SCHED\_RR scheduling policies, the child process shall inherit the  
 12687 policy and priority settings of the parent process during a *fork()* function. For other  
 12688 scheduling policies, the policy and priority settings on *fork()* are implementation-defined.
- 12689 TMR • Per-process timers created by the parent shall not be inherited by the child process.
- 12690 MSG • The child process shall have its own copy of the message queue descriptors of the parent.  
 12691 Each of the message descriptors of the child shall refer to the same open message queue

- 12692 description as the corresponding message descriptor of the parent.
- 12693 AIO  
12694 • No asynchronous input or asynchronous output operations shall be inherited by the child process.
- 12695 • A process shall be created with a single thread. If a multi-threaded process calls *fork()*, the  
12696 new process shall contain a replica of the calling thread and its entire address space, possibly  
12697 including the states of mutexes and other resources. Consequently, to avoid errors, the child  
12698 process may only execute async-signal-safe operations until such time as one of the *exec*  
12699 THR functions is called. Fork handlers may be established by means of the *pthread\_atfork()*  
12700 function in order to maintain application invariants across *fork()* calls.
- 12701 TRC TRI • If the Trace option and the Trace Inherit option are both supported:
- 12702 If the calling process was being traced in a trace stream that had its inheritance policy set to  
12703 POSIX\_TRACE\_INHERITED, the child process shall be traced into that trace stream, and the  
12704 child process shall inherit the parent's mapping of trace event names to trace event type  
12705 identifiers. If the trace stream in which the calling process was being traced had its  
12706 inheritance policy set to POSIX\_TRACE\_CLOSE\_FOR\_CHILD, the child process shall not be  
12707 traced into that trace stream. The inheritance policy is set by a call to the  
12708 *posix\_trace\_attr\_setinherited()* function.
- 12709 TRC • If the Trace option is supported, but the Trace Inherit option is not supported:
- 12710 The child process shall not be traced into any of the trace streams of its parent process.
- 12711 TRC • If the Trace option is supported, the child process of a trace controller process shall not  
12712 control the trace streams controlled by its parent process.
- 12713 CPT • The initial value of the CPU-time clock of the child process shall be set to zero.
- 12714 TCT • The initial value of the CPU-time clock of the single thread of the child process shall be set to  
12715 zero.
- 12716 All other process characteristics defined by IEEE Std 1003.1-2001 shall be the same in the parent  
12717 and child processes. The inheritance of process characteristics not defined by  
12718 IEEE Std 1003.1-2001 is unspecified by IEEE Std 1003.1-2001.
- 12719 After *fork()*, both the parent and the child processes shall be capable of executing independently  
12720 before either one terminates.
- 12721 **RETURN VALUE**
- 12722 Upon successful completion, *fork()* shall return 0 to the child process and shall return the  
12723 process ID of the child process to the parent process. Both processes shall continue to execute  
12724 from the *fork()* function. Otherwise, *-1* shall be returned to the parent process, no child process  
12725 shall be created, and *errno* shall be set to indicate the error.
- 12726 **ERRORS**
- 12727 The *fork()* function shall fail if:
- 12728 [EAGAIN] The system lacked the necessary resources to create another process, or the  
12729 system-imposed limit on the total number of processes under execution  
12730 system-wide or by a single user {CHILD\_MAX} would be exceeded.
- 12731 The *fork()* function may fail if:
- 12732 [ENOMEM] Insufficient storage space is available.

12733 **EXAMPLES**

12734 None.

12735 **APPLICATION USAGE**

12736 None.

12737 **RATIONALE**

12738 Many historical implementations have timing windows where a signal sent to a process group  
 12739 (for example, an interactive SIGINT) just prior to or during execution of *fork()* is delivered to the  
 12740 parent following the *fork()* but not to the child because the *fork()* code clears the child's set of  
 12741 pending signals. This volume of IEEE Std 1003.1-2001 does not require, or even permit, this  
 12742 behavior. However, it is pragmatic to expect that problems of this nature may continue to exist  
 12743 in implementations that appear to conform to this volume of IEEE Std 1003.1-2001 and pass  
 12744 available verification suites. This behavior is only a consequence of the implementation failing to  
 12745 make the interval between signal generation and delivery totally invisible. From the  
 12746 application's perspective, a *fork()* call should appear atomic. A signal that is generated prior to  
 12747 the *fork()* should be delivered prior to the *fork()*. A signal sent to the process group after the  
 12748 *fork()* should be delivered to both parent and child. The implementation may actually initialize  
 12749 internal data structures corresponding to the child's set of pending signals to include signals  
 12750 sent to the process group during the *fork()*. Since the *fork()* call can be considered as atomic  
 12751 from the application's perspective, the set would be initialized as empty and such signals would  
 12752 have arrived after the *fork()*; see also <signal.h>.

12753 One approach that has been suggested to address the problem of signal inheritance across *fork()*  
 12754 is to add an [EINTR] error, which would be returned when a signal is detected during the call.  
 12755 While this is preferable to losing signals, it was not considered an optimal solution. Although it  
 12756 is not recommended for this purpose, such an error would be an allowable extension for an  
 12757 implementation.

12758 The [ENOMEM] error value is reserved for those implementations that detect and distinguish  
 12759 such a condition. This condition occurs when an implementation detects that there is not enough  
 12760 memory to create the process. This is intended to be returned when [EAGAIN] is inappropriate  
 12761 because there can never be enough memory (either primary or secondary storage) to perform the  
 12762 operation. Since *fork()* duplicates an existing process, this must be a condition where there is  
 12763 sufficient memory for one such process, but not for two. Many historical implementations  
 12764 actually return [ENOMEM] due to temporary lack of memory, a case that is not generally  
 12765 distinct from [EAGAIN] from the perspective of a conforming application.

12766 Part of the reason for including the optional error [ENOMEM] is because the SVID specifies it  
 12767 and it should be reserved for the error condition specified there. The condition is not applicable  
 12768 on many implementations.

12769 IEEE Std 1003.1-1988 neglected to require concurrent execution of the parent and child of *fork()*.  
 12770 A system that single-threads processes was clearly not intended and is considered an  
 12771 unacceptable "toy implementation" of this volume of IEEE Std 1003.1-2001. The only objection  
 12772 anticipated to the phrase "executing independently" is testability, but this assertion should be  
 12773 testable. Such tests require that both the parent and child can block on a detectable action of the  
 12774 other, such as a write to a pipe or a signal. An interactive exchange of such actions should be  
 12775 possible for the system to conform to the intent of this volume of IEEE Std 1003.1-2001.

12776 The [EAGAIN] error exists to warn applications that such a condition might occur. Whether it  
 12777 occurs or not is not in any practical sense under the control of the application because the  
 12778 condition is usually a consequence of the user's use of the system, not of the application's code.  
 12779 Thus, no application can or should rely upon its occurrence under any circumstances, nor  
 12780 should the exact semantics of what concept of "user" is used be of concern to the application  
 12781 writer. Validation writers should be cognizant of this limitation.

12782 There are two reasons why POSIX programmers call *fork()*. One reason is to create a new thread  
 12783 of control within the same program (which was originally only possible in POSIX by creating a  
 12784 new process); the other is to create a new process running a different program. In the latter case,  
 12785 the call to *fork()* is soon followed by a call to one of the *exec* functions.

12786 The general problem with making *fork()* work in a multi-threaded world is what to do with all  
 12787 of the threads. There are two alternatives. One is to copy all of the threads into the new process.  
 12788 This causes the programmer or implementation to deal with threads that are suspended on  
 12789 system calls or that might be about to execute system calls that should not be executed in the  
 12790 new process. The other alternative is to copy only the thread that calls *fork()*. This creates the  
 12791 difficulty that the state of process-local resources is usually held in process memory. If a thread  
 12792 that is not calling *fork()* holds a resource, that resource is never released in the child process  
 12793 because the thread whose job it is to release the resource does not exist in the child process.

12794 When a programmer is writing a multi-threaded program, the first described use of *fork()*,  
 12795 creating new threads in the same program, is provided by the *pthread\_create()* function. The  
 12796 *fork()* function is thus used only to run new programs, and the effects of calling functions that  
 12797 require certain resources between the call to *fork()* and the call to an *exec* function are undefined.

12798 The addition of the *forkall()* function to the standard was considered and rejected. The *forkall()*  
 12799 function lets all the threads in the parent be duplicated in the child. This essentially duplicates  
 12800 the state of the parent in the child. This allows threads in the child to continue processing and  
 12801 allows locks and the state to be preserved without explicit *pthread\_atfork()* code. The calling  
 12802 process has to ensure that the threads processing state that is shared between the parent and  
 12803 child (that is, file descriptors or MAP\_SHARED memory) behaves properly after *forkall()*. For  
 12804 example, if a thread is reading a file descriptor in the parent when *forkall()* is called, then two  
 12805 threads (one in the parent and one in the child) are reading the file descriptor after the *forkall()*.  
 12806 If this is not desired behavior, the parent process has to synchronize with such threads before  
 12807 calling *forkall()*.

12808 When *forkall()* is called, threads, other than the calling thread, that are in functions that can  
 12809 return with an [EINTR] error may have those functions return [EINTR] if the implementation  
 12810 cannot ensure that the function behaves correctly in the parent and child. In particular,  
 12811 *pthread\_cond\_wait()* and *pthread\_cond\_timedwait()* need to return in order to ensure that the  
 12812 condition has not changed. These functions can be awakened by a spurious condition wakeup  
 12813 rather than returning [EINTR].

#### 12814 FUTURE DIRECTIONS

12815 None.

#### 12816 SEE ALSO

12817 *alarm()*, *exec*, *fcntl()*, *posix\_trace\_attr\_getinherited()*, *posix\_trace\_trid\_eventid\_open()*, *semop()*,  
 12818 *signal()*, *times()*, the Base Definitions volume of IEEE Std 1003.1-2001, <sys/types.h>, <unistd.h>

#### 12819 CHANGE HISTORY

12820 First released in Issue 1. Derived from Issue 1 of the SVID.

#### 12821 Issue 5

12822 The DESCRIPTION is changed for alignment with the POSIX Realtime Extension and the POSIX  
 12823 Threads Extension.

#### 12824 Issue 6

12825 The following new requirements on POSIX implementations derive from alignment with the  
 12826 Single UNIX Specification:

- 12827 • The requirement to include <sys/types.h> has been removed. Although <sys/types.h> was  
 12828 required for conforming implementations of previous POSIX specifications, it was not

12829           required for UNIX applications.

12830           The following changes were made to align with the IEEE P1003.1a draft standard:

12831           • The effect of *fork()* on a pending alarm call in the child process is clarified.

12832           The description of CPU-time clock semantics is added for alignment with IEEE Std 1003.1d-1999.

12833           The description of tracing semantics is added for alignment with IEEE Std 1003.1q-2000.

12834 **NAME**

12835 fpathconf, pathconf — get configurable pathname variables

12836 **SYNOPSIS**

12837 #include &lt;unistd.h&gt;

12838 long fpathconf(int *fildev*, int *name*);12839 long pathconf(const char \**path*, int *name*);12840 **DESCRIPTION**12841 The *fpathconf()* and *pathconf()* functions shall determine the current value of a configurable limit  
12842 or option (*variable*) that is associated with a file or directory.12843 For *pathconf()*, the *path* argument points to the pathname of a file or directory.12844 For *fpathconf()*, the *fildev* argument is an open file descriptor.12845 The *name* argument represents the variable to be queried relative to that file or directory.  
12846 Implementations shall support all of the variables listed in the following table and may support  
12847 others. The variables in the following table come from <limits.h> or <unistd.h> and the  
12848 symbolic constants, defined in <unistd.h>, are the corresponding values used for *name*. Support  
12849 for some pathname configuration variables is dependent on implementation options (see  
12850 shading and margin codes in the table below). Where an implementation option is not  
12851 supported, the variable need not be supported.

_POSIX_SYNC_IO	_PC_SYNC_IO	8

12873 **Requirements**

- 12874 1. If *path* or *fildev* refers to a directory, the value returned shall apply to the directory itself.
- 12875 2. If *path* or *fildev* does not refer to a terminal file, it is unspecified whether an implementation  
12876 supports an association of the variable name with the specified file.
- 12877 3. If *path* or *fildev* refers to a directory, the value returned shall apply to filenames within the  
12878 directory.
- 12879 4. If *path* or *fildev* does not refer to a directory, it is unspecified whether an implementation  
12880 supports an association of the variable name with the specified file.
- 12881 5. If *path* or *fildev* refers to a directory, the value returned shall be the maximum length of a  
12882 relative pathname when the specified directory is the working directory.
- 12883 6. If *path* refers to a FIFO, or *fildev* refers to a pipe or FIFO, the value returned shall apply to  
12884 the referenced object. If *path* or *fildev* refers to a directory, the value returned shall apply to  
12885 any FIFO that exists or can be created within the directory. If *path* or *fildev* refers to any  
12886 other type of file, it is unspecified whether an implementation supports an association of  
12887 the variable name with the specified file.
- 12888 7. If *path* or *fildev* refers to a directory, the value returned shall apply to any files, other than  
12889 directories, that exist or can be created within the directory.
- 12890 8. If *path* or *fildev* refers to a directory, it is unspecified whether an implementation supports  
12891 an association of the variable name with the specified file.
- 12892 9. If *path* or *fildev* refers to a directory, the value returned shall be the maximum length of the  
12893 string that a symbolic link in that directory can contain.

12894 **RETURN VALUE**

12895 If *name* is an invalid value, both *pathconf()* and *fpathconf()* shall return `-1` and set *errno* to  
12896 indicate the error.

12897 If the variable corresponding to *name* has no limit for the *path* or file descriptor, both *pathconf()*  
12898 and *fpathconf()* shall return `-1` without changing *errno*. If the implementation needs to use *path*  
12899 to determine the value of *name* and the implementation does not support the association of *name*  
12900 with the file specified by *path*, or if the process did not have appropriate privileges to query the  
12901 file specified by *path*, or *path* does not exist, *pathconf()* shall return `-1` and set *errno* to indicate the  
12902 error.

12903 If the implementation needs to use *fildev* to determine the value of *name* and the implementation  
12904 does not support the association of *name* with the file specified by *fildev*, or if *fildev* is an invalid  
12905 file descriptor, *fpathconf()* shall return `-1` and set *errno* to indicate the error.

12906 Otherwise, *pathconf()* or *fpathconf()* shall return the current variable value for the file or  
12907 directory without changing *errno*. The value returned shall not be more restrictive than the  
12908 corresponding value available to the application when it was compiled with the  
12909 implementation's `<limits.h>` or `<unistd.h>`.

12910 **ERRORS**

12911 The *pathconf()* function shall fail if:

- 12912 [EINVAL] The value of *name* is not valid.
- 12913 [ELOOP] A loop exists in symbolic links encountered during resolution of the *path*  
12914 argument.

12915 The *pathconf()* function may fail if:

12916	[EACCES]	Search permission is denied for a component of the path prefix.
12917	[EINVAL]	The implementation does not support an association of the variable <i>name</i> with the specified file.
12918		
12919	[ELOOP]	More than {SYMLOOP_MAX} symbolic links were encountered during resolution of the <i>path</i> argument.
12920		
12921	[ENAMETOOLONG]	
12922		The length of the <i>path</i> argument exceeds {PATH_MAX} or a pathname component is longer than {NAME_MAX}.
12923		
12924	[ENAMETOOLONG]	
12925		As a result of encountering a symbolic link in resolution of the <i>path</i> argument, the length of the substituted pathname string exceeded {PATH_MAX}.
12926		
12927	[ENOENT]	A component of <i>path</i> does not name an existing file or <i>path</i> is an empty string.
12928	[ENOTDIR]	A component of the path prefix is not a directory.
12929		The <i>fpathconf()</i> function shall fail if:
12930	[EINVAL]	The value of <i>name</i> is not valid.
12931		The <i>fpathconf()</i> function may fail if:
12932	[EBADF]	The <i>fdes</i> argument is not a valid file descriptor.
12933	[EINVAL]	The implementation does not support an association of the variable <i>name</i> with the specified file.
12934		

12935 **EXAMPLES**

12936 None.

12937 **APPLICATION USAGE**

12938 None.

12939 **RATIONALE**

12940 The *pathconf()* function was proposed immediately after the *sysconf()* function when it was realized that some configurable values may differ across file system, directory, or device boundaries.

12943 For example, {NAME\_MAX} frequently changes between System V and BSD-based file systems; System V uses a maximum of 14, BSD 255. On an implementation that provides both types of file systems, an application would be forced to limit all pathname components to 14 bytes, as this would be the value specified in <limits.h> on such a system.

12947 Therefore, various useful values can be queried on any pathname or file descriptor, assuming that the appropriate permissions are in place.

12949 The value returned for the variable {PATH\_MAX} indicates the longest relative pathname that could be given if the specified directory is the process' current working directory. A process may not always be able to generate a name that long and use it if a subdirectory in the pathname crosses into a more restrictive file system.

12953 The value returned for the variable \_POSIX\_CHOWN\_RESTRICTED also applies to directories that do not have file systems mounted on them. The value may change when crossing a mount point, so applications that need to know should check for each directory. (An even easier check is to try the *chown()* function and look for an error in case it happens.)

12957 Unlike the values returned by *sysconf()*, the pathname-oriented variables are potentially more volatile and are not guaranteed to remain constant throughout the process' lifetime. For

12959 example, in between two calls to *pathconf()*, the file system in question may have been  
12960 unmounted and remounted with different characteristics.

12961 Also note that most of the errors are optional. If one of the variables always has the same value  
12962 on an implementation, the implementation need not look at *path* or *fildev* to return that value and  
12963 is, therefore, not required to detect any of the errors except the meaning of [EINVAL] that  
12964 indicates that the value of *name* is not valid for that variable.

12965 If the value of any of the limits is unspecified (logically infinite), they will not be defined in  
12966 <limits.h> and the *pathconf()* and *fpathconf()* functions return  $-1$  without changing *errno*. This  
12967 can be distinguished from the case of giving an unrecognized *name* argument because *errno* is set  
12968 to [EINVAL] in this case.

12969 Since  $-1$  is a valid return value for the *pathconf()* and *fpathconf()* functions, applications should  
12970 set *errno* to zero before calling them and check *errno* only if the return value is  $-1$ .

12971 For the case of {SYMLINK\_MAX}, since both *pathconf()* and *open()* follow symbolic links, there  
12972 is no way that *path* or *fildev* could refer to a symbolic link.

#### 12973 FUTURE DIRECTIONS

12974 None.

#### 12975 SEE ALSO

12976 *confstr()*, *sysconf()*, the Base Definitions volume of IEEE Std 1003.1-2001, <limits.h>, <unistd.h>,

#### 12978 CHANGE HISTORY

12979 First released in Issue 3. Included for alignment with the POSIX.1-1988 standard.

#### 12980 Issue 5

12981 The DESCRIPTION is updated for alignment with the POSIX Realtime Extension.

12982 Large File Summit extensions are added.

#### 12983 Issue 6

12984 The following new requirements on POSIX implementations derive from alignment with the  
12985 Single UNIX Specification:

- 12986 • The DESCRIPTION is updated to include {FILESIZEBITS}.
- 12987 • The [ELOOP] mandatory error condition is added.
- 12988 • A second [ENAMETOOLONG] is added as an optional error condition.

12989 The following changes were made to align with the IEEE P1003.1a draft standard:

- 12990 • The \_PC\_SYMLINK\_MAX entry is added to the table in the DESCRIPTION.

12991 The following *pathconf()* variables and their associated names are added for alignment with  
12992 IEEE Std 1003.1d-1999:

12993 {POSIX\_ALLOC\_SIZE\_MIN}  
12994 {POSIX\_REC\_INCR\_XFER\_SIZE}  
12995 {POSIX\_REC\_MAX\_XFER\_SIZE}  
12996 {POSIX\_REC\_MIN\_XFER\_SIZE}  
12997 {POSIX\_REC\_XFER\_ALIGN}

12998 **NAME**

12999 fpclassify — classify real floating type

13000 **SYNOPSIS**

13001 #include <math.h>

13002 int fpclassify(real-floating x);

13003 **DESCRIPTION**

13004 cx The functionality described on this reference page is aligned with the ISO C standard. Any  
13005 conflict between the requirements described here and the ISO C standard is unintentional. This  
13006 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

13007 The *fpclassify()* macro shall classify its argument value as NaN, infinite, normal, subnormal,  
13008 zero, or into another implementation-defined category. First, an argument represented in a  
13009 format wider than its semantic type is converted to its semantic type. Then classification is based  
13010 on the type of the argument.

13011 **RETURN VALUE**

13012 The *fpclassify()* macro shall return the value of the number classification macro appropriate to  
13013 the value of its argument.

13014 **ERRORS**

13015 No errors are defined.

13016 **EXAMPLES**

13017 None.

13018 **APPLICATION USAGE**

13019 None.

13020 **RATIONALE**

13021 None.

13022 **FUTURE DIRECTIONS**

13023 None.

13024 **SEE ALSO**

13026 IEEE Std 1003.1-2001, <math.h>

13027 **CHANGE HISTORY**

13028 First released in Issue 6. Derived from the ISO/IEC 9899:1999 standard.

## 13029 NAME

13030 fprintf, printf, snprintf, sprintf — print formatted output

## 13031 SYNOPSIS

13032 #include &lt;stdio.h&gt;

13033 int fprintf(FILE \*restrict stream, const char \*restrict format, ...);

13034 int printf(const char \*restrict format, ...);

13035 int snprintf(char \*restrict s, size\_t n,

13036 const char \*restrict format, ...);

13037 int sprintf(char \*restrict s, const char \*restrict format, ...);

## 13038 DESCRIPTION

13039 cx The functionality described on this reference page is aligned with the ISO C standard. Any  
 13040 conflict between the requirements described here and the ISO C standard is unintentional. This  
 13041 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

13042 The *fprintf()* function shall place output on the named output *stream*. The *printf()* function shall  
 13043 place output on the standard output stream *stdout*. The *sprintf()* function shall place output  
 13044 followed by the null byte, '\0', in consecutive bytes starting at *s*; it is the user's responsibility  
 13045 to ensure that enough space is available.

13046 The *snprintf()* function shall be equivalent to *sprintf()*, with the addition of the *n* argument  
 13047 which states the size of the buffer referred to by *s*. If *n* is zero, nothing shall be written and *s* may  
 13048 be a null pointer. Otherwise, output bytes beyond the *n*-1st shall be discarded instead of being  
 13049 written to the array, and a null byte is written at the end of the bytes actually written into the  
 13050 array.

13051 If copying takes place between objects that overlap as a result of a call to *sprintf()* or *snprintf()*,  
 13052 the results are undefined.

13053 Each of these functions converts, formats, and prints its arguments under control of the *format*.  
 13054 The *format* is a character string, beginning and ending in its initial shift state, if any. The *format* is  
 13055 composed of zero or more directives: *ordinary characters*, which are simply copied to the output  
 13056 stream, and *conversion specifications*, each of which shall result in the fetching of zero or more  
 13057 arguments. The results are undefined if there are insufficient arguments for the *format*. If the  
 13058 *format* is exhausted while arguments remain, the excess arguments shall be evaluated but are  
 13059 otherwise ignored.

13060 xsi Conversions can be applied to the *n*th argument after the *format* in the argument list, rather than  
 13061 to the next unused argument. In this case, the conversion specifier character % (see below) is  
 13062 replaced by the sequence "%n\$", where *n* is a decimal integer in the range [1,{NL\_ARGMAX}],  
 13063 giving the position of the argument in the argument list. This feature provides for the definition  
 13064 of format strings that select arguments in an order appropriate to specific languages (see the  
 13065 EXAMPLES section).

13066 The *format* can contain either numbered argument conversion specifications (that is, "%n\$" and  
 13067 "%m\$"), or unnumbered argument conversion specifications (that is, % and \*), but not both. The  
 13068 only exception to this is that %% can be mixed with the "%n\$" form. The results of mixing  
 13069 numbered and unnumbered argument specifications in a *format* string are undefined. When  
 13070 numbered argument specifications are used, specifying the *N*th argument requires that all the  
 13071 leading arguments, from the first to the (*N*-1)th, are specified in the format string.

13072 In format strings containing the "%n\$" form of conversion specification, numbered arguments  
 13073 in the argument list can be referenced from the format string as many times as required.

13074 In format strings containing the % form of conversion specification, each conversion specification  
 13075 uses the first unused argument in the argument list.

- 13076 CX All forms of the *fprintf()* functions allow for the insertion of a language-dependent radix character in the output string. The radix character is defined in the program's locale (category *LC\_NUMERIC*). In the POSIX locale, or in a locale where the radix character is not defined, the radix character shall default to a period ( '.' ).
- 13077
- 13078
- 13079
- 13080 XSI Each conversion specification is introduced by the '%' character or by the character sequence "%n\$", after which the following appear in sequence:
- 13081
- 13082 • Zero or more *flags* (in any order), which modify the meaning of the conversion specification.
  - 13083 • An optional minimum *field width*. If the converted value has fewer bytes than the field width, it shall be padded with spaces by default on the left; it shall be padded on the right if the left-adjustment flag ('-'), described below, is given to the field width. The field width takes the form of an asterisk ('\*'), described below, or a decimal integer.
  - 13084
  - 13085
  - 13086
  - 13087 • An optional *precision* that gives the minimum number of digits to appear for the d, i, o, u, x, and X conversion specifiers; the number of digits to appear after the radix character for the a, A, e, E, f, and F conversion specifiers; the maximum number of significant digits for the g and G conversion specifiers; or the maximum number of bytes to be printed from a string in the s and S conversion specifiers. The precision takes the form of a period ( '.' ) followed either by an asterisk ( '\*' ), described below, or an optional decimal digit string, where a null digit string is treated as zero. If a precision appears with any other conversion specifier, the behavior is undefined.
  - 13088
  - 13089
  - 13090
  - 13091 XSI
  - 13092
  - 13093
  - 13094
  - 13095 • An optional length modifier that specifies the size of the argument.
  - 13096 • A *conversion specifier* character that indicates the type of conversion to be applied.
- 13097 A field width, or precision, or both, may be indicated by an asterisk ( '\*' ). In this case an argument of type *int* supplies the field width or precision. Applications shall ensure that arguments specifying field width, or precision, or both appear in that order before the argument, if any, to be converted. A negative field width is taken as a '-' flag followed by a positive field width. A negative precision is taken as if the precision were omitted. In format strings containing the "%n\$" form of a conversion specification, a field width or precision may be indicated by the sequence "\*m\$", where *m* is a decimal integer in the range [1,{NL\_ARGMAX}] giving the position in the argument list (after the *format* argument) of an integer argument containing the field width or precision, for example:
- 13098
- 13099
- 13100
- 13101 XSI
- 13102
- 13103
- 13104
- 13105
- ```
13106 printf("%1$d:%2$.*3$d:%4$.*3$d\n", hour, min, precision, sec);
```
- 13107 The flag characters and their meanings are:
- 13108 XSI ' The integer portion of the result of a decimal conversion (%i, %d, %u, %f, %F, %g, or %G) shall be formatted with thousands' grouping characters. For other conversions the behavior is undefined. The non-monetary grouping character is used.
  - 13109
  - 13110
  - 13111 - The result of the conversion shall be left-justified within the field. The conversion is right-justified if this flag is not specified.
  - 13112
  - 13113 + The result of a signed conversion shall always begin with a sign ('+' or '-'). The conversion shall begin with a sign only when a negative value is converted if this flag is not specified.
  - 13114
  - 13115
  - 13116 <space> If the first character of a signed conversion is not a sign or if a signed conversion results in no characters, a <space> shall be prefixed to the result. This means that if the <space> and '+' flags both appear, the <space> flag shall be ignored.
  - 13117
  - 13118
  - 13119 # Specifies that the value is to be converted to an alternative form. For o conversion, it increases the precision (if necessary) to force the first digit of the result to be zero. For x
  - 13120

13121 or X conversion specifiers, a non-zero result shall have 0x (or 0X) prefixed to it. For a, A,  
 13122 e, E, f, F, g, and G conversion specifiers, the result shall always contain a radix  
 13123 character, even if no digits follow the radix character. Without this flag, a radix  
 13124 character appears in the result of these conversions only if a digit follows it. For g and G  
 13125 conversion specifiers, trailing zeros shall *not* be removed from the result as they  
 13126 normally are. For other conversion specifiers, the behavior is undefined.

13127 0 For d, i, o, u, x, X, a, A, e, E, f, F, g, and G conversion specifiers, leading zeros  
 13128 (following any indication of sign or base) are used to pad to the field width; no space  
 13129 padding is performed. If the '0' and '-' flags both appear, the '0' flag is ignored. For  
 13130 d, i, o, u, x, and X conversion specifiers, if a precision is specified, the '0' flag is  
 13131 XSI ignored. If the '0' and '' flags both appear, the grouping characters are inserted  
 13132 before zero padding. For other conversions, the behavior is undefined.

13133 The length modifiers and their meanings are:

13134 hh Specifies that a following d, i, o, u, x, or X conversion specifier applies to a **signed char**  
 13135 or **unsigned char** argument (the argument will have been promoted according to the  
 13136 integer promotions, but its value shall be converted to **signed char** or **unsigned char**  
 13137 before printing); or that a following n conversion specifier applies to a pointer to a  
 13138 **signed char** argument.

13139 h Specifies that a following d, i, o, u, x, or X conversion specifier applies to a **short** or  
 13140 **unsigned short** argument (the argument will have been promoted according to the  
 13141 integer promotions, but its value shall be converted to **short** or **unsigned short** before  
 13142 printing); or that a following n conversion specifier applies to a pointer to a **short**  
 13143 argument.

13144 l (ell) Specifies that a following d, i, o, u, x, or X conversion specifier applies to a **long** or  
 13145 **unsigned long** argument; that a following n conversion specifier applies to a pointer to  
 13146 a **long** argument; that a following c conversion specifier applies to a **wint\_t** argument;  
 13147 that a following s conversion specifier applies to a pointer to a **wchar\_t** argument; or  
 13148 has no effect on a following a, A, e, E, f, F, g, or G conversion specifier.

13149 ll (ell-ell) Specifies that a following d, i, o, u, x, or X conversion specifier applies to a **long long** or  
 13150 **unsigned long long** argument; or that a following n conversion specifier applies to a  
 13151 pointer to a **long long** argument.

13152 j Specifies that a following d, i, o, u, x, or X conversion specifier applies to an **intmax\_t**  
 13153 or **uintmax\_t** argument; or that a following n conversion specifier applies to a pointer  
 13154 to an **intmax\_t** argument.

13155 z Specifies that a following d, i, o, u, x, or X conversion specifier applies to a **size\_t** or the  
 13156 corresponding signed integer type argument; or that a following n conversion specifier  
 13157 applies to a pointer to a signed integer type corresponding to a **size\_t** argument.

13158 t Specifies that a following d, i, o, u, x, or X conversion specifier applies to a **ptrdiff\_t** or  
 13159 the corresponding **unsigned** type argument; or that a following n conversion specifier  
 13160 applies to a pointer to a **ptrdiff\_t** argument.

13161 L Specifies that a following a, A, e, E, f, F, g, or G conversion specifier applies to a **long**  
 13162 **double** argument.

13163

13164 If a length modifier appears with any conversion specifier other than as specified above, the  
 13165 behavior is undefined.

- 13166 The conversion specifiers and their meanings are:
- 13167 d, i The **int** argument shall be converted to a signed decimal in the style "[−]ddd". The  
13168 precision specifies the minimum number of digits to appear; if the value being  
13169 converted can be represented in fewer digits, it shall be expanded with leading zeros.  
13170 The default precision is 1. The result of converting zero with an explicit precision of  
13171 zero shall be no characters.
- 13172 o The **unsigned** argument shall be converted to unsigned octal format in the style  
13173 "ddd". The precision specifies the minimum number of digits to appear; if the value  
13174 being converted can be represented in fewer digits, it shall be expanded with leading  
13175 zeros. The default precision is 1. The result of converting zero with an explicit precision  
13176 of zero shall be no characters.
- 13177 u The **unsigned** argument shall be converted to unsigned decimal format in the style  
13178 "ddd". The precision specifies the minimum number of digits to appear; if the value  
13179 being converted can be represented in fewer digits, it shall be expanded with leading  
13180 zeros. The default precision is 1. The result of converting zero with an explicit precision  
13181 of zero shall be no characters.
- 13182 x The **unsigned** argument shall be converted to unsigned hexadecimal format in the style  
13183 "ddd"; the letters "abcdef" are used. The precision specifies the minimum number  
13184 of digits to appear; if the value being converted can be represented in fewer digits, it  
13185 shall be expanded with leading zeros. The default precision is 1. The result of  
13186 converting zero with an explicit precision of zero shall be no characters.
- 13187 X Equivalent to the x conversion specifier, except that letters "ABCDEF" are used instead  
13188 of "abcdef".
- 13189 f, F The **double** argument shall be converted to decimal notation in the style  
13190 "[−]ddd.ddd", where the number of digits after the radix character is equal to the  
13191 precision specification. If the precision is missing, it shall be taken as 6; if the precision  
13192 is explicitly zero and no '#' flag is present, no radix character shall appear. If a radix  
13193 character appears, at least one digit appears before it. The low-order digit shall be  
13194 rounded in an implementation-defined manner.
- 13195 A **double** argument representing an infinity shall be converted in one of the styles  
13196 "[−]inf" or "[−]infinity"; which style is implementation-defined. A **double**  
13197 argument representing a NaN shall be converted in one of the styles "[−]nan(*n-char-sequence*)"  
13198 or "[−]nan"; which style, and the meaning of any *n-char-sequence*,  
13199 is implementation-defined. The F conversion specifier produces "INF", "INFINITY",  
13200 or "NAN" instead of "inf", "infinity", or "nan", respectively.
- 13201 e, E The **double** argument shall be converted in the style "[−]d.dde±dd", where there is  
13202 one digit before the radix character (which is non-zero if the argument is non-zero) and  
13203 the number of digits after it is equal to the precision; if the precision is missing, it shall  
13204 be taken as 6; if the precision is zero and no '#' flag is present, no radix character shall  
13205 appear. The low-order digit shall be rounded in an implementation-defined manner.  
13206 The E conversion specifier shall produce a number with 'E' instead of 'e'  
13207 introducing the exponent. The exponent shall always contain at least two digits. If the  
13208 value is zero, the exponent shall be zero.
- 13209 A **double** argument representing an infinity or NaN shall be converted in the style of  
13210 an f or F conversion specifier.
- 13211 g, G The **double** argument shall be converted in the style f or e (or in the style F or E in the  
13212 case of a G conversion specifier), with the precision specifying the number of significant

|       |      |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|-------|------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 13213 |      | digits. If an explicit precision is zero, it shall be taken as 1. The style used depends on the value converted; style <code>e</code> (or <code>E</code> ) shall be used only if the exponent resulting from such a conversion is less than <code>-4</code> or greater than or equal to the precision. Trailing zeros shall be removed from the fractional portion of the result; a radix character shall appear only if it is followed by a digit or a <code>'#'</code> flag is present.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

| 13220 | a, A | A <b>double</b> argument representing a floating-point number shall be converted in the style <code>"[-]0xh.hhhhp±d"</code> , where there is one hexadecimal digit (which shall be non-zero if the argument is a normalized floating-point number and is otherwise unspecified) before the decimal-point character and the number of hexadecimal digits after it is equal to the precision; if the precision is missing and <code>FLT_RADIX</code> is a power of 2, then the precision shall be sufficient for an exact representation of the value; if the precision is missing and <code>FLT_RADIX</code> is not a power of 2, then the precision shall be sufficient to distinguish values of type <b>double</b> , except that trailing zeros may be omitted; if the precision is zero and the <code>'#'</code> flag is not specified, no decimal-point character shall appear. The letters <code>"abcdef"</code> shall be used for a conversion and the letters <code>"ABCDEF"</code> for A conversion. The A conversion specifier produces a number with <code>'X'</code> and <code>'P'</code> instead of <code>'x'</code> and <code>'p'</code> . The exponent shall always contain at least one digit, and only as many more digits as necessary to represent the decimal exponent of 2. If the value is zero, the exponent shall be zero. |

| 13242 |      |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| 13243 | s    | The argument shall be a pointer to an array of <b>char</b> . Bytes from the array shall be written up to (but not including) any terminating null byte. If the precision is specified, no more than that many bytes shall be written. If the precision is not specified or is greater than the size of the array, the application shall ensure that the array contains a null byte.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| 13244 |      |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| 13245 |      |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| 13246 |      |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| 13247 |      |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| 13248 |      | If an <code>l</code> ( <code>ell</code> ) qualifier is present, the argument shall be a pointer to an array of type <b>wchar_t</b> . Wide characters from the array shall be converted to characters (each as if by a call to the <code>wcrtomb()</code> function, with the conversion state described by an <b>mbstate_t</b> object initialized to zero before the first wide character is converted) up to and including a terminating null wide character. The resulting characters shall be written up to (but not including) the terminating null character (byte). If no precision is specified, the application shall ensure that the array contains a null wide character. If a precision is specified, no more than that many characters (bytes) shall be written (including shift sequences, if any), and the array shall contain a null wide character if, to equal the character sequence length given by the precision, the function would need to access a wide character one past the end of the array. In no case shall a partial character be written.                                                                                                                                                                                                                                                                          |

| 13267     | %                   | Print a '%' character; no argument is converted. The complete conversion specification                                                                                                   |
| 13268     |                     | shall be <code>%%</code> .                                                                                                                                                               |
| 13269     |                     | If a conversion specification does not match one of the above forms, the behavior is undefined. If                                                                                       |
| 13270     |                     | any argument is not the correct type for the corresponding conversion specification, the                                                                                                 |
| 13271     |                     | behavior is undefined.                                                                                                                                                                   |
| 13272     |                     | In no case shall a nonexistent or small field width cause truncation of a field; if the result of a                                                                                      |
| 13273     |                     | conversion is wider than the field width, the field shall be expanded to contain the conversion                                                                                          |
| 13274     |                     | result. Characters generated by <i>fprintf()</i> and <i>printf()</i> are printed as if <i>fputc()</i> had been called.                                                                   |
| 13275     |                     | For the <code>a</code> and <code>A</code> conversion specifiers, if <code>FLT_RADIX</code> is a power of 2, the value shall be correctly                                                 |
| 13276     |                     | rounded to a hexadecimal floating number with the given precision.                                                                                                                       |
| 13277     |                     | For <code>a</code> and <code>A</code> conversions, if <code>FLT_RADIX</code> is not a power of 2 and the result is not exactly                                                           |
| 13278     |                     | representable in the given precision, the result should be one of the two adjacent numbers in                                                                                            |
| 13279     |                     | hexadecimal floating style with the given precision, with the extra stipulation that the error                                                                                           |
| 13280     |                     | should have a correct sign for the current rounding direction.                                                                                                                           |
| 13281     |                     | For the <code>e</code> , <code>E</code> , <code>f</code> , <code>F</code> , <code>g</code> , and <code>G</code> conversion specifiers, if the number of significant decimal digits is at |
| 13282     |                     | most <code>DECIMAL_DIG</code> , then the result should be correctly rounded. If the number of significant                                                                                |
| 13283     |                     | decimal digits is more than <code>DECIMAL_DIG</code> but the source value is exactly representable with                                                                                  |
| 13284     |                     | <code>DECIMAL_DIG</code> digits, then the result should be an exact representation with trailing zeros.                                                                                  |
| 13285     |                     | Otherwise, the source value is bounded by two adjacent decimal strings $L < U$ , both having                                                                                             |
| 13286     |                     | <code>DECIMAL_DIG</code> significant digits; the value of the resultant decimal string $D$ should satisfy $L \leq$                                                                       |
| 13287     |                     | $D \leq U$ , with the extra stipulation that the error should have a correct sign for the current                                                                                        |
| 13288     |                     | rounding direction.                                                                                                                                                                      |
| 13289 CX  |                     | The <code>st_ctime</code> and <code>st_mtime</code> fields of the file shall be marked for update between the call to a                                                                  |
| 13290     |                     | successful execution of <i>fprintf()</i> or <i>printf()</i> and the next successful completion of a call to <i>fflush()</i>                                                              |
| 13291     |                     | or <i>fclose()</i> on the same stream or a call to <i>exit()</i> or <i>abort()</i> .                                                                                                     |
| 13292     | <b>RETURN VALUE</b> |                                                                                                                                                                                          |
| 13293     |                     | Upon successful completion, the <i>fprintf()</i> and <i>printf()</i> functions shall return the number of bytes                                                                          |
| 13294     |                     | transmitted.                                                                                                                                                                             |
| 13295     |                     | Upon successful completion, the <i>sprintf()</i> function shall return the number of bytes written to <code>s</code> ,                                                                   |
| 13296     |                     | excluding the terminating null byte.                                                                                                                                                     |
| 13297     |                     | Upon successful completion, the <i>snprintf()</i> function shall return the number of bytes that would                                                                                   |
| 13298     |                     | be written to <code>s</code> had <code>n</code> been sufficiently large excluding the terminating null byte.                                                                             |
| 13299     |                     | If an output error was encountered, these functions shall return a negative value.                                                                                                       |
| 13300     |                     | If the value of <code>n</code> is zero on a call to <i>snprintf()</i> , nothing shall be written, the number of bytes that                                                               |
| 13301     |                     | would have been written had <code>n</code> been sufficiently large excluding the terminating null shall be                                                                               |
| 13302     |                     | returned, and <code>s</code> may be a null pointer.                                                                                                                                      |

13303 **ERRORS**

13304 For the conditions under which *fprintf()* and *printf()* fail and may fail, refer to *fputc()* or  
13305 *fputwc()*.

13306 In addition, all forms of *fprintf()* may fail if:

13307 XSI [EILSEQ] A wide-character code that does not correspond to a valid character has been  
13308 detected.

13309 XSI [EINVAL] There are insufficient arguments.

13310 The *printf()* and *fprintf()* functions may fail if:

13311 XSI [ENOMEM] Insufficient storage space is available.

13312 The *snprintf()* function shall fail if:

13313 XSI [EOVERFLOW] The value of *n* is greater than {INT\_MAX} or the number of bytes needed to  
13314 hold the output excluding the terminating null is greater than {INT\_MAX}.

13315 **EXAMPLES**13316 **Printing Language-Independent Date and Time**

13317 The following statement can be used to print date and time using a language-independent  
13318 format:

13319 `printf(format, weekday, month, day, hour, min);`

13320 For American usage, *format* could be a pointer to the following string:

13321 `"%s, %s %d, %d:%.2d\n"`

13322 This example would produce the following message:

13323 `Sunday, July 3, 10:02`

13324 For German usage, *format* could be a pointer to the following string:

13325 `"%1$s, %3$d. %2$s, %4$d:%5$.2d\n"`

13326 This definition of *format* would produce the following message:

13327 `Sonntag, 3. Juli, 10:02`

13328 **Printing File Information**

13329 The following example prints information about the type, permissions, and number of links of a  
13330 specific file in a directory.

13331 The first two calls to *printf()* use data decoded from a previous *stat()* call. The user-defined  
13332 *strperm()* function shall return a string similar to the one at the beginning of the output for the  
13333 following command:

13334 `ls -l`

13335 The next call to *printf()* outputs the owner's name if it is found using *getpwuid()*; the *getpwuid()*  
13336 function shall return a **passwd** structure from which the name of the user is extracted. If the user  
13337 name is not found, the program instead prints out the numeric value of the user ID.

13338 The next call prints out the group name if it is found using *getgrgid()*; *getgrgid()* is very similar to  
13339 *getpwuid()* except that it shall return group information based on the group number. Once  
13340 again, if the group is not found, the program prints the numeric value of the group for the entry.

```

13341     The final call to printf() prints the size of the file.
13342     #include <stdio.h>
13343     #include <sys/types.h>
13344     #include <pwd.h>
13345     #include <grp.h>
13346     char *strperm (mode_t);
13347     ...
13348     struct stat statbuf;
13349     struct passwd *pwd;
13350     struct group *grp;
13351     ...
13352     printf("%10.10s", strperm (statbuf.st_mode));
13353     printf("%4d", statbuf.st_nlink);
13354     if ((pwd = getpwuid(statbuf.st_uid)) != NULL)
13355         printf(" %-8.8s", pwd->pw_name);
13356     else
13357         printf(" %-8ld", (long) statbuf.st_uid);
13358     if ((grp = getgrgid(statbuf.st_gid)) != NULL)
13359         printf(" %-8.8s", grp->gr_name);
13360     else
13361         printf(" %-8ld", (long) statbuf.st_gid);
13362     printf("%9jd", (intmax_t) statbuf.st_size);
13363     ...

```

### 13364 **Printing a Localized Date String**

13365 The following example gets a localized date string. The *nl\_langinfo()* function shall return the  
13366 localized date string, which specifies the order and layout of the date. The *strftime()* function  
13367 takes this information and, using the **tm** structure for values, places the date and time  
13368 information into *datestring*. The *printf()* function then outputs *datestring* and the name of the  
13369 entry.

```

13370     #include <stdio.h>
13371     #include <time.h>
13372     #include <langinfo.h>
13373     ...
13374     struct dirent *dp;
13375     struct tm *tm;
13376     char datestring[256];
13377     ...
13378     strftime(datestring, sizeof(datestring), nl_langinfo (D_T_FMT), tm);
13379     printf(" %s %s\n", datestring, dp->d_name);
13380     ...

```

13381 **Printing Error Information**

13382 The following example uses *fprintf()* to write error information to standard error.

13383 In the first group of calls, the program tries to open the password lock file named **LOCKFILE**. If  
 13384 the file already exists, this is an error, as indicated by the **O\_EXCL** flag on the *open()* function. If  
 13385 the call fails, the program assumes that someone else is updating the password file, and the  
 13386 program exits.

13387 The next group of calls saves a new password file as the current password file by creating a link  
 13388 between **LOCKFILE** and the new password file **PASSWDFILE**.

```

13389 #include <sys/types.h>
13390 #include <sys/stat.h>
13391 #include <fcntl.h>
13392 #include <stdio.h>
13393 #include <stdlib.h>
13394 #include <unistd.h>
13395 #include <string.h>
13396 #include <errno.h>

13397 #define LOCKFILE "/etc/ptmp"
13398 #define PASSWDFILE "/etc/passwd"
13399 ...
13400 int pfd;
13401 ...
13402 if ((pfd = open(LOCKFILE, O_WRONLY | O_CREAT | O_EXCL,
13403               S_IRUSR | S_IWUSR | S_IRGRP | S_IROTH)) == -1)
13404 {
13405     fprintf(stderr, "Cannot open /etc/ptmp. Try again later.\n");
13406     exit(1);
13407 }
13408 ...
13409 if (link(LOCKFILE, PASSWDFILE) == -1) {
13410     fprintf(stderr, "Link error: %s\n", strerror(errno));
13411     exit(1);
13412 }
13413 ...

```

13414 **Printing Usage Information**

13415 The following example checks to make sure the program has the necessary arguments, and uses  
 13416 *fprintf()* to print usage information if the expected number of arguments is not present.

```

13417 #include <stdio.h>
13418 #include <stdlib.h>
13419 ...
13420 char *Options = "hdbt1";
13421 ...
13422 if (argc < 2) {
13423     fprintf(stderr, "Usage: %s -%s <file\n", argv[0], Options); exit(1);
13424 }
13425 ...

```

13426 **Formatting a Decimal String**

13427 The following example prints a key and data pair on *stdout*. Note use of the '\*' (asterisk) in the  
 13428 format string; this ensures the correct number of decimal places for the element based on the  
 13429 number of elements requested.

```
13430 #include <stdio.h>
13431 ...
13432 long i;
13433 char *keyst;
13434 int elementlen, len;
13435 ...
13436 while (len < elementlen) {
13437 ...
13438     printf("%s Element%0*ld\n", keyst, elementlen, i);
13439 ...
13440 }
```

13441 **Creating a Filename**

13442 The following example creates a filename using information from a previous *getpwnam()*  
 13443 function that returned the HOME directory of the user.

```
13444 #include <stdio.h>
13445 #include <sys/types.h>
13446 #include <unistd.h>
13447 ...
13448 char filename[PATH_MAX+1];
13449 struct passwd *pw;
13450 ...
13451 sprintf(filename, "%s/%d.out", pw->pw_dir, getpid());
13452 ...
```

13453 **Reporting an Event**

13454 The following example loops until an event has timed out. The *pause()* function waits forever  
 13455 unless it receives a signal. The *fprintf()* statement should never occur due to the possible return  
 13456 values of *pause()*.

```
13457 #include <stdio.h>
13458 #include <unistd.h>
13459 #include <string.h>
13460 #include <errno.h>
13461 ...
13462 while (!event_complete) {
13463 ...
13464     if (pause() != -1 || errno != EINTR)
13465         fprintf(stderr, "pause: unknown error: %s\n", strerror(errno));
13466 }
13467 ...
```

13468 **Printing Monetary Information**

13469 The following example uses *strfmon()* to convert a number and store it as a formatted monetary  
 13470 string named *convbuf*. If the first number is printed, the program prints the format and the  
 13471 description; otherwise, it just prints the number.

```

13472 #include <monetary.h>
13473 #include <stdio.h>
13474 ...
13475 struct tblfmt {
13476     char *format;
13477     char *description;
13478 };
13479 struct tblfmt table[] = {
13480     { "%n", "default formatting" },
13481     { "%11n", "right align within an 11 character field" },
13482     { "%#5n", "aligned columns for values up to 99999" },
13483     { "%=*#5n", "specify a fill character" },
13484     { "%=0#5n", "fill characters do not use grouping" },
13485     { "%^#5n", "disable the grouping separator" },
13486     { "%^#5.0n", "round off to whole units" },
13487     { "%^#5.4n", "increase the precision" },
13488     { "%(#5n", "use an alternative pos/neg style" },
13489     { "%!(#5n", "disable the currency symbol" },
13490 };
13491 ...
13492 float input[3];
13493 int i, j;
13494 char convbuf[100];
13495 ...
13496 strfmon(convbuf, sizeof(convbuf), table[i].format, input[j]);
13497
13498 if (j == 0) {
13499     printf("%s%s\n", table[i].format,
13500           convbuf, table[i].description);
13501 }
13502 else {
13503     printf("%s\n", convbuf);
13504 }
13505 ...

```

13505 **Printing Wide Characters**

13506 The following example prints a series of wide characters. Suppose that "L'@'" expands to three  
 13507 bytes:

```

13508 wchar_t wz [3] = L"@@";           // Zero-terminated
13509 wchar_t wn [3] = L"@@";           // Unterminated
13510 fprintf (stdout, "%ls", wz);      // Outputs 6 bytes
13511 fprintf (stdout, "%ls", wn);      // Undefined because wn has no terminator
13512 fprintf (stdout, "%4ls", wz);     // Outputs 3 bytes
13513 fprintf (stdout, "%4ls", wn);     // Outputs 3 bytes; no terminator needed
13514 fprintf (stdout, "%9ls", wz);     // Outputs 6 bytes

```

```

13515     fprintf (stdout, "%9ls", wn); // Outputs 9 bytes; no terminator needed
13516     fprintf (stdout, "%10ls", wz); // Outputs 6 bytes
13517     fprintf (stdout, "%10ls", wn); // Undefined because wn has no terminator

```

13518 In the last line of the example, after processing three characters, nine bytes have been output.  
 13519 The fourth character must then be examined to determine whether it converts to one byte or  
 13520 more. If it converts to more than one byte, the output is only nine bytes. Since there is no fourth  
 13521 character in the array, the behavior is undefined.

#### 13522 APPLICATION USAGE

13523 If the application calling *fprintf()* has any objects of type **wint\_t** or **wchar\_t**, it must also include  
 13524 the **<wchar.h>** header to have these objects defined.

#### 13525 RATIONALE

13526 None.

#### 13527 FUTURE DIRECTIONS

13528 None.

#### 13529 SEE ALSO

13530 *fputc()*, *fscanf()*, *setlocale()*, *strfmon()*, *wcrtomb()*, the Base Definitions volume of  
 13531 IEEE Std 1003.1-2001, Chapter 7, Locale, **<stdio.h>**, **<wchar.h>**

#### 13532 CHANGE HISTORY

13533 First released in Issue 1. Derived from Issue 1 of the SVID.

#### 13534 Issue 5

13535 Aligned with ISO/IEC 9899:1990/Amendment 1:1995 (E). Specifically, the **l** (ell) qualifier can  
 13536 now be used with **c** and **s** conversion specifiers.

13537 The *snprintf()* function is new in Issue 5.

#### 13538 Issue 6

13539 Extensions beyond the ISO C standard are marked.

13540 The DESCRIPTION is updated to avoid use of the term “must” for application requirements.

13541 The following changes are made for alignment with the ISO/IEC 9899:1999 standard:

- 13542 • The prototypes for *fprintf()*, *printf()*, *snprintf()*, and *sprintf()* are updated, and the XSI  
 13543 shading is removed from *snprintf()*.
- 13544 • The description of *snprintf()* is aligned with the ISO C standard. Note that this supersedes  
 13545 the *snprintf()* description in The Open Group Base Resolution bwg98-006, which changed the  
 13546 behavior from Issue 5.
- 13547 • The DESCRIPTION is updated.

13548 The DESCRIPTION is updated to use the terms “conversion specifier” and “conversion  
 13549 specification” consistently.

13550 ISO/IEC 9899:1999 standard, Technical Corrigendum No. 1 is incorporated.

13551 An example of printing wide characters is added.

## 13552 NAME

13553 fputc — put a byte on a stream

## 13554 SYNOPSIS

13555 #include &lt;stdio.h&gt;

13556 int fputc(int *c*, FILE \**stream*);

## 13557 DESCRIPTION

13558 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
 13559 conflict between the requirements described here and the ISO C standard is unintentional. This  
 13560 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

13561 The *fputc()* function shall write the byte specified by *c* (converted to an **unsigned char**) to the  
 13562 output stream pointed to by *stream*, at the position indicated by the associated file-position  
 13563 indicator for the stream (if defined), and shall advance the indicator appropriately. If the file  
 13564 cannot support positioning requests, or if the stream was opened with append mode, the byte  
 13565 shall be appended to the output stream.

13566 CX The *st\_ctime* and *st\_mtime* fields of the file shall be marked for update between the successful  
 13567 execution of *fputc()* and the next successful completion of a call to *fflush()* or *fclose()* on the same  
 13568 stream or a call to *exit()* or *abort()*.

## 13569 RETURN VALUE

13570 Upon successful completion, *fputc()* shall return the value it has written. Otherwise, it shall  
 13571 CX return EOF, the error indicator for the stream shall be set, and *errno* shall be set to indicate the  
 13572 error.

## 13573 ERRORS

13574 The *fputc()* function shall fail if either the *stream* is unbuffered or the *stream*'s buffer needs to be  
 13575 flushed, and:

13576 CX [EAGAIN] The O\_NONBLOCK flag is set for the file descriptor underlying *stream* and the  
 13577 process would be delayed in the write operation.

13578 CX [EBADF] The file descriptor underlying *stream* is not a valid file descriptor open for  
 13579 writing.

13580 CX [EFBIG] An attempt was made to write to a file that exceeds the maximum file size.

13581 XSI [EFBIG] An attempt was made to write to a file that exceeds the process' file size limit.

13582 CX [EFBIG] The file is a regular file and an attempt was made to write at or beyond the  
 13583 offset maximum.

13584 CX [EINTR] The write operation was terminated due to the receipt of a signal, and no data  
 13585 was transferred.

13586 CX [EIO] A physical I/O error has occurred, or the process is a member of a  
 13587 background process group attempting to write to its controlling terminal,  
 13588 TOSTOP is set, the process is neither ignoring nor blocking SIGTTOU, and the  
 13589 process group of the process is orphaned. This error may also be returned  
 13590 under implementation-defined conditions.

13591 CX [ENOSPC] There was no free space remaining on the device containing the file.

13592 CX [EPIPE] An attempt is made to write to a pipe or FIFO that is not open for reading by  
 13593 any process. A SIGPIPE signal shall also be sent to the thread.

13594 The *fputc()* function may fail if:

- 13595 CX [ENOMEM] Insufficient storage space is available.
- 13596 CX [ENXIO] A request was made of a nonexistent device, or the request was outside the  
13597 capabilities of the device.
- 13598 **EXAMPLES**
- 13599 None.
- 13600 **APPLICATION USAGE**
- 13601 None.
- 13602 **RATIONALE**
- 13603 None.
- 13604 **FUTURE DIRECTIONS**
- 13605 None.
- 13606 **SEE ALSO**
- 13607 *ferror()*, *fopen()*, *getrlimit()*, *putc()*, *puts()*, *setbuf()*, *ulimit()*, the Base Definitions volume of  
13608 IEEE Std 1003.1-2001, <stdio.h>
- 13609 **CHANGE HISTORY**
- 13610 First released in Issue 1. Derived from Issue 1 of the SVID.
- 13611 **Issue 5**
- 13612 Large File Summit extensions are added.
- 13613 **Issue 6**
- 13614 Extensions beyond the ISO C standard are marked.
- 13615 The following new requirements on POSIX implementations derive from alignment with the  
13616 Single UNIX Specification:
- 13617
  - The [EIO] and [EFBIG] mandatory error conditions are added.
- 13618
  - The [ENOMEM] and [ENXIO] optional error conditions are added.

13619 **NAME**

13620 fputs — put a string on a stream

13621 **SYNOPSIS**

13622 #include &lt;stdio.h&gt;

13623 int fputs(const char \*restrict *s*, FILE \*restrict *stream*);13624 **DESCRIPTION**

13625 **CX** The functionality described on this reference page is aligned with the ISO C standard. Any  
 13626 conflict between the requirements described here and the ISO C standard is unintentional. This  
 13627 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

13628 The *fputs()* function shall write the null-terminated string pointed to by *s* to the stream pointed  
 13629 to by *stream*. The terminating null byte shall not be written.

13630 **CX** The *st\_ctime* and *st\_mtime* fields of the file shall be marked for update between the successful  
 13631 execution of *fputs()* and the next successful completion of a call to *fflush()* or *fclose()* on the same  
 13632 stream or a call to *exit()* or *abort()*.

13633 **RETURN VALUE**

13634 Upon successful completion, *fputs()* shall return a non-negative number. Otherwise, it shall  
 13635 **CX** return EOF, set an error indicator for the stream, and set *errno* to indicate the error.

13636 **ERRORS**13637 Refer to *fputc()*.13638 **EXAMPLES**13639 **Printing to Standard Output**

13640 The following example gets the current time, converts it to a string using *localtime()* and  
 13641 *asctime()*, and prints it to standard output using *fputs()*. It then prints the number of minutes to  
 13642 an event for which it is waiting.

```

13643 #include <time.h>
13644 #include <stdio.h>
13645 ...
13646 time_t now;
13647 int minutes_to_event;
13648 ...
13649 time(&now);
13650 printf("The time is ");
13651 fputs(asctime(localtime(&now)), stdout);
13652 printf("There are still %d minutes to the event.\n",
13653        minutes_to_event);
13654 ...

```

13655 **APPLICATION USAGE**13656 The *puts()* function appends a <newline> while *fputs()* does not.13657 **RATIONALE**

13658 None.

13659 **FUTURE DIRECTIONS**

13660 None.

13661 **SEE ALSO**

13662 *fopen()*, *putc()*, *puts()*, the Base Definitions volume of IEEE Std 1003.1-2001, <stdio.h>

13663 **CHANGE HISTORY**

13664 First released in Issue 1. Derived from Issue 1 of the SVID.

13665 **Issue 6**

13666 Extensions beyond the ISO C standard are marked.

13667 The *fputs()* prototype is updated for alignment with the ISO/IEC 9899:1999 standard.

13668 **NAME**

13669       fputcw — put a wide-character code on a stream

13670 **SYNOPSIS**

13671       #include &lt;stdio.h&gt;

13672       #include &lt;wchar.h&gt;

13673       wint\_t fputcw(wchar\_t *wc*, FILE \**stream*);13674 **DESCRIPTION**

13675 CX       The functionality described on this reference page is aligned with the ISO C standard. Any  
 13676       conflict between the requirements described here and the ISO C standard is unintentional. This  
 13677       volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

13678       The *fputcw()* function shall write the character corresponding to the wide-character code *wc* to  
 13679       the output stream pointed to by *stream*, at the position indicated by the associated file-position  
 13680       indicator for the stream (if defined), and advances the indicator appropriately. If the file cannot  
 13681       support positioning requests, or if the stream was opened with append mode, the character is  
 13682       appended to the output stream. If an error occurs while writing the character, the shift state of  
 13683       the output file is left in an undefined state.

13684 CX       The *st\_ctime* and *st\_mtime* fields of the file shall be marked for update between the successful  
 13685       execution of *fputcw()* and the next successful completion of a call to *fflush()* or *fclose()* on the  
 13686       same stream or a call to *exit()* or *abort()*.

13687 **RETURN VALUE**

13688       Upon successful completion, *fputcw()* shall return *wc*. Otherwise, it shall return WEOF, the error  
 13689 CX       indicator for the stream shall be set, and *errno* shall be set to indicate the error.

13690 **ERRORS**

13691       The *fputcw()* function shall fail if either the stream is unbuffered or data in the *stream*'s buffer  
 13692       needs to be written, and:

13693 CX       [EAGAIN]       The O\_NONBLOCK flag is set for the file descriptor underlying *stream* and the  
 13694       process would be delayed in the write operation.

13695 CX       [EBADF]       The file descriptor underlying *stream* is not a valid file descriptor open for  
 13696       writing.

13697 CX       [EFBIG]       An attempt was made to write to a file that exceeds the maximum file size or  
 13698       the process' file size limit.

13699 CX       [EFBIG]       The file is a regular file and an attempt was made to write at or beyond the  
 13700       offset maximum associated with the corresponding stream.

13701       [EILSEQ]       The wide-character code *wc* does not correspond to a valid character.

13702 CX       [EINTR]       The write operation was terminated due to the receipt of a signal, and no data  
 13703       was transferred.

13704 CX       [EIO]       A physical I/O error has occurred, or the process is a member of a  
 13705       background process group attempting to write to its controlling terminal,  
 13706       TOSTOP is set, the process is neither ignoring nor blocking SIGTTOU, and the  
 13707       process group of the process is orphaned. This error may also be returned  
 13708       under implementation-defined conditions.

13709 CX       [ENOSPC]       There was no free space remaining on the device containing the file.

13710 CX       [EPIPE]       An attempt is made to write to a pipe or FIFO that is not open for reading by  
 13711       any process. A SIGPIPE signal shall also be sent to the thread.

13712 The *fputc()* function may fail if:

13713 CX [ENOMEM] Insufficient storage space is available.

13714 CX [ENXIO] A request was made of a nonexistent device, or the request was outside the  
13715 capabilities of the device.

#### 13716 EXAMPLES

13717 None.

#### 13718 APPLICATION USAGE

13719 None.

#### 13720 RATIONALE

13721 None.

#### 13722 FUTURE DIRECTIONS

13723 None.

13725 *ferror()*, *fopen()*, *setbuf()*, *ulimit()*, the Base Definitions volume of IEEE Std 1003.1-2001,  
13726 `<stdio.h>`, `<wchar.h>`

#### 13727 CHANGE HISTORY

13728 First released in Issue 4. Derived from the MSE working draft.

#### 13729 Issue 5

13730 Aligned with ISO/IEC 9899:1990/Amendment 1:1995 (E). Specifically, the type of argument *wc*  
13731 is changed from `wint_t` to `wchar_t`.

13732 The Optional Header (OH) marking is removed from `<stdio.h>`.

13733 Large File Summit extensions are added.

#### 13734 Issue 6

13735 Extensions beyond the ISO C standard are marked.

13736 The following new requirements on POSIX implementations derive from alignment with the  
13737 Single UNIX Specification:

- 13738
- The [EFBIG] and [EIO] mandatory error conditions are added.
  - The [ENOMEM] and [ENXIO] optional error conditions are added.
- 13739

13740 **NAME**

13741 fputws — put a wide-character string on a stream

13742 **SYNOPSIS**

13743 #include &lt;stdio.h&gt;

13744 #include &lt;wchar.h&gt;

13745 int fputws(const wchar\_t \*restrict ws, FILE \*restrict stream);

13746 **DESCRIPTION**

13747 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
13748 conflict between the requirements described here and the ISO C standard is unintentional. This  
13749 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

13750 The *fputws()* function shall write a character string corresponding to the (null-terminated)  
13751 wide-character string pointed to by *ws* to the stream pointed to by *stream*. No character  
13752 corresponding to the terminating null wide-character code shall be written.

13753 CX The *st\_ctime* and *st\_mtime* fields of the file shall be marked for update between the successful  
13754 execution of *fputws()* and the next successful completion of a call to *flush()* or *fclose()* on the  
13755 same stream or a call to *exit()* or *abort()*.

13756 **RETURN VALUE**

13757 Upon successful completion, *fputws()* shall return a non-negative number. Otherwise, it shall  
13758 CX return -1, set an error indicator for the stream, and set *errno* to indicate the error.

13759 **ERRORS**13760 Refer to *fputwc()*.13761 **EXAMPLES**

13762 None.

13763 **APPLICATION USAGE**13764 The *fputws()* function does not append a <newline>.13765 **RATIONALE**

13766 None.

13767 **FUTURE DIRECTIONS**

13768 None.

13769 **SEE ALSO**13770 *fopen()*, the Base Definitions volume of IEEE Std 1003.1-2001, <stdio.h>, <wchar.h>13771 **CHANGE HISTORY**

13772 First released in Issue 4. Derived from the MSE working draft.

13773 **Issue 5**

13774 The Optional Header (OH) marking is removed from &lt;stdio.h&gt;.

13775 **Issue 6**

13776 Extensions beyond the ISO C standard are marked.

13777 The *fputws()* prototype is updated for alignment with the ISO/IEC 9899:1999 standard.

13778 **NAME**

13779 fread — binary input

13780 **SYNOPSIS**

13781 #include &lt;stdio.h&gt;

```
13782 size_t fread(void *restrict ptr, size_t size, size_t nitems,
13783 FILE *restrict stream);
```

13784 **DESCRIPTION**

13785 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
 13786 conflict between the requirements described here and the ISO C standard is unintentional. This  
 13787 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

13788 The *fread()* function shall read into the array pointed to by *ptr* up to *nitems* elements whose size  
 13789 is specified by *size* in bytes, from the stream pointed to by *stream*. For each object, *size* calls shall  
 13790 be made to the *fgetc()* function and the results stored, in the order read, in an array of **unsigned**  
 13791 **char** exactly overlaying the object. The file position indicator for the stream (if defined) shall be  
 13792 advanced by the number of bytes successfully read. If an error occurs, the resulting value of the  
 13793 file position indicator for the stream is unspecified. If a partial element is read, its value is  
 13794 unspecified.

13795 CX The *fread()* function may mark the *st\_atime* field of the file associated with *stream* for update. The  
 13796 *st\_atime* field shall be marked for update by the first successful execution of *fgetc()*, *fgets()*,  
 13797 *fgetwc()*, *fgetws()*, *fread()*, *fscanf()*, *getc()*, *getchar()*, *gets()*, or *scanf()* using *stream* that returns  
 13798 data not supplied by a prior call to *ungetc()* or *ungetwc()*.

13799 **RETURN VALUE**

13800 Upon successful completion, *fread()* shall return the number of elements successfully read which  
 13801 is less than *nitems* only if a read error or end-of-file is encountered. If *size* or *nitems* is 0, *fread()*  
 13802 shall return 0 and the contents of the array and the state of the stream remain unchanged.  
 13803 CX Otherwise, if a read error occurs, the error indicator for the stream shall be set, and *errno* shall be  
 13804 set to indicate the error.

13805 **ERRORS**13806 Refer to *fgetc()*.13807 **EXAMPLES**13808 **Reading from a Stream**13809 The following example reads a single element from the *fp* stream into the array pointed to by *buf*.

```
13810 #include <stdio.h>
13811 ...
13812 size_t bytes_read;
13813 char buf[100];
13814 FILE *fp;
13815 ...
13816 bytes_read = fread(buf, sizeof(buf), 1, fp);
13817 ...
```

13818 **APPLICATION USAGE**

13819 The *ferror()* or *feof()* functions must be used to distinguish between an error condition and an  
 13820 end-of-file condition.

13821 Because of possible differences in element length and byte ordering, files written using *fwrite()*  
 13822 are application-dependent, and possibly cannot be read using *fread()* by a different application

13823 or by the same application on a different processor.

13824 **RATIONALE**

13825 None.

13826 **FUTURE DIRECTIONS**

13827 None.

13828 **SEE ALSO**

13829 *feof()*, *ferror()*, *fgetc()*, *fopen()*, *getc()*, *gets()*, *scanf()*, the Base Definitions volume of  
13830 IEEE Std 1003.1-2001, <**stdio.h**>

13831 **CHANGE HISTORY**

13832 First released in Issue 1. Derived from Issue 1 of the SVID.

13833 **Issue 6**

13834 Extensions beyond the ISO C standard are marked.

13835 The following changes are made for alignment with the ISO/IEC 9899:1999 standard:

- 13836
- The *fread()* prototype is updated.
- 13837
- The DESCRIPTION is updated to describe how the bytes from a call to *fgetc()* are stored.

13838 **NAME**

13839 free — free allocated memory

13840 **SYNOPSIS**

13841 #include &lt;stdlib.h&gt;

13842 void free(void \*ptr);

13843 **DESCRIPTION**

13844 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
13845 conflict between the requirements described here and the ISO C standard is unintentional. This  
13846 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

13847 The *free()* function shall cause the space pointed to by *ptr* to be deallocated; that is, made  
13848 available for further allocation. If *ptr* is a null pointer, no action shall occur. Otherwise, if the  
13849 ADV argument does not match a pointer earlier returned by the *calloc()*, *malloc()*, *posix\_memalign()*,  
13850 XSI *realloc()*, or *strdup()* function, or if the space has been deallocated by a call to *free()* or *realloc()*,  
13851 the behavior is undefined.

13852 Any use of a pointer that refers to freed space results in undefined behavior.

13853 **RETURN VALUE**13854 The *free()* function shall not return a value.13855 **ERRORS**

13856 No errors are defined.

13857 **EXAMPLES**

13858 None.

13859 **APPLICATION USAGE**

13860 There is now no requirement for the implementation to support the inclusion of &lt;malloc.h&gt;.

13861 **RATIONALE**

13862 None.

13863 **FUTURE DIRECTIONS**

13864 None.

13865 **SEE ALSO**13866 *calloc()*, *malloc()*, *realloc()*, the Base Definitions volume of IEEE Std 1003.1-2001, <stdlib.h>13867 **CHANGE HISTORY**

13868 First released in Issue 1. Derived from Issue 1 of the SVID.

13869 **Issue 6**13870 Reference to the *valloc()* function is removed.

## 13871 NAME

13872 freeaddrinfo, getaddrinfo — get address information

## 13873 SYNOPSIS

```

13874 #include <sys/socket.h>
13875 #include <netdb.h>

13876 void freeaddrinfo(struct addrinfo *ai);
13877 int getaddrinfo(const char *restrict nodename,
13878               const char *restrict servname,
13879               const struct addrinfo *restrict hints,
13880               struct addrinfo **restrict res);

```

## 13881 DESCRIPTION

13882 The *freeaddrinfo()* function shall free one or more **addrinfo** structures returned by *getaddrinfo()*,  
 13883 along with any additional storage associated with those structures. If the *ai\_next* field of the  
 13884 structure is not null, the entire list of structures shall be freed. The *freeaddrinfo()* function shall  
 13885 support the freeing of arbitrary sublists of an **addrinfo** list originally returned by *getaddrinfo()*.

13886 The *getaddrinfo()* function shall translate the name of a service location (for example, a host  
 13887 name) and/or a service name and shall return a set of socket addresses and associated  
 13888 information to be used in creating a socket with which to address the specified service.

13889 The *freeaddrinfo()* and *getaddrinfo()* functions shall be thread-safe.

13890 The *nodename* and *servname* arguments are either null pointers or pointers to null-terminated  
 13891 strings. One or both of these two arguments shall be supplied by the application as a non-null  
 13892 pointer.

13893 The format of a valid name depends on the address family or families. If a specific family is not  
 13894 given and the name could be interpreted as valid within multiple supported families, the  
 13895 implementation shall attempt to resolve the name in all supported families and, in absence of  
 13896 errors, one or more results shall be returned.

13897 If the *nodename* argument is not null, it can be a descriptive name or can be an address string. If  
 13898 IP6 the specified address family is AF\_INET, AF\_INET6, or AF\_UNSPEC, valid descriptive names  
 13899 include host names. If the specified address family is AF\_INET or AF\_UNSPEC, address strings  
 13900 using Internet standard dot notation as specified in *inet\_addr()* are valid.

13901 IP6 If the specified address family is AF\_INET6 or AF\_UNSPEC, standard IPv6 text forms described  
 13902 in *inet\_ntop()* are valid.

13903 If *nodename* is not null, the requested service location is named by *nodename*; otherwise, the  
 13904 requested service location is local to the caller.

13905 If *servname* is null, the call shall return network-level addresses for the specified *nodename*. If  
 13906 *servname* is not null, it is a null-terminated character string identifying the requested service. This  
 13907 can be either a descriptive name or a numeric representation suitable for use with the address  
 13908 IP6 family or families. If the specified address family is AF\_INET, AF\_INET6, or AF\_UNSPEC, the  
 13909 service can be specified as a string specifying a decimal port number.

13910 If the *hints* argument is not null, it refers to a structure containing input values that may direct  
 13911 the operation by providing options and by limiting the returned information to a specific socket  
 13912 type, address family, and/or protocol. In this *hints* structure every member other than *ai\_flags*,  
 13913 *ai\_family*, *ai\_socktype*, and *ai\_protocol* shall be set to zero or a null pointer. A value of  
 13914 AF\_UNSPEC for *ai\_family* means that the caller shall accept any address family. A value of zero  
 13915 for *ai\_socktype* means that the caller shall accept any socket type. A value of zero for *ai\_protocol*  
 13916 means that the caller shall accept any protocol. If *hints* is a null pointer, the behavior shall be as if

- 13917 it referred to a structure containing the value zero for the *ai\_flags*, *ai\_socktype*, and *ai\_protocol*  
13918 fields, and AF\_UNSPEC for the *ai\_family* field.
- 13919 The *ai\_flags* field to which the *hints* parameter points shall be set to zero or be the bitwise-  
13920 inclusive OR of one or more of the values AI\_PASSIVE, AI\_CANONNAME,  
13921 AI\_NUMERICHOST, and AI\_NUMERICSERV.
- 13922 If the AI\_PASSIVE flag is specified, the returned address information shall be suitable for use in  
13923 binding a socket for accepting incoming connections for the specified service. In this case, if the  
13924 *nodename* argument is null, then the IP address portion of the socket address structure shall be  
13925 set to INADDR\_ANY for an IPv4 address or IN6ADDR\_ANY\_INIT for an IPv6 address. If the  
13926 AI\_PASSIVE flag is not specified, the returned address information shall be suitable for a call to  
13927 *connect()* (for a connection-mode protocol) or for a call to *connect()*, *sendto()*, or *sendmsg()* (for a  
13928 connectionless protocol). In this case, if the *nodename* argument is null, then the IP address  
13929 portion of the socket address structure shall be set to the loopback address.
- 13930 If the AI\_CANONNAME flag is specified and the *nodename* argument is not null, the function  
13931 shall attempt to determine the canonical name corresponding to *nodename* (for example, if  
13932 *nodename* is an alias or shorthand notation for a complete name).
- 13933 If the AI\_NUMERICHOST flag is specified, then a non-null *nodename* string supplied shall be a  
13934 numeric host address string. Otherwise, an [EAI\_NONAME] error is returned. This flag shall  
13935 prevent any type of name resolution service (for example, the DNS) from being invoked.
- 13936 If the AI\_NUMERICSERV flag is specified, then a non-null *servname* string supplied shall be a  
13937 numeric port string. Otherwise, an [EAI\_NONAME] error shall be returned. This flag shall  
13938 prevent any type of name resolution service (for example, NIS+) from being invoked.
- 13939 IP6 If the AI\_V4MAPPED flag is specified along with an *ai\_family* of AF\_INET6, then *getaddrinfo()*  
13940 shall return IPv4-mapped IPv6 addresses on finding no matching IPv6 addresses (*ai\_addrlen*  
13941 shall be 16). The AI\_V4MAPPED flag shall be ignored unless *ai\_family* equals AF\_INET6. If the  
13942 AI\_ALL flag is used with the AI\_V4MAPPED flag, then *getaddrinfo()* shall return all matching  
13943 IPv6 and IPv4 addresses. The AI\_ALL flag without the AI\_V4MAPPED flag is ignored.
- 13944 The *ai\_socktype* field to which argument *hints* points specifies the socket type for the service, as  
13945 defined in *socket()*. If a specific socket type is not given (for example, a value of zero) and the  
13946 service name could be interpreted as valid with multiple supported socket types, the  
13947 implementation shall attempt to resolve the service name for all supported socket types and, in  
13948 the absence of errors, all possible results shall be returned. A non-zero socket type value shall  
13949 limit the returned information to values with the specified socket type.
- 13950 If the *ai\_family* field to which *hints* points has the value AF\_UNSPEC, addresses shall be  
13951 returned for use with any address family that can be used with the specified *nodename* and/or  
13952 *servname*. Otherwise, addresses shall be returned for use only with the specified address family.  
13953 If *ai\_family* is not AF\_UNSPEC and *ai\_protocol* is not zero, then addresses are returned for use  
13954 only with the specified address family and protocol; the value of *ai\_protocol* shall be interpreted  
13955 as in a call to the *socket()* function with the corresponding values of *ai\_family* and *ai\_protocol*.
- 13956 **RETURN VALUE**
- 13957 A zero return value for *getaddrinfo()* indicates successful completion; a non-zero return value  
13958 indicates failure. The possible values for the failures are listed in the ERRORS section.
- 13959 Upon successful return of *getaddrinfo()*, the location to which *res* points shall refer to a linked list  
13960 of **addrinfo** structures, each of which shall specify a socket address and information for use in  
13961 creating a socket with which to use that socket address. The list shall include at least one  
13962 **addrinfo** structure. The *ai\_next* field of each structure contains a pointer to the next structure on  
13963 the list, or a null pointer if it is the last structure on the list. Each structure on the list shall

13964 include values for use with a call to the *socket()* function, and a socket address for use with the  
 13965 *connect()* function or, if the AI\_PASSIVE flag was specified, for use with the *bind()* function. The  
 13966 fields *ai\_family*, *ai\_socktype*, and *ai\_protocol* shall be usable as the arguments to the *socket()*  
 13967 function to create a socket suitable for use with the returned address. The fields *ai\_addr* and  
 13968 *ai\_addrlen* are usable as the arguments to the *connect()* or *bind()* functions with such a socket,  
 13969 according to the AI\_PASSIVE flag.

13970 If *nodename* is not null, and if requested by the AI\_CANONNAME flag, the *ai\_canonname* field of  
 13971 the first returned **addrinfo** structure shall point to a null-terminated string containing the  
 13972 canonical name corresponding to the input *nodename*; if the canonical name is not available, then  
 13973 *ai\_canonname* shall refer to the *nodename* argument or a string with the same contents. The  
 13974 contents of the *ai\_flags* field of the returned structures are undefined.

13975 All fields in socket address structures returned by *getaddrinfo()* that are not filled in through an  
 13976 explicit argument (for example, *sin6\_flowinfo*) shall be set to zero.

13977 **Note:** This makes it easier to compare socket address structures.

### 13978 ERRORS

13979 The *getaddrinfo()* function shall fail and return the corresponding value if:

13980 [EAI\_AGAIN] The name could not be resolved at this time. Future attempts may succeed.

13981 [EAI\_BADFLAGS]

13982 The *flags* parameter had an invalid value.

13983 [EAI\_FAIL] A non-recoverable error occurred when attempting to resolve the name.

13984 [EAI\_FAMILY] The address family was not recognized.

13985 [EAI\_MEMORY] There was a memory allocation failure when trying to allocate storage for the  
 13986 return value.

13987 [EAI\_NONAME] The name does not resolve for the supplied parameters.

13988 Neither *nodename* nor *servname* were supplied. At least one of these shall be  
 13989 supplied.

13990 [EAI\_SERVICE] The service passed was not recognized for the specified socket type.

13991 [EAI\_SOCKTYPE]

13992 The intended socket type was not recognized.

13993 [EAI\_SYSTEM] A system error occurred; the error code can be found in *errno*.

13994 [EAI\_OVERFLOW]

13995 An argument buffer overflowed.

### 13996 EXAMPLES

13997 None.

### 13998 APPLICATION USAGE

13999 If the caller handles only TCP and not UDP, for example, then the *ai\_protocol* member of the *hints*  
 14000 structure should be set to IPPROTO\_TCP when *getaddrinfo()* is called.

14001 If the caller handles only IPv4 and not IPv6, then the *ai\_family* member of the *hints* structure  
 14002 should be set to AF\_INET when *getaddrinfo()* is called.

### 14003 RATIONALE

14004 None.

14005 **FUTURE DIRECTIONS**

14006       None.

14007 **SEE ALSO**14008       *connect()*, *gai\_strerror()*, *gethostbyaddr()*, *getnameinfo()*, *getservbyname()*, *socket()*, the Base  
14009       Definitions volume of IEEE Std 1003.1-2001, <netdb.h>, <sys/socket.h>14010 **CHANGE HISTORY**

14011       First released in Issue 6. Derived from the XNS, Issue 5.2 specification.

14012       The **restrict** keyword is added to the *getaddrinfo()* prototype for alignment with the  
14013       ISO/IEC 9899:1999 standard.

## 14014 NAME

14015        freopen — open a stream

## 14016 SYNOPSIS

14017        #include &lt;stdio.h&gt;

14018        FILE \*freopen(const char \*restrict *filename*, const char \*restrict *mode*,  
14019                      FILE \*restrict *stream*);

## 14020 DESCRIPTION

14021 CX        The functionality described on this reference page is aligned with the ISO C standard. Any  
14022        conflict between the requirements described here and the ISO C standard is unintentional. This  
14023        volume of IEEE Std 1003.1-2001 defers to the ISO C standard.14024        The *freopen()* function shall first attempt to flush the stream and close any file descriptor  
14025        associated with *stream*. Failure to flush or close the file descriptor successfully shall be ignored.  
14026        The error and end-of-file indicators for the stream shall be cleared.14027        The *freopen()* function shall open the file whose pathname is the string pointed to by *filename* and  
14028        associate the stream pointed to by *stream* with it. The *mode* argument shall be used just as in  
14029        *fopen()*.

14030        The original stream shall be closed regardless of whether the subsequent open succeeds.

14031        If *filename* is a null pointer, the *freopen()* function shall attempt to change the mode of the stream  
14032        to that specified by *mode*, as if the name of the file currently associated with the stream had been  
14033        used. It is implementation-defined which changes of mode are permitted (if any), and under  
14034        what circumstances.14035 XSI       After a successful call to the *freopen()* function, the orientation of the stream shall be cleared, the  
14036        encoding rule shall be cleared, and the associated **mbstate\_t** object shall be set to describe an  
14037        initial conversion state.14038 CX        The largest value that can be represented correctly in an object of type **off\_t** shall be established  
14039        as the offset maximum in the open file description.

## 14040 RETURN VALUE

14041        Upon successful completion, *freopen()* shall return the value of *stream*. Otherwise, a null pointer  
14042 CX        shall be returned, and *errno* shall be set to indicate the error.

## 14043 ERRORS

14044        The *freopen()* function shall fail if:14045 CX        [EACCES]        Search permission is denied on a component of the path prefix, or the file  
14046        exists and the permissions specified by *mode* are denied, or the file does not  
14047        exist and write permission is denied for the parent directory of the file to be  
14048        created.14049 CX        [EINTR]        A signal was caught during *freopen()*.14050 CX        [EISDIR]        The named file is a directory and *mode* requires write access.14051 CX        [ELOOP]        A loop exists in symbolic links encountered during resolution of the *path*  
14052        argument.

14053 CX        [EMFILE]        {OPEN\_MAX} file descriptors are currently open in the calling process.

14054 CX        [ENAMETOOLONG]        The length of the *filename* argument exceeds {PATH\_MAX} or a pathname  
14055        component is longer than {NAME\_MAX}.  
14056

| 14057 CX                   | [ENFILE]       | The maximum allowable number of files is currently open in the system.                                                              |
| 14058 CX<br>14059          | [ENOENT]       | A component of <i>filename</i> does not name an existing file or <i>filename</i> is an empty string.                                |
| 14060 CX<br>14061          | [ENOSPC]       | The directory or file system that would contain the new file cannot be expanded, the file does not exist, and it was to be created. |
| 14062 CX                   | [ENOTDIR]      | A component of the path prefix is not a directory.                                                                                  |
| 14063 CX<br>14064          | [ENXIO]        | The named file is a character special or block special file, and the device associated with this special file does not exist.       |
| 14065 CX<br>14066          | [EOVERFLOW]    | The named file is a regular file and the size of the file cannot be represented correctly in an object of type <code>off_t</code> . |
| 14067 CX<br>14068          | [EROFS]        | The named file resides on a read-only file system and <i>mode</i> requires write access.                                            |
| 14069                      |                | The <i>freopen()</i> function may fail if:                                                                                          |
| 14070 CX                   | [EINVAL]       | The value of the <i>mode</i> argument is not valid.                                                                                 |
| 14071 CX<br>14072          | [ELOOP]        | More than {SYMLOOP_MAX} symbolic links were encountered during resolution of the <i>path</i> argument.                              |
| 14073 CX<br>14074<br>14075 | [ENAMETOOLONG] | Pathname resolution of a symbolic link produced an intermediate result whose length exceeds {PATH_MAX}.                             |
| 14076 CX                   | [ENOMEM]       | Insufficient storage space is available.                                                                                            |
| 14077 CX<br>14078          | [ENXIO]        | A request was made of a nonexistent device, or the request was outside the capabilities of the device.                              |
| 14079 CX<br>14080          | [ETXTBSY]      | The file is a pure procedure (shared text) file that is being executed and <i>mode</i> requires write access.                       |

#### 14081 EXAMPLES

##### 14082 Directing Standard Output to a File

14083 The following example logs all standard output to the `/tmp/logfile` file.

```
14084 #include <stdio.h>
14085 ...
14086 FILE *fp;
14087 ...
14088 fp = freopen ("/tmp/logfile", "a+", stdout);
14089 ...
```

#### 14090 APPLICATION USAGE

14091 The *freopen()* function is typically used to attach the preopened *streams* associated with *stdin*,  
14092 *stdout*, and *stderr* to other files.

#### 14093 RATIONALE

14094 None.

14095 **FUTURE DIRECTIONS**

14096 None.

14097 **SEE ALSO**14098 *fclose()*, *fopen()*, *fdopen()*, *mbsinit()*, the Base Definitions volume of IEEE Std 1003.1-2001,  
14099 **<stdio.h>**14100 **CHANGE HISTORY**

14101 First released in Issue 1. Derived from Issue 1 of the SVID.

14102 **Issue 5**14103 The DESCRIPTION is updated to indicate that the orientation of the stream is cleared and the  
14104 conversion state of the stream is set to an initial conversion state by a successful call to the  
14105 *freopen()* function.

14106 Large File Summit extensions are added.

14107 **Issue 6**

14108 Extensions beyond the ISO C standard are marked.

14109 The following new requirements on POSIX implementations derive from alignment with the  
14110 Single UNIX Specification:14111 • In the DESCRIPTION, text is added to indicate setting of the offset maximum in the open file  
14112 description. This change is to support large files.14113 • In the ERRORS section, the [E\_OVERFLOW] condition is added. This change is to support  
14114 large files.

14115 • The [ELOOP] mandatory error condition is added.

14116 • A second [ENAMETOOLONG] is added as an optional error condition.

14117 • The [EINVAL], [ENOMEM], [ENXIO], and [ETXTBSY] optional error conditions are added.

14118 The following changes are made for alignment with the ISO/IEC 9899:1999 standard:

14119 • The *freopen()* prototype is updated.

14120 • The DESCRIPTION is updated.

14121 The wording of the mandatory [ELOOP] error condition is updated, and a second optional  
14122 [ELOOP] error condition is added.

14123 The DESCRIPTION is updated regarding failure to close, changing the “file” to “file descriptor”.

14124 **NAME**

14125 frexp, frexpf, frexpl — extract mantissa and exponent from a double precision number

14126 **SYNOPSIS**

14127 #include <math.h>

14128 double frexp(double *num*, int \**exp*);

14129 float frexpf(float *num*, int \**exp*);

14130 long double frexpl(long double *num*, int \**exp*);

14131 **DESCRIPTION**

14132 **CX** The functionality described on this reference page is aligned with the ISO C standard. Any  
 14133 conflict between the requirements described here and the ISO C standard is unintentional. This  
 14134 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

14135 These functions shall break a floating-point number *num* into a normalized fraction and an  
 14136 integral power of 2. The integer exponent shall be stored in the **int** object pointed to by *exp*.

14137 **RETURN VALUE**

14138 For finite arguments, these functions shall return the value *x*, such that *x* has a magnitude in the  
 14139 interval  $[\frac{1}{2}, 1)$  or 0, and *num* equals *x* times 2 raised to the power \**exp*.

14140 **MX** If *num* is NaN, a NaN shall be returned, and the value of \**exp* is unspecified.

14141 If *num* is ±0, ±0 shall be returned, and the value of \**exp* shall be 0.

14142 If *num* is ±Inf, *num* shall be returned, and the value of \**exp* is unspecified.

14143 **ERRORS**

14144 No errors are defined.

14145 **EXAMPLES**

14146 None.

14147 **APPLICATION USAGE**

14148 None.

14149 **RATIONALE**

14150 None.

14151 **FUTURE DIRECTIONS**

14152 None.

14153 **SEE ALSO**

14154 *isnan()*, *ldexp()*, *modf()*, the Base Definitions volume of IEEE Std 1003.1-2001, <math.h>

14155 **CHANGE HISTORY**

14156 First released in Issue 1. Derived from Issue 1 of the SVID.

14157 **Issue 5**

14158 The DESCRIPTION is updated to indicate how an application should check for an error. This  
 14159 text was previously published in the APPLICATION USAGE section.

14160 **Issue 6**

14161 The *frexpf()* and *frexpl()* functions are added for alignment with the ISO/IEC 9899:1999  
 14162 standard.

14163 The DESCRIPTION, RETURN VALUE, ERRORS, and APPLICATION USAGE sections are  
14164 revised to align with the ISO/IEC 9899:1999 standard.

14165 IEC 60559:1989 standard floating-point extensions over the ISO/IEC 9899:1999 standard are  
14166 marked.

14167 **NAME**

14168 fscanf, scanf, sscanf — convert formatted input

14169 **SYNOPSIS**

14170 #include &lt;stdio.h&gt;

14171 int fscanf(FILE \*restrict *stream*, const char \*restrict *format*, ... );14172 int scanf(const char \*restrict *format*, ... );14173 int sscanf(const char \*restrict *s*, const char \*restrict *format*, ... );14174 **DESCRIPTION**

14175 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
 14176 conflict between the requirements described here and the ISO C standard is unintentional. This  
 14177 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

14178 The *fscanf()* function shall read from the named input *stream*. The *scanf()* function shall read  
 14179 from the standard input stream *stdin*. The *sscanf()* function shall read from the string *s*. Each  
 14180 function reads bytes, interprets them according to a format, and stores the results in its  
 14181 arguments. Each expects, as arguments, a control string *format* described below, and a set of  
 14182 *pointer* arguments indicating where the converted input should be stored. The result is  
 14183 undefined if there are insufficient arguments for the format. If the format is exhausted while  
 14184 arguments remain, the excess arguments shall be evaluated but otherwise ignored.

14185 XSI Conversions can be applied to the *n*th argument after the *format* in the argument list, rather than  
 14186 to the next unused argument. In this case, the conversion specifier character % (see below) is  
 14187 replaced by the sequence "%n\$", where *n* is a decimal integer in the range [1,{NL\_ARGMAX}].  
 14188 This feature provides for the definition of format strings that select arguments in an order  
 14189 appropriate to specific languages. In format strings containing the "%n\$" form of conversion  
 14190 specifications, it is unspecified whether numbered arguments in the argument list can be  
 14191 referenced from the format string more than once.

14192 The *format* can contain either form of a conversion specification—that is, % or "%n\$"—but the  
 14193 two forms cannot be mixed within a single *format* string. The only exception to this is that %% or  
 14194 %\* can be mixed with the "%n\$" form. When numbered argument specifications are used,  
 14195 specifying the *N*th argument requires that all the leading arguments, from the first to the  
 14196 (*N*–1)th, are pointers.

14197 CX The *fscanf()* function in all its forms shall allow detection of a language-dependent radix  
 14198 character in the input string. The radix character is defined in the program's locale (category  
 14199 *LC\_NUMERIC*). In the POSIX locale, or in a locale where the radix character is not defined, the  
 14200 radix character shall default to a period ( '.' ).

14201 The format is a character string, beginning and ending in its initial shift state, if any, composed  
 14202 of zero or more directives. Each directive is composed of one of the following: one or more  
 14203 white-space characters (<space>*s*, <tab>*s*, <newline>*s*, <vertical-tab>*s*, or <form-feed>*s*); an  
 14204 ordinary character (neither '%' nor a white-space character); or a conversion specification. Each  
 14205 XSI conversion specification is introduced by the character '%' or the character sequence "%n\$",  
 14206 after which the following appear in sequence:

- 14207 • An optional assignment-suppressing character '\*'.
- 14208 • An optional non-zero decimal integer that specifies the maximum field width.
- 14209 • An option length modifier that specifies the size of the receiving object.
- 14210 • A *conversion specifier* character that specifies the type of conversion to be applied. The valid  
 14211 conversion specifiers are described below.

- 14212 The *fscanf()* functions shall execute each directive of the format in turn. If a directive fails, as  
 14213 detailed below, the function shall return. Failures are described as input failures (due to the  
 14214 unavailability of input bytes) or matching failures (due to inappropriate input).
- 14215 A directive composed of one or more white-space characters shall be executed by reading input  
 14216 until no more valid input can be read, or up to the first byte which is not a white-space character,  
 14217 which remains unread.
- 14218 A directive that is an ordinary character shall be executed as follows: the next byte shall be read  
 14219 from the input and compared with the byte that comprises the directive; if the comparison  
 14220 shows that they are not equivalent, the directive shall fail, and the differing and subsequent  
 14221 bytes shall remain unread. Similarly, if end-of-file, an encoding error, or a read error prevents a  
 14222 character from being read, the directive shall fail.
- 14223 A directive that is a conversion specification defines a set of matching input sequences, as  
 14224 described below for each conversion character. A conversion specification shall be executed in  
 14225 the following steps.
- 14226 Input white-space characters (as specified by *isspace()*) shall be skipped, unless the conversion  
 14227 specification includes a `[`, `c`, `C`, or `n` conversion specifier.
- 14228 An item shall be read from the input, unless the conversion specification includes an `n`  
 14229 conversion specifier. An input item shall be defined as the longest sequence of input bytes (up to  
 14230 any specified maximum field width, which may be measured in characters or bytes dependent  
 14231 on the conversion specifier) which is an initial subsequence of a matching sequence. The first  
 14232 byte, if any, after the input item shall remain unread. If the length of the input item is 0, the  
 14233 execution of the conversion specification shall fail; this condition is a matching failure, unless  
 14234 end-of-file, an encoding error, or a read error prevented input from the stream, in which case it is  
 14235 an input failure.
- 14236 Except in the case of a `%` conversion specifier, the input item (or, in the case of a `%n` conversion  
 14237 specification, the count of input bytes) shall be converted to a type appropriate to the conversion  
 14238 character. If the input item is not a matching sequence, the execution of the conversion  
 14239 specification fails; this condition is a matching failure. Unless assignment suppression was  
 14240 indicated by a `'*'`, the result of the conversion shall be placed in the object pointed to by the  
 14241 first argument following the *format* argument that has not already received a conversion result if  
 14242 XSI the conversion specification is introduced by `%`, or in the *n*th argument if introduced by the  
 14243 character sequence `"%n$"`. If this object does not have an appropriate type, or if the result of the  
 14244 conversion cannot be represented in the space provided, the behavior is undefined.
- 14245 The length modifiers and their meanings are:
- 14246 `hh` Specifies that a following `d`, `i`, `o`, `u`, `x`, `X`, or `n` conversion specifier applies to an  
 14247 argument with type pointer to **signed char** or **unsigned char**.
- 14248 `h` Specifies that a following `d`, `i`, `o`, `u`, `x`, `X`, or `n` conversion specifier applies to an  
 14249 argument with type pointer to **short** or **unsigned short**.
- 14250 `l` (`ell`) Specifies that a following `d`, `i`, `o`, `u`, `x`, `X`, or `n` conversion specifier applies to an  
 14251 argument with type pointer to **long** or **unsigned long**; that a following `a`, `A`, `e`, `E`, `f`, `F`, `g`,  
 14252 or `G` conversion specifier applies to an argument with type pointer to **double**; or that a  
 14253 following `c`, `s`, or `[` conversion specifier applies to an argument with type pointer to  
 14254 **wchar\_t**.
- 14255 `ll` (`ell-ell`)  
 14256 Specifies that a following `d`, `i`, `o`, `u`, `x`, `X`, or `n` conversion specifier applies to an  
 14257 argument with type pointer to **long long** or **unsigned long long**.

|       |            |                                                                                                                                                                                                                                                                                                                                                         |
|-------|------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 14258 | j          | Specifies that a following d, i, o, u, x, X, or n conversion specifier applies to an argument with type pointer to <b>intmax_t</b> or <b>uintmax_t</b> .                                                                                                                                                                                                |
| 14259 |            |                                                                                                                                                                                                                                                                                                                                                         |
| 14260 | z          | Specifies that a following d, i, o, u, x, X, or n conversion specifier applies to an argument with type pointer to <b>size_t</b> or the corresponding signed integer type.                                                                                                                                                                              |
| 14261 |            |                                                                                                                                                                                                                                                                                                                                                         |
| 14262 | t          | Specifies that a following d, i, o, u, x, X, or n conversion specifier applies to an argument with type pointer to <b>ptrdiff_t</b> or the corresponding <b>unsigned</b> type.                                                                                                                                                                          |
| 14263 |            |                                                                                                                                                                                                                                                                                                                                                         |
| 14264 | L          | Specifies that a following a, A, e, E, f, F, g, or G conversion specifier applies to an argument with type pointer to <b>long double</b> .                                                                                                                                                                                                              |
| 14265 |            |                                                                                                                                                                                                                                                                                                                                                         |
| 14266 |            | If a length modifier appears with any conversion specifier other than as specified above, the behavior is undefined.                                                                                                                                                                                                                                    |
| 14267 |            |                                                                                                                                                                                                                                                                                                                                                         |
| 14268 |            | The following conversion specifiers are valid:                                                                                                                                                                                                                                                                                                          |
| 14269 | d          | Matches an optionally signed decimal integer, whose format is the same as expected for the subject sequence of <i>strtol()</i> with the value 10 for the <i>base</i> argument. In the absence of a size modifier, the application shall ensure that the corresponding argument is a pointer to <b>int</b> .                                             |
| 14270 |            |                                                                                                                                                                                                                                                                                                                                                         |
| 14271 |            |                                                                                                                                                                                                                                                                                                                                                         |
| 14272 |            |                                                                                                                                                                                                                                                                                                                                                         |
| 14273 | i          | Matches an optionally signed integer, whose format is the same as expected for the subject sequence of <i>strtol()</i> with 0 for the <i>base</i> argument. In the absence of a size modifier, the application shall ensure that the corresponding argument is a pointer to <b>int</b> .                                                                |
| 14274 |            |                                                                                                                                                                                                                                                                                                                                                         |
| 14275 |            |                                                                                                                                                                                                                                                                                                                                                         |
| 14276 |            |                                                                                                                                                                                                                                                                                                                                                         |
| 14277 | o          | Matches an optionally signed octal integer, whose format is the same as expected for the subject sequence of <i>strtoul()</i> with the value 8 for the <i>base</i> argument. In the absence of a size modifier, the application shall ensure that the corresponding argument is a pointer to <b>unsigned</b> .                                          |
| 14278 |            |                                                                                                                                                                                                                                                                                                                                                         |

| 14292 |            |                                                                                                                                                                                                                                                                                                                                                         |
| 14293 |            |                                                                                                                                                                                                                                                                                                                                                         |
| 14294 |            | If the <i>fprintf()</i> family of functions generates character string representations for infinity and NaN (a symbolic entity encoded in floating-point format) to support IEEE Std 754-1985, the <i>fscanf()</i> family of functions shall recognize them as input.                                                                                   |
| 14295 |            |                                                                                                                                                                                                                                                                                                                                                         |
| 14296 |            |                                                                                                                                                                                                                                                                                                                                                         |
| 14297 | s          | Matches a sequence of bytes that are not white-space characters. The application shall ensure that the corresponding argument is a pointer to the initial byte of an array of <b>char</b> , <b>signed char</b> , or <b>unsigned char</b> large enough to accept the sequence and a terminating null character code, which shall be added automatically. |
| 14298 |            |                                                                                                                                                                                                                                                                                                                                                         |
| 14299 |            |                                                                                                                                                                                                                                                                                                                                                         |
| 14300 |            |                                                                                                                                                                                                                                                                                                                                                         |
| 14301 |            | If an l (ell) qualifier is present, the input is a sequence of characters that begins in the initial shift state. Each character shall be converted to a wide character as if by a call to                                                                                                                                                              |
| 14302 |            |                                                                                                                                                                                                                                                                                                                                                         |

|       |   |                                                                                                               |
|-------|---|---------------------------------------------------------------------------------------------------------------|
| 14303 |   | the <i>mbrtowc()</i> function, with the conversion state described by an <b>mbstate_t</b> object              |
| 14304 |   | initialized to zero before the first character is converted. The application shall ensure                     |
| 14305 |   | that the corresponding argument is a pointer to an array of <b>wchar_t</b> large enough to                    |
| 14306 |   | accept the sequence and the terminating null wide character, which shall be added                             |
| 14307 |   | automatically.                                                                                                |
| 14308 | [ | Matches a non-empty sequence of bytes from a set of expected bytes (the <i>scanset</i> ). The                 |
| 14309 |   | normal skip over white-space characters shall be suppressed in this case. The                                 |
| 14310 |   | application shall ensure that the corresponding argument is a pointer to the initial byte                     |
| 14311 |   | of an array of <b>char</b> , <b>signed char</b> , or <b>unsigned char</b> large enough to accept the sequence |
| 14312 |   | and a terminating null byte, which shall be added automatically.                                              |
| 14313 |   | If an <b>l</b> (ell) qualifier is present, the input is a sequence of characters that begins in the           |
| 14314 |   | initial shift state. Each character in the sequence shall be converted to a wide character                    |
| 14315 |   | as if by a call to the <i>mbrtowc()</i> function, with the conversion state described by an                   |
| 14316 |   | <b>mbstate_t</b> object initialized to zero before the first character is converted. The                      |
| 14317 |   | application shall ensure that the corresponding argument is a pointer to an array of                          |
| 14318 |   | <b>wchar_t</b> large enough to accept the sequence and the terminating null wide character,                   |
| 14319 |   | which shall be added automatically.                                                                           |
| 14320 |   | The conversion specification includes all subsequent bytes in the <i>format</i> string up to                  |
| 14321 |   | and including the matching right square bracket (']'). The bytes between the square                           |
| 14322 |   | brackets (the <i>scanlist</i> ) comprise the scanset, unless the byte after the left square bracket           |
| 14323 |   | is a circumflex (^), in which case the scanset contains all bytes that do not appear in                       |
| 14324 |   | the scanlist between the circumflex and the right square bracket. If the conversion                           |
| 14325 |   | specification begins with "[ ]" or "[ ^ ]", the right square bracket is included in the                       |
| 14326 |   | scanlist and the next right square bracket is the matching right square bracket that ends                     |
| 14327 |   | the conversion specification; otherwise, the first right square bracket is the one that                       |
| 14328 |   | ends the conversion specification. If a '-' is in the scanlist and is not the first character,                |
| 14329 |   | nor the second where the first character is a '^', nor the last character, the behavior is                    |
| 14330 |   | implementation-defined.                                                                                       |
| 14331 | c | Matches a sequence of bytes of the number specified by the field width (1 if no field                         |
| 14332 |   | width is present in the conversion specification). The application shall ensure that the                      |
| 14333 |   | corresponding argument is a pointer to the initial byte of an array of <b>char</b> , <b>signed char</b> ,     |
| 14334 |   | or <b>unsigned char</b> large enough to accept the sequence. No null byte is added. The                       |
| 14335 |   | normal skip over white-space characters shall be suppressed in this case.                                     |
| 14336 |   | If an <b>l</b> (ell) qualifier is present, the input shall be a sequence of characters that begins in         |
| 14337 |   | the initial shift state. Each character in the sequence is converted to a wide character as                   |
| 14338 |   | if by a call to the <i>mbrtowc()</i> function, with the conversion state described by an                      |
| 14339 |   | <b>mbstate_t</b> object initialized to zero before the first character is converted. The                      |
| 14340 |   | application shall ensure that the corresponding argument is a pointer to an array of                          |
| 14341 |   | <b>wchar_t</b> large enough to accept the resulting sequence of wide characters. No null wide                 |
| 14342 |   | character is added.                                                                                           |
| 14343 | p | Matches an implementation-defined set of sequences, which shall be the same as the set                        |
| 14344 |   | of sequences that is produced by the %p conversion specification of the corresponding                         |
| 14345 |   | <i>fprintf()</i> functions. The application shall ensure that the corresponding argument is a                 |
| 14346 |   | pointer to a pointer to <b>void</b> . The interpretation of the input item is implementation-                 |
| 14347 |   | defined. If the input item is a value converted earlier during the same program                               |
| 14348 |   | execution, the pointer that results shall compare equal to that value; otherwise, the                         |
| 14349 |   | behavior of the %p conversion specification is undefined.                                                     |
| 14350 | n | No input is consumed. The application shall ensure that the corresponding argument is                         |
| 14351 |   | a pointer to the integer into which shall be written the number of bytes read from the                        |

14352 input so far by this call to the *fscanf()* functions. Execution of a `%n` conversion  
 14353 specification shall not increment the assignment count returned at the completion of  
 14354 execution of the function. No argument shall be converted, but one shall be consumed.  
 14355 If the conversion specification includes an assignment-suppressing character or a field  
 14356 width, the behavior is undefined.

14357 XSI **C** Equivalent to `lc`.

14358 XSI **S** Equivalent to `ls`.

14359 `%` Matches a single `'%'` character; no conversion or assignment occurs. The complete  
 14360 conversion specification shall be `%%`.

14361 If a conversion specification is invalid, the behavior is undefined.

14362 The conversion specifiers `A`, `E`, `F`, `G`, and `X` are also valid and shall be equivalent to `a`, `e`, `f`, `g`, and  
 14363 `x`, respectively.

14364 If end-of-file is encountered during input, conversion shall be terminated. If end-of-file occurs  
 14365 before any bytes matching the current conversion specification (except for `%n`) have been read  
 14366 (other than leading white-space characters, where permitted), execution of the current  
 14367 conversion specification shall terminate with an input failure. Otherwise, unless execution of the  
 14368 current conversion specification is terminated with a matching failure, execution of the  
 14369 following conversion specification (if any) shall be terminated with an input failure.

14370 Reaching the end of the string in *sscanf()* shall be equivalent to encountering end-of-file for  
 14371 *fscanf()*.

14372 If conversion terminates on a conflicting input, the offending input is left unread in the input.  
 14373 Any trailing white space (including `<newline>`s) shall be left unread unless matched by a  
 14374 conversion specification. The success of literal matches and suppressed assignments is only  
 14375 directly determinable via the `%n` conversion specification.

14376 CX The *fscanf()* and *scanf()* functions may mark the *st\_atime* field of the file associated with *stream*  
 14377 for update. The *st\_atime* field shall be marked for update by the first successful execution of  
 14378 *fgetc()*, *fgets()*, *fread()*, *getc()*, *getchar()*, *gets()*, *fscanf()*, or *scanf()* using *stream* that returns data  
 14379 not supplied by a prior call to *ungetc()*.

#### 14380 RETURN VALUE

14381 Upon successful completion, these functions shall return the number of successfully matched  
 14382 and assigned input items; this number can be zero in the event of an early matching failure. If  
 14383 the input ends before the first matching failure or conversion, EOF shall be returned. If a read  
 14384 CX error occurs, the error indicator for the stream is set, EOF shall be returned, and *errno* shall be set  
 14385 to indicate the error.

#### 14386 ERRORS

14387 For the conditions under which the *fscanf()* functions fail and may fail, refer to *fgetc()* or  
 14388 *fgetwc()*.

14389 In addition, *fscanf()* may fail if:

14390 XSI **[EILSEQ]** Input byte sequence does not form a valid character.

14391 XSI **[EINVAL]** There are insufficient arguments.

14392 **EXAMPLES**

14393 The call:

```
14394 int i, n; float x; char name[50];
14395 n = scanf("%d%f%s", &i, &x, name);
```

14396 with the input line:

14397 25 54.32E-1 Hamster

14398 assigns to *n* the value 3, to *i* the value 25, to *x* the value 5.432, and *name* contains the string  
14399 "Hamster".

14400 The call:

```
14401 int i; float x; char name[50];
14402 (void) scanf("%2d%f*d %[0123456789]", &i, &x, name);
```

14403 with input:

14404 56789 0123 56a72

14405 assigns 56 to *i*, 789.0 to *x*, skips 0123, and places the string "56\0" in *name*. The next call to  
14406 *getchar()* shall return the character 'a'.

14407 **Reading Data into an Array**

14408 The following call uses *fscanf()* to read three floating-point numbers from standard input into  
14409 the *input* array.

```
14410 float input[3]; fscanf (stdin, "%f %f %f", input, input+1, input+2);
```

14411 **APPLICATION USAGE**

14412 If the application calling *fscanf()* has any objects of type **wint\_t** or **wchar\_t**, it must also include  
14413 the **<wchar.h>** header to have these objects defined.

14414 **RATIONALE**

14415 This function is aligned with the ISO/IEC 9899:1999 standard, and in doing so a few "obvious"  
14416 things were not included. Specifically, the set of characters allowed in a scanset is limited to  
14417 single-byte characters. In other similar places, multi-byte characters have been permitted, but  
14418 for alignment with the ISO/IEC 9899:1999 standard, it has not been done here. Applications  
14419 needing this could use the corresponding wide-character functions to achieve the desired  
14420 results.

14421 **FUTURE DIRECTIONS**

14422 None.

14423 **SEE ALSO**

14424 *getc()*, *printf()*, *setlocale()*, *strtod()*, *strtol()*, *strtoul()*, *wcrtomb()*, the Base Definitions volume of  
14425 IEEE Std 1003.1-2001, Chapter 7, Locale, **<langinfo.h>**, **<stdio.h>**, **<wchar.h>**

14426 **CHANGE HISTORY**

14427 First released in Issue 1. Derived from Issue 1 of the SVID.

14428 **Issue 5**

14429 Aligned with ISO/IEC 9899:1990/Amendment 1:1995 (E). Specifically, the **l** (ell) qualifier is  
14430 now defined for the **c**, **s**, and **[** conversion specifiers.

14431 The DESCRIPTION is updated to indicate that if infinity and NaN can be generated by the  
14432 *fprintf()* family of functions, then they are recognized by the *fscanf()* family.

14433 **Issue 6**

14434 The Open Group Corrigenda U021/7 and U028/10 are applied. These correct several  
14435 occurrences of “characters” in the text which have been replaced with the term “bytes”.

14436 The DESCRIPTION is updated to avoid use of the term “must” for application requirements.

14437 The following changes are made for alignment with the ISO/IEC 9899:1999 standard:

14438 • The prototypes for *fscanf()*, *scanf()*, and *sscanf()* are updated.

14439 • The DESCRIPTION is updated.

14440 • The *hh*, *ll*, *j*, *t*, and *z* length modifiers are added.

14441 • The *a*, *A*, and *F* conversion characters are added.

14442 The DESCRIPTION is updated to use the terms “conversion specifier” and “conversion  
14443 specification” consistently.

## 14444 NAME

14445       fseek, fseeko — reposition a file-position indicator in a stream

## 14446 SYNOPSIS

14447       #include <stdio.h>

14448       int fseek(FILE \*stream, long offset, int whence);

14449 CX      int fseeko(FILE \*stream, off\_t offset, int whence);

14450

## 14451 DESCRIPTION

14452 CX      The functionality described on this reference page is aligned with the ISO C standard. Any  
14453 conflict between the requirements described here and the ISO C standard is unintentional. This  
14454 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

14455       The *fseek()* function shall set the file-position indicator for the stream pointed to by *stream*. If a  
14456 read or write error occurs, the error indicator for the stream shall be set and *fseek()* fails.

14457       The new position, measured in bytes from the beginning of the file, shall be obtained by adding  
14458 *offset* to the position specified by *whence*. The specified point is the beginning of the file for  
14459 SEEK\_SET, the current value of the file-position indicator for SEEK\_CUR, or end-of-file for  
14460 SEEK\_END.

14461       If the stream is to be used with wide-character input/output functions, the application shall  
14462 ensure that *offset* is either 0 or a value returned by an earlier call to *ftell()* on the same stream and  
14463 *whence* is SEEK\_SET.

14464       A successful call to *fseek()* shall clear the end-of-file indicator for the stream and undo any effects  
14465 of *ungetc()* and *ungetwc()* on the same stream. After an *fseek()* call, the next operation on an  
14466 update stream may be either input or output.

14467 CX      If the most recent operation, other than *ftell()*, on a given stream is *flush()*, the file offset in the  
14468 underlying open file description shall be adjusted to reflect the location specified by *fseek()*.

14469       The *fseek()* function shall allow the file-position indicator to be set beyond the end of existing  
14470 data in the file. If data is later written at this point, subsequent reads of data in the gap shall  
14471 return bytes with the value 0 until data is actually written into the gap.

14472       The behavior of *fseek()* on devices which are incapable of seeking is implementation-defined.  
14473 The value of the file offset associated with such a device is undefined.

14474       If the stream is writable and buffered data had not been written to the underlying file, *fseek()*  
14475 shall cause the unwritten data to be written to the file and shall mark the *st\_ctime* and *st\_mtime*  
14476 fields of the file for update.

14477       In a locale with state-dependent encoding, whether *fseek()* restores the stream's shift state is  
14478 implementation-defined.

14479       The *fseeko()* function shall be equivalent to the *fseek()* function except that the *offset* argument is  
14480 of type **off\_t**.

## 14481 RETURN VALUE

14482 CX      The *fseek()* and *fseeko()* functions shall return 0 if they succeed.

14483 CX      Otherwise, they shall return -1 and set *errno* to indicate the error.

## 14484 ERRORS

14485 CX      The *fseek()* and *fseeko()* functions shall fail if, either the *stream* is unbuffered or the *stream*'s  
14486 buffer needed to be flushed, and the call to *fseek()* or *fseeko()* causes an underlying *lseek()* or  
14487 *write()* to be invoked, and:

|                                              |             |                                                                                                                                                                                                                                                                                                                                                                 |
|----------------------------------------------|-------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 14488 CX<br>14489                            | [EAGAIN]    | The O_NONBLOCK flag is set for the file descriptor and the process would be delayed in the write operation.                                                                                                                                                                                                                                                     |
| 14490 CX<br>14491                            | [EBADF]     | The file descriptor underlying the stream file is not open for writing or the stream's buffer needed to be flushed and the file is not open.                                                                                                                                                                                                                    |
| 14492 CX                                     | [EFBIG]     | An attempt was made to write a file that exceeds the maximum file size.                                                                                                                                                                                                                                                                                         |
| 14493 XSI                                    | [EFBIG]     | An attempt was made to write a file that exceeds the process' file size limit.                                                                                                                                                                                                                                                                                  |
| 14494 CX<br>14495                            | [EFBIG]     | The file is a regular file and an attempt was made to write at or beyond the offset maximum associated with the corresponding stream.                                                                                                                                                                                                                           |
| 14496 CX<br>14497                            | [EINTR]     | The write operation was terminated due to the receipt of a signal, and no data was transferred.                                                                                                                                                                                                                                                                 |
| 14498 CX<br>14499                            | [EINVAL]    | The <i>whence</i> argument is invalid. The resulting file-position indicator would be set to a negative value.                                                                                                                                                                                                                                                  |
| 14500 CX<br>14501<br>14502<br>14503<br>14504 | [EIO]       | A physical I/O error has occurred, or the process is a member of a background process group attempting to perform a <i>write()</i> to its controlling terminal, TOSTOP is set, the process is neither ignoring nor blocking SIGTTOU, and the process group of the process is orphaned. This error may also be returned under implementation-defined conditions. |
| 14505 CX                                     | [ENOSPC]    | There was no free space remaining on the device containing the file.                                                                                                                                                                                                                                                                                            |
| 14506 CX<br>14507                            | [ENXIO]     | A request was made of a nonexistent device, or the request was outside the capabilities of the device.                                                                                                                                                                                                                                                          |
| 14508 CX<br>14509                            | [EOVERFLOW] | For <i>fseek()</i> , the resulting file offset would be a value which cannot be represented correctly in an object of type <b>long</b> .                                                                                                                                                                                                                        |
| 14510 CX<br>14511                            | [EOVERFLOW] | For <i>fseeko()</i> , the resulting file offset would be a value which cannot be represented correctly in an object of type <b>off_t</b> .                                                                                                                                                                                                                      |
| 14512 CX<br>14513                            | [EPIPE]     | An attempt was made to write to a pipe or FIFO that is not open for reading by any process; a SIGPIPE signal shall also be sent to the thread.                                                                                                                                                                                                                  |
| 14514 CX                                     | [ESPIPE]    | The file descriptor underlying <i>stream</i> is associated with a pipe or FIFO.                                                                                                                                                                                                                                                                                 |

**14526 CHANGE HISTORY**

14527 First released in Issue 1. Derived from Issue 1 of the SVID.

14528 **Issue 5**

14529 Normative text previously in the APPLICATION USAGE section is moved to the  
14530 DESCRIPTION.

14531 Large File Summit extensions are added.

14532 **Issue 6**

14533 Extensions beyond the ISO C standard are marked.

14534 The following new requirements on POSIX implementations derive from alignment with the  
14535 Single UNIX Specification:

14536 • The *fseeko()* function is added.

14537 • The [EFBIG], [EOVERFLOW], and [ENXIO] mandatory error conditions are added.

14538 The following change is incorporated for alignment with the FIPS requirements:

14539 • The [EINTR] error is no longer an indication that the implementation does not report partial  
14540 transfers.

14541 The DESCRIPTION is updated to avoid use of the term “must” for application requirements.

14542 The DESCRIPTION is updated to explicitly state that *fseek()* sets the file-position indicator, and  
14543 then on error the error indicator is set and *fseek()* fails. This is for alignment with the  
14544 ISO/IEC 9899:1999 standard.

14545 **NAME**

14546           fsetpos — set current file position

14547 **SYNOPSIS**

14548           #include &lt;stdio.h&gt;

14549           int fsetpos(FILE \*stream, const fpos\_t \*pos);

14550 **DESCRIPTION**

14551 CX       The functionality described on this reference page is aligned with the ISO C standard. Any  
 14552       conflict between the requirements described here and the ISO C standard is unintentional. This  
 14553       volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

14554       The *fsetpos()* function shall set the file position and state indicators for the stream pointed to by  
 14555       *stream* according to the value of the object pointed to by *pos*, which the application shall ensure  
 14556       is a value obtained from an earlier call to *fgetpos()* on the same stream. If a read or write error  
 14557       occurs, the error indicator for the stream shall be set and *fsetpos()* fails.

14558       A successful call to the *fsetpos()* function shall clear the end-of-file indicator for the stream and  
 14559       undo any effects of *ungetc()* on the same stream. After an *fsetpos()* call, the next operation on an  
 14560       update stream may be either input or output.

14561 CX       The behavior of *fsetpos()* on devices which are incapable of seeking is implementation-defined.  
 14562       The value of the file offset associated with such a device is undefined.

14563 **RETURN VALUE**

14564       The *fsetpos()* function shall return 0 if it succeeds; otherwise, it shall return a non-zero value and  
 14565       set *errno* to indicate the error.

14566 **ERRORS**

14567 CX       The *fsetpos()* function shall fail if, either the *stream* is unbuffered or the *stream*'s buffer needed to  
 14568       be flushed, and the call to *fsetpos()* causes an underlying *lseek()* or *write()* to be invoked, and:

14569 CX       [EAGAIN]       The O\_NONBLOCK flag is set for the file descriptor and the process would be  
 14570       delayed in the write operation.

14571 CX       [EBADF]       The file descriptor underlying the stream file is not open for writing or the  
 14572       stream's buffer needed to be flushed and the file is not open.

14573 CX       [EFBIG]       An attempt was made to write a file that exceeds the maximum file size.

14574 XSI       [EFBIG]       An attempt was made to write a file that exceeds the process' file size limit.

14575 CX       [EFBIG]       The file is a regular file and an attempt was made to write at or beyond the  
 14576       offset maximum associated with the corresponding stream.

14577 CX       [EINTR]       The write operation was terminated due to the receipt of a signal, and no data  
 14578       was transferred.

14579 CX       [EINVAL]       The *whence* argument is invalid. The resulting file-position indicator would be  
 14580       set to a negative value.

14581 CX       [EIO]       A physical I/O error has occurred, or the process is a member of a  
 14582       background process group attempting to perform a *write()* to its controlling  
 14583       terminal, TOSTOP is set, the process is neither ignoring nor blocking  
 14584       SIGTTOU, and the process group of the process is orphaned. This error may  
 14585       also be returned under implementation-defined conditions.

14586 CX       [ENOSPC]       There was no free space remaining on the device containing the file.

14587 CX [ENXIO] A request was made of a nonexistent device, or the request was outside the  
14588 capabilities of the device.

14589 CX [EPIPE] The file descriptor underlying *stream* is associated with a pipe or FIFO.

14590 CX [EPIPE] An attempt was made to write to a pipe or FIFO that is not open for reading  
14591 by any process; a SIGPIPE signal shall also be sent to the thread.

14599 None.

#### 14600 SEE ALSO

14601 *fopen()*, *ftell()*, *lseek()*, *rewind()*, *ungetc()*, *write()*, the Base Definitions volume of  
14602 IEEE Std 1003.1-2001, <stdio.h>

#### 14603 CHANGE HISTORY

14604 First released in Issue 4. Derived from the ISO C standard.

#### 14605 Issue 6

14606 Extensions beyond the ISO C standard are marked.

14607 An additional [EPIPE] error condition is added for sockets.

14608 The DESCRIPTION is updated to avoid use of the term “must” for application requirements.

14609 The DESCRIPTION is updated to clarify that the error indicator is set for the stream on a read or  
14610 write error. This is for alignment with the ISO/IEC 9899:1999 standard.

14611 **NAME**

14612           fstat — get file status

14613 **SYNOPSIS**

14614           #include &lt;sys/stat.h&gt;

14615           int fstat(int *fildev*, struct stat \**buf*);14616 **DESCRIPTION**14617           The *fstat()* function shall obtain information about an open file associated with the file  
14618           descriptor *fildev*, and shall write it to the area pointed to by *buf*.14619 SHM       If *fildev* references a shared memory object, the implementation shall update in the **stat** structure  
14620           pointed to by the *buf* argument only the *st\_uid*, *st\_gid*, *st\_size*, and *st\_mode* fields, and only the  
14621           S\_IRUSR, S\_IWUSR, S\_IRGRP, S\_IWGRP, S\_IROTH, and S\_IWOTH file permission bits need be  
14622           valid. The implementation may update other fields and flags.14623 TYM       If *fildev* references a typed memory object, the implementation shall update in the **stat** structure  
14624           pointed to by the *buf* argument only the *st\_uid*, *st\_gid*, *st\_size*, and *st\_mode* fields, and only the  
14625           S\_IRUSR, S\_IWUSR, S\_IRGRP, S\_IWGRP, S\_IROTH, and S\_IWOTH file permission bits need be  
14626           valid. The implementation may update other fields and flags.14627           The *buf* argument is a pointer to a **stat** structure, as defined in <sys/stat.h>, into which  
14628           information is placed concerning the file.14629           The structure members *st\_mode*, *st\_ino*, *st\_dev*, *st\_uid*, *st\_gid*, *st\_atime*, *st\_ctime*, and *st\_mtime*  
14630           shall have meaningful values for all other file types defined in this volume of  
14631           IEEE Std 1003.1-2001. The value of the member *st\_nlink* shall be set to the number of links to the  
14632           file.14633           An implementation that provides additional or alternative file access control mechanisms may,  
14634           under implementation-defined conditions, cause *fstat()* to fail.14635           The *fstat()* function shall update any time-related fields as described in the Base Definitions  
14636           volume of IEEE Std 1003.1-2001, Section 4.7, File Times Update, before writing into the **stat**  
14637           structure.14638 **RETURN VALUE**14639           Upon successful completion, 0 shall be returned. Otherwise, -1 shall be returned and *errno* set to  
14640           indicate the error.14641 **ERRORS**14642           The *fstat()* function shall fail if:14643           [EBAADF]       The *fildev* argument is not a valid file descriptor.

14644           [EIO]         An I/O error occurred while reading from the file system.

14645           [EOVERFLOW]   The file size in bytes or the number of blocks allocated to the file or the file  
14646           serial number cannot be represented correctly in the structure pointed to by  
14647           *buf*.14648           The *fstat()* function may fail if:14649           [EOVERFLOW]   One of the values is too large to store into the structure pointed to by the *buf*  
14650           argument.

14651 **EXAMPLES**14652 **Obtaining File Status Information**

14653 The following example shows how to obtain file status information for a file named  
 14654 `/home/cnd/mod1`. The structure variable `buffer` is defined for the `stat` structure. The  
 14655 `/home/cnd/mod1` file is opened with read/write privileges and is passed to the open file  
 14656 descriptor `fildev`.

```
14657 #include <sys/types.h>
14658 #include <sys/stat.h>
14659 #include <fcntl.h>

14660 struct stat buffer;
14661 int status;
14662 ...
14663 fildev = open("/home/cnd/mod1", O_RDWR);
14664 status = fstat(fildev, &buffer);
```

14665 **APPLICATION USAGE**

14666 None.

14667 **RATIONALE**

14668 None.

14669 **FUTURE DIRECTIONS**

14670 None.

14671 **SEE ALSO**

14672 `lstat()`, `stat()`, the Base Definitions volume of IEEE Std 1003.1-2001, `<sys/stat.h>`, `<sys/types.h>`

14673 **CHANGE HISTORY**

14674 First released in Issue 1. Derived from Issue 1 of the SVID.

14675 **Issue 5**

14676 The DESCRIPTION is updated for alignment with the POSIX Realtime Extension.

14677 Large File Summit extensions are added.

14678 **Issue 6**

14679 In the SYNOPSIS, the optional include of the `<sys/types.h>` header is removed.

14680 The following new requirements on POSIX implementations derive from alignment with the  
 14681 Single UNIX Specification:

- 14682 • The requirement to include `<sys/types.h>` has been removed. Although `<sys/types.h>` was  
 14683 required for conforming implementations of previous POSIX specifications, it was not  
 14684 required for UNIX applications.
- 14685 • The [EIO] mandatory error condition is added.
- 14686 • The [EOVERFLOW] mandatory error condition is added. This change is to support large  
 14687 files.
- 14688 • The [EOVERFLOW] optional error condition is added.

14689 The DESCRIPTION is updated for alignment with IEEE Std 1003.1j-2000 by specifying that  
 14690 shared memory object semantics apply to typed memory objects.

14691 **NAME**

14692 fstatvfs, statvfs — get file system information

14693 **SYNOPSIS**

14694 XSI #include &lt;sys/statvfs.h&gt;

14695 int fstatvfs(int *fildev*, struct statvfs \**buf*);14696 int statvfs(const char \*restrict *path*, struct statvfs \*restrict *buf*);

14697

14698 **DESCRIPTION**14699 The *fstatvfs()* function shall obtain information about the file system containing the file  
14700 referenced by *fildev*.14701 The *statvfs()* function shall obtain information about the file system containing the file named by  
14702 *path*.14703 For both functions, the *buf* argument is a pointer to a **statvfs** structure that shall be filled. Read,  
14704 write, or execute permission of the named file is not required.14705 The following flags can be returned in the *f\_flag* member:

14706 ST\_RDONLY Read-only file system.

14707 ST\_NOSUID Setuid/setgid bits ignored by *exec*.14708 It is unspecified whether all members of the **statvfs** structure have meaningful values on all file  
14709 systems.14710 **RETURN VALUE**14711 Upon successful completion, *statvfs()* shall return 0. Otherwise, it shall return  $-1$  and set *errno* to  
14712 indicate the error.14713 **ERRORS**14714 The *fstatvfs()* and *statvfs()* functions shall fail if:

14715 [EIO] An I/O error occurred while reading the file system.

14716 [EINTR] A signal was caught during execution of the function.

14717 [EOVERFLOW] One of the values to be returned cannot be represented correctly in the  
14718 structure pointed to by *buf*.14719 The *fstatvfs()* function shall fail if:14720 [EBADF] The *fildev* argument is not an open file descriptor.14721 The *statvfs()* function shall fail if:

14722 [EACCES] Search permission is denied on a component of the path prefix.

14723 [ELOOP] A loop exists in symbolic links encountered during resolution of the *path*  
14724 argument.

14725 [ENAMETOOLONG]

14726 The length of a pathname exceeds {PATH\_MAX} or a pathname component is  
14727 longer than {NAME\_MAX}.14728 [ENOENT] A component of *path* does not name an existing file or *path* is an empty string.14729 [ENOTDIR] A component of the path prefix of *path* is not a directory.14730 The *statvfs()* function may fail if:

14731 [ELOOP] More than {SYMLOOP\_MAX} symbolic links were encountered during  
14732 resolution of the *path* argument.

14733 [ENAMETOOLONG]  
14734 Pathname resolution of a symbolic link produced an intermediate result  
14735 whose length exceeds {PATH\_MAX}.

#### 14736 EXAMPLES

##### 14737 Obtaining File System Information Using *fstatvfs()*

14738 The following example shows how to obtain file system information for the file system upon  
14739 which the file named */home/cnd/mod1* resides, using the *fstatvfs()* function. The  
14740 */home/cnd/mod1* file is opened with read/write privileges and the open file descriptor is passed  
14741 to the *fstatvfs()* function.

```
14742 #include <statvfs.h>
14743 #include <fcntl.h>
14744 struct statvfs buffer;
14745 int status;
14746 ...
14747 fildes = open("/home/cnd/mod1", O_RDWR);
14748 status = fstatvfs(fildes, &buffer);
```

##### 14749 Obtaining File System Information Using *statvfs()*

14750 The following example shows how to obtain file system information for the file system upon  
14751 which the file named */home/cnd/mod1* resides, using the *statvfs()* function.

```
14752 #include <statvfs.h>
14753 struct statvfs buffer;
14754 int status;
14755 ...
14756 status = statvfs("/home/cnd/mod1", &buffer);
```

#### 14757 APPLICATION USAGE

14758 None.

#### 14759 RATIONALE

14760 None.

#### 14761 FUTURE DIRECTIONS

14762 None.

#### 14763 SEE ALSO

#### 14766 CHANGE HISTORY

14767 First released in Issue 4, Version 2.

#### 14768 Issue 5

14769 Moved from X/OPEN UNIX extension to BASE.

14770 Large File Summit extensions are added.

14771 **Issue 6**

- 14772 The DESCRIPTION is updated to avoid use of the term “must” for application requirements.
- 14773 The **restrict** keyword is added to the *statvfs()* prototype for alignment with the  
14774 ISO/IEC 9899:1999 standard.
- 14775 The wording of the mandatory [ELOOP] error condition is updated, and a second optional  
14776 [ELOOP] error condition is added.

14777 **NAME**

14778 fsync — synchronize changes to a file

14779 **SYNOPSIS**

14780 FSC #include &lt;unistd.h&gt;

14781 int fsync(int *fildev*);

14782

14783 **DESCRIPTION**

14784 The *fsync()* function shall request that all data for the open file descriptor named by *fildev* is to be  
 14785 transferred to the storage device associated with the file described by *fildev* in an  
 14786 implementation-defined manner. The *fsync()* function shall not return until the system has  
 14787 completed that action or until an error is detected.

14788 SIO If `_POSIX_SYNCHRONIZED_IO` is defined, the *fsync()* function shall force all currently queued  
 14789 I/O operations associated with the file indicated by file descriptor *fildev* to the synchronized I/O  
 14790 completion state. All I/O operations shall be completed as defined for synchronized I/O file  
 14791 integrity completion.

14792 **RETURN VALUE**

14793 Upon successful completion, *fsync()* shall return 0. Otherwise, `-1` shall be returned and *errno* set  
 14794 to indicate the error. If the *fsync()* function fails, outstanding I/O operations are not guaranteed  
 14795 to have been completed.

14796 **ERRORS**14797 The *fsync()* function shall fail if:14798 [EBADF] The *fildev* argument is not a valid descriptor.14799 [EINTR] The *fsync()* function was interrupted by a signal.14800 [EINVAL] The *fildev* argument does not refer to a file on which this operation is possible.

14801 [EIO] An I/O error occurred while reading from or writing to the file system.

14802 In the event that any of the queued I/O operations fail, *fsync()* shall return the error conditions  
 14803 defined for *read()* and *write()*.

14804 **EXAMPLES**

14805 None.

14806 **APPLICATION USAGE**

14807 The *fsync()* function should be used by programs which require modifications to a file to be  
 14808 completed before continuing; for example, a program which contains a simple transaction  
 14809 facility might use it to ensure that all modifications to a file or files caused by a transaction are  
 14810 recorded.

14811 **RATIONALE**

14812 The *fsync()* function is intended to force a physical write of data from the buffer cache, and to  
 14813 assure that after a system crash or other failure that all data up to the time of the *fsync()* call is  
 14814 recorded on the disk. Since the concepts of “buffer cache”, “system crash”, “physical write”, and  
 14815 “non-volatile storage” are not defined here, the wording has to be more abstract.

14816 If `_POSIX_SYNCHRONIZED_IO` is not defined, the wording relies heavily on the conformance  
 14817 document to tell the user what can be expected from the system. It is explicitly intended that a  
 14818 null implementation is permitted. This could be valid in the case where the system cannot assure  
 14819 non-volatile storage under any circumstances or when the system is highly fault-tolerant and the  
 14820 functionality is not required. In the middle ground between these extremes, *fsync()* might or  
 14821 might not actually cause data to be written where it is safe from a power failure. The

14822 conformance document should identify at least that one configuration exists (and how to obtain  
14823 that configuration) where this can be assured for at least some files that the user can select to use  
14824 for critical data. It is not intended that an exhaustive list is required, but rather sufficient  
14825 information is provided so that if critical data needs to be saved, the user can determine how the  
14826 system is to be configured to allow the data to be written to non-volatile storage.

14827 It is reasonable to assert that the key aspects of *fsync()* are unreasonable to test in a test suite.  
14828 That does not make the function any less valuable, just more difficult to test. A formal  
14829 conformance test should probably force a system crash (power shutdown) during the test for  
14830 this condition, but it needs to be done in such a way that automated testing does not require this  
14831 to be done except when a formal record of the results is being made. It would also not be  
14832 unreasonable to omit testing for *fsync()*, allowing it to be treated as a quality-of-implementation  
14833 issue.

#### 14834 **FUTURE DIRECTIONS**

14835 None.

#### 14836 **SEE ALSO**

14837 *sync()*, the Base Definitions volume of IEEE Std 1003.1-2001, <**unistd.h**>

#### 14838 **CHANGE HISTORY**

14839 First released in Issue 3.

#### 14840 **Issue 5**

14841 Aligned with *fsync()* in the POSIX Realtime Extension. Specifically, the DESCRIPTION and  
14842 RETURN VALUE sections are much expanded, and the ERRORS section is updated to indicate  
14843 that *fsync()* can return the error conditions defined for *read()* and *write()*.

#### 14844 **Issue 6**

14845 This function is marked as part of the File Synchronization option.

14846 The following new requirements on POSIX implementations derive from alignment with the  
14847 Single UNIX Specification:

- 14848 • The [EINVAL] and [EIO] mandatory error conditions are added.

14849 **NAME**

14850 ftell, ftello — return a file offset in a stream

14851 **SYNOPSIS**

14852 #include &lt;stdio.h&gt;

14853 long ftell(FILE \*stream);

14854 CX off\_t ftello(FILE \*stream);

14855

14856 **DESCRIPTION**

14857 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
 14858 conflict between the requirements described here and the ISO C standard is unintentional. This  
 14859 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

14860 The *ftell()* function shall obtain the current value of the file-position indicator for the stream  
 14861 pointed to by *stream*.

14862 CX The *ftello()* function shall be equivalent to *ftell()*, except that the return value is of type **off\_t**.

14863 **RETURN VALUE**

14864 CX Upon successful completion, *ftell()* and *ftello()* shall return the current value of the file-position  
 14865 indicator for the stream measured in bytes from the beginning of the file.

14866 CX Otherwise, *ftell()* and *ftello()* shall return  $-1$ , cast to **long** and **off\_t** respectively, and set *errno* to  
 14867 indicate the error.

14868 **ERRORS**

14869 CX The *ftell()* and *ftello()* functions shall fail if:

14870 CX [EBADF] The file descriptor underlying *stream* is not an open file descriptor.

14871 CX [EOVERFLOW] For *ftell()*, the current file offset cannot be represented correctly in an object of  
 14872 type **long**.

14873 CX [EOVERFLOW] For *ftello()*, the current file offset cannot be represented correctly in an object  
 14874 of type **off\_t**.

14875 CX [ESPIPE] The file descriptor underlying *stream* is associated with a pipe or FIFO.

14876 The *ftell()* function may fail if:

14877 CX [ESPIPE] The file descriptor underlying *stream* is associated with a socket.

14878 **EXAMPLES**

14879 None.

14880 **APPLICATION USAGE**

14881 None.

14882 **RATIONALE**

14883 None.

14884 **FUTURE DIRECTIONS**

14885 None.

14886 **SEE ALSO**14887 *fgetpos()*, *fopen()*, *fseek()*, *lseek()*, the Base Definitions volume of IEEE Std 1003.1-2001, <stdio.h>

14888 **CHANGE HISTORY**

14889 First released in Issue 1. Derived from Issue 1 of the SVID.

14890 **Issue 5**

14891 Large File Summit extensions are added.

14892 **Issue 6**

14893 Extensions beyond the ISO C standard are marked.

14894 The following new requirements on POSIX implementations derive from alignment with the  
14895 Single UNIX Specification:

- 14896 • The *ftello()* function is added.
- 14897 • The [Eoverflow] error conditions are added.

14898 An additional [ESPIPE] error condition is added for sockets.

14899 **NAME**14900 ftime — get date and time (**LEGACY**)14901 **SYNOPSIS**14902 xSI `#include <sys/timeb.h>`14903 `int ftime(struct timeb *tp);`

14904

14905 **DESCRIPTION**

14906 The *ftime()* function shall set the *time* and *millitm* members of the **timeb** structure pointed to by  
 14907 *tp* to contain the seconds and milliseconds portions, respectively, of the current time in seconds  
 14908 since the Epoch. The contents of the *timezone* and *dstflag* members of *tp* after a call to *ftime()* are  
 14909 unspecified.

14910 The system clock need not have millisecond granularity. Depending on any granularity  
 14911 (particularly a granularity of one) renders code non-portable.

14912 **RETURN VALUE**14913 Upon successful completion, the *ftime()* function shall return 0; otherwise, -1 shall be returned.14914 **ERRORS**

14915 No errors are defined.

14916 **EXAMPLES**14917 **Getting the Current Time and Date**

14918 The following example shows how to get the current system time values using the *ftime()*  
 14919 function. The **timeb** structure pointed to by *tp* is filled with the current system time values for  
 14920 *time* and *millitm*.

14921 `#include <sys/timeb.h>`14922 `struct timeb tp;`14923 `int status;`14924 `...`14925 `status = ftime(&tp);`14926 **APPLICATION USAGE**

14927 For applications portability, the *time()* function should be used to determine the current time  
 14928 instead of *ftime()*. Realtime applications should use *clock\_gettime()* to determine the current  
 14929 time instead of *ftime()*.

14930 **RATIONALE**

14931 None.

14932 **FUTURE DIRECTIONS**

14933 This function may be withdrawn in a future version.

14934 **SEE ALSO**

14935 *clock\_getres()*, *ctime()*, *gettimeofday()*, *time()*, the Base Definitions volume of  
 14936 IEEE Std 1003.1-2001, <sys/timeb.h>

14937 **CHANGE HISTORY**

14938 First released in Issue 4, Version 2.

14939 **Issue 5**

14940 Moved from X/OPEN UNIX extension to BASE.

14941 Normative text previously in the APPLICATION USAGE section is moved to the  
14942 DESCRIPTION.

14943 **Issue 6**

14944 This function is marked LEGACY.

14945 The DESCRIPTION is updated to refer to “seconds since the Epoch” rather than “seconds since  
14946 00:00:00 UTC (Coordinated Universal Time), January 1 1970” for consistency with other *time*  
14947 functions.

14948 **NAME**

14949 ftok — generate an IPC key

14950 **SYNOPSIS**

14951 xSI #include &lt;sys/ipc.h&gt;

14952 key\_t ftok(const char \*path, int id);

14953

14954 **DESCRIPTION**

14955 The *ftok()* function shall return a key based on *path* and *id* that is usable in subsequent calls to  
 14956 *msgget()*, *semget()*, and *shmget()*. The application shall ensure that the *path* argument is the  
 14957 pathname of an existing file that the process is able to *stat()*.

14958 The *ftok()* function shall return the same key value for all paths that name the same file, when  
 14959 called with the same *id* value, and return different key values when called with different *id*  
 14960 values or with paths that name different files existing on the same file system at the same time. It  
 14961 is unspecified whether *ftok()* shall return the same key value when called again after the file  
 14962 named by *path* is removed and recreated with the same name.

14963 Only the low-order 8-bits of *id* are significant. The behavior of *ftok()* is unspecified if these bits  
 14964 are 0.

14965 **RETURN VALUE**

14966 Upon successful completion, *ftok()* shall return a key. Otherwise, *ftok()* shall return (**key\_t**)−1  
 14967 and set *errno* to indicate the error.

14968 **ERRORS**14969 The *ftok()* function shall fail if:

14970 [EACCES] Search permission is denied for a component of the path prefix.

14971 [ELOOP] A loop exists in symbolic links encountered during resolution of the *path*  
 14972 argument.

14973 [ENAMETOOLONG]

14974 The length of the *path* argument exceeds {PATH\_MAX} or a pathname  
 14975 component is longer than {NAME\_MAX}.

14976 [ENOENT] A component of *path* does not name an existing file or *path* is an empty string.

14977 [ENOTDIR] A component of the path prefix is not a directory.

14978 The *ftok()* function may fail if:

14979 [ELOOP] More than {SYMLOOP\_MAX} symbolic links were encountered during  
 14980 resolution of the *path* argument.

14981 [ENAMETOOLONG]

14982 Pathname resolution of a symbolic link produced an intermediate result  
 14983 whose length exceeds {PATH\_MAX}.

14984 **EXAMPLES**14985 **Getting an IPC Key**

14986 The following example gets a unique key that can be used by the IPC functions *semget()*,  
 14987 *msgget()*, and *shmget()*. The key returned by *ftok()* for this example is based on the ID value *S*  
 14988 and the pathname */tmp*.

```
14989 #include <sys/ipc.h>
14990 ...
14991 key_t key;
14992 char *path = "/tmp";
14993 int id = 'S';
14994 key = ftok(path, id);
```

14995 **Saving an IPC Key**

14996 The following example gets a unique key based on the pathname */tmp* and the ID value *a*. It  
 14997 also assigns the value of the resulting key to the *semkey* variable so that it will be available to a  
 14998 later call to *semget()*, *msgget()*, or *shmget()*.

```
14999 #include <sys/ipc.h>
15000 ...
15001 key_t semkey;
15002 if ((semkey = ftok("/tmp", 'a')) == (key_t) -1) {
15003     perror("IPC error: ftok"); exit(1);
15004 }
```

15005 **APPLICATION USAGE**

15006 For maximum portability, *id* should be a single-byte character.

15007 **RATIONALE**

15008 None.

15009 **FUTURE DIRECTIONS**

15010 None.

15011 **SEE ALSO**

15012 *msgget()*, *semget()*, *shmget()*, the Base Definitions volume of IEEE Std 1003.1-2001, *<sys/ipc.h>*

15013 **CHANGE HISTORY**

15014 First released in Issue 4, Version 2.

15015 **Issue 5**

15016 Moved from X/OPEN UNIX extension to BASE.

15017 **Issue 6**

15018 The DESCRIPTION is updated to avoid use of the term “must” for application requirements.

15019 The wording of the mandatory [ELOOP] error condition is updated, and a second optional  
 15020 [ELOOP] error condition is added.

15021 **NAME**

15022 ftruncate — truncate a file to a specified length

15023 **SYNOPSIS**

15024 #include &lt;unistd.h&gt;

15025 int ftruncate(int *fildev*, off\_t *length*);15026 **DESCRIPTION**15027 If *fildev* is not a valid file descriptor open for writing, the *ftruncate()* function shall fail.

15028 If *fildev* refers to a regular file, the *ftruncate()* function shall cause the size of the file to be truncated to *length*. If the size of the file previously exceeded *length*, the extra data shall no longer be available to reads on the file. If the file previously was smaller than this size, *ftruncate()* shall either increase the size of the file or fail. XSI-conformant systems shall increase the size of the file. If the file size is increased, the extended area shall appear as if it were zero-filled. The value of the seek pointer shall not be modified by a call to *ftruncate()*.

15034 Upon successful completion, if *fildev* refers to a regular file, the *ftruncate()* function shall mark for update the *st\_ctime* and *st\_mtime* fields of the file and the S\_ISUID and S\_ISGID bits of the file mode may be cleared. If the *ftruncate()* function is unsuccessful, the file is unaffected.

15037 XSI If the request would cause the file size to exceed the soft file size limit for the process, the request shall fail and the implementation shall generate the SIGXFSZ signal for the thread.

15039 If *fildev* refers to a directory, *ftruncate()* shall fail.15040 If *fildev* refers to any other file type, except a shared memory object, the result is unspecified.

15041 SHM If *fildev* refers to a shared memory object, *ftruncate()* shall set the size of the shared memory object to *length*.

15043 MF|SHM If the effect of *ftruncate()* is to decrease the size of a shared memory object or memory mapped file and whole pages beyond the new end were previously mapped, then the whole pages beyond the new end shall be discarded.

15046 MPR If the Memory Protection option is supported, references to discarded pages shall result in the generation of a SIGBUS signal; otherwise, the result of such references is undefined.

15048 MF|SHM If the effect of *ftruncate()* is to increase the size of a shared memory object, it is unspecified whether the contents of any mapped pages between the old end-of-file and the new are flushed to the underlying object.

15051 **RETURN VALUE**

15052 Upon successful completion, *ftruncate()* shall return 0; otherwise, -1 shall be returned and *errno* set to indicate the error.

15054 **ERRORS**15055 The *ftruncate()* function shall fail if:

15056 [EINTR] A signal was caught during execution.

15057 [EINVAL] The *length* argument was less than 0.

15058 [EFBIG] or [EINVAL]

15059 The *length* argument was greater than the maximum file size.

15060 XSI [EFBIG] The file is a regular file and *length* is greater than the offset maximum established in the open file description associated with *fildev*.

15062 [EIO] An I/O error occurred while reading from or writing to a file system.

- 15063 [EBADF] or [EINVAL]  
 15064 The *fildest* argument is not a file descriptor open for writing.
- 15065 [EINVAL]  
 15066 The *fildest* argument references a file that was opened without write permission.
- 15067 [EROFS] The named file resides on a read-only file system.

15068 **EXAMPLES**

15069 None.

15070 **APPLICATION USAGE**

15071 None.

15072 **RATIONALE**

15073 The *ftruncate()* function is part of IEEE Std 1003.1-2001 as it was deemed to be more useful than  
 15074 *truncate()*. The *truncate()* function is provided as an XSI extension.

15075 **FUTURE DIRECTIONS**

15076 None.

15077 **SEE ALSO**15078 *open()*, *truncate()*, the Base Definitions volume of IEEE Std 1003.1-2001, <*unistd.h*>15079 **CHANGE HISTORY**

15080 First released in Issue 4, Version 2.

15081 **Issue 5**

15082 Moved from X/OPEN UNIX extension to BASE and aligned with *ftruncate()* in the POSIX  
 15083 Realtime Extension. Specifically, the DESCRIPTION is extensively reworded and [EROFS] is  
 15084 added to the list of mandatory errors that can be returned by *ftruncate()*.

15085 Large File Summit extensions are added.

15086 **Issue 6**15087 The *truncate()* function has been split out into a separate reference page.

15088 The following new requirements on POSIX implementations derive from alignment with the  
 15089 Single UNIX Specification:

- 15090 • The DESCRIPTION is changed to indicate that if the file size is changed, and if the file is a  
 15091 regular file, the S\_ISUID and S\_ISGID bits in the file mode may be cleared.

15092 The following changes were made to align with the IEEE P1003.1a draft standard:

- 15093 • The DESCRIPTION text is updated.

15094 XSI-conformant systems are required to increase the size of the file if the file was previously  
 15095 smaller than the size requested.

15096 **NAME**

15097       ftrylockfile — stdio locking functions

15098 **SYNOPSIS**

15099 TSF     #include <stdio.h>

15100       int ftrylockfile(FILE \*file);

15101

15102 **DESCRIPTION**

15103       Refer to *flockfile()*.

15104 **NAME**

15105 ftw — traverse (walk) a file tree

15106 **SYNOPSIS**

15107 xSI #include &lt;ftw.h&gt;

```
15108 int ftw(const char *path, int (*fn)(const char *,
15109     const struct stat *ptr, int flag), int ndirs);
```

15110

15111 **DESCRIPTION**

15112 The *ftw()* function shall recursively descend the directory hierarchy rooted in *path*. For each  
 15113 object in the hierarchy, *ftw()* shall call the function pointed to by *fn*, passing it a pointer to a  
 15114 null-terminated character string containing the name of the object, a pointer to a **stat** structure  
 15115 containing information about the object, and an integer. Possible values of the integer, defined  
 15116 in the <ftw.h> header, are:

15117 FTW\_D For a directory.

15118 FTW\_DNR For a directory that cannot be read.

15119 FTW\_F For a file.

15120 FTW\_SL For a symbolic link (but see also FTW\_NS below).

15121 FTW\_NS For an object other than a symbolic link on which *stat()* could not successfully be  
 15122 executed. If the object is a symbolic link and *stat()* failed, it is unspecified whether  
 15123 *ftw()* passes FTW\_SL or FTW\_NS to the user-supplied function.

15124 If the integer is FTW\_DNR, descendants of that directory shall not be processed. If the integer is  
 15125 FTW\_NS, the **stat** structure contains undefined values. An example of an object that would  
 15126 cause FTW\_NS to be passed to the function pointed to by *fn* would be a file in a directory with  
 15127 read but without execute (search) permission.

15128 The *ftw()* function shall visit a directory before visiting any of its descendants.15129 The *ftw()* function shall use at most one file descriptor for each level in the tree.15130 The argument *ndirs* should be in the range [1,{OPEN\_MAX}].

15131 The tree traversal shall continue until either the tree is exhausted, an invocation of *fn* returns a  
 15132 non-zero value, or some error, other than [EACCES], is detected within *ftw()*.

15133 The *ndirs* argument shall specify the maximum number of directory streams or file descriptors  
 15134 or both available for use by *ftw()* while traversing the tree. When *ftw()* returns it shall close any  
 15135 directory streams and file descriptors it uses not counting any opened by the application-  
 15136 supplied *fn* function.

15137 The results are unspecified if the application-supplied *fn* function does not preserve the current  
 15138 working directory.

15139 The *ftw()* function need not be reentrant. A function that is not required to be reentrant is not  
 15140 required to be thread-safe.

15141 **RETURN VALUE**

15142 If the tree is exhausted, *ftw()* shall return 0. If the function pointed to by *fn* returns a non-zero  
 15143 value, *ftw()* shall stop its tree traversal and return whatever value was returned by the function  
 15144 pointed to by *fn*. If *ftw()* detects an error, it shall return -1 and set *errno* to indicate the error.

15145 If *ftw()* encounters an error other than [EACCES] (see FTW\_DNR and FTW\_NS above), it shall  
 15146 return -1 and set *errno* to indicate the error. The external variable *errno* may contain any error

15147 value that is possible when a directory is opened or when one of the *stat* functions is executed on  
15148 a directory or file.

#### 15149 ERRORS

15150 The *ftw()* function shall fail if:

15151 [EACCES] Search permission is denied for any component of *path* or read permission is  
15152 denied for *path*.

15153 [ELOOP] A loop exists in symbolic links encountered during resolution of the *path*  
15154 argument.

15155 [ENAMETOOLONG]  
15156 The length of the *path* argument exceeds {PATH\_MAX} or a pathname  
15157 component is longer than {NAME\_MAX}.

15158 [ENOENT] A component of *path* does not name an existing file or *path* is an empty string.

15159 [ENOTDIR] A component of *path* is not a directory.

15160 [EOVERFLOW] A field in the *stat* structure cannot be represented correctly in the current  
15161 programming environment for one or more files found in the file hierarchy.

15162 The *ftw()* function may fail if:

15163 [EINVAL] The value of the *ndirs* argument is invalid.

15164 [ELOOP] More than {SYMLOOP\_MAX} symbolic links were encountered during  
15165 resolution of the *path* argument.

15166 [ENAMETOOLONG]  
15167 Pathname resolution of a symbolic link produced an intermediate result  
15168 whose length exceeds {PATH\_MAX}.

15169 In addition, if the function pointed to by *fn* encounters system errors, *errno* may be set  
15170 accordingly.

#### 15171 EXAMPLES

##### 15172 Walking a Directory Structure

15173 The following example walks the current directory structure, calling the *fn* function for every  
15174 directory entry, using at most 10 file descriptors:

```
15175 #include <ftw.h>
15176 ...
15177 if (ftw(".", fn, 10) != 0) {
15178     perror("ftw"); exit(2);
15179 }
```

#### 15180 APPLICATION USAGE

15181 The *ftw()* function may allocate dynamic storage during its operation. If *ftw()* is forcibly  
15182 terminated, such as by *longjmp()* or *siglongjmp()* being executed by the function pointed to by *fn*  
15183 or an interrupt routine, *ftw()* does not have a chance to free that storage, so it remains  
15184 permanently allocated. A safe way to handle interrupts is to store the fact that an interrupt has  
15185 occurred, and arrange to have the function pointed to by *fn* return a non-zero value at its next  
15186 invocation.

15187 **RATIONALE**

15188 None.

15189 **FUTURE DIRECTIONS**

15190 None.

15191 **SEE ALSO**

15192 *longjmp()*, *lstat()*, *malloc()*, *nftw()*, *opendir()*, *siglongjmp()*, *stat()*, the Base Definitions volume of  
15193 IEEE Std 1003.1-2001, <ftw.h>, <sys/stat.h>

15194 **CHANGE HISTORY**

15195 First released in Issue 1. Derived from Issue 1 of the SVID.

15196 **Issue 5**

15197 UX codings in the DESCRIPTION, RETURN VALUE, and ERRORS sections are changed to EX.

15198 **Issue 6**

15199 The ERRORS section is updated as follows:

- 15200 • The wording of the mandatory [ELOOP] error condition is updated.
- 15201 • A second optional [ELOOP] error condition is added.
- 15202 • The [EOVERFLOW] mandatory error condition is added.

15203 Text is added to the DESCRIPTION to say that the *ftw()* function need not be reentrant and that  
15204 the results are unspecified if the application-supplied *fn* function does not preserve the current  
15205 working directory.

15206 **NAME**

15207 funlockfile — stdio locking functions

15208 **SYNOPSIS**

15209 TSF #include <stdio.h>

15210 void funlockfile(FILE \*file);

15211

15212 **DESCRIPTION**

15213 Refer to *flockfile()*.

15214 **NAME**

15215 fwide — set stream orientation

15216 **SYNOPSIS**

15217 #include &lt;stdio.h&gt;

15218 #include &lt;wchar.h&gt;

15219 int fwide(FILE \**stream*, int *mode*);15220 **DESCRIPTION**

15221 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
 15222 conflict between the requirements described here and the ISO C standard is unintentional. This  
 15223 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

15224 The *fwide()* function shall determine the orientation of the stream pointed to by *stream*. If *mode* is  
 15225 greater than zero, the function first attempts to make the stream wide-oriented. If *mode* is less  
 15226 than zero, the function first attempts to make the stream byte-oriented. Otherwise, *mode* is zero  
 15227 and the function does not alter the orientation of the stream.

15228 If the orientation of the stream has already been determined, *fwide()* shall not change it.

15229 CX Since no return value is reserved to indicate an error, an application wishing to check for error  
 15230 situations should set *errno* to 0, then call *fwide()*, then check *errno*, and if it is non-zero, assume  
 15231 an error has occurred.

15232 **RETURN VALUE**

15233 The *fwide()* function shall return a value greater than zero if, after the call, the stream has wide-  
 15234 orientation, a value less than zero if the stream has byte-orientation, or zero if the stream has no  
 15235 orientation.

15236 **ERRORS**15237 The *fwide()* function may fail if:

15238 CX [EBADF] The *stream* argument is not a valid stream.

15239 **EXAMPLES**

15240 None.

15241 **APPLICATION USAGE**

15242 A call to *fwide()* with *mode* set to zero can be used to determine the current orientation of a  
 15243 stream.

15244 **RATIONALE**

15245 None.

15246 **FUTURE DIRECTIONS**

15247 None.

15248 **SEE ALSO**

15249 The Base Definitions volume of IEEE Std 1003.1-2001, &lt;wchar.h&gt;

15250 **CHANGE HISTORY**

15251 First released in Issue 5. Included for alignment with ISO/IEC 9899:1990/Amendment 1:1995  
 15252 (E).

15253 **Issue 6**

15254 Extensions beyond the ISO C standard are marked.

## 15255 NAME

15256 fwprintf, swprintf, wprintf — print formatted wide-character output

## 15257 SYNOPSIS

15258 #include &lt;stdio.h&gt;

15259 #include &lt;wchar.h&gt;

15260 int fwprintf(FILE \*restrict *stream*, const wchar\_t \*restrict *format*, ...);15261 int swprintf(wchar\_t \*restrict *ws*, size\_t *n*,15262 const wchar\_t \*restrict *format*, ...);15263 int wprintf(const wchar\_t \*restrict *format*, ...);

## 15264 DESCRIPTION

15265 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
 15266 conflict between the requirements described here and the ISO C standard is unintentional. This  
 15267 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

15268 The *fwprintf()* function shall place output on the named output *stream*. The *wprintf()* function  
 15269 shall place output on the standard output stream *stdout*. The *swprintf()* function shall place  
 15270 output followed by the null wide character in consecutive wide characters starting at *\*ws*; no  
 15271 more than *n* wide characters shall be written, including a terminating null wide character, which  
 15272 is always added (unless *n* is zero).

15273 Each of these functions shall convert, format, and print its arguments under control of the *format*  
 15274 wide-character string. The *format* is composed of zero or more directives: *ordinary wide-*  
 15275 *characters*, which are simply copied to the output stream, and *conversion specifications*, each of  
 15276 which results in the fetching of zero or more arguments. The results are undefined if there are  
 15277 insufficient arguments for the *format*. If the *format* is exhausted while arguments remain, the  
 15278 excess arguments are evaluated but are otherwise ignored.

15279 XSI Conversions can be applied to the *n*th argument after the *format* in the argument list, rather than  
 15280 to the next unused argument. In this case, the conversion specifier wide character % (see below)  
 15281 is replaced by the sequence "%n\$", where *n* is a decimal integer in the range [1,{NL\_ARGMAX}],  
 15282 giving the position of the argument in the argument list. This feature provides for the definition  
 15283 of *format* wide-character strings that select arguments in an order appropriate to specific  
 15284 languages (see the EXAMPLES section).

15285 The *format* can contain either numbered argument specifications (that is, "%n\$" and "%m\$"), or  
 15286 unnumbered argument conversion specifications (that is, % and \*), but not both. The only  
 15287 exception to this is that %% can be mixed with the "%n\$" form. The results of mixing numbered  
 15288 and unnumbered argument specifications in a *format* wide-character string are undefined. When  
 15289 numbered argument specifications are used, specifying the *N*th argument requires that all the  
 15290 leading arguments, from the first to the (*N*-1)th, are specified in the *format* wide-character string.

15291 In *format* wide-character strings containing the "%n\$" form of conversion specification,  
 15292 numbered arguments in the argument list can be referenced from the *format* wide-character  
 15293 string as many times as required.

15294 In *format* wide-character strings containing the % form of conversion specification, each  
 15295 argument in the argument list shall be used exactly once.

15296 CX All forms of the *fwprintf()* function allow for the insertion of a locale-dependent radix character  
 15297 in the output string, output as a wide-character value. The radix character is defined in the  
 15298 program's locale (category *LC\_NUMERIC*). In the POSIX locale, or in a locale where the radix  
 15299 character is not defined, the radix character shall default to a period ('.').

15300 XSI Each conversion specification is introduced by the '%' wide character or by the wide-character  
 15301 sequence "%n\$", after which the following appear in sequence:

- 15302       • Zero or more *flags* (in any order), which modify the meaning of the conversion specification.
- 15303       • An optional minimum *field width*. If the converted value has fewer wide characters than the  
15304       field width, it shall be padded with spaces by default on the left; it shall be padded on the  
15305       right, if the left-adjustment flag ('-'), described below, is given to the field width. The field  
15306       width takes the form of an asterisk ('\*'), described below, or a decimal integer.
- 15307       • An optional *precision* that gives the minimum number of digits to appear for the d, i, o, u, x,  
15308       and X conversion specifiers; the number of digits to appear after the radix character for the a,  
15309       A, e, E, f, and F conversion specifiers; the maximum number of significant digits for the g  
15310       and G conversion specifiers; or the maximum number of wide characters to be printed from a  
15311       string in the s conversion specifiers. The precision takes the form of a period ('.') followed  
15312       either by an asterisk ('\*'), described below, or an optional decimal digit string, where a null  
15313       digit string is treated as 0. If a precision appears with any other conversion wide character,  
15314       the behavior is undefined.
- 15315       • An optional length modifier that specifies the size of the argument.
- 15316       • A *conversion specifier* wide character that indicates the type of conversion to be applied.
- 15317       A field width, or precision, or both, may be indicated by an asterisk ('\*'). In this case an  
15318       argument of type **int** supplies the field width or precision. Applications shall ensure that  
15319       arguments specifying field width, or precision, or both appear in that order before the argument,  
15320       if any, to be converted. A negative field width is taken as a '-' flag followed by a positive field  
15321 XSI       width. A negative precision is taken as if the precision were omitted. In *format* wide-character  
15322       strings containing the "%n\$" form of a conversion specification, a field width or precision may  
15323       be indicated by the sequence "\*m\$", where *m* is a decimal integer in the range  
15324       [1,{NL\_ARGMAX}] giving the position in the argument list (after the *format* argument) of an  
15325       integer argument containing the field width or precision, for example:
- 15326       

```
wprintf(L"%1$d:%2$.*3$d:%4$.*3$d\n", hour, min, precision, sec);
```
- 15327       The flag wide characters and their meanings are:
- 15328 XSI       '       The integer portion of the result of a decimal conversion (%i, %d, %u, %f, %F, %g, or %G)  
15329       shall be formatted with thousands' grouping wide characters. For other conversions,  
15330       the behavior is undefined. The numeric grouping wide character is used.
- 15331       -       The result of the conversion shall be left-justified within the field. The conversion shall  
15332       be right-justified if this flag is not specified.
- 15333       +       The result of a signed conversion shall always begin with a sign ('+' or '-'). The  
15334       conversion shall begin with a sign only when a negative value is converted if this flag is  
15335       not specified.
- 15336       <space> If the first wide character of a signed conversion is not a sign, or if a signed conversion  
15337       results in no wide characters, a <space> shall be prefixed to the result. This means that  
15338       if the <space> and '+' flags both appear, the <space> flag shall be ignored.
- 15339       #       Specifies that the value is to be converted to an alternative form. For o conversion, it  
15340       increases the precision (if necessary) to force the first digit of the result to be 0. For x or  
15341       X conversion specifiers, a non-zero result shall have 0x (or 0X) prefixed to it. For a, A, e,  
15342       E, f, F, g, and G conversion specifiers, the result shall always contain a radix character,  
15343       even if no digits follow it. Without this flag, a radix character appears in the result of  
15344       these conversions only if a digit follows it. For g and G conversion specifiers, trailing  
15345       zeros shall *not* be removed from the result as they normally are. For other conversion  
15346       specifiers, the behavior is undefined.

15347 0 For `d`, `i`, `o`, `u`, `x`, `X`, `a`, `A`, `e`, `E`, `f`, `F`, `g`, and `G` conversion specifiers, leading zeros  
 15348 (following any indication of sign or base) are used to pad to the field width; no space  
 15349 padding is performed. If the `'0'` and `'-'` flags both appear, the `'0'` flag shall be  
 15350 ignored. For `d`, `i`, `o`, `u`, `x`, and `X` conversion specifiers, if a precision is specified, the `'0'`  
 15351 flag shall be ignored. If the `'0'` and `' '` flags both appear, the grouping wide  
 15352 characters are inserted before zero padding. For other conversions, the behavior is  
 15353 undefined.

15354 The length modifiers and their meanings are:

15355 `hh` Specifies that a following `d`, `i`, `o`, `u`, `x`, or `X` conversion specifier applies to a **signed char**  
 15356 or **unsigned char** argument (the argument will have been promoted according to the  
 15357 integer promotions, but its value shall be converted to **signed char** or **unsigned char**  
 15358 before printing); or that a following `n` conversion specifier applies to a pointer to a  
 15359 **signed char** argument.

15360 `h` Specifies that a following `d`, `i`, `o`, `u`, `x`, or `X` conversion specifier applies to a **short** or  
 15361 **unsigned short** argument (the argument will have been promoted according to the  
 15362 integer promotions, but its value shall be converted to **short** or **unsigned short** before  
 15363 printing); or that a following `n` conversion specifier applies to a pointer to a **short**  
 15364 argument.

15365 `l` (`ell`) Specifies that a following `d`, `i`, `o`, `u`, `x`, or `X` conversion specifier applies to a **long** or  
 15366 **unsigned long** argument; that a following `n` conversion specifier applies to a pointer to  
 15367 a **long** argument; that a following `c` conversion specifier applies to a **wint\_t** argument;  
 15368 that a following `s` conversion specifier applies to a pointer to a **wchar\_t** argument; or  
 15369 has no effect on a following `a`, `A`, `e`, `E`, `f`, `F`, `g`, or `G` conversion specifier.

15370 `ll` (`ell-ell`)

15371 Specifies that a following `d`, `i`, `o`, `u`, `x`, or `X` conversion specifier applies to a **long long** or  
 15372 **unsigned long long** argument; or that a following `n` conversion specifier applies to a  
 15373 pointer to a **long long** argument.

15374 `j` Specifies that a following `d`, `i`, `o`, `u`, `x`, or `X` conversion specifier applies to an **intmax\_t**  
 15375 or **uintmax\_t** argument; or that a following `n` conversion specifier applies to a pointer  
 15376 to an **intmax\_t** argument.

15377 `z` Specifies that a following `d`, `i`, `o`, `u`, `x`, or `X` conversion specifier applies to a **size\_t** or the  
 15378 corresponding signed integer type argument; or that a following `n` conversion specifier  
 15379 applies to a pointer to a signed integer type corresponding to a **size\_t** argument.

15380 `t` Specifies that a following `d`, `i`, `o`, `u`, `x`, or `X` conversion specifier applies to a **ptrdiff\_t** or  
 15381 the corresponding **unsigned** type argument; or that a following `n` conversion specifier  
 15382 applies to a pointer to a **ptrdiff\_t** argument.

15383 `L` Specifies that a following `a`, `A`, `e`, `E`, `f`, `F`, `g`, or `G` conversion specifier applies to a **long**  
 15384 **double** argument.

15385 If a length modifier appears with any conversion specifier other than as specified above, the  
 15386 behavior is undefined.

15387 The conversion specifiers and their meanings are:

15388 `d`, `i` The **int** argument shall be converted to a signed decimal in the style `"[-]dddd"`. The  
 15389 precision specifies the minimum number of digits to appear; if the value being  
 15390 converted can be represented in fewer digits, it shall be expanded with leading zeros.  
 15391 The default precision shall be 1. The result of converting zero with an explicit precision  
 15392 of zero shall be no wide characters.

- 15393           o       The **unsigned** argument shall be converted to unsigned octal format in the style  
15394                    "ddd". The precision specifies the minimum number of digits to appear; if the value  
15395                    being converted can be represented in fewer digits, it shall be expanded with leading  
15396                    zeros. The default precision shall be 1. The result of converting zero with an explicit  
15397                    precision of zero shall be no wide characters.
- 15398           u       The **unsigned** argument shall be converted to unsigned decimal format in the style  
15399                    "ddd". The precision specifies the minimum number of digits to appear; if the value  
15400                    being converted can be represented in fewer digits, it shall be expanded with leading  
15401                    zeros. The default precision shall be 1. The result of converting zero with an explicit  
15402                    precision of zero shall be no wide characters.
- 15403           x       The **unsigned** argument shall be converted to unsigned hexadecimal format in the style  
15404                    "ddd"; the letters "abcdef" are used. The precision specifies the minimum number  
15405                    of digits to appear; if the value being converted can be represented in fewer digits, it  
15406                    shall be expanded with leading zeros. The default precision shall be 1. The result of  
15407                    converting zero with an explicit precision of zero shall be no wide characters.
- 15408           X       Equivalent to the x conversion specifier, except that letters "ABCDEF" are used instead  
15409                    of "abcdef".
- 15410           f, F     The **double** argument shall be converted to decimal notation in the style  
15411                    "[-]ddd.ddd", where the number of digits after the radix character shall be equal to  
15412                    the precision specification. If the precision is missing, it shall be taken as 6; if the  
15413                    precision is explicitly zero and no '#' flag is present, no radix character shall appear. If  
15414                    a radix character appears, at least one digit shall appear before it. The value shall be  
15415                    rounded in an implementation-defined manner to the appropriate number of digits.
- 15416                    A **double** argument representing an infinity shall be converted in one of the styles  
15417                    "[-]inf" or "[-]infinity"; which style is implementation-defined. A **double**  
15418                    argument representing a NaN shall be converted in one of the styles "[-]nan" or  
15419                    "[-]nan(*n-char-sequence*)"; which style, and the meaning of any *n-char-sequence*,  
15420                    is implementation-defined. The F conversion specifier produces "INF", "INFINITY",  
15421                    or "NAN" instead of "inf", "infinity", or "nan", respectively.
- 15422           e, E     The **double** argument shall be converted in the style "[-]d.ddde±dd", where there  
15423                    shall be one digit before the radix character (which is non-zero if the argument is non-  
15424                    zero) and the number of digits after it shall be equal to the precision; if the precision is  
15425                    missing, it shall be taken as 6; if the precision is zero and no '#' flag is present, no  
15426                    radix character shall appear. The value shall be rounded in an implementation-defined  
15427                    manner to the appropriate number of digits. The E conversion wide character shall  
15428                    produce a number with 'E' instead of 'e' introducing the exponent. The exponent  
15429                    shall always contain at least two digits. If the value is zero, the exponent shall be zero.
- 15430                    A **double** argument representing an infinity or NaN shall be converted in the style of  
15431                    an f or F conversion specifier.
- 15432           g, G     The **double** argument shall be converted in the style f or e (or in the style F or E in the  
15433                    case of a G conversion specifier), with the precision specifying the number of significant  
15434                    digits. If an explicit precision is zero, it shall be taken as 1. The style used depends on  
15435                    the value converted; style e (or E) shall be used only if the exponent resulting from  
15436                    such a conversion is less than -4 or greater than or equal to the precision. Trailing zeros  
15437                    shall be removed from the fractional portion of the result; a radix character shall appear  
15438                    only if it is followed by a digit.
- 15439                    A **double** argument representing an infinity or NaN shall be converted in the style of  
15440                    an f or F conversion specifier.

| 15441 | a, A  | A <b>double</b> argument representing a floating-point number shall be converted in the style "[−]0xh.hhhhp±d", where there shall be one hexadecimal digit (which is non-zero if the argument is a normalized floating-point number and is otherwise unspecified) before the decimal-point wide character and the number of hexadecimal digits after it shall be equal to the precision; if the precision is missing and FLT_RADIX is a power of 2, then the precision shall be sufficient for an exact representation of the value; if the precision is missing and FLT_RADIX is not a power of 2, then the precision shall be sufficient to distinguish values of type <b>double</b> , except that trailing zeros may be omitted; if the precision is zero and the '#' flag is not specified, no decimal-point wide character shall appear. The letters "abcdef" are used for a conversion and the letters "ABCDEF" for A conversion. The A conversion specifier produces a number with 'X' and 'P' instead of 'x' and 'p'. The exponent shall always contain at least one digit, and only as many more digits as necessary to represent the decimal exponent of 2. If the value is zero, the exponent shall be zero. |
| 15442 |       |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| 15443 |       |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| 15444 |       |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

| 15459 |       |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| 15460 | s     | If no l (ell) qualifier is present, the application shall ensure that the argument is a pointer to a character array containing a character sequence beginning in the initial shift state. Characters from the array shall be converted as if by repeated calls to the <i>mbrtowc()</i> function, with the conversion state described by an <b>mbstate_t</b> object initialized to zero before the first character is converted, and written up to (but not including) the terminating null wide character. If the precision is specified, no more than that many wide characters shall be written. If the precision is not specified, or is greater than the size of the array, the application shall ensure that the array contains a null wide character.                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

| 15469 |       | If an l (ell) qualifier is present, the application shall ensure that the argument is a pointer to an array of type <b>wchar_t</b> . Wide characters from the array shall be written up to (but not including) a terminating null wide character. If no precision is specified, or is greater than the size of the array, the application shall ensure that the array contains a null wide character. If a precision is specified, no more than that many wide characters shall be written.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

| 15478 | n     | The application shall ensure that the argument is a pointer to an integer into which is written the number of wide characters written to the output so far by this call to one of the <i>fwprintf()</i> functions. No argument shall be converted, but one shall be consumed. If the conversion specification includes any flags, a field width, or a precision, the behavior is undefined.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

| 15485 | %     | Output a '%' wide character; no argument shall be converted. The entire conversion specification shall be %%.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| 15486 |       |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

15487 If a conversion specification does not match one of the above forms, the behavior is undefined.  
 15488 In no case does a nonexistent or small field width cause truncation of a field; if the result of a  
 15489 conversion is wider than the field width, the field shall be expanded to contain the conversion  
 15490 result. Characters generated by *fwprintf()* and *wprintf()* shall be printed as if *fputc()* had been  
 15491 called.

15492 For *a* and *A* conversions, if *FLT\_RADIX* is not a power of 2 and the result is not exactly  
 15493 representable in the given precision, the result should be one of the two adjacent numbers in  
 15494 hexadecimal floating style with the given precision, with the extra stipulation that the error  
 15495 should have a correct sign for the current rounding direction.

15496 For *e*, *E*, *f*, *F*, *g*, and *G* conversion specifiers, if the number of significant decimal digits is at most  
 15497 *DECIMAL\_DIG*, then the result should be correctly rounded. If the number of significant  
 15498 decimal digits is more than *DECIMAL\_DIG* but the source value is exactly representable with  
 15499 *DECIMAL\_DIG* digits, then the result should be an exact representation with trailing zeros.  
 15500 Otherwise, the source value is bounded by two adjacent decimal strings  $L < U$ , both having  
 15501 *DECIMAL\_DIG* significant digits; the value of the resultant decimal string  $D$  should satisfy  $L \leq$   
 15502  $D \leq U$ , with the extra stipulation that the error should have a correct sign for the current  
 15503 rounding direction.

15504 CX The *st\_ctime* and *st\_mtime* fields of the file shall be marked for update between the call to a  
 15505 successful execution of *fwprintf()* or *wprintf()* and the next successful completion of a call to  
 15506 *fflush()* or *fclose()* on the same stream, or a call to *exit()* or *abort()*.

#### 15507 RETURN VALUE

15508 Upon successful completion, these functions shall return the number of wide characters  
 15509 transmitted, excluding the terminating null wide character in the case of *swprintf()*, or a negative  
 15510 CX value if an output error was encountered, and set *errno* to indicate the error.

15511 If *n* or more wide characters were requested to be written, *swprintf()* shall return a negative  
 15512 CX value, and set *errno* to indicate the error.

#### 15513 ERRORS

15514 For the conditions under which *fwprintf()* and *wprintf()* fail and may fail, refer to *fputc()*.

15515 In addition, all forms of *fwprintf()* may fail if:

15516 XSI [EILSEQ] A wide-character code that does not correspond to a valid character has been  
 15517 detected.

15518 XSI [EINVAL] There are insufficient arguments.

15519 In addition, *wprintf()* and *fwprintf()* may fail if:

15520 XSI [ENOMEM] Insufficient storage space is available.

#### 15521 EXAMPLES

15522 To print the language-independent date and time format, the following statement could be used:

```
15523 wprintf(format, weekday, month, day, hour, min);
```

15524 For American usage, *format* could be a pointer to the wide-character string:

```
15525 L"%s, %s %d, %d:%.2d\n"
```

15526 producing the message:

```
15527 Sunday, July 3, 10:02
```

15528 whereas for German usage, *format* could be a pointer to the wide-character string:

- 15529 L"%1\$s, %3\$d. %2\$s, %4\$d:%5\$.2d\n"
- 15530 producing the message:
- 15531 Sonntag, 3. Juli, 10:02
- 15532 **APPLICATION USAGE**
- 15533 None.
- 15534 **RATIONALE**
- 15535 None.
- 15536 **FUTURE DIRECTIONS**
- 15537 None.
- 15538 **SEE ALSO**
- 15539 *btowc()*, *fputwc()*, *fwscanf()*, *mbrtowc()*, *setlocale()*, the Base Definitions volume of
- 15540 IEEE Std 1003.1-2001, Chapter 7, Locale, <**stdio.h**>, <**wchar.h**>
- 15541 **CHANGE HISTORY**
- 15542 First released in Issue 5. Included for alignment with ISO/IEC 9899:1990/Amendment 1:1995
- 15543 (E).
- 15544 **Issue 6**
- 15545 The Open Group Corrigendum U040/1 is applied to the RETURN VALUE section, describing
- 15546 the case if *n* or more wide characters are requested to be written using *swprintf()*.
- 15547 The DESCRIPTION is updated to avoid use of the term “must” for application requirements.
- 15548 The following changes are made for alignment with the ISO/IEC 9899:1999 standard:
- 15549
- The prototypes for *fwprintf()*, *swprintf()*, and *wprintf()* are updated.
- 15550
- The DESCRIPTION is updated.
- 15551
- The *hh*, *ll*, *j*, *t*, and *z* length modifiers are added.
- 15552
- The *a*, *A*, and *F* conversion characters are added.
- 15553
- XSI shading is removed from the description of character string representations of infinity
- 15554 and NaN floating-point values.
- 15555 The DESCRIPTION is updated to use the terms “conversion specifier” and “conversion
- 15556 specification” consistently.
- 15557 ISO/IEC 9899:1999 standard, Technical Corrigendum No. 1 is incorporated.

15558 **NAME**

15559        fwrite — binary output

15560 **SYNOPSIS**

15561        #include &lt;stdio.h&gt;

15562        size\_t fwrite(const void \*restrict ptr, size\_t size, size\_t nitems,  
15563                      FILE \*restrict stream);15564 **DESCRIPTION**15565 **CX**        The functionality described on this reference page is aligned with the ISO C standard. Any  
15566 conflict between the requirements described here and the ISO C standard is unintentional. This  
15567 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.15568        The *fwrite()* function shall write, from the array pointed to by *ptr*, up to *nitems* elements whose  
15569 size is specified by *size*, to the stream pointed to by *stream*. For each object, *size* calls shall be  
15570 made to the *fputc()* function, taking the values (in order) from an array of **unsigned char** exactly  
15571 overlaying the object. The file-position indicator for the stream (if defined) shall be advanced by  
15572 the number of bytes successfully written. If an error occurs, the resulting value of the file-  
15573 position indicator for the stream is unspecified.15574 **CX**        The *st\_ctime* and *st\_mtime* fields of the file shall be marked for update between the successful  
15575 execution of *fwrite()* and the next successful completion of a call to *fflush()* or *fclose()* on the  
15576 same stream, or a call to *exit()* or *abort()*.15577 **RETURN VALUE**15578        The *fwrite()* function shall return the number of elements successfully written, which may be  
15579 less than *nitems* if a write error is encountered. If *size* or *nitems* is 0, *fwrite()* shall return 0 and the  
15580 state of the stream remains unchanged. Otherwise, if a write error occurs, the error indicator for  
15581 **CX**        the stream shall be set, and *errno* shall be set to indicate the error.15582 **ERRORS**15583        Refer to *fputc()*.15584 **EXAMPLES**

15585        None.

15586 **APPLICATION USAGE**15587        Because of possible differences in element length and byte ordering, files written using *fwrite()*  
15588 are application-dependent, and possibly cannot be read using *fread()* by a different application  
15589 or by the same application on a different processor.15590 **RATIONALE**

15591        None.

15592 **FUTURE DIRECTIONS**

15593        None.

15594 **SEE ALSO**15595        *ferror()*, *fopen()*, *printf()*, *putc()*, *puts()*, *write()*, the Base Definitions volume of  
15596 IEEE Std 1003.1-2001, <stdio.h>15597 **CHANGE HISTORY**

15598        First released in Issue 1. Derived from Issue 1 of the SVID.

15599 **Issue 6**

15600        Extensions beyond the ISO C standard are marked.

15601        The following changes are made for alignment with the ISO/IEC 9899:1999 standard:

15602

- The *fwrite()* prototype is updated.

15603

- The DESCRIPTION is updated to clarify how the data is written out using *fputc()*.

## 15604 NAME

15605 fwscanf, swscanf, wscanf — convert formatted wide-character input

## 15606 SYNOPSIS

15607 #include &lt;stdio.h&gt;

15608 #include &lt;wchar.h&gt;

15609 int fwscanf(FILE \*restrict stream, const wchar\_t \*restrict format, ... );

15610 int swscanf(const wchar\_t \*restrict ws,

15611 const wchar\_t \*restrict format, ... );

15612 int wscanf(const wchar\_t \*restrict format, ... );

## 15613 DESCRIPTION

15614 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
 15615 conflict between the requirements described here and the ISO C standard is unintentional. This  
 15616 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

15617 The *fwscanf()* function shall read from the named input *stream*. The *wscanf()* function shall read  
 15618 from the standard input stream *stdin*. The *swscanf()* function shall read from the wide-character  
 15619 string *ws*. Each function reads wide characters, interprets them according to a format, and stores  
 15620 the results in its arguments. Each expects, as arguments, a control wide-character string *format*  
 15621 described below, and a set of *pointer* arguments indicating where the converted input should be  
 15622 stored. The result is undefined if there are insufficient arguments for the format. If the *format* is  
 15623 exhausted while arguments remain, the excess arguments are evaluated but are otherwise  
 15624 ignored.

15625 XSI Conversions can be applied to the *n*th argument after the *format* in the argument list, rather than  
 15626 to the next unused argument. In this case, the conversion specifier wide character % (see below)  
 15627 is replaced by the sequence "%n\$", where *n* is a decimal integer in the range [1,{NL\_ARGMAX}].  
 15628 This feature provides for the definition of *format* wide-character strings that select arguments in  
 15629 an order appropriate to specific languages. In *format* wide-character strings containing the  
 15630 "%n\$" form of conversion specifications, it is unspecified whether numbered arguments in the  
 15631 argument list can be referenced from the *format* wide-character string more than once.

15632 The *format* can contain either form of a conversion specification—that is, % or "%n\$"—but the  
 15633 two forms cannot normally be mixed within a single *format* wide-character string. The only  
 15634 exception to this is that %% or %\* can be mixed with the "%n\$" form. When numbered  
 15635 argument specifications are used, specifying the *N*th argument requires that all the leading  
 15636 arguments, from the first to the (*N*–1)th, are pointers.

15637 CX The *fwscanf()* function in all its forms allows for detection of a language-dependent radix  
 15638 character in the input string, encoded as a wide-character value. The radix character is defined in  
 15639 the program's locale (category *LC\_NUMERIC*). In the POSIX locale, or in a locale where the  
 15640 radix character is not defined, the radix character shall default to a period ( '.' ).

15641 The *format* is a wide-character string composed of zero or more directives. Each directive is  
 15642 composed of one of the following: one or more white-space wide characters (<space>s, <tab>s,  
 15643 <newline>s, <vertical-tab>s, or <form-feed>s); an ordinary wide character (neither '%' nor a  
 15644 white-space character); or a conversion specification. Each conversion specification is introduced  
 15645 XSI by a '%' or the sequence "%n\$" after which the following appear in sequence:

- 15646 • An optional assignment-suppressing character ' \* '.
- 15647 • An optional non-zero decimal integer that specifies the maximum field width.
- 15648 • An optional length modifier that specifies the size of the receiving object.

- 15649       • A conversion specifier wide character that specifies the type of conversion to be applied. The  
15650       valid conversion specifiers are described below.
- 15651       The *fwscanf()* functions shall execute each directive of the format in turn. If a directive fails, as  
15652       detailed below, the function shall return. Failures are described as input failures (due to the  
15653       unavailability of input bytes) or matching failures (due to inappropriate input).
- 15654       A directive composed of one or more white-space wide characters is executed by reading input  
15655       until no more valid input can be read, or up to the first wide character which is not a white-  
15656       space wide character, which remains unread.
- 15657       A directive that is an ordinary wide character shall be executed as follows. The next wide  
15658       character is read from the input and compared with the wide character that comprises the  
15659       directive; if the comparison shows that they are not equivalent, the directive shall fail, and the  
15660       differing and subsequent wide characters remain unread. Similarly, if end-of-file, an encoding  
15661       error, or a read error prevents a wide character from being read, the directive shall fail.
- 15662       A directive that is a conversion specification defines a set of matching input sequences, as  
15663       described below for each conversion wide character. A conversion specification is executed in  
15664       the following steps.
- 15665       Input white-space wide characters (as specified by *isspace()*) shall be skipped, unless the  
15666       conversion specification includes a `[`, `c`, or `n` conversion specifier.
- 15667       An item shall be read from the input, unless the conversion specification includes an `n`  
15668       conversion specifier wide character. An input item is defined as the longest sequence of input  
15669       wide characters, not exceeding any specified field width, which is an initial subsequence of a  
15670       matching sequence. The first wide character, if any, after the input item shall remain unread. If  
15671       the length of the input item is zero, the execution of the conversion specification shall fail; this  
15672       condition is a matching failure, unless end-of-file, an encoding error, or a read error prevented  
15673       input from the stream, in which case it is an input failure.
- 15674       Except in the case of a `%` conversion specifier, the input item (or, in the case of a `%n` conversion  
15675       specification, the count of input wide characters) shall be converted to a type appropriate to the  
15676       conversion wide character. If the input item is not a matching sequence, the execution of the  
15677       conversion specification shall fail; this condition is a matching failure. Unless assignment  
15678       suppression was indicated by a `'*'`, the result of the conversion shall be placed in the object  
15679       pointed to by the first argument following the *format* argument that has not already received a  
15680 XSI       conversion result if the conversion specification is introduced by `%`, or in the *n*th argument if  
15681       introduced by the wide-character sequence `"%n$"`. If this object does not have an appropriate  
15682       type, or if the result of the conversion cannot be represented in the space provided, the behavior  
15683       is undefined.
- 15684       The length modifiers and their meanings are:
- 15685       hh       Specifies that a following `d`, `i`, `o`, `u`, `x`, `X`, or `n` conversion specifier applies to an  
15686       argument with type pointer to **signed char** or **unsigned char**.
- 15687       h        Specifies that a following `d`, `i`, `o`, `u`, `x`, `X`, or `n` conversion specifier applies to an  
15688       argument with type pointer to **short** or **unsigned short**.
- 15689       l (ell) Specifies that a following `d`, `i`, `o`, `u`, `x`, `X`, or `n` conversion specifier applies to an  
15690       argument with type pointer to **long** or **unsigned long**; that a following `a`, `A`, `e`, `E`, `f`, `F`, `g`,  
15691       or `G` conversion specifier applies to an argument with type pointer to **double**; or that a  
15692       following `c`, `s`, or `[` conversion specifier applies to an argument with type pointer to  
15693       **wchar\_t**.

|       |              |                                                                                                         |
|-------|--------------|---------------------------------------------------------------------------------------------------------|
| 15694 | ll (ell-ell) |                                                                                                         |
| 15695 |              | Specifies that a following d, i, o, u, x, X, or n conversion specifier applies to an                    |
| 15696 |              | argument with type pointer to <b>long long</b> or <b>unsigned long long</b> .                           |
| 15697 | j            | Specifies that a following d, i, o, u, x, X, or n conversion specifier applies to an                    |
| 15698 |              | argument with type pointer to <b>intmax_t</b> or <b>uintmax_t</b> .                                     |
| 15699 | z            | Specifies that a following d, i, o, u, x, X, or n conversion specifier applies to an                    |
| 15700 |              | argument with type pointer to <b>size_t</b> or the corresponding signed integer type.                   |
| 15701 | t            | Specifies that a following d, i, o, u, x, X, or n conversion specifier applies to an                    |
| 15702 |              | argument with type pointer to <b>ptrdiff_t</b> or the corresponding <b>unsigned</b> type.               |
| 15703 | L            | Specifies that a following a, A, e, E, f, F, g, or G conversion specifier applies to an                 |
| 15704 |              | argument with type pointer to <b>long double</b> .                                                      |
| 15705 |              | If a length modifier appears with any conversion specifier other than as specified above, the           |
| 15706 |              | behavior is undefined.                                                                                  |
| 15707 |              | The following conversion specifier wide characters are valid:                                           |
| 15708 | d            | Matches an optionally signed decimal integer, whose format is the same as expected for                  |
| 15709 |              | the subject sequence of <i>wcstol()</i> with the value 10 for the <i>base</i> argument. In the absence  |
| 15710 |              | of a size modifier, the application shall ensure that the corresponding argument is a                   |
| 15711 |              | pointer to <b>int</b> .                                                                                 |
| 15712 | i            | Matches an optionally signed integer, whose format is the same as expected for the                      |
| 15713 |              | subject sequence of <i>wcstol()</i> with 0 for the <i>base</i> argument. In the absence of a size       |
| 15714 |              | modifier, the application shall ensure that the corresponding argument is a pointer to                  |
| 15715 |              | <b>int</b> .                                                                                            |
| 15716 | o            | Matches an optionally signed octal integer, whose format is the same as expected for                    |
| 15717 |              | the subject sequence of <i>wcstoul()</i> with the value 8 for the <i>base</i> argument. In the absence  |
| 15718 |              | of a size modifier, the application shall ensure that the corresponding argument is a                   |
| 15719 |              | pointer to <b>unsigned</b> .                                                                            |
| 15720 | u            | Matches an optionally signed decimal integer, whose format is the same as expected for                  |
| 15721 |              | the subject sequence of <i>wcstoul()</i> with the value 10 for the <i>base</i> argument. In the absence |
| 15722 |              | of a size modifier, the application shall ensure that the corresponding argument is a                   |
| 15723 |              | pointer to <b>unsigned</b> .                                                                            |
| 15724 | x            | Matches an optionally signed hexadecimal integer, whose format is the same as                           |
| 15725 |              | expected for the subject sequence of <i>wcstoul()</i> with the value 16 for the <i>base</i> argument.   |
| 15726 |              | In the absence of a size modifier, the application shall ensure that the corresponding                  |
| 15727 |              | argument is a pointer to <b>unsigned</b> .                                                              |
| 15728 | a, e, f, g   |                                                                                                         |
| 15729 |              | Matches an optionally signed floating-point number, infinity, or NaN whose format is                    |
| 15730 |              | the same as expected for the subject sequence of <i>wcstod()</i> . In the absence of a size             |
| 15731 |              | modifier, the application shall ensure that the corresponding argument is a pointer to                  |
| 15732 |              | <b>float</b> .                                                                                          |
| 15733 |              | If the <i>fwprintf()</i> family of functions generates character string representations for             |
| 15734 |              | infinity and NaN (a symbolic entity encoded in floating-point format) to support                        |
| 15735 |              | IEEE Std 754-1985, the <i>fwscanf()</i> family of functions shall recognize them as input.              |
| 15736 | s            | Matches a sequence of non white-space wide characters. If no l (ell) qualifier is present,              |
| 15737 |              | characters from the input field shall be converted as if by repeated calls to the                       |
| 15738 |              | <i>wcrtomb()</i> function, with the conversion state described by an <b>mbstate_t</b> object            |

15739 initialized to zero before the first wide character is converted. The application shall  
 15740 ensure that the corresponding argument is a pointer to a character array large enough  
 15741 to accept the sequence and the terminating null character, which shall be added  
 15742 automatically.

15743 Otherwise, the application shall ensure that the corresponding argument is a pointer to  
 15744 an array of **wchar\_t** large enough to accept the sequence and the terminating null wide  
 15745 character, which shall be added automatically.

15746 [ Matches a non-empty sequence of wide characters from a set of expected wide  
 15747 characters (the *scanset*). If no **l** (ell) qualifier is present, wide characters from the input  
 15748 field shall be converted as if by repeated calls to the *wcrtomb()* function, with the  
 15749 conversion state described by an **mbstate\_t** object initialized to zero before the first  
 15750 wide character is converted. The application shall ensure that the corresponding  
 15751 argument is a pointer to a character array large enough to accept the sequence and the  
 15752 terminating null character, which shall be added automatically.

15753 If an **l** (ell) qualifier is present, the application shall ensure that the corresponding  
 15754 argument is a pointer to an array of **wchar\_t** large enough to accept the sequence and  
 15755 the terminating null wide character, which shall be added automatically.

15756 The conversion specification includes all subsequent wide characters in the *format*  
 15757 string up to and including the matching right square bracket (']'). The wide  
 15758 characters between the square brackets (the *scanlist*) comprise the scanset, unless the  
 15759 wide character after the left square bracket is a circumflex ('^'), in which case the  
 15760 scanset contains all wide characters that do not appear in the scanlist between the  
 15761 circumflex and the right square bracket. If the conversion specification begins with  
 15762 "[ ]" or "[ ^ ]", the right square bracket is included in the scanlist and the next right  
 15763 square bracket is the matching right square bracket that ends the conversion  
 15764 specification; otherwise, the first right square bracket is the one that ends the  
 15765 conversion specification. If a '-' is in the scanlist and is not the first wide character,  
 15766 nor the second where the first wide character is a '^', nor the last wide character, the  
 15767 behavior is implementation-defined.

15768 c Matches a sequence of wide characters of exactly the number specified by the field  
 15769 width (1 if no field width is present in the conversion specification).

15770 If no **l** (ell) length modifier is present, characters from the input field shall be converted  
 15771 as if by repeated calls to the *wcrtomb()* function, with the conversion state described by  
 15772 an **mbstate\_t** object initialized to zero before the first wide character is converted. The  
 15773 corresponding argument shall be a pointer to the initial element of a character array  
 15774 large enough to accept the sequence. No null character is added.

15775 If an **l** (ell) length modifier is present, the corresponding argument shall be a pointer to  
 15776 the initial element of an array of **wchar\_t** large enough to accept the sequence. No null  
 15777 wide character is added.

15778 Otherwise, the application shall ensure that the corresponding argument is a pointer to  
 15779 an array of **wchar\_t** large enough to accept the sequence. No null wide character is  
 15780 added.

15781 p Matches an implementation-defined set of sequences, which shall be the same as the set  
 15782 of sequences that is produced by the **%p** conversion specification of the corresponding  
 15783 *fwprintf()* functions. The application shall ensure that the corresponding argument is a  
 15784 pointer to a pointer to **void**. The interpretation of the input item is implementation-  
 15785 defined. If the input item is a value converted earlier during the same program  
 15786 execution, the pointer that results shall compare equal to that value; otherwise, the

|       |     |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|-------|-----|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 15787 |     | behavior of the %p conversion is undefined.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| 15788 | n   | No input is consumed. The application shall ensure that the corresponding argument is a pointer to the integer into which is to be written the number of wide characters read from the input so far by this call to the <i>fwscanf()</i> functions. Execution of a %n conversion specification shall not increment the assignment count returned at the completion of execution of the function. No argument shall be converted, but one shall be consumed. If the conversion specification includes an assignment-suppressing wide character or a field width, the behavior is undefined. |
| 15789 |     |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| 15790 |     |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| 15791 |     |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| 15792 |     |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

| 15808 |     | Reaching the end of the string in <i>swscanf()</i> shall be equivalent to encountering end-of-file for <i>fwscanf()</i> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| 15809 |     |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| 15810 |     | If conversion terminates on a conflicting input, the offending input shall be left unread in the input. Any trailing white space (including <newline>) shall be left unread unless matched by a conversion specification. The success of literal matches and suppressed assignments is only directly determinable via the %n conversion specification.                                                                                                                                                                                                                                     |

| 15819 |     | Upon successful completion, these functions shall return the number of successfully matched and assigned input items; this number can be zero in the event of an early matching failure. If the input ends before the first matching failure or conversion, EOF shall be returned. If a read error occurs, the error indicator for the stream is set, EOF shall be returned, and <i>errno</i> shall be set to indicate the error.                                                                                                                                                          |
| 15820 |     |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| 15821 |     |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| 15822 | CX  |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| 15823 |     |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| 15824 |     | <b>ERRORS</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| 15825 |     | For the conditions under which the <i>fwscanf()</i> functions shall fail and may fail, refer to <i>fgetwc()</i> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| 15826 |     | In addition, <i>fwscanf()</i> may fail if:                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| 15827 | XSI | <b>[EILSEQ]</b> Input byte sequence does not form a valid character.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| 15828 | XSI | <b>[EINVAL]</b> There are insufficient arguments.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

15829 **EXAMPLES**

15830 The call:

```
15831 int i, n; float x; char name[50];
15832 n = wscanf(L"%d%f%s", &i, &x, name);
```

15833 with the input line:

15834 25 54.32E-1 Hamster

15835 assigns to *n* the value 3, to *i* the value 25, to *x* the value 5.432, and *name* contains the string  
15836 "Hamster".

15837 The call:

```
15838 int i; float x; char name[50];
15839 (void) wscanf(L"%2d%f*d %[0123456789]", &i, &x, name);
```

15840 with input:

15841 56789 0123 56a72

15842 assigns 56 to *i*, 789.0 to *x*, skips 0123, and places the string "56\0" in *name*. The next call to  
15843 *getchar()* shall return the character 'a'.

15844 **APPLICATION USAGE**

15845 In format strings containing the '%' form of conversion specifications, each argument in the  
15846 argument list is used exactly once.

15847 **RATIONALE**

15848 None.

15849 **FUTURE DIRECTIONS**

15850 None.

15851 **SEE ALSO**

15852 *getwc()*, *fwprintf()*, *setlocale()*, *wcstod()*, *wcstol()*, *wcstoul()*, *wcrtomb()*, the Base Definitions  
15853 volume of IEEE Std 1003.1-2001, Chapter 7, Locale, <langinfo.h>, <stdio.h>, <wchar.h>

15854 **CHANGE HISTORY**

15855 First released in Issue 5. Included for alignment with ISO/IEC 9899:1990/Amendment 1:1995  
15856 (E).

15857 **Issue 6**

15858 The DESCRIPTION is updated to avoid use of the term “must” for application requirements.

15859 The following changes are made for alignment with the ISO/IEC 9899:1999 standard:

- 15860 • The prototypes for *fwscanf()* and *swscanf()* are updated.
- 15861 • The DESCRIPTION is updated.
- 15862 • The hh, ll, j, t, and z length modifiers are added.
- 15863 • The a, A, and F conversion characters are added.

15864 The DESCRIPTION is updated to use the terms “conversion specifier” and “conversion  
15865 specification” consistently.

15866 **NAME**

15867        `gai_strerror` — address and name information error description

15868 **SYNOPSIS**

15869        `#include <netdb.h>`

15870        `const char *gai_strerror(int ecode);`

15871 **DESCRIPTION**

15872        The `gai_strerror()` function shall return a text string describing an error value for the `getaddrinfo()`  
15873        and `getnameinfo()` functions listed in the `<netdb.h>` header.

15874        When the `ecode` argument is one of the following values listed in the `<netdb.h>` header:

15875            `[EAI_AGAIN]`

15876            `[EAI_BADFLAGS]`

15877            `[EAI_FAIL]`

15878            `[EAI_FAMILY]`

15879            `[EAI_MEMORY]`

15880            `[EAI_NONAME]`

15881            `[EAI_SERVICE]`

15882            `[EAI_SOCKTYPE]`

15883            `[EAI_SYSTEM]`

15884        the function return value shall point to a string describing the error. If the argument is not one  
15885        of those values, the function shall return a pointer to a string whose contents indicate an  
15886        unknown error.

15887 **RETURN VALUE**

15888        Upon successful completion, `gai_strerror()` shall return a pointer to an implementation-defined  
15889        string.

15890 **ERRORS**

15891        No errors are defined.

15892 **EXAMPLES**

15893        None.

15894 **APPLICATION USAGE**

15895        None.

15896 **RATIONALE**

15897        None.

15898 **FUTURE DIRECTIONS**

15899        None.

15900 **SEE ALSO**

15901        `getaddrinfo()`, the Base Definitions volume of IEEE Std 1003.1-2001, `<netdb.h>`

15902 **CHANGE HISTORY**

15903        First released in Issue 6. Derived from the XNS, Issue 5.2 specification.

15904        The Open Group Base Resolution bwg2001-009 is applied, which changes the return type from

15905        `char *` to `const char *`. This is for coordination with the IPnG Working Group.

15906 **NAME**

15907           gcvt — convert a floating-point number to a string (**LEGACY**)

15908 **SYNOPSIS**

15909 XSI       #include <stdlib.h>

15910       char \*gcvt(double *value*, int *ndigit*, char \**buf*);

15911

15912 **DESCRIPTION**

15913       Refer to *ecvt()*.

15914 **NAME**

15915       getaddrinfo — get address information

15916 **SYNOPSIS**

15917       #include &lt;sys/socket.h&gt;

15918       #include &lt;netdb.h&gt;

15919       int getaddrinfo(const char \*restrict *nodename*,15920                      const char \*restrict *servname*,15921                      const struct addrinfo \*restrict *hints*,15922                      struct addrinfo \*\*restrict *res*);15923 **DESCRIPTION**15924       Refer to *freeaddrinfo()*.

15925 **NAME**

15926        getc — get a byte from a stream

15927 **SYNOPSIS**

15928        #include &lt;stdio.h&gt;

15929        int getc(FILE \*stream);

15930 **DESCRIPTION**

15931 **CX**        The functionality described on this reference page is aligned with the ISO C standard. Any  
15932 conflict between the requirements described here and the ISO C standard is unintentional. This  
15933 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

15934        The *getc()* function shall be equivalent to *fgetc()*, except that if it is implemented as a macro it  
15935 may evaluate *stream* more than once, so the argument should never be an expression with side  
15936 effects.

15937 **RETURN VALUE**15938        Refer to *fgetc()*.15939 **ERRORS**15940        Refer to *fgetc()*.15941 **EXAMPLES**

15942        None.

15943 **APPLICATION USAGE**

15944        If the integer value returned by *getc()* is stored into a variable of type **char** and then compared  
15945 against the integer constant EOF, the comparison may never succeed, because sign-extension of  
15946 a variable of type **char** on widening to integer is implementation-defined.

15947        Since it may be implemented as a macro, *getc()* may treat incorrectly a *stream* argument with  
15948 side effects. In particular, *getc(\*f++)* does not necessarily work as expected. Therefore, use of this  
15949 function should be preceded by "#undef getc" in such situations; *fgetc()* could also be used.

15950 **RATIONALE**

15951        None.

15952 **FUTURE DIRECTIONS**

15953        None.

15954 **SEE ALSO**15955        *fgetc()*, the Base Definitions volume of IEEE Std 1003.1-2001, <stdio.h>15956 **CHANGE HISTORY**

15957        First released in Issue 1. Derived from Issue 1 of the SVID.

15958 **NAME**

15959        getc\_unlocked, getchar\_unlocked, putc\_unlocked, putchar\_unlocked — stdio with explicit client  
15960        locking

15961 **SYNOPSIS**

```
15962 TSF     #include <stdio.h>

15963         int getc_unlocked(FILE *stream);
15964         int getchar_unlocked(void);
15965         int putc_unlocked(int c, FILE *stream);
15966         int putchar_unlocked(int c);
15967
```

15968 **DESCRIPTION**

15969        Versions of the functions *getc()*, *getchar()*, *putc()*, and *putchar()* respectively named  
15970        *getc\_unlocked()*, *getchar\_unlocked()*, *putc\_unlocked()*, and *putchar\_unlocked()* shall be provided  
15971        which are functionally equivalent to the original versions, with the exception that they are not  
15972        required to be implemented in a thread-safe manner. They may only safely be used within a  
15973        scope protected by *flockfile()* (or *ftrylockfile()*) and *funlockfile()*. These functions may safely be  
15974        used in a multi-threaded program if and only if they are called while the invoking thread owns  
15975        the (**FILE**\*) object, as is the case after a successful call to the *flockfile()* or *ftrylockfile()* functions.

15976 **RETURN VALUE**

15977        See *getc()*, *getchar()*, *putc()*, and *putchar()*.

15978 **ERRORS**

15979        See *getc()*, *getchar()*, *putc()*, and *putchar()*.

15980 **EXAMPLES**

15981        None.

15982 **APPLICATION USAGE**

15983        Since they may be implemented as macros, *getc\_unlocked()* and *putc\_unlocked()* may treat  
15984        incorrectly a *stream* argument with side effects. In particular, *getc\_unlocked(\*f++)* and  
15985        *putc\_unlocked(\*f++)* do not necessarily work as expected. Therefore, use of these functions in  
15986        such situations should be preceded by the following statement as appropriate:

```
15987         #undef getc_unlocked
15988         #undef putc_unlocked
```

15989 **RATIONALE**

15990        Some I/O functions are typically implemented as macros for performance reasons (for example,  
15991        *putc()* and *getc()*). For safety, they need to be synchronized, but it is often too expensive to  
15992        synchronize on every character. Nevertheless, it was felt that the safety concerns were more  
15993        important; consequently, the *getc()*, *getchar()*, *putc()*, and *putchar()* functions are required to be  
15994        thread-safe. However, unlocked versions are also provided with names that clearly indicate the  
15995        unsafe nature of their operation but can be used to exploit their higher performance. These  
15996        unlocked versions can be safely used only within explicitly locked program regions, using  
15997        exported locking primitives. In particular, a sequence such as:

```
15998         flockfile(fileptr);
15999         putc_unlocked('1', fileptr);
16000         putc_unlocked('\n', fileptr);
16001         fprintf(fileptr, "Line 2\n");
16002         funlockfile(fileptr);
```

16003        is permissible, and results in the text sequence:

- 16004 1  
16005 Line 2  
16006 being printed without being interspersed with output from other threads.
- 16007 It would be wrong to have the standard names such as *getc()*, *putc()*, and so on, map to the  
16008 “faster, but unsafe” rather than the “slower, but safe” versions. In either case, you would still  
16009 want to inspect all uses of *getc()*, *putc()*, and so on, by hand when converting existing code.  
16010 Choosing the safe bindings as the default, at least, results in correct code and maintains the  
16011 “atomicity at the function” invariant. To do otherwise would introduce gratuitous  
16012 synchronization errors into converted code. Other routines that modify the *stdio* (**FILE** \*)  
16013 structures or buffers are also safely synchronized.
- 16014 Note that there is no need for functions of the form *getc\_locked()*, *putc\_locked()*, and so on, since  
16015 this is the functionality of *getc()*, *putc()*, *et al.* It would be inappropriate to use a feature test  
16016 macro to switch a macro definition of *getc()* between *getc\_locked()* and *getc\_unlocked()*, since the  
16017 ISO C standard requires an actual function to exist, a function whose behavior could not be  
16018 changed by the feature test macro. Also, providing both the *xxx\_locked()* and *xxx\_unlocked()*  
16019 forms leads to the confusion of whether the suffix describes the behavior of the function or the  
16020 circumstances under which it should be used.
- 16021 Three additional routines, *flockfile()*, *ftrylockfile()*, and *funlockfile()* (which may be macros), are  
16022 provided to allow the user to delineate a sequence of I/O statements that are executed  
16023 synchronously.
- 16024 The *ungetc()* function is infrequently called relative to the other functions/macros so no  
16025 unlocked variation is needed.
- 16026 **FUTURE DIRECTIONS**  
16027 None.
- 16028 **SEE ALSO**  
16029 *getc()*, *getchar()*, *putc()*, *putchar()*, the Base Definitions volume of IEEE Std 1003.1-2001,  
16030 **<stdio.h>**
- 16031 **CHANGE HISTORY**  
16032 First released in Issue 5. Included for alignment with the POSIX Threads Extension.
- 16033 **Issue 6**  
16034 These functions are marked as part of the Thread-Safe Functions option.
- 16035 The Open Group Corrigendum U030/2 is applied, adding APPLICATION USAGE describing  
16036 how applications should be written to avoid the case when the functions are implemented as  
16037 macros.

16038 **NAME**

16039            *getchar* — get a byte from a stdin stream

16040 **SYNOPSIS**

16041            #include <stdio.h>

16042            int *getchar*(void);

16043 **DESCRIPTION**

16044 *cx*        The functionality described on this reference page is aligned with the ISO C standard. Any  
16045            conflict between the requirements described here and the ISO C standard is unintentional. This  
16046            volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

16047            The *getchar()* function shall be equivalent to *getc(stdin)*.

16048 **RETURN VALUE**

16049            Refer to *fgetc()*.

16050 **ERRORS**

16051            Refer to *fgetc()*.

16052 **EXAMPLES**

16053            None.

16054 **APPLICATION USAGE**

16055            If the integer value returned by *getchar()* is stored into a variable of type **char** and then  
16056            compared against the integer constant EOF, the comparison may never succeed, because sign-  
16057            extension of a variable of type **char** on widening to integer is implementation-defined.

16058 **RATIONALE**

16059            None.

16060 **FUTURE DIRECTIONS**

16061            None.

16062 **SEE ALSO**

16063            *getc()*, the Base Definitions volume of IEEE Std 1003.1-2001, <stdio.h>

16064 **CHANGE HISTORY**

16065            First released in Issue 1. Derived from Issue 1 of the SVID.

16066 **NAME**

16067        getchar\_unlocked — stdio with explicit client locking

16068 **SYNOPSIS**

16069 TSF     #include <stdio.h>

16070        int getchar\_unlocked(void);

16071

16072 **DESCRIPTION**

16073        Refer to *getc\_unlocked()*.

16074 **NAME**

16075 getcontext, setcontext — get and set current user context

16076 **SYNOPSIS**16077 XSI 

```
#include <ucontext.h>
```

16078 

```
int getcontext(ucontext_t *ucp);
```

16079 

```
int setcontext(const ucontext_t *ucp);
```

16080

16081 **DESCRIPTION**

16082 The *getcontext()* function shall initialize the structure pointed to by *ucp* to the current user  
 16083 context of the calling thread. The **ucontext\_t** type that *ucp* points to defines the user context and  
 16084 includes the contents of the calling thread's machine registers, the signal mask, and the current  
 16085 execution stack.

16086 The *setcontext()* function shall restore the user context pointed to by *ucp*. A successful call to  
 16087 *setcontext()* shall not return; program execution resumes at the point specified by the *ucp*  
 16088 argument passed to *setcontext()*. The *ucp* argument should be created either by a prior call to  
 16089 *getcontext()* or *makecontext()*, or by being passed as an argument to a signal handler. If the *ucp*  
 16090 argument was created with *getcontext()*, program execution continues as if the corresponding  
 16091 call of *getcontext()* had just returned. If the *ucp* argument was created with *makecontext()*,  
 16092 program execution continues with the function passed to *makecontext()*. When that function  
 16093 returns, the thread shall continue as if after a call to *setcontext()* with the *ucp* argument that was  
 16094 input to *makecontext()*. If the *uc\_link* member of the **ucontext\_t** structure pointed to by the *ucp*  
 16095 argument is equal to 0, then this context is the main context, and the thread shall exit when this  
 16096 context returns. The effects of passing a *ucp* argument obtained from any other source are  
 16097 unspecified.

16098 **RETURN VALUE**

16099 Upon successful completion, *setcontext()* shall not return and *getcontext()* shall return 0;  
 16100 otherwise, a value of -1 shall be returned.

16101 **ERRORS**

16102 No errors are defined.

16103 **EXAMPLES**16104 Refer to *makecontext()*.16105 **APPLICATION USAGE**

16106 When a signal handler is executed, the current user context is saved and a new context is  
 16107 created. If the thread leaves the signal handler via *longjmp()*, then it is unspecified whether the  
 16108 context at the time of the corresponding *setjmp()* call is restored and thus whether future calls to  
 16109 *getcontext()* provide an accurate representation of the current context, since the context restored  
 16110 by *longjmp()* does not necessarily contain all the information that *setcontext()* requires. Signal  
 16111 handlers should use *siglongjmp()* or *setcontext()* instead.

16112 Conforming applications should not modify or access the *uc\_mcontext* member of **ucontext\_t**. A  
 16113 conforming application cannot assume that context includes any process-wide static data,  
 16114 possibly including *errno*. Users manipulating contexts should take care to handle these  
 16115 explicitly when required.

16116 Use of contexts to create alternate stacks is not defined by this volume of IEEE Std 1003.1-2001.

16117 **RATIONALE**

16118           None.

16119 **FUTURE DIRECTIONS**

16120           None.

16121 **SEE ALSO**

16122           *bsd\_signal()*, *makecontext()*, *setcontext()*, *setjmp()*, *sigaction()*, *sigaltstack()*, *siglongjmp()*,  
16123           *sigprocmask()*, *sigsetjmp()*, the Base Definitions volume of IEEE Std 1003.1-2001, <**ucontext.h**>

16124 **CHANGE HISTORY**

16125           First released in Issue 4, Version 2.

16126 **Issue 5**

16127           Moved from X/OPEN UNIX extension to BASE.

16128           The following sentence was removed from the DESCRIPTION: “If the *ucp* argument was passed  
16129           to a signal handler, program execution continues with the program instruction following the  
16130           instruction interrupted by the signal.”

16131 **NAME**

16132         getcwd — get the pathname of the current working directory

16133 **SYNOPSIS**

16134         #include &lt;unistd.h&gt;

16135         char \*getcwd(char \*buf, size\_t size);

16136 **DESCRIPTION**

16137         The *getcwd()* function shall place an absolute pathname of the current working directory in the  
 16138         array pointed to by *buf*, and return *buf*. The pathname copied to the array shall contain no  
 16139         components that are symbolic links. The *size* argument is the size in bytes of the character array  
 16140         pointed to by the *buf* argument. If *buf* is a null pointer, the behavior of *getcwd()* is unspecified.

16141 **RETURN VALUE**

16142         Upon successful completion, *getcwd()* shall return the *buf* argument. Otherwise, *getcwd()* shall  
 16143         return a null pointer and set *errno* to indicate the error. The contents of the array pointed to by  
 16144         *buf* are then undefined.

16145 **ERRORS**16146         The *getcwd()* function shall fail if:16147         [EINVAL]         The *size* argument is 0.

16148         [ERANGE]         The *size* argument is greater than 0, but is smaller than the length of the  
 16149         pathname +1.

16150         The *getcwd()* function may fail if:

16151         [EACCES]         Read or search permission was denied for a component of the pathname.

16152         [ENOMEM]         Insufficient storage space is available.

16153 **EXAMPLES**16154         **Determining the Absolute Pathname of the Current Working Directory**

16155         The following example returns a pointer to an array that holds the absolute pathname of the  
 16156         current working directory. The pointer is returned in the *ptr* variable, which points to the *buf*  
 16157         array where the pathname is stored.

16158         #include &lt;stdlib.h&gt;

16159         #include &lt;unistd.h&gt;

16160         ...

16161         long size;

16162         char \*buf;

16163         char \*ptr;

16164         size = pathconf(".", \_PC\_PATH\_MAX);

16165         if ((buf = (char \*)malloc((size\_t)size)) != NULL)

16166                 ptr = getcwd(buf, (size\_t)size);

16167         ...

16168 **APPLICATION USAGE**

16169         None.

16170 **RATIONALE**

16171 Since the maximum pathname length is arbitrary unless {PATH\_MAX} is defined, an application  
16172 generally cannot supply a *buf* with *size* {{PATH\_MAX}+1}.

16173 Having *getcwd()* take no arguments and instead use the *malloc()* function to produce space for  
16174 the returned argument was considered. The advantage is that *getcwd()* knows how big the  
16175 working directory pathname is and can allocate an appropriate amount of space. But the  
16176 programmer would have to use the *free()* function to free the resulting object, or each use of  
16177 *getcwd()* would further reduce the available memory. Also, *malloc()* and *free()* are used nowhere  
16178 else in this volume of IEEE Std 1003.1-2001. Finally, *getcwd()* is taken from the SVID where it has  
16179 the two arguments used in this volume of IEEE Std 1003.1-2001.

16180 The older function *getwd()* was rejected for use in this context because it had only a buffer  
16181 argument and no *size* argument, and thus had no way to prevent overwriting the buffer, except  
16182 to depend on the programmer to provide a large enough buffer.

16183 On some implementations, if *buf* is a null pointer, *getcwd()* may obtain *size* bytes of memory  
16184 using *malloc()*. In this case, the pointer returned by *getcwd()* may be used as the argument in a  
16185 subsequent call to *free()*. Invoking *getcwd()* with *buf* as a null pointer is not recommended in  
16186 conforming applications.

16187 If a program is operating in a directory where some (grand)parent directory does not permit  
16188 reading, *getcwd()* may fail, as in most implementations it must read the directory to determine  
16189 the name of the file. This can occur if search, but not read, permission is granted in an  
16190 intermediate directory, or if the program is placed in that directory by some more privileged  
16191 process (for example, login). Including the [EACCES] error condition makes the reporting of the  
16192 error consistent and warns the application writer that *getcwd()* can fail for reasons beyond the  
16193 control of the application writer or user. Some implementations can avoid this occurrence (for  
16194 example, by implementing *getcwd()* using *pwd*, where *pwd* is a set-user-root process), thus the  
16195 error was made optional. Since this volume of IEEE Std 1003.1-2001 permits the addition of other  
16196 errors, this would be a common addition and yet one that applications could not be expected to  
16197 deal with without this addition.

16198 **FUTURE DIRECTIONS**

16199 None.

16200 **SEE ALSO**

16201 *malloc()*, the Base Definitions volume of IEEE Std 1003.1-2001, <unistd.h>

16202 **CHANGE HISTORY**

16203 First released in Issue 1. Derived from Issue 1 of the SVID.

16204 **Issue 6**

16205 The following new requirements on POSIX implementations derive from alignment with the  
16206 Single UNIX Specification:

- 16207 • The [ENOMEM] optional error condition is added.

16208 **NAME**

16209 getdate — convert user format date and time

16210 **SYNOPSIS**

```
16211 xSI #include <time.h>
16212 struct tm *getdate(const char *string);
16213
```

16214 **DESCRIPTION**

16215 The *getdate()* function shall convert a string representation of a date or time into a broken-down  
 16216 time.

16217 The external variable or macro *getdate\_err* is used by *getdate()* to return error values.

16218 Templates are used to parse and interpret the input string. The templates are contained in a text  
 16219 file identified by the environment variable *DATEMSK*. The *DATEMSK* variable should be set to  
 16220 indicate the full pathname of the file that contains the templates. The first line in the template  
 16221 that matches the input specification is used for interpretation and conversion into the internal  
 16222 time format.

16223 The following conversion specifications shall be supported:

|       |    |                                                                                           |
|-------|----|-------------------------------------------------------------------------------------------|
| 16224 | %% | Equivalent to %.                                                                          |
| 16225 | %a | Abbreviated weekday name.                                                                 |
| 16226 | %A | Full weekday name.                                                                        |
| 16227 | %b | Abbreviated month name.                                                                   |
| 16228 | %B | Full month name.                                                                          |
| 16229 | %c | Locale's appropriate date and time representation.                                        |
| 16230 | %C | Century number [00,99]; leading zeros are permitted but not required.                     |
| 16231 | %d | Day of month [01,31]; the leading 0 is optional.                                          |
| 16232 | %D | Date as %m/%d/%y.                                                                         |
| 16233 | %e | Equivalent to %d.                                                                         |
| 16234 | %h | Abbreviated month name.                                                                   |
| 16235 | %H | Hour [00,23].                                                                             |
| 16236 | %I | Hour [01,12].                                                                             |
| 16237 | %m | Month number [01,12].                                                                     |
| 16238 | %M | Minute [00,59].                                                                           |
| 16239 | %n | Equivalent to <newline>.                                                                  |
| 16240 | %p | Locale's equivalent of either AM or PM.                                                   |
| 16241 | %r | The locale's appropriate representation of time in AM and PM notation. In the POSIX       |
| 16242 |    | locale, this shall be equivalent to %I:%M:%S %p.                                          |
| 16243 | %R | Time as %H:%M.                                                                            |
| 16244 | %S | Seconds [00,60]. The range goes to 60 (rather than stopping at 59) to allow positive leap |
| 16245 |    | seconds to be expressed. Since leap seconds cannot be predicted by any algorithm, leap    |
| 16246 |    | second data must come from some external source.                                          |

|       |    |                                                                                                                                                                                                                                                                                                                                            |
|-------|----|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 16247 | %t | Equivalent to <tab>.                                                                                                                                                                                                                                                                                                                       |
| 16248 | %T | Time as %H:%M:%S.                                                                                                                                                                                                                                                                                                                          |
| 16249 | %w | Weekday number (Sunday = [0,6]).                                                                                                                                                                                                                                                                                                           |
| 16250 | %x | Locale's appropriate date representation.                                                                                                                                                                                                                                                                                                  |
| 16251 | %X | Locale's appropriate time representation.                                                                                                                                                                                                                                                                                                  |
| 16252 | %y | Year within century. When a century is not otherwise specified, values in the range [69,99] shall refer to years 1969 to 1999 inclusive, and values in the range [00,68] shall refer to years 2000 to 2068 inclusive.                                                                                                                      |
| 16255 |    | <b>Note:</b> It is expected that in a future version of IEEE Std 1003.1-2001 the default century inferred from a 2-digit year will change. (This would apply to all commands accepting a 2-digit year as input.)                                                                                                                           |
| 16256 |    |                                                                                                                                                                                                                                                                                                                                            |
| 16257 |    |                                                                                                                                                                                                                                                                                                                                            |
| 16258 | %Y | Year as "ccyy" (for example, 2001).                                                                                                                                                                                                                                                                                                        |
| 16259 | %Z | Timezone name or no characters if no timezone exists. If the timezone supplied by %Z is not the timezone that <i>getdate()</i> expects, an invalid input specification error shall result. The <i>getdate()</i> function calculates an expected timezone based on information supplied to the function (such as the hour, day, and month). |
| 16260 |    |                                                                                                                                                                                                                                                                                                                                            |
| 16261 |    |                                                                                                                                                                                                                                                                                                                                            |
| 16262 |    |                                                                                                                                                                                                                                                                                                                                            |
| 16263 |    | The match between the template and input specification performed by <i>getdate()</i> shall be case-insensitive.                                                                                                                                                                                                                            |
| 16264 |    |                                                                                                                                                                                                                                                                                                                                            |
| 16265 |    | The month and weekday names can consist of any combination of upper and lowercase letters. The process can request that the input date or time specification be in a specific language by setting the <i>LC_TIME</i> category (see <i>setlocale()</i> ).                                                                                   |
| 16266 |    |                                                                                                                                                                                                                                                                                                                                            |
| 16267 |    |                                                                                                                                                                                                                                                                                                                                            |
| 16268 |    | Leading zeros are not necessary for the descriptors that allow leading zeros. However, at most two digits are allowed for those descriptors, including leading zeros. Extra whitespace in either the template file or in <i>string</i> shall be ignored.                                                                                   |
| 16269 |    |                                                                                                                                                                                                                                                                                                                                            |
| 16270 |    |                                                                                                                                                                                                                                                                                                                                            |
| 16271 |    | The results are undefined if the conversion specifications %c, %x, and %X include unsupported conversion specifications.                                                                                                                                                                                                                   |
| 16272 |    |                                                                                                                                                                                                                                                                                                                                            |
| 16273 |    | The following rules apply for converting the input specification into the internal format:                                                                                                                                                                                                                                                 |
| 16274 |    | • If %Z is being scanned, then <i>getdate()</i> shall initialize the broken-down time to be the current time in the scanned timezone. Otherwise, it shall initialize the broken-down time based on the current local time as if <i>localtime()</i> had been called.                                                                        |
| 16275 |    |                                                                                                                                                                                                                                                                                                                                            |
| 16276 |    |                                                                                                                                                                                                                                                                                                                                            |
| 16277 |    | • If only the weekday is given, the day chosen shall be the day, starting with today and moving into the future, which first matches the named day.                                                                                                                                                                                        |
| 16278 |    |                                                                                                                                                                                                                                                                                                                                            |
| 16279 |    | • If only the month (and no year) is given, the month chosen shall be the month, starting with the current month and moving into the future, which first matches the named month. The first day of the month shall be assumed if no day is given.                                                                                          |
| 16280 |    |                                                                                                                                                                                                                                                                                                                                            |
| 16281 |    |                                                                                                                                                                                                                                                                                                                                            |
| 16282 |    | • If no hour, minute, and second are given, the current hour, minute, and second shall be assumed.                                                                                                                                                                                                                                         |
| 16283 |    |                                                                                                                                                                                                                                                                                                                                            |
| 16284 |    | • If no date is given, the hour chosen shall be the hour, starting with the current hour and moving into the future, which first matches the named hour.                                                                                                                                                                                   |
| 16285 |    |                                                                                                                                                                                                                                                                                                                                            |
| 16286 |    | If a conversion specification in the <i>DATMSK</i> file does not correspond to one of the conversion specifications above, the behavior is unspecified.                                                                                                                                                                                    |
| 16287 |    |                                                                                                                                                                                                                                                                                                                                            |
| 16288 |    | The <i>getdate()</i> function need not be reentrant. A function that is not required to be reentrant is not required to be thread-safe.                                                                                                                                                                                                    |
| 16289 |    |                                                                                                                                                                                                                                                                                                                                            |

## 16290 RETURN VALUE

16291 Upon successful completion, `getdate()` shall return a pointer to a **struct tm**. Otherwise, it shall  
 16292 return a null pointer and set `getdate_err` to indicate the error.

## 16293 ERRORS

16294 The `getdate()` function shall fail in the following cases, setting `getdate_err` to the value shown in  
 16295 the list below. Any changes to `errno` are unspecified.

- 16296 1. The `DATEMSK` environment variable is null or undefined.
- 16297 2. The template file cannot be opened for reading.
- 16298 3. Failed to get file status information.
- 16299 4. The template file is not a regular file.
- 16300 5. An I/O error is encountered while reading the template file.
- 16301 6. Memory allocation failed (not enough memory available).
- 16302 7. There is no line in the template that matches the input.
- 16303 8. Invalid input specification. For example, February 31; or a time is specified that cannot be  
 16304 represented in a `time_t` (representing the time in seconds since the Epoch).

## 16305 EXAMPLES

- 16306 1. The following example shows the possible contents of a template:

```
16307 %m
16308 %A %B %d, %Y, %H:%M:%S
16309 %A
16310 %B
16311 %m/%d/%y %I %p
16312 %d,%m,%Y %H:%M
16313 at %A the %dst of %B in %Y
16314 run job at %I %p,%B %dnd
16315 %A den %d. %B %Y %H.%M Uhr
```

- 16316 2. The following are examples of valid input specifications for the template in Example 1:

```
16317 getdate("10/1/87 4 PM");
16318 getdate("Friday");
16319 getdate("Friday September 18, 1987, 10:30:30");
16320 getdate("24,9,1986 10:30");
16321 getdate("at monday the 1st of december in 1986");
16322 getdate("run job at 3 PM, december 2nd");
```

16323 If the `LC_TIME` category is set to a German locale that includes *freitag* as a weekday name  
 16324 and *oktober* as a month name, the following would be valid:

```
16325 getdate("freitag den 10. oktober 1986 10.30 Uhr");
```

- 16326 3. The following example shows how local date and time specification can be defined in the  
 16327 template:

16328  
16329  
16330  
16331  
16332  
16333

| Invocation                 | Line in Template |
|----------------------------|------------------|
| getdate("11/27/86")        | %m/%d/%y         |
| getdate("27.11.86")        | %d.%m.%y         |
| getdate("86-11-27")        | %y-%m-%d         |
| getdate("Friday 12:00:00") | %A %H:%M:%S      |

16334  
16335  
16336  
16337

4. The following examples help to illustrate the above rules assuming that the current date is Mon Sep 22 12:19:47 EDT 1986 and the *LC\_TIME* category is set to the default C locale:

16338  
16339  
16340  
16341  
16342  
16343  
16344  
16345  
16346  
16347  
16348  
16349  
16350  
16351

| Input        | Line in Template | Date                         |
|--------------|------------------|------------------------------|
| Mon          | %a               | Mon Sep 22 12:19:47 EDT 1986 |
| Sun          | %a               | Sun Sep 28 12:19:47 EDT 1986 |
| Fri          | %a               | Fri Sep 26 12:19:47 EDT 1986 |
| September    | %B               | Mon Sep 1 12:19:47 EDT 1986  |
| January      | %B               | Thu Jan 1 12:19:47 EST 1987  |
| December     | %B               | Mon Dec 1 12:19:47 EST 1986  |
| Sep Mon      | %b %a            | Mon Sep 1 12:19:47 EDT 1986  |
| Jan Fri      | %b %a            | Fri Jan 2 12:19:47 EST 1987  |
| Dec Mon      | %b %a            | Mon Dec 1 12:19:47 EST 1986  |
| Jan Wed 1989 | %b %a %Y         | Wed Jan 4 12:19:47 EST 1989  |
| Fri 9        | %a %H            | Fri Sep 26 09:00:00 EDT 1986 |
| Feb 10:30    | %b %H:%S         | Sun Feb 1 10:00:30 EST 1987  |
| 10:30        | %H:%M            | Tue Sep 23 10:30:00 EDT 1986 |
| 13:30        | %H:%M            | Mon Sep 22 13:30:00 EDT 1986 |

#### 16352 APPLICATION USAGE

16353 Although historical versions of *getdate()* did not require that **<time.h>** declare the external  
16354 variable *getdate\_err*, this volume of IEEE Std 1003.1-2001 does require it. The standard  
16355 developers encourage applications to remove declarations of *getdate\_err* and instead incorporate  
16356 the declaration by including **<time.h>**.

16357 Applications should use %Y (4-digit years) in preference to %y (2-digit years).

#### 16358 RATIONALE

16359 In standard locales, the conversion specifications %c, %x, and %X do not include unsupported  
16360 conversion specifiers and so the text regarding results being undefined is not a problem in that  
16361 case.

#### 16362 FUTURE DIRECTIONS

16363 None.

#### 16364 SEE ALSO

16365 *ctime()*, *localtime()*, *setlocale()*, *strftime()*, *times()*, the Base Definitions volume of  
16366 IEEE Std 1003.1-2001, **<time.h>**

#### 16367 CHANGE HISTORY

16368 First released in Issue 4, Version 2.

#### 16369 Issue 5

16370 Moved from X/OPEN UNIX extension to BASE.

16371 The last paragraph of the DESCRIPTION is added.

16372 The %C conversion specification is added, and the exact meaning of the %y conversion  
16373 specification is clarified in the DESCRIPTION.

- 16374 A note indicating that this function need not be reentrant is added to the DESCRIPTION.
- 16375 The %R conversion specification is changed to follow historical practice.
- 16376 **Issue 6**
- 16377 The DESCRIPTION is updated to refer to “seconds since the Epoch” rather than “seconds since
- 16378 00:00:00 UTC (Coordinated Universal Time), January 1 1970” for consistency with other *time*
- 16379 functions.
- 16380 The description of %S is updated so that the valid range is [00,60] rather than [00,61].
- 16381 The DESCRIPTION is updated to refer to conversion specifications instead of field descriptors
- 16382 for consistency with other functions.

16383 **NAME**

16384           getegid — get the effective group ID

16385 **SYNOPSIS**

16386           #include <unistd.h>

16387           gid\_t getegid(void);

16388 **DESCRIPTION**

16389           The *getegid()* function shall return the effective group ID of the calling process.

16390 **RETURN VALUE**

16391           The *getegid()* function shall always be successful and no return value is reserved to indicate an error.

16393 **ERRORS**

16394           No errors are defined.

16395 **EXAMPLES**

16396           None.

16397 **APPLICATION USAGE**

16398           None.

16399 **RATIONALE**

16400           None.

16401 **FUTURE DIRECTIONS**

16402           None.

16403 **SEE ALSO**

16404           *geteuid()*, *getgid()*, *getuid()*, *setegid()*, *seteuid()*, *setgid()*, *setregid()*, *setreuid()*, *setuid()*, the Base Definitions volume of IEEE Std 1003.1-2001, <sys/types.h>, <unistd.h>

16406 **CHANGE HISTORY**

16407           First released in Issue 1. Derived from Issue 1 of the SVID.

16408 **Issue 6**

16409           In the SYNOPSIS, the optional include of the <sys/types.h> header is removed.

16410           The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:

- 16412
  - The requirement to include <sys/types.h> has been removed. Although <sys/types.h> was required for conforming implementations of previous POSIX specifications, it was not required for UNIX applications.
- 16413
- 16414

16415 **NAME**

16416        getenv — get value of an environment variable

16417 **SYNOPSIS**

16418        #include &lt;stdlib.h&gt;

16419        char \*getenv(const char \*name);

16420 **DESCRIPTION**

16421 **CX**        The functionality described on this reference page is aligned with the ISO C standard. Any  
16422 conflict between the requirements described here and the ISO C standard is unintentional. This  
16423 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

16424        The *getenv()* function shall search the environment of the calling process (see the Base  
16425 Definitions volume of IEEE Std 1003.1-2001, Chapter 8, Environment Variables) for the  
16426 environment variable *name* if it exists and return a pointer to the value of the environment  
16427 variable. If the specified environment variable cannot be found, a null pointer shall be returned.  
16428 The application shall ensure that it does not modify the string pointed to by the *getenv()*  
16429 function.

16430 **CX**        The string pointed to may be overwritten by a subsequent call to *getenv()*, *setenv()*, or *unsetenv()*,  
16431 but shall not be overwritten by a call to any other function in this volume of  
16432 IEEE Std 1003.1-2001.

16433 **CX**        If the application modifies *environ* or the pointers to which it points, the behavior of *getenv()* is  
16434 undefined.

16435        The *getenv()* function need not be reentrant. A function that is not required to be reentrant is not  
16436 required to be thread-safe.

16437 **RETURN VALUE**

16438        Upon successful completion, *getenv()* shall return a pointer to a string containing the *value* for  
16439 the specified *name*. If the specified *name* cannot be found in the environment of the calling  
16440 process, a null pointer shall be returned.

16441        The return value from *getenv()* may point to static data which may be overwritten by  
16442 **CX** subsequent calls to *getenv()*, *setenv()*, or *unsetenv()*.

16443 **XSI**        On XSI-conformant systems, the return value from *getenv()* may point to static data which may  
16444 also be overwritten by subsequent calls to *putenv()*.

16445 **ERRORS**

16446        No errors are defined.

16447 **EXAMPLES**16448        **Getting the Value of an Environment Variable**16449        The following example gets the value of the *HOME* environment variable.

```
16450        #include <stdlib.h>
16451        ...
16452        const char *name = "HOME";
16453        char *value;
16454        value = getenv(name);
```

16455 **APPLICATION USAGE**

16456 None.

16457 **RATIONALE**

16458 The *clearenv()* function was considered but rejected. The *putenv()* function has now been  
16459 included for alignment with the Single UNIX Specification.

16460 The *getenv()* function is inherently not reentrant because it returns a value pointing to static  
16461 data.

16462 Conforming applications are required not to modify *environ* directly, but to use only the  
16463 functions described here to manipulate the process environment as an abstract object. Thus, the  
16464 implementation of the environment access functions has complete control over the data  
16465 structure used to represent the environment (subject to the requirement that *environ* be  
16466 maintained as a list of strings with embedded equal signs for applications that wish to scan the  
16467 environment). This constraint allows the implementation to properly manage the memory it  
16468 allocates, either by using allocated storage for all variables (copying them on the first invocation  
16469 of *setenv()* or *unsetenv()*), or keeping track of which strings are currently in allocated space and  
16470 which are not, via a separate table or some other means. This enables the implementation to free  
16471 any allocated space used by strings (and perhaps the pointers to them) stored in *environ* when  
16472 *unsetenv()* is called. A C runtime start-up procedure (that which invokes *main()* and perhaps  
16473 initializes *environ*) can also initialize a flag indicating that none of the environment has yet been  
16474 copied to allocated storage, or that the separate table has not yet been initialized.

16475 In fact, for higher performance of *getenv()*, the implementation could also maintain a separate  
16476 copy of the environment in a data structure that could be searched much more quickly (such as  
16477 an indexed hash table, or a binary tree), and update both it and the linear list at *environ* when  
16478 *setenv()* or *unsetenv()* is invoked.

16479 Performance of *getenv()* can be important for applications which have large numbers of  
16480 environment variables. Typically, applications like this use the environment as a resource  
16481 database of user-configurable parameters. The fact that these variables are in the user's shell  
16482 environment usually means that any other program that uses environment variables (such as *ls*,  
16483 which attempts to use *COLUMNS*), or really almost any utility (*LANG*, *LC\_ALL*, and so on) is  
16484 similarly slowed down by the linear search through the variables.

16485 An implementation that maintains separate data structures, or even one that manages the  
16486 memory it consumes, is not currently required as it was thought it would reduce consensus  
16487 among implementors who do not want to change their historical implementations.

16488 The POSIX Threads Extension states that multi-threaded applications must not modify *environ*  
16489 directly, and that IEEE Std 1003.1-2001 is providing functions which such applications can use in  
16490 the future to manipulate the environment in a thread-safe manner. Thus, moving away from  
16491 application use of *environ* is desirable from that standpoint as well.

16492 **FUTURE DIRECTIONS**

16493 None.

16494 **SEE ALSO**

16495 *exec*, *putenv()*, *setenv()*, *unsetenv()*, the Base Definitions volume of IEEE Std 1003.1-2001, Chapter  
16496 8, Environment Variables, <**stdlib.h**>

16497 **CHANGE HISTORY**

16498 First released in Issue 1. Derived from Issue 1 of the SVID.

16499 **Issue 5**

16500 Normative text previously in the APPLICATION USAGE section is moved to the RETURN  
16501 VALUE section.

16502 A note indicating that this function need not be reentrant is added to the DESCRIPTION.

16503 **Issue 6**

16504 The following changes were made to align with the IEEE P1003.1a draft standard:

16505 • References added to the new *setenv()* and *unsetenv()* functions.

16506 The DESCRIPTION is updated to avoid use of the term “must” for application requirements.

16507 **NAME**

16508           geteuid — get the effective user ID

16509 **SYNOPSIS**

16510           #include <unistd.h>

16511           uid\_t geteuid(void);

16512 **DESCRIPTION**

16513           The *geteuid()* function shall return the effective user ID of the calling process.

16514 **RETURN VALUE**

16515           The *geteuid()* function shall always be successful and no return value is reserved to indicate an error.

16517 **ERRORS**

16518           No errors are defined.

16519 **EXAMPLES**

16520           None.

16521 **APPLICATION USAGE**

16522           None.

16523 **RATIONALE**

16524           None.

16525 **FUTURE DIRECTIONS**

16526           None.

16527 **SEE ALSO**

16528           *getegid()*, *getgid()*, *getuid()*, *setegid()*, *seteuid()*, *setgid()*, *setregid()*, *setreuid()*, *setuid()*, the Base Definitions volume of IEEE Std 1003.1-2001, <sys/types.h>, <unistd.h>

16530 **CHANGE HISTORY**

16531           First released in Issue 1. Derived from Issue 1 of the SVID.

16532 **Issue 6**

16533           In the SYNOPSIS, the optional include of the <sys/types.h> header is removed.

16534           The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:

- 16536           • The requirement to include <sys/types.h> has been removed. Although <sys/types.h> was required for conforming implementations of previous POSIX specifications, it was not required for UNIX applications.
- 16537
- 16538

16539 **NAME**

16540           getgid — get the real group ID

16541 **SYNOPSIS**

16542           #include <unistd.h>

16543           gid\_t getgid(void);

16544 **DESCRIPTION**

16545           The *getgid()* function shall return the real group ID of the calling process.

16546 **RETURN VALUE**

16547           The *getgid()* function shall always be successful and no return value is reserved to indicate an error.

16549 **ERRORS**

16550           No errors are defined.

16551 **EXAMPLES**

16552           None.

16553 **APPLICATION USAGE**

16554           None.

16555 **RATIONALE**

16556           None.

16557 **FUTURE DIRECTIONS**

16558           None.

16559 **SEE ALSO**

16562 **CHANGE HISTORY**

16563           First released in Issue 1. Derived from Issue 1 of the SVID.

16564 **Issue 6**

16565           In the SYNOPSIS, the optional include of the <sys/types.h> header is removed.

16566           The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:

- 16568
  - The requirement to include <sys/types.h> has been removed. Although <sys/types.h> was required for conforming implementations of previous POSIX specifications, it was not required for UNIX applications.
- 16569
- 16570

16571 **NAME**

16572           getgrent — get the group database entry

16573 **SYNOPSIS**

16574 xSI       #include <grp.h>

16575           struct group \*getgrent(void);

16576

16577 **DESCRIPTION**

16578           Refer to *endgrent()*.

16579 **NAME**16580 `getgrgid, getgrgid_r` — get group database entry for a group ID16581 **SYNOPSIS**16582 `#include <grp.h>`16583 `struct group *getgrgid(gid_t gid);`16584 TSF `int getgrgid_r(gid_t gid, struct group *grp, char *buffer,`16585 `size_t bufsize, struct group **result);`

16586

16587 **DESCRIPTION**16588 The `getgrgid()` function shall search the group database for an entry with a matching *gid*.16589 The `getgrgid()` function need not be reentrant. A function that is not required to be reentrant is  
16590 not required to be thread-safe.16591 TSF The `getgrgid_r()` function shall update the **group** structure pointed to by *grp* and store a pointer  
16592 to that structure at the location pointed to by *result*. The structure shall contain an entry from  
16593 the group database with a matching *gid*. Storage referenced by the group structure is allocated  
16594 from the memory provided with the *buffer* parameter, which is *bufsize* bytes in size. The  
16595 maximum size needed for this buffer can be determined with the `{_SC_GETGR_R_SIZE_MAX}`  
16596 `sysconf()` parameter. A NULL pointer shall be returned at the location pointed to by *result* on  
16597 error or if the requested entry is not found.16598 **RETURN VALUE**16599 Upon successful completion, `getgrgid()` shall return a pointer to a **struct group** with the structure  
16600 defined in `<grp.h>` with a matching entry if one is found. The `getgrgid()` function shall return a  
16601 null pointer if either the requested entry was not found, or an error occurred. On error, *errno*  
16602 shall be set to indicate the error.16603 The return value may point to a static area which is overwritten by a subsequent call to  
16604 `getgrent()`, `getgrgid()`, or `getgrnam()`.16605 TSF If successful, the `getgrgid_r()` function shall return zero; otherwise, an error number shall be  
16606 returned to indicate the error.16607 **ERRORS**16608 The `getgrgid()` and `getgrgid_r()` functions may fail if:

16609 [EIO] An I/O error has occurred.

16610 [EINTR] A signal was caught during `getgrgid()`.16611 [EMFILE] `{OPEN_MAX}` file descriptors are currently open in the calling process.

16612 [ENFILE] The maximum allowable number of files is currently open in the system.

16613 TSF The `getgrgid_r()` function may fail if:16614 TSF [ERANGE] Insufficient storage was supplied via *buffer* and *bufsize* to contain the data to  
16615 be referenced by the resulting **group** structure.

## 16616 EXAMPLES

16617 **Finding an Entry in the Group Database**

16618 The following example uses *getgrgid()* to search the group database for a group ID that was  
 16619 previously stored in a **stat** structure, then prints out the group name if it is found. If the group is  
 16620 not found, the program prints the numeric value of the group for the entry.

```
16621 #include <sys/types.h>
16622 #include <grp.h>
16623 #include <stdio.h>
16624 ...
16625 struct stat statbuf;
16626 struct group *grp;
16627 ...
16628 if ((grp = getgrgid(statbuf.st_gid)) != NULL)
16629     printf(" %-8.8s", grp->gr_name);
16630 else
16631     printf(" %-8d", statbuf.st_gid);
16632 ...
```

16633 **APPLICATION USAGE**

16634 Applications wishing to check for error situations should set *errno* to 0 before calling *getgrgid()*.  
 16635 If *errno* is set on return, an error occurred.

16636 The *getgrgid\_r()* function is thread-safe and shall return values in a user-supplied buffer instead  
 16637 of possibly using a static data area that may be overwritten by each call.

16638 **RATIONALE**

16639 None.

16640 **FUTURE DIRECTIONS**

16641 None.

16642 **SEE ALSO**

16643 *endgrent()*, *getgrnam()*, the Base Definitions volume of IEEE Std 1003.1-2001, **<grp.h>**,  
 16644 **<limits.h>**, **<sys/types.h>**

16645 **CHANGE HISTORY**

16646 First released in Issue 1. Derived from System V Release 2.0.

16647 **Issue 5**

16648 Normative text previously in the APPLICATION USAGE section is moved to the RETURN  
 16649 VALUE section.

16650 The *getgrgid\_r()* function is included for alignment with the POSIX Threads Extension.

16651 A note indicating that the *getgrgid()* function need not be reentrant is added to the  
 16652 DESCRIPTION.

16653 **Issue 6**

16654 The *getgrgid\_r()* function is marked as part of the Thread-Safe Functions option.

16655 The Open Group Corrigendum U028/3 is applied, correcting text in the DESCRIPTION  
 16656 describing matching the *gid*.

16657 In the DESCRIPTION, the note about reentrancy is expanded to cover thread-safety.

16658 In the SYNOPSIS, the optional include of the **<sys/types.h>** header is removed.

- 16659           The following new requirements on POSIX implementations derive from alignment with the  
16660           Single UNIX Specification:
- 16661           • The requirement to include `<sys/types.h>` has been removed. Although `<sys/types.h>` was  
16662           required for conforming implementations of previous POSIX specifications, it was not  
16663           required for UNIX applications.
  - 16664           • In the RETURN VALUE section, the requirement to set *errno* on error is added.
  - 16665           • The [EIO], [EINTR], [EMFILE], and [ENFILE] optional error conditions are added.
- 16666           The APPLICATION USAGE section is updated to include a note on the thread-safe function and  
16667           its avoidance of possibly using a static data area.
- 16668           IEEE PASC Interpretation 1003.1 #116 is applied, changing the description of the size of the  
16669           buffer from *bufsize* characters to bytes.

## 16670 NAME

16671 getgrnam, getgrnam\_r — search group database for a name

## 16672 SYNOPSIS

16673 #include <grp.h>

16674 struct group \*getgrnam(const char \*name);

16675 TSF int getgrnam\_r(const char \*name, struct group \*grp, char \*buffer,  
16676 size\_t bufsize, struct group \*\*result);

16677

## 16678 DESCRIPTION

16679 The *getgrnam()* function shall search the group database for an entry with a matching *name*.

16680 The *getgrnam()* function need not be reentrant. A function that is not required to be reentrant is  
16681 not required to be thread-safe.

16682 TSF The *getgrnam\_r()* function shall update the **group** structure pointed to by *grp* and store a pointer  
16683 to that structure at the location pointed to by *result*. The structure shall contain an entry from  
16684 the group database with a matching *gid* or *name*. Storage referenced by the **group** structure is  
16685 allocated from the memory provided with the *buffer* parameter, which is *bufsize* bytes in size. The  
16686 maximum size needed for this buffer can be determined with the `{_SC_GETGR_R_SIZE_MAX}`  
16687 *sysconf()* parameter. A NULL pointer is returned at the location pointed to by *result* on error or if  
16688 the requested entry is not found.

## 16689 RETURN VALUE

16690 The *getgrnam()* function shall return a pointer to a **struct group** with the structure defined in  
16691 <grp.h> with a matching entry if one is found. The *getgrnam\_r()* function shall return a null  
16692 pointer if either the requested entry was not found, or an error occurred. On error, *errno* shall be  
16693 set to indicate the error.

16694 The return value may point to a static area which is overwritten by a subsequent call to  
16695 *getgrent()*, *getgrgid()*, or *getgrnam()*.

16696 TSF If successful, the *getgrnam\_r()* function shall return zero; otherwise, an error number shall be  
16697 returned to indicate the error.

## 16698 ERRORS

16699 The *getgrnam()* and *getgrnam\_r()* functions may fail if:

16700 [EIO] An I/O error has occurred.

16701 [EINTR] A signal was caught during *getgrnam()*.

16702 [EMFILE] `{OPEN_MAX}` file descriptors are currently open in the calling process.

16703 [ENFILE] The maximum allowable number of files is currently open in the system.

16704 The *getgrnam\_r()* function may fail if:

16705 TSF [ERANGE] Insufficient storage was supplied via *buffer* and *bufsize* to contain the data to  
16706 be referenced by the resulting **group** structure.

16707 **EXAMPLES**

16708 None.

16709 **APPLICATION USAGE**

16710 Applications wishing to check for error situations should set *errno* to 0 before calling *getgrnam()*.  
 16711 If *errno* is set on return, an error occurred.

16712 The *getgrnam\_r()* function is thread-safe and shall return values in a user-supplied buffer instead  
 16713 of possibly using a static data area that may be overwritten by each call.

16714 **RATIONALE**

16715 None.

16716 **FUTURE DIRECTIONS**

16717 None.

16718 **SEE ALSO**

16719 *endgrent()*, *getgrgid()*, the Base Definitions volume of IEEE Std 1003.1-2001, **<grp.h>**, **<limits.h>**,  
 16720 **<sys/types.h>**

16721 **CHANGE HISTORY**

16722 First released in Issue 1. Derived from System V Release 2.0.

16723 **Issue 5**

16724 Normative text previously in the APPLICATION USAGE section is moved to the RETURN  
 16725 VALUE section.

16726 The *getgrnam\_r()* function is included for alignment with the POSIX Threads Extension.

16727 A note indicating that the *getgrnam()* function need not be reentrant is added to the  
 16728 DESCRIPTION.

16729 **Issue 6**16730 The *getgrnam\_r()* function is marked as part of the Thread-Safe Functions option.

16731 In the DESCRIPTION, the note about reentrancy is expanded to cover thread-safety.

16732 In the SYNOPSIS, the optional include of the **<sys/types.h>** header is removed.

16733 The following new requirements on POSIX implementations derive from alignment with the  
 16734 Single UNIX Specification:

16735 • The requirement to include **<sys/types.h>** has been removed. Although **<sys/types.h>** was  
 16736 required for conforming implementations of previous POSIX specifications, it was not  
 16737 required for UNIX applications.

16738 • In the RETURN VALUE section, the requirement to set *errno* on error is added.

16739 • The [EIO], [EINTR], [EMFILE], and [ENFILE] optional error conditions are added.

16740 The APPLICATION USAGE section is updated to include a note on the thread-safe function and  
 16741 its avoidance of possibly using a static data area.

16742 IEEE PASC Interpretation 1003.1 #116 is applied, changing the description of the size of the  
 16743 buffer from *bufsize* characters to bytes.

16744 **NAME**

16745           getgroups — get supplementary group IDs

16746 **SYNOPSIS**

16747           #include &lt;unistd.h&gt;

16748           int getgroups(int *gidsetsize*, gid\_t *grouplist*[]);16749 **DESCRIPTION**

16750           The *getgroups()* function shall fill in the array *grouplist* with the current supplementary group  
 16751           IDs of the calling process. It is implementation-defined whether *getgroups()* also returns the  
 16752           effective group ID in the *grouplist* array.

16753           The *gidsetsize* argument specifies the number of elements in the array *grouplist*. The actual  
 16754           number of group IDs stored in the array shall be returned. The values of array entries with  
 16755           indices greater than or equal to the value returned are undefined.

16756           If *gidsetsize* is 0, *getgroups()* shall return the number of group IDs that it would otherwise return  
 16757           without modifying the array pointed to by *grouplist*.

16758           If the effective group ID of the process is returned with the supplementary group IDs, the value  
 16759           returned shall always be greater than or equal to one and less than or equal to the value of  
 16760           {NGROUPS\_MAX}+1.

16761 **RETURN VALUE**

16762           Upon successful completion, the number of supplementary group IDs shall be returned. A  
 16763           return value of -1 indicates failure and *errno* shall be set to indicate the error.

16764 **ERRORS**16765           The *getgroups()* function shall fail if:

16766           [EINVAL]           The *gidsetsize* argument is non-zero and less than the number of group IDs  
 16767           that would have been returned.

16768 **EXAMPLES**16769           **Getting the Supplementary Group IDs of the Calling Process**

16770           The following example places the current supplementary group IDs of the calling process into  
 16771           the *group* array.

```
16772           #include <sys/types.h>
16773           #include <unistd.h>
16774           ...
16775           gid_t *group;
16776           int nogroups;
16777           long ngroups_max;

16778           ngroups_max = sysconf(_SC_NGROUPS_MAX) + 1;
16779           group = (gid_t *)malloc(ngroups_max * sizeof(gid_t));

16780           ngroups = getgroups(ngroups_max, group);
```

16781 **APPLICATION USAGE**

16782           None.

16783 **RATIONALE**

16784           The related function *setgroups()* is a privileged operation and therefore is not covered by this  
 16785           volume of IEEE Std 1003.1-2001.

16786 As implied by the definition of supplementary groups, the effective group ID may appear in the  
16787 array returned by *getgroups()* or it may be returned only by *getegid()*. Duplication may exist, but  
16788 the application needs to call *getegid()* to be sure of getting all of the information. Various  
16789 implementation variations and administrative sequences cause the set of groups appearing in  
16790 the result of *getgroups()* to vary in order and as to whether the effective group ID is included,  
16791 even when the set of groups is the same (in the mathematical sense of “set”). (The history of a  
16792 process and its parents could affect the details of the result.)

16793 Application writers should note that {NGROUPS\_MAX} is not necessarily a constant on all  
16794 implementations.

#### 16795 **FUTURE DIRECTIONS**

16796 None.

#### 16797 **SEE ALSO**

16798 *getegid()*, *setgid()*, the Base Definitions volume of IEEE Std 1003.1-2001, <**sys/types.h**>,  
16799 <**unistd.h**>

#### 16800 **CHANGE HISTORY**

16801 First released in Issue 3. Included for alignment with the POSIX.1-1988 standard.

#### 16802 **Issue 5**

16803 Normative text previously in the APPLICATION USAGE section is moved to the  
16804 DESCRIPTION.

#### 16805 **Issue 6**

16806 In the SYNOPSIS, the optional include of the <**sys/types.h**> header is removed.

16807 The following new requirements on POSIX implementations derive from alignment with the  
16808 Single UNIX Specification:

- 16809 • The requirement to include <**sys/types.h**> has been removed. Although <**sys/types.h**> was  
16810 required for conforming implementations of previous POSIX specifications, it was not  
16811 required for UNIX applications.
- 16812 • A return value of 0 is not permitted, because {NGROUPS\_MAX} cannot be 0. This is a FIPS  
16813 requirement.

16814 The following changes were made to align with the IEEE P1003.1a draft standard:

- 16815 • Explanation added that the effective group ID may be included in the supplementary group  
16816 list.

## 16817 NAME

16818 gethostbyaddr, gethostbyname — network host database functions

## 16819 SYNOPSIS

16820 #include <netdb.h>

```
16821 OB struct hostent *gethostbyaddr(const void *addr, socklen_t len,
16822 int type);
```

```
16823 struct hostent *gethostbyname(const char *name);
```

16824

## 16825 DESCRIPTION

16826 These functions shall retrieve information about hosts. This information is considered to be  
16827 stored in a database that can be accessed sequentially or randomly. Implementation of this  
16828 database is unspecified.

16829 **Note:** In many cases it is implemented by the Domain Name System, as documented in RFC 1034,  
16830 RFC 1035, and RFC 1886.

16831 Entries shall be returned in **hostent** structures.

16832 The *gethostbyaddr()* function shall return an entry containing addresses of address family *type* for  
16833 the host with address *addr*. The *len* argument contains the length of the address pointed to by  
16834 *addr*. The *gethostbyaddr()* function need not be reentrant. A function that is not required to be  
16835 reentrant is not required to be thread-safe.

16836 The *gethostbyname()* function shall return an entry containing addresses of address family  
16837 AF\_INET for the host with name *name*. The *gethostbyname()* function need not be reentrant. A  
16838 function that is not required to be reentrant is not required to be thread-safe.

16839 The *addr* argument of *gethostbyaddr()* shall be an **in\_addr** structure when *type* is AF\_INET. It  
16840 contains a binary format (that is, not null-terminated) address in network byte order. The  
16841 *gethostbyaddr()* function is not guaranteed to return addresses of address families other than  
16842 AF\_INET, even when such addresses exist in the database.

16843 If *gethostbyaddr()* returns successfully, then the *h\_addrtype* field in the result shall be the same as  
16844 the *type* argument that was passed to the function, and the *h\_addr\_list* field shall list a single  
16845 address that is a copy of the *addr* argument that was passed to the function.

16846 The *name* argument of *gethostbyname()* shall be a node name; the behavior of *gethostbyname()*  
16847 when passed a numeric address string is unspecified. For IPv4, a numeric address string shall be  
16848 in the dotted-decimal notation described in *inet\_addr()*.

16849 If *name* is not a numeric address string and is an alias for a valid host name, then *gethostbyname()*  
16850 shall return information about the host name to which the alias refers, and *name* shall be  
16851 included in the list of aliases returned.

## 16852 RETURN VALUE

16853 Upon successful completion, these functions shall return a pointer to a **hostent** structure if the  
16854 requested entry was found, and a null pointer if the end of the database was reached or the  
16855 requested entry was not found.

16856 Upon unsuccessful completion, *gethostbyaddr()* and *gethostbyname()* shall set *h\_errno* to indicate  
16857 the error.

## 16858 ERRORS

16859 These functions shall fail in the following cases. The *gethostbyaddr()* and *gethostbyname()*  
16860 functions shall set *h\_errno* to the value shown in the list below. Any changes to *errno* are  
16861 unspecified.

16862 [HOST\_NOT\_FOUND]  
16863 No such host is known.

16864 [NO\_DATA] The server recognized the request and the name, but no address is available.  
16865 Another type of request to the name server for the domain might return an  
16866 answer.

16867 [NO\_RECOVERY]  
16868 An unexpected server failure occurred which cannot be recovered.

16869 [TRY\_AGAIN] A temporary and possibly transient error occurred, such as a failure of a  
16870 server to respond.

**16871 EXAMPLES**

16872 None.

**16873 APPLICATION USAGE**

16874 The *gethostbyaddr()* and *gethostbyname()* functions may return pointers to static data, which may  
16875 be overwritten by subsequent calls to any of these functions.

16876 The *getaddrinfo()* and *getnameinfo()* functions are preferred over the *gethostbyaddr()* and  
16877 *gethostbyname()* functions.

**16878 RATIONALE**

16879 None.

**16880 FUTURE DIRECTIONS**

16881 The *gethostbyaddr()* and *gethostbyname()* functions may be withdrawn in a future version.

**16882 SEE ALSO**

16883 *endhostent()*, *endservent()*, *gai\_strerror()*, *getaddrinfo()*, *h\_errno*, *inet\_addr()*, the Base Definitions  
16884 volume of IEEE Std 1003.1-2001, <**netdb.h**>

**16885 CHANGE HISTORY**

16886 First released in Issue 6. Derived from the XNS, Issue 5.2 specification.

16887 **NAME**

16888           gethostent — network host database functions

16889 **SYNOPSIS**

16890           #include <netdb.h>

16891           struct hostent \*gethostent(void);

16892 **DESCRIPTION**

16893           Refer to *endhostent()*.

16894 **NAME**

16895           gethostid — get an identifier for the current host

16896 **SYNOPSIS**

```
16897 xSI       #include <unistd.h>
```

```
16898           long gethostid(void);
```

16899

16900 **DESCRIPTION**

16901           The *gethostid()* function shall retrieve a 32-bit identifier for the current host.

16902 **RETURN VALUE**

16903           Upon successful completion, *gethostid()* shall return an identifier for the current host.

16904 **ERRORS**

16905           No errors are defined.

16906 **EXAMPLES**

16907           None.

16908 **APPLICATION USAGE**

16909           This volume of IEEE Std 1003.1-2001 does not define the domain in which the return value is  
16910           unique.

16911 **RATIONALE**

16912           None.

16913 **FUTURE DIRECTIONS**

16914           None.

16915 **SEE ALSO**

16916           *random()*, the Base Definitions volume of IEEE Std 1003.1-2001, <unistd.h>

16917 **CHANGE HISTORY**

16918           First released in Issue 4, Version 2.

16919 **Issue 5**

16920           Moved from X/OPEN UNIX extension to BASE.

16921 **NAME**

16922         gethostname — get name of current host

16923 **SYNOPSIS**

16924         #include <unistd.h>

16925         int gethostname(char \*name, size\_t namelen);

16926 **DESCRIPTION**

16927         The *gethostname()* function shall return the standard host name for the current machine. The  
16928         *namelen* argument shall specify the size of the array pointed to by the *name* argument. The  
16929         returned name shall be null-terminated, except that if *namelen* is an insufficient length to hold  
16930         the host name, then the returned name shall be truncated and it is unspecified whether the  
16931         returned name is null-terminated.

16932         Host names are limited to {HOST\_NAME\_MAX} bytes.

16933 **RETURN VALUE**

16934         Upon successful completion, 0 shall be returned; otherwise, -1 shall be returned.

16935 **ERRORS**

16936         No errors are defined.

16937 **EXAMPLES**

16938         None.

16939 **APPLICATION USAGE**

16940         None.

16941 **RATIONALE**

16942         None.

16943 **FUTURE DIRECTIONS**

16944         None.

16945 **SEE ALSO**

16946         *gethostid()*, *uname()*, the Base Definitions volume of IEEE Std 1003.1-2001, <unistd.h>

16947 **CHANGE HISTORY**

16948         First released in Issue 6. Derived from the XNS, Issue 5.2 specification.

16949         The Open Group Base Resolution bwg2001-008 is applied, changing the *namelen* parameter from  
16950         **socklen\_t** to **size\_t**.

16951 **NAME**

16952 getitimer, setitimer — get and set value of interval timer

16953 **SYNOPSIS**

```
16954 XSI #include <sys/time.h>
16955 int getitimer(int which, struct itimerval *value);
16956 int setitimer(int which, const struct itimerval *restrict value,
16957 struct itimerval *restrict ovalue);
16958
```

16959 **DESCRIPTION**

16960 The *getitimer()* function shall store the current value of the timer specified by *which* into the  
 16961 structure pointed to by *value*. The *setitimer()* function shall set the timer specified by *which* to  
 16962 the value specified in the structure pointed to by *value*, and if *ovalue* is not a null pointer, store  
 16963 the previous value of the timer in the structure pointed to by *ovalue*.

16964 A timer value is defined by the **itimerval** structure, specified in **<sys/time.h>**. If *it\_value* is non-  
 16965 zero, it shall indicate the time to the next timer expiration. If *it\_interval* is non-zero, it shall  
 16966 specify a value to be used in reloading *it\_value* when the timer expires. Setting *it\_value* to 0 shall  
 16967 disable a timer, regardless of the value of *it\_interval*. Setting *it\_interval* to 0 shall disable a timer  
 16968 after its next expiration (assuming *it\_value* is non-zero).

16969 Implementations may place limitations on the granularity of timer values. For each interval  
 16970 timer, if the requested timer value requires a finer granularity than the implementation supports,  
 16971 the actual timer value shall be rounded up to the next supported value.

16972 An XSI-conforming implementation provides each process with at least three interval timers,  
 16973 which are indicated by the *which* argument:

|       |                |                                                                                                                                                                                                                                                                                        |
|-------|----------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 16974 | ITIMER_REAL    | Decrements in real time. A SIGALRM signal is delivered when this timer expires.                                                                                                                                                                                                        |
| 16975 |                |                                                                                                                                                                                                                                                                                        |
| 16976 | ITIMER_VIRTUAL | Decrements in process virtual time. It runs only when the process is executing. A SIGVTALRM signal is delivered when it expires.                                                                                                                                                       |
| 16977 |                |                                                                                                                                                                                                                                                                                        |
| 16978 | ITIMER_PROF    | Decrements both in process virtual time and when the system is running on behalf of the process. It is designed to be used by interpreters in statistically profiling the execution of interpreted programs. Each time the ITIMER_PROF timer expires, the SIGPROF signal is delivered. |
| 16979 |                |                                                                                                                                                                                                                                                                                        |
| 16980 |                |                                                                                                                                                                                                                                                                                        |
| 16981 |                |                                                                                                                                                                                                                                                                                        |

16982 The interaction between *setitimer()* and any of *alarm()*, *sleep()*, or *usleep()* is unspecified.

16983 **RETURN VALUE**

16984 Upon successful completion, *getitimer()* or *setitimer()* shall return 0; otherwise,  $-1$  shall be  
 16985 returned and *errno* set to indicate the error.

16986 **ERRORS**

16987 The *setitimer()* function shall fail if:

|       |          |                                                                                                                                                                                                        |
|-------|----------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 16988 | [EINVAL] | The <i>value</i> argument is not in canonical form. (In canonical form, the number of microseconds is a non-negative integer less than 1 000 000 and the number of seconds is a non-negative integer.) |
| 16989 |          |                                                                                                                                                                                                        |
| 16990 |          |                                                                                                                                                                                                        |

16991 The *getitimer()* and *setitimer()* functions may fail if:

|       |          |                                              |
|-------|----------|----------------------------------------------|
| 16992 | [EINVAL] | The <i>which</i> argument is not recognized. |
|-------|----------|----------------------------------------------|

16993 **EXAMPLES**

16994           None.

16995 **APPLICATION USAGE**

16996           None.

16997 **RATIONALE**

16998           None.

16999 **FUTURE DIRECTIONS**

17000           None.

17001 **SEE ALSO**

17002           *alarm()*, *sleep()*, *timer\_getoverrun()*, *ualarm()*, *usleep()*, the Base Definitions volume of  
17003           IEEE Std 1003.1-2001, <**signal.h**>, <**sys/time.h**>

17004 **CHANGE HISTORY**

17005           First released in Issue 4, Version 2.

17006 **Issue 5**

17007           Moved from X/OPEN UNIX extension to BASE.

17008 **Issue 6**

17009           The **restrict** keyword is added to the *setitimer()* prototype for alignment with the  
17010           ISO/IEC 9899:1999 standard.

17011 **NAME**

17012 getlogin, getlogin\_r — get login name

17013 **SYNOPSIS**

17014 #include &lt;unistd.h&gt;

17015 char \*getlogin(void);

17016 TSF int getlogin\_r(char \*name, size\_t namesize);

17017

17018 **DESCRIPTION**

17019 The *getlogin()* function shall return a pointer to a string containing the user name associated by  
 17020 the login activity with the controlling terminal of the current process. If *getlogin()* returns a non-  
 17021 null pointer, then that pointer points to the name that the user logged in under, even if there are  
 17022 several login names with the same user ID.

17023 The *getlogin()* function need not be reentrant. A function that is not required to be reentrant is  
 17024 not required to be thread-safe.

17025 TSF The *getlogin\_r()* function shall put the name associated by the login activity with the controlling  
 17026 terminal of the current process in the character array pointed to by *name*. The array is *namesize*  
 17027 characters long and should have space for the name and the terminating null character. The  
 17028 maximum size of the login name is {LOGIN\_NAME\_MAX}.

17029 If *getlogin\_r()* is successful, *name* points to the name the user used at login, even if there are  
 17030 several login names with the same user ID.

17031 **RETURN VALUE**

17032 Upon successful completion, *getlogin()* shall return a pointer to the login name or a null pointer  
 17033 if the user's login name cannot be found. Otherwise, it shall return a null pointer and set *errno* to  
 17034 indicate the error.

17035 The return value from *getlogin()* may point to static data whose content is overwritten by each  
 17036 call.

17037 TSF If successful, the *getlogin\_r()* function shall return zero; otherwise, an error number shall be  
 17038 returned to indicate the error.

17039 **ERRORS**

17040 The *getlogin()* and *getlogin\_r()* functions may fail if:

17041 [EMFILE] {OPEN\_MAX} file descriptors are currently open in the calling process.

17042 [ENFILE] The maximum allowable number of files is currently open in the system.

17043 [ENXIO] The calling process has no controlling terminal.

17044 The *getlogin\_r()* function may fail if:

17045 TSF [ERANGE] The value of *namesize* is smaller than the length of the string to be returned  
 17046 including the terminating null character.

17047 **EXAMPLES**17048 **Getting the User Login Name**

17049 The following example calls the *getlogin()* function to obtain the name of the user associated  
 17050 with the calling process, and passes this information to the *getpwnam()* function to get the  
 17051 associated user database information.

```

17052 #include <unistd.h>
17053 #include <sys/types.h>
17054 #include <pwd.h>
17055 #include <stdio.h>
17056 ...
17057 char *lgn;
17058 struct passwd *pw;
17059 ...
17060 if ((lgn = getlogin()) == NULL || (pw = getpwnam(lgn)) == NULL) {
17061     fprintf(stderr, "Get of user information failed.\n"); exit(1);
17062 }
```

17063 **APPLICATION USAGE**

17064 Three names associated with the current process can be determined: *getpwuid(geteuid())* shall  
 17065 return the name associated with the effective user ID of the process; *getlogin()* shall return the  
 17066 name associated with the current login activity; and *getpwuid(getuid())* shall return the name  
 17067 associated with the real user ID of the process.

17068 The *getlogin\_r()* function is thread-safe and returns values in a user-supplied buffer instead of  
 17069 possibly using a static data area that may be overwritten by each call.

17070 **RATIONALE**

17071 The *getlogin()* function returns a pointer to the user's login name. The same user ID may be  
 17072 shared by several login names. If it is desired to get the user database entry that is used during  
 17073 login, the result of *getlogin()* should be used to provide the argument to the *getpwnam()*  
 17074 function. (This might be used to determine the user's login shell, particularly where a single user  
 17075 has multiple login shells with distinct login names, but the same user ID.)

17076 The information provided by the *cuserid()* function, which was originally defined in the  
 17077 POSIX.1-1988 standard and subsequently removed, can be obtained by the following:

```
17078 getpwuid(geteuid())
```

17079 while the information provided by historical implementations of *cuserid()* can be obtained by:

```
17080 getpwuid(getuid())
```

17081 The thread-safe version of this function places the user name in a user-supplied buffer and  
 17082 returns a non-zero value if it fails. The non-thread-safe version may return the name in a static  
 17083 data area that may be overwritten by each call.

17084 **FUTURE DIRECTIONS**

17085 None.

17086 **SEE ALSO**

17087 *getpwnam()*, *getpwuid()*, *geteuid()*, *getuid()*, the Base Definitions volume of IEEE Std 1003.1-2001,  
 17088 <limits.h>, <unistd.h>

17089 **CHANGE HISTORY**

17090 First released in Issue 1. Derived from System V Release 2.0.

17091 **Issue 5**

17092 Normative text previously in the APPLICATION USAGE section is moved to the RETURN  
17093 VALUE section.

17094 The *getlogin\_r()* function is included for alignment with the POSIX Threads Extension.

17095 A note indicating that the *getlogin()* function need not be reentrant is added to the  
17096 DESCRIPTION.

17097 **Issue 6**

17098 The *getlogin\_r()* function is marked as part of the Thread-Safe Functions option.

17099 In the DESCRIPTION, the note about reentrancy is expanded to cover thread-safety.

17100 The following new requirements on POSIX implementations derive from alignment with the  
17101 Single UNIX Specification:

17102 • In the RETURN VALUE section, the requirement to set *errno* on error is added.

17103 • The [EMFILE], [ENFILE], and [ENXIO] optional error conditions are added.

17104 The APPLICATION USAGE section is updated to include a note on the thread-safe function and  
17105 its avoidance of possibly using a static data area.

## 17106 NAME

17107 getmsg, getpmsg — receive next message from a STREAMS file (STREAMS)

## 17108 SYNOPSIS

```
17109 XSR #include <stropts.h>
17110 int getmsg(int fildes, struct strbuf *restrict ctlptr,
17111           struct strbuf *restrict dataptr, int *restrict flagsp);
17112 int getpmsg(int fildes, struct strbuf *restrict ctlptr,
17113            struct strbuf *restrict dataptr, int *restrict bandp,
17114            int *restrict flagsp);
17115
```

## 17116 DESCRIPTION

17117 The *getmsg()* function shall retrieve the contents of a message located at the head of the  
 17118 STREAM head read queue associated with a STREAMS file and place the contents into one or  
 17119 more buffers. The message contains either a data part, a control part, or both. The data and  
 17120 control parts of the message shall be placed into separate buffers, as described below. The  
 17121 semantics of each part are defined by the originator of the message.

17122 The *getpmsg()* function shall be equivalent to *getmsg()*, except that it provides finer control over  
 17123 the priority of the messages received. Except where noted, all requirements on *getmsg()* also  
 17124 pertain to *getpmsg()*.

17125 The *fildes* argument specifies a file descriptor referencing a STREAMS-based file.

17126 The *ctlptr* and *dataptr* arguments each point to a **strbuf** structure, in which the *buf* member points  
 17127 to a buffer in which the data or control information is to be placed, and the *maxlen* member  
 17128 indicates the maximum number of bytes this buffer can hold. On return, the *len* member shall  
 17129 contain the number of bytes of data or control information actually received. The *len* member  
 17130 shall be set to 0 if there is a zero-length control or data part and *len* shall be set to -1 if no data or  
 17131 control information is present in the message.

17132 When *getmsg()* is called, *flagsp* should point to an integer that indicates the type of message the  
 17133 process is able to receive. This is described further below.

17134 The *ctlptr* argument is used to hold the control part of the message, and *dataptr* is used to hold  
 17135 the data part of the message. If *ctlptr* (or *dataptr*) is a null pointer or the *maxlen* member is -1, the  
 17136 control (or data) part of the message shall not be processed and shall be left on the STREAM  
 17137 head read queue, and if the *ctlptr* (or *dataptr*) is not a null pointer, *len* shall be set to -1. If the  
 17138 *maxlen* member is set to 0 and there is a zero-length control (or data) part, that zero-length part  
 17139 shall be removed from the read queue and *len* shall be set to 0. If the *maxlen* member is set to 0  
 17140 and there are more than 0 bytes of control (or data) information, that information shall be left on  
 17141 the read queue and *len* shall be set to 0. If the *maxlen* member in *ctlptr* (or *dataptr*) is less than the  
 17142 control (or data) part of the message, *maxlen* bytes shall be retrieved. In this case, the remainder  
 17143 of the message shall be left on the STREAM head read queue and a non-zero return value shall  
 17144 be provided.

17145 By default, *getmsg()* shall process the first available message on the STREAM head read queue.  
 17146 However, a process may choose to retrieve only high-priority messages by setting the integer  
 17147 pointed to by *flagsp* to RS\_HIPRI. In this case, *getmsg()* shall only process the next message if it is  
 17148 a high-priority message. When the integer pointed to by *flagsp* is 0, any available message shall  
 17149 be retrieved. In this case, on return, the integer pointed to by *flagsp* shall be set to RS\_HIPRI if a  
 17150 high-priority message was retrieved, or 0 otherwise.

17151 For *getpmsg()*, the flags are different. The *flagsp* argument points to a bitmask with the following  
 17152 mutually-exclusive flags defined: MSG\_HIPRI, MSG\_BAND, and MSG\_ANY. Like *getmsg()*,

17153 *getpmsg()* shall process the first available message on the STREAM head read queue. A process  
 17154 may choose to retrieve only high-priority messages by setting the integer pointed to by *flagsp* to  
 17155 MSG\_HIPRI and the integer pointed to by *bandp* to 0. In this case, *getpmsg()* shall only process  
 17156 the next message if it is a high-priority message. In a similar manner, a process may choose to  
 17157 retrieve a message from a particular priority band by setting the integer pointed to by *flagsp* to  
 17158 MSG\_BAND and the integer pointed to by *bandp* to the priority band of interest. In this case,  
 17159 *getpmsg()* shall only process the next message if it is in a priority band equal to, or greater than,  
 17160 the integer pointed to by *bandp*, or if it is a high-priority message. If a process wants to get the  
 17161 first message off the queue, the integer pointed to by *flagsp* should be set to MSG\_ANY and the  
 17162 integer pointed to by *bandp* should be set to 0. On return, if the message retrieved was a high-  
 17163 priority message, the integer pointed to by *flagsp* shall be set to MSG\_HIPRI and the integer  
 17164 pointed to by *bandp* shall be set to 0. Otherwise, the integer pointed to by *flagsp* shall be set to  
 17165 MSG\_BAND and the integer pointed to by *bandp* shall be set to the priority band of the message.

17166 If O\_NONBLOCK is not set, *getmsg()* and *getpmsg()* shall block until a message of the type  
 17167 specified by *flagsp* is available at the front of the STREAM head read queue. If O\_NONBLOCK is  
 17168 set and a message of the specified type is not present at the front of the read queue, *getmsg()* and  
 17169 *getpmsg()* shall fail and set *errno* to [EAGAIN].

17170 If a hangup occurs on the STREAM from which messages are retrieved, *getmsg()* and *getpmsg()*  
 17171 shall continue to operate normally, as described above, until the STREAM head read queue is  
 17172 empty. Thereafter, they shall return 0 in the *len* members of *ctlptr* and *dataptr*.

#### 17173 RETURN VALUE

17174 Upon successful completion, *getmsg()* and *getpmsg()* shall return a non-negative value. A value  
 17175 of 0 indicates that a full message was read successfully. A return value of MORECTL indicates  
 17176 that more control information is waiting for retrieval. A return value of MOREDATA indicates  
 17177 that more data is waiting for retrieval. A return value of the bitwise-logical OR of MORECTL  
 17178 and MOREDATA indicates that both types of information remain. Subsequent *getmsg()* and  
 17179 *getpmsg()* calls shall retrieve the remainder of the message. However, if a message of higher  
 17180 priority has come in on the STREAM head read queue, the next call to *getmsg()* or *getpmsg()*  
 17181 shall retrieve that higher-priority message before retrieving the remainder of the previous  
 17182 message.

17183 If the high priority control part of the message is consumed, the message shall be placed back on  
 17184 the queue as a normal message of band 0. Subsequent *getmsg()* and *getpmsg()* calls shall retrieve  
 17185 the remainder of the message. If, however, a priority message arrives or already exists on the  
 17186 STREAM head, the subsequent call to *getmsg()* or *getpmsg()* shall retrieve the higher-priority  
 17187 message before retrieving the remainder of the message that was put back.

17188 Upon failure, *getmsg()* and *getpmsg()* shall return -1 and set *errno* to indicate the error.

#### 17189 ERRORS

17190 The *getmsg()* and *getpmsg()* functions shall fail if:

- |       |           |                                                                                                                                                                              |
|-------|-----------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 17191 | [EAGAIN]  | The O_NONBLOCK flag is set and no messages are available.                                                                                                                    |
| 17192 | [EBADF]   | The <i>fildev</i> argument is not a valid file descriptor open for reading.                                                                                                  |
| 17193 | [EBADMSG] | The queued message to be read is not valid for <i>getmsg()</i> or <i>getpmsg()</i> or a pending file descriptor is at the STREAM head.                                       |
| 17194 |           |                                                                                                                                                                              |
| 17195 | [EINTR]   | A signal was caught during <i>getmsg()</i> or <i>getpmsg()</i> .                                                                                                             |
| 17196 | [EINVAL]  | An illegal value was specified by <i>flagsp</i> , or the STREAM or multiplexer referenced by <i>fildev</i> is linked (directly or indirectly) downstream from a multiplexer. |
| 17197 |           |                                                                                                                                                                              |
| 17198 |           |                                                                                                                                                                              |

17199 [ENOSTR] A STREAM is not associated with *filde*s.

17200 In addition, *getmsg()* and *getpmsg()* shall fail if the STREAM head had processed an  
17201 asynchronous error before the call. In this case, the value of *errno* does not reflect the result of  
17202 *getmsg()* or *getpmsg()* but reflects the prior error.

### 17203 EXAMPLES

#### 17204 Getting Any Message

17205 In the following example, the value of *fd* is assumed to refer to an open STREAMS file. The call  
17206 to *getmsg()* retrieves any available message on the associated STREAM-head read queue,  
17207 returning control and data information to the buffers pointed to by *ctrlbuf* and *databuf*,  
17208 respectively.

```
17209 #include <stropts.h>
17210 ...
17211 int fd;
17212 char ctrlbuf[128];
17213 char databuf[512];
17214 struct strbuf ctrl;
17215 struct strbuf data;
17216 int flags = 0;
17217 int ret;

17218 ctrl.buf = ctrlbuf;
17219 ctrl.maxlen = sizeof(ctrlbuf);

17220 data.buf = databuf;
17221 data.maxlen = sizeof(databuf);

17222 ret = getmsg (fd, &ctrl, &data, &flags);
```

#### 17223 Getting the First Message off the Queue

17224 In the following example, the call to *getpmsg()* retrieves the first available message on the  
17225 associated STREAM-head read queue.

```
17226 #include <stropts.h>
17227 ...

17228 int fd;
17229 char ctrlbuf[128];
17230 char databuf[512];
17231 struct strbuf ctrl;
17232 struct strbuf data;
17233 int band = 0;
17234 int flags = MSG_ANY;
17235 int ret;

17236 ctrl.buf = ctrlbuf;
17237 ctrl.maxlen = sizeof(ctrlbuf);

17238 data.buf = databuf;
17239 data.maxlen = sizeof(databuf);

17240 ret = getpmsg (fd, &ctrl, &data, &band, &flags);
```

17241 **APPLICATION USAGE**

17242 None.

17243 **RATIONALE**

17244 None.

17245 **FUTURE DIRECTIONS**

17246 None.

17247 **SEE ALSO**17248 Section 2.6 (on page 38), *poll()*, *putmsg()*, *read()*, *write()*, the Base Definitions volume of  
17249 IEEE Std 1003.1-2001, <**stropts.h**>17250 **CHANGE HISTORY**

17251 First released in Issue 4, Version 2.

17252 **Issue 5**

17253 Moved from X/OPEN UNIX extension to BASE.

17254 A paragraph regarding “high-priority control parts of messages” is added to the RETURN  
17255 VALUE section.17256 **Issue 6**

17257 This function is marked as part of the XSI STREAMS Option Group.

17258 The **restrict** keyword is added to the *getmsg()* and *getpmsg()* prototypes for alignment with the  
17259 ISO/IEC 9899:1999 standard.

## 17260 NAME

17261 getnameinfo — get name information

## 17262 SYNOPSIS

17263 #include &lt;sys/socket.h&gt;

17264 #include &lt;netdb.h&gt;

```
17265 int getnameinfo(const struct sockaddr *restrict sa, socklen_t salen,
17266 char *restrict node, socklen_t nodelen, char *restrict service,
17267 socklen_t servicelen, unsigned flags);
```

## 17268 DESCRIPTION

17269 The *getnameinfo()* function shall translate a socket address to a node name and service location, all of which are defined as in *getaddrinfo()*.

17271 The *sa* argument points to a socket address structure to be translated.

17272 IP6 If the socket address structure contains an IPv4-mapped IPv6 address or an IPv4-compatible IPv6 address, the implementation shall extract the embedded IPv4 address and lookup the node name for that IPv4 address.

17275 **Note:** The IPv6 unspecified address ("::") and the IPv6 loopback address ("::1") are not IPv4-compatible addresses. If the address is the IPv6 unspecified address ("::"), a lookup is not performed, and the [EAI\_NONAME] error is returned.

17278 If the *node* argument is non-NULL and the *nodelen* argument is non-zero, then the *node* argument points to a buffer able to contain up to *nodelen* characters that receives the node name as a null-terminated string. If the *node* argument is NULL or the *nodelen* argument is zero, the node name shall not be returned. If the node's name cannot be located, the numeric form of the node's address is returned instead of its name.

17283 If the *service* argument is non-NULL and the *servicelen* argument is non-zero, then the *service* argument points to a buffer able to contain up to *servicelen* bytes that receives the service name as a null-terminated string. If the *service* argument is NULL or the *servicelen* argument is zero, the service name shall not be returned. If the service's name cannot be located, the numeric form of the service address (for example, its port number) shall be returned instead of its name.

17288 The *flags* argument is a flag that changes the default actions of the function. By default the fully-qualified domain name (FQDN) for the host shall be returned, but:

- 17290 • If the flag bit NI\_NOFQDN is set, only the node name portion of the FQDN shall be returned for local hosts.
- 17292 • If the flag bit NI\_NUMERICHOST is set, the numeric form of the host's address shall be returned instead of its name, under all circumstances.
- 17294 • If the flag bit NI\_NAMEREQD is set, an error shall be returned if the host's name cannot be located.
- 17296 • If the flag bit NI\_NUMERICSERV is set, the numeric form of the service address shall be returned (for example, its port number) instead of its name, under all circumstances.
- 17298 • If the flag bit NI\_DGRAM is set, this indicates that the service is a datagram service (SOCK\_DGRAM). The default behavior shall assume that the service is a stream service (SOCK\_STREAM).

17301 **Notes:**

- 17302 1. The two NI\_NUMERICxxx flags are required to support the *-n* flag that many
- 17303 commands provide.

17304 2. The NI\_DGRAM flag is required for the few AF\_INET and AF\_INET6 port numbers (for  
17305 example, [512,514]) that represent different services for UDP and TCP.

17306 The *getnameinfo()* function shall be thread-safe.

#### 17307 RETURN VALUE

17308 A zero return value for *getnameinfo()* indicates successful completion; a non-zero return value  
17309 indicates failure. The possible values for the failures are listed in the ERRORS section.

17310 Upon successful completion, *getnameinfo()* shall return the *node* and *service* names, if requested,  
17311 in the buffers provided. The returned names are always null-terminated strings.

#### 17312 ERRORS

17313 The *getnameinfo()* function shall fail and return the corresponding value if:

17314 [EAI\_AGAIN] The name could not be resolved at this time. Future attempts may succeed.

17315 [EAI\_BADFLAGS]

17316 The *flags* had an invalid value.

17317 [EAI\_FAIL] A non-recoverable error occurred.

17318 [EAI\_FAMILY] The address family was not recognized or the address length was invalid for  
17319 the specified family.

17320 [EAI\_MEMORY] There was a memory allocation failure.

17321 [EAI\_NONAME] The name does not resolve for the supplied parameters.

17322 NI\_NAMEREQD is set and the host's name cannot be located, or both  
17323 *nodename* and *servname* were null.

17324 [EAI\_SYSTEM] A system error occurred. The error code can be found in *errno*.

#### 17325 EXAMPLES

17326 None.

#### 17327 APPLICATION USAGE

17328 If the returned values are to be used as part of any further name resolution (for example, passed  
17329 to *getaddrinfo()*), applications should provide buffers large enough to store any result possible  
17330 on the system.

17331 Given the IPv4-mapped IPv6 address "`::ffff:1.2.3.4`", the implementation performs a  
17332 lookup as if the socket address structure contains the IPv4 address "`1.2.3.4`".

#### 17333 RATIONALE

17334 None.

#### 17335 FUTURE DIRECTIONS

17336 None.

17338 *gai\_strerror()*, *getaddrinfo()*, *getservbyname()*, *inet\_ntop()*, *socket()*, the Base Definitions volume of  
17339 IEEE Std 1003.1-2001, `<netdb.h>`, `<sys/socket.h>`

#### 17340 CHANGE HISTORY

17341 First released in Issue 6. Derived from the XNS, Issue 5.2 specification.

17342 The **restrict** keyword is added to the *getnameinfo()* prototype for alignment with the  
17343 ISO/IEC 9899:1999 standard.

17344 **NAME**

17345           getnetbyaddr, getnetbyname, getnetent — network database functions

17346 **SYNOPSIS**

17347           #include <netdb.h>

17348           struct netent \*getnetbyaddr(uint32\_t net, int type);

17349           struct netent \*getnetbyname(const char \*name);

17350           struct netent \*getnetent(void);

17351 **DESCRIPTION**

17352           Refer to *endnetent()*.

17353 **NAME**17354 `getopt, optarg, opterr, optind, optopt` — command option parsing17355 **SYNOPSIS**17356 `#include <unistd.h>`17357 `int getopt(int argc, char * const argv[], const char *optstring);`17358 `extern char *optarg;`17359 `extern int optind, opterr, optopt;`17360 **DESCRIPTION**

17361 The `getopt()` function is a command-line parser that shall follow Utility Syntax Guidelines 3, 4, 5,  
 17362 6, 7, 9, and 10 in the Base Definitions volume of IEEE Std 1003.1-2001, Section 12.2, Utility Syntax  
 17363 Guidelines.

17364 The parameters `argc` and `argv` are the argument count and argument array as passed to `main()`  
 17365 (see `exec`). The argument `optstring` is a string of recognized option characters; if a character is  
 17366 followed by a colon, the option takes an argument. All option characters allowed by Utility  
 17367 Syntax Guideline 3 are allowed in `optstring`. The implementation may accept other characters as  
 17368 an extension.

17369 The variable `optind` is the index of the next element of the `argv[]` vector to be processed. It shall  
 17370 be initialized to 1 by the system, and `getopt()` shall update it when it finishes with each element  
 17371 of `argv[]`. When an element of `argv[]` contains multiple option characters, it is unspecified how  
 17372 `getopt()` determines which options have already been processed.

17373 The `getopt()` function shall return the next option character (if one is found) from `argv` that  
 17374 matches a character in `optstring`, if there is one that matches. If the option takes an argument,  
 17375 `getopt()` shall set the variable `optarg` to point to the option-argument as follows:

- 17376 1. If the option was the last character in the string pointed to by an element of `argv`, then  
 17377 `optarg` shall contain the next element of `argv`, and `optind` shall be incremented by 2. If the  
 17378 resulting value of `optind` is greater than `argc`, this indicates a missing option-argument, and  
 17379 `getopt()` shall return an error indication.
- 17380 2. Otherwise, `optarg` shall point to the string following the option character in that element of  
 17381 `argv`, and `optind` shall be incremented by 1.

17382 If, when `getopt()` is called:

17383 `argv[optind]` is a null pointer  
 17384 `*argv[optind]` is not the character `-`  
 17385 `argv[optind]` points to the string `"-"`

17386 `getopt()` shall return `-1` without changing `optind`. If:

17387 `argv[optind]` points to the string `"--"`

17388 `getopt()` shall return `-1` after incrementing `optind`.

17389 If `getopt()` encounters an option character that is not contained in `optstring`, it shall return the  
 17390 question-mark (`'?'`) character. If it detects a missing option-argument, it shall return the colon  
 17391 character (`':'`) if the first character of `optstring` was a colon, or a question-mark character (`'?'`)  
 17392 otherwise. In either case, `getopt()` shall set the variable `optopt` to the option character that caused  
 17393 the error. If the application has not set the variable `opterr` to 0 and the first character of `optstring`  
 17394 is not a colon, `getopt()` shall also print a diagnostic message to `stderr` in the format specified for  
 17395 the `getopts` utility.

17396 The `getopt()` function need not be reentrant. A function that is not required to be reentrant is not  
 17397 required to be thread-safe.

17398 **RETURN VALUE**

17399 The *getopt()* function shall return the next option character specified on the command line.

17400 A colon (':') shall be returned if *getopt()* detects a missing argument and the first character of  
17401 *optstring* was a colon (':').

17402 A question mark ('?') shall be returned if *getopt()* encounters an option character not in  
17403 *optstring* or detects a missing argument and the first character of *optstring* was not a colon (':').

17404 Otherwise, *getopt()* shall return -1 when all command line options are parsed.

17405 **ERRORS**

17406 No errors are defined.

17407 **EXAMPLES**17408 **Parsing Command Line Options**

17409 The following code fragment shows how you might process the arguments for a utility that can  
17410 take the mutually-exclusive options *a* and *b* and the options *f* and *o*, both of which require  
17411 arguments:

```
17412 #include <unistd.h>
17413
17414 int
17415 main(int argc, char *argv[ ])
17416 {
17417     int c;
17418     int bflg, aflag, errflag;
17419     char *ifile;
17420     char *ofile;
17421     extern char *optarg;
17422     extern int optind, optopt;
17423     . . .
17424     while ((c = getopt(argc, argv, ":abf:o:")) != -1) {
17425         switch(c) {
17426             case 'a':
17427                 if (bflg)
17428                     errflag++;
17429                 else
17430                     aflag++;
17431                 break;
17432             case 'b':
17433                 if (aflag)
17434                     errflag++;
17435                 else {
17436                     bflg++;
17437                     bproc();
17438                 }
17439                 break;
17440             case 'f':
17441                 ifile = optarg;
17442                 break;
17443             case 'o':
17444                 ofile = optarg;
17445                 break;
```

```

17445         case ':':          /* -f or -o without operand */
17446             fprintf(stderr,
17447                 "Option -%c requires an operand\n", optopt);
17448             errflg++;
17449             break;
17450         case '?':
17451             fprintf(stderr,
17452                 "Unrecognized option: -%c\n", optopt);
17453             errflg++;
17454         }
17455     }
17456     if (errflg) {
17457         fprintf(stderr, "usage: . . . ");
17458         exit(2);
17459     }
17460     for ( ; optind < argc; optind++) {
17461         if (access(argv[optind], R_OK)) {
17462             . . .
17463         }

```

17464 **This code accepts any of the following as equivalent:**

```

17465 cmd -ao arg path path
17466 cmd -a -o arg path path
17467 cmd -o arg -a path path
17468 cmd -a -o arg -- path path
17469 cmd -a -oarg path path
17470 cmd -aoarg path path

```

### 17471 **Checking Options and Arguments**

17472 The following example parses a set of command line options and prints messages to standard  
 17473 output for each option and argument that it encounters.

```

17474 #include <unistd.h>
17475 #include <stdio.h>
17476 ...
17477 int c;
17478 char *filename;
17479 extern char *optarg;
17480 extern int optind, optopt, opterr;
17481 ...
17482 while ((c = getopt(argc, argv, ":abf:")) != -1) {
17483     switch(c) {
17484     case 'a':
17485         printf("a is set\n");
17486         break;
17487     case 'b':
17488         printf("b is set\n");
17489         break;
17490     case 'f':
17491         filename = optarg;
17492         printf("filename is %s\n", filename);
17493         break;

```

```

17494         case ':' :
17495             printf("--%c without filename\n", optopt);
17496             break;
17497         case '?':
17498             printf("unknown arg %c\n", optopt);
17499             break;
17500     }
17501 }

```

## 17502 Selecting Options from the Command Line

17503 The following example selects the type of database routines the user wants to use based on the  
 17504 *Options* argument.

```

17505 #include <unistd.h>
17506 #include <string.h>
17507 ...
17508 char *Options = "hdbt1";
17509 ...
17510 int dbtype, i;
17511 char c;
17512 char *st;
17513 ...
17514 dbtype = 0;
17515 while ((c = getopt(argc, argv, Options)) != -1) {
17516     if ((st = strchr(Options, c)) != NULL) {
17517         dbtype = st - Options;
17518         break;
17519     }
17520 }

```

## 17521 APPLICATION USAGE

17522 The *getopt()* function is only required to support option characters included in Utility Syntax  
 17523 Guideline 3. Many historical implementations of *getopt()* support other characters as options.  
 17524 This is an allowed extension, but applications that use extensions are not maximally portable.  
 17525 Note that support for multi-byte option characters is only possible when such characters can be  
 17526 represented as type **int**.

## 17527 RATIONALE

17528 The *optopt* variable represents historical practice and allows the application to obtain the identity  
 17529 of the invalid option.

17530 The description has been written to make it clear that *getopt()*, like the *getopts* utility, deals with  
 17531 option-arguments whether separated from the option by <blank>s or not. Note that the  
 17532 requirements on *getopt()* and *getopts* are more stringent than the Utility Syntax Guidelines.

17533 The *getopt()* function shall return  $-1$ , rather than EOF, so that **<stdio.h>** is not required.

17534 The special significance of a colon as the first character of *optstring* makes *getopt()* consistent  
 17535 with the *getopts* utility. It allows an application to make a distinction between a missing  
 17536 argument and an incorrect option letter without having to examine the option letter. It is true  
 17537 that a missing argument can only be detected in one case, but that is a case that has to be  
 17538 considered.

17539 **FUTURE DIRECTIONS**

17540 None.

17541 **SEE ALSO**17542 *exec*, the Base Definitions volume of IEEE Std 1003.1-2001, <**unistd.h**>, the Shell and Utilities  
17543 volume of IEEE Std 1003.1-200117544 **CHANGE HISTORY**

17545 First released in Issue 1. Derived from Issue 1 of the SVID.

17546 **Issue 5**17547 A note indicating that the *getopt()* function need not be reentrant is added to the DESCRIPTION.17548 **Issue 6**

17549 IEEE PASC Interpretation 1003.2 #150 is applied.

17550 **NAME**

17551 getpeername — get the name of the peer socket

17552 **SYNOPSIS**

17553 #include <sys/socket.h>

17554 int getpeername(int *socket*, struct sockaddr \*restrict *address*,  
17555 socklen\_t \*restrict *address\_len*);

17556 **DESCRIPTION**

17557 The *getpeername()* function shall retrieve the peer address of the specified socket, store this  
17558 address in the **sockaddr** structure pointed to by the *address* argument, and store the length of this  
17559 address in the object pointed to by the *address\_len* argument.

17560 If the actual length of the address is greater than the length of the supplied **sockaddr** structure,  
17561 the stored address shall be truncated.

17562 If the protocol permits connections by unbound clients, and the peer is not bound, then the value  
17563 stored in the object pointed to by *address* is unspecified.

17564 **RETURN VALUE**

17565 Upon successful completion, 0 shall be returned. Otherwise, -1 shall be returned and *errno* set to  
17566 indicate the error.

17567 **ERRORS**

17568 The *getpeername()* function shall fail if:

17569 [EBADF] The *socket* argument is not a valid file descriptor.

17570 [EINVAL] The socket has been shut down.

17571 [ENOTCONN] The socket is not connected or otherwise has not had the peer pre-specified.

17572 [ENOTSOCK] The *socket* argument does not refer to a socket.

17573 [EOPNOTSUPP] The operation is not supported for the socket protocol.

17574 The *getpeername()* function may fail if:

17575 [ENOBUFS] Insufficient resources were available in the system to complete the call.

17576 **EXAMPLES**

17577 None.

17578 **APPLICATION USAGE**

17579 None.

17580 **RATIONALE**

17581 None.

17582 **FUTURE DIRECTIONS**

17583 None.

17584 **SEE ALSO**

17585 *accept()*, *bind()*, *getsockname()*, *socket()*, the Base Definitions volume of IEEE Std 1003.1-2001,  
17586 <sys/socket.h>

17587 **CHANGE HISTORY**

17588 First released in Issue 6. Derived from the XNS, Issue 5.2 specification.

17589 The **restrict** keyword is added to the *getpeername()* prototype for alignment with the  
17590 ISO/IEC 9899:1999 standard.

17591 **NAME**

17592           getpgid — get the process group ID for a process

17593 **SYNOPSIS**

17594 XSI       #include <unistd.h>

17595           pid\_t getpgid(pid\_t pid);

17596

17597 **DESCRIPTION**

17598           The *getpgid()* function shall return the process group ID of the process whose process ID is equal  
17599           to *pid*. If *pid* is equal to 0, *getpgid()* shall return the process group ID of the calling process.

17600 **RETURN VALUE**

17601           Upon successful completion, *getpgid()* shall return a process group ID. Otherwise, it shall return  
17602           (**pid\_t**)-1 and set *errno* to indicate the error.

17603 **ERRORS**

17604           The *getpgid()* function shall fail if:

17605           [EPERM]           The process whose process ID is equal to *pid* is not in the same session as the  
17606           calling process, and the implementation does not allow access to the process  
17607           group ID of that process from the calling process.

17608           [ESRCH]           There is no process with a process ID equal to *pid*.

17609           The *getpgid()* function may fail if:

17610           [EINVAL]          The value of the *pid* argument is invalid.

17611 **EXAMPLES**

17612           None.

17613 **APPLICATION USAGE**

17614           None.

17615 **RATIONALE**

17616           None.

17617 **FUTURE DIRECTIONS**

17618           None.

17619 **SEE ALSO**

17620           *exec*, *fork()*, *getpgrp()*, *getpid()*, *getsid()*, *setpgid()*, *setsid()*, the Base Definitions volume of  
17621           IEEE Std 1003.1-2001, <unistd.h>

17622 **CHANGE HISTORY**

17623           First released in Issue 4, Version 2.

17624 **Issue 5**

17625           Moved from X/OPEN UNIX extension to BASE.

17626 **NAME**

17627           getpgrp — get the process group ID of the calling process

17628 **SYNOPSIS**

17629           #include <unistd.h>  
17630           pid\_t getpgrp(void);

17631 **DESCRIPTION**

17632           The *getpgrp()* function shall return the process group ID of the calling process.

17633 **RETURN VALUE**

17634           The *getpgrp()* function shall always be successful and no return value is reserved to indicate an  
17635           error.

17636 **ERRORS**

17637           No errors are defined.

17638 **EXAMPLES**

17639           None.

17640 **APPLICATION USAGE**

17641           None.

17642 **RATIONALE**

17643           4.3 BSD provides a *getpgrp()* function that returns the process group ID for a specified process.  
17644           Although this function supports job control, all known job control shells always specify the  
17645           calling process with this function. Thus, the simpler System V *getpgrp()* suffices, and the added  
17646           complexity of the 4.3 BSD *getpgrp()* is provided by the XSI extension *getpgid()*.

17647 **FUTURE DIRECTIONS**

17648           None.

17649 **SEE ALSO**

17650           *exec*, *fork()*, *getpgid()*, *getpid()*, *getppid()*, *kill()*, *setpgid()*, *setsid()*, the Base Definitions volume of  
17651           IEEE Std 1003.1-2001, <sys/types.h>, <unistd.h>

17652 **CHANGE HISTORY**

17653           First released in Issue 1. Derived from Issue 1 of the SVID.

17654 **Issue 6**

17655           In the SYNOPSIS, the optional include of the <sys/types.h> header is removed.

17656           The following new requirements on POSIX implementations derive from alignment with the  
17657           Single UNIX Specification:

- 17658
  - The requirement to include <sys/types.h> has been removed. Although <sys/types.h> was  
17659           required for conforming implementations of previous POSIX specifications, it was not  
17660           required for UNIX applications.

17661 **NAME**

17662            *getpid* — get the process ID

17663 **SYNOPSIS**

17664            #include <unistd.h>

17665            pid\_t *getpid*(void);

17666 **DESCRIPTION**

17667            The *getpid*() function shall return the process ID of the calling process.

17668 **RETURN VALUE**

17669            The *getpid*() function shall always be successful and no return value is reserved to indicate an error.

17671 **ERRORS**

17672            No errors are defined.

17673 **EXAMPLES**

17674            None.

17675 **APPLICATION USAGE**

17676            None.

17677 **RATIONALE**

17678            None.

17679 **FUTURE DIRECTIONS**

17680            None.

17681 **SEE ALSO**

17682            *exec*, *fork*(), *getpgrp*(), *getppid*(), *kill*(), *setpgid*(), *setsid*(), the Base Definitions volume of IEEE Std 1003.1-2001, <sys/types.h>, <unistd.h>

17684 **CHANGE HISTORY**

17685            First released in Issue 1. Derived from Issue 1 of the SVID.

17686 **Issue 6**

17687            In the SYNOPSIS, the optional include of the <sys/types.h> header is removed.

17688            The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:

- 17690
  - The requirement to include <sys/types.h> has been removed. Although <sys/types.h> was required for conforming implementations of previous POSIX specifications, it was not required for UNIX applications.
- 17691
- 17692

17693 **NAME**

17694       getpmsg — receive next message from a STREAMS file

17695 **SYNOPSIS**

```
17696 xSI     #include <stropts.h>
```

```
17697       int getpmsg(int fildev, struct strbuf *restrict ctlptr,  
17698                   struct strbuf *restrict dataptr, int *restrict bandp,  
17699                   int *restrict flagsp);
```

17700

17701 **DESCRIPTION**

17702       Refer to *getmsg()*.

17703 **NAME**

17704           getppid — get the parent process ID

17705 **SYNOPSIS**

17706           #include <unistd.h>

17707           pid\_t getppid(void);

17708 **DESCRIPTION**

17709           The *getppid()* function shall return the parent process ID of the calling process.

17710 **RETURN VALUE**

17711           The *getppid()* function shall always be successful and no return value is reserved to indicate an error.

17713 **ERRORS**

17714           No errors are defined.

17715 **EXAMPLES**

17716           None.

17717 **APPLICATION USAGE**

17718           None.

17719 **RATIONALE**

17720           None.

17721 **FUTURE DIRECTIONS**

17722           None.

17726 **CHANGE HISTORY**

17727           First released in Issue 1. Derived from Issue 1 of the SVID.

17728 **Issue 6**

17729           In the SYNOPSIS, the optional include of the <sys/types.h> header is removed.

17730           The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:

- 17731
- 17732           • The requirement to include <sys/types.h> has been removed. Although <sys/types.h> was
  - 17733           required for conforming implementations of previous POSIX specifications, it was not
  - 17734           required for UNIX applications.

17735 **NAME**

17736 getpriority, setpriority — get and set the nice value

17737 **SYNOPSIS**

17738 XSI #include &lt;sys/resource.h&gt;

17739 int getpriority(int which, id\_t who);

17740 int setpriority(int which, id\_t who, int value);

17741

17742 **DESCRIPTION**

17743 The *getpriority()* function shall obtain the nice value of a process, process group, or user. The  
 17744 *setpriority()* function shall set the nice value of a process, process group, or user to  
 17745 *value*+{NZERO}.

17746 Target processes are specified by the values of the *which* and *who* arguments. The *which*  
 17747 argument may be one of the following values: PRIO\_PROCESS, PRIO\_PGRP, or PRIO\_USER,  
 17748 indicating that the *who* argument is to be interpreted as a process ID, a process group ID, or an  
 17749 effective user ID, respectively. A 0 value for the *who* argument specifies the current process,  
 17750 process group, or user.

17751 The nice value set with *setpriority()* shall be applied to the process. If the process is multi-  
 17752 threaded, the nice value shall affect all system scope threads in the process.

17753 If more than one process is specified, *getpriority()* shall return value {NZERO} less than the  
 17754 lowest nice value pertaining to any of the specified processes, and *setpriority()* shall set the nice  
 17755 values of all of the specified processes to *value*+{NZERO}.

17756 The default nice value is {NZERO}; lower nice values shall cause more favorable scheduling.  
 17757 While the range of valid nice values is [0,{NZERO}\*2-1], implementations may enforce more  
 17758 restrictive limits. If *value*+{NZERO} is less than the system's lowest supported nice value,  
 17759 *setpriority()* shall set the nice value to the lowest supported value; if *value*+{NZERO} is greater  
 17760 than the system's highest supported nice value, *setpriority()* shall set the nice value to the highest  
 17761 supported value.

17762 Only a process with appropriate privileges can lower its nice value.

17763 PS|TPS Any processes or threads using SCHED\_FIFO or SCHED\_RR shall be unaffected by a call to  
 17764 *setpriority()*. This is not considered an error. A process which subsequently reverts to  
 17765 SCHED\_OTHER need not have its priority affected by such a *setpriority()* call.

17766 The effect of changing the nice value may vary depending on the process-scheduling algorithm  
 17767 in effect.

17768 Since *getpriority()* can return the value -1 on successful completion, it is necessary to set *errno* to  
 17769 0 prior to a call to *getpriority()*. If *getpriority()* returns the value -1, then *errno* can be checked to  
 17770 see if an error occurred or if the value is a legitimate nice value.

17771 **RETURN VALUE**

17772 Upon successful completion, *getpriority()* shall return an integer in the range -{NZERO} to  
 17773 {NZERO}-1. Otherwise, -1 shall be returned and *errno* set to indicate the error.

17774 Upon successful completion, *setpriority()* shall return 0; otherwise, -1 shall be returned and *errno*  
 17775 set to indicate the error.

17776 **ERRORS**

17777 The *getpriority()* and *setpriority()* functions shall fail if:

17778 [ESRCH] No process could be located using the *which* and *who* argument values  
 17779 specified.

17780 [EINVAL] The value of the *which* argument was not recognized, or the value of the *who*  
 17781 argument is not a valid process ID, process group ID, or user ID.

17782 In addition, *setpriority()* may fail if:

17783 [EPERM] A process was located, but neither the real nor effective user ID of the  
 17784 executing process match the effective user ID of the process whose nice value  
 17785 is being changed.

17786 [EACCES] A request was made to change the nice value to a lower numeric value and  
 17787 the current process does not have appropriate privileges.

#### 17788 EXAMPLES

##### 17789 Using *getpriority()*

17790 The following example returns the current scheduling priority for the process ID returned by the  
 17791 call to *getpid()*.

```
17792 #include <sys/resource.h>
17793 ...
17794 int which = PRIO_PROCESS;
17795 id_t pid;
17796 int ret;

17797 pid = getpid();
17798 ret = getpriority(which, pid);
```

##### 17799 Using *setpriority()*

17800 The following example sets the priority for the current process ID to  $-20$ .

```
17801 #include <sys/resource.h>
17802 ...
17803 int which = PRIO_PROCESS;
17804 id_t pid;
17805 int priority = -20;
17806 int ret;

17807 pid = getpid();
17808 ret = setpriority(which, pid, priority);
```

#### 17809 APPLICATION USAGE

17810 The *getpriority()* and *setpriority()* functions work with an offset nice value (nice value  
 17811  $-\{\text{NZERO}\}$ ). The nice value is in the range  $[0, 2^*\{\text{NZERO}\} - 1]$ , while the return value for  
 17812 *getpriority()* and the third parameter for *setpriority()* are in the range  $[-\{\text{NZERO}\}, \{\text{NZERO}\} - 1]$ .

#### 17813 RATIONALE

17814 None.

#### 17815 FUTURE DIRECTIONS

17816 None.

#### 17817 SEE ALSO

17818 *nice()*, *sched\_get\_priority\_max()*, *sched\_setscheduler()*, the Base Definitions volume of  
 17819 IEEE Std 1003.1-2001, `<sys/resource.h>`

17820 **CHANGE HISTORY**

17821 First released in Issue 4, Version 2.

17822 **Issue 5**

17823 Moved from X/OPEN UNIX extension to BASE.

17824 The DESCRIPTION is reworded in terms of the nice value rather than *priority* to avoid confusion  
17825 with functionality in the POSIX Realtime Extension.

17826 **NAME**

17827           getprotobyname, getprotobynumber, getprotent — network protocol database functions

17828 **SYNOPSIS**

17829           #include <netdb.h>

17830           struct protoent \*getprotobyname(const char \*name);

17831           struct protoent \*getprotobynumber(int proto);

17832           struct protoent \*getprotoent(void);

17833 **DESCRIPTION**

17834           Refer to *endprotoent()*.

17835 **NAME**

17836           getpwent — get user database entry

17837 **SYNOPSIS**

17838 xSI       #include <pwd.h>

17839           struct passwd \*getpwent(void);

17840

17841 **DESCRIPTION**

17842           Refer to *endpwent()*.

## 17843 NAME

17844 getpwnam, getpwnam\_r — search user database for a name

## 17845 SYNOPSIS

17846 #include <pwd.h>

17847 struct passwd \*getpwnam(const char \*name);

17848 TSF int getpwnam\_r(const char \*name, struct passwd \*pwd, char \*buffer,  
17849 size\_t bufsize, struct passwd \*\*result);

17850

## 17851 DESCRIPTION

17852 The *getpwnam()* function shall search the user database for an entry with a matching *name*.

17853 The *getpwnam()* function need not be reentrant. A function that is not required to be reentrant is  
17854 not required to be thread-safe.

17855 Applications wishing to check for error situations should set *errno* to 0 before calling  
17856 *getpwnam()*. If *getpwnam()* returns a null pointer and *errno* is non-zero, an error occurred.

17857 TSF The *getpwnam\_r()* function shall update the **passwd** structure pointed to by *pwd* and store a  
17858 pointer to that structure at the location pointed to by *result*. The structure shall contain an entry  
17859 from the user database with a matching *name*. Storage referenced by the structure is allocated  
17860 from the memory provided with the *buffer* parameter, which is *bufsize* bytes in size. The  
17861 maximum size needed for this buffer can be determined with the `{_SC_GETPW_R_SIZE_MAX}`  
17862 *sysconf()* parameter. A NULL pointer shall be returned at the location pointed to by *result* on  
17863 error or if the requested entry is not found.

## 17864 RETURN VALUE

17865 The *getpwnam()* function shall return a pointer to a **struct passwd** with the structure as defined  
17866 in <pwd.h> with a matching entry if found. A null pointer shall be returned if the requested  
17867 entry is not found, or an error occurs. On error, *errno* shall be set to indicate the error.

17868 The return value may point to a static area which is overwritten by a subsequent call to  
17869 *getpwent()*, *getpwnam()*, or *getpwuid()*.

17870 TSF If successful, the *getpwnam\_r()* function shall return zero; otherwise, an error number shall be  
17871 returned to indicate the error.

## 17872 ERRORS

17873 The *getpwnam()* and *getpwnam\_r()* functions may fail if:

17874 [EIO] An I/O error has occurred.

17875 [EINTR] A signal was caught during *getpwnam()*.

17876 [EMFILE] `{OPEN_MAX}` file descriptors are currently open in the calling process.

17877 [ENFILE] The maximum allowable number of files is currently open in the system.

17878 The *getpwnam\_r()* function may fail if:

17879 TSF [ERANGE] Insufficient storage was supplied via *buffer* and *bufsize* to contain the data to  
17880 be referenced by the resulting **passwd** structure.

17881 **EXAMPLES**17882 **Getting an Entry for the Login Name**

17883 The following example uses the *getlogin()* function to return the name of the user who logged in;  
17884 this information is passed to the *getpwnam()* function to get the user database entry for that user.

```
17885 #include <sys/types.h>
17886 #include <pwd.h>
17887 #include <unistd.h>
17888 #include <stdio.h>
17889 #include <stdlib.h>
17890 ...
17891 char *lgn;
17892 struct passwd *pw;
17893 ...
17894 if ((lgn = getlogin()) == NULL || (pw = getpwnam(lgn)) == NULL) {
17895     fprintf(stderr, "Get of user information failed.\n"); exit(1);
17896 }
17897 ...
```

17898 **APPLICATION USAGE**

17899 Three names associated with the current process can be determined: *getpwuid(geteuid())* returns  
17900 the name associated with the effective user ID of the process; *getlogin()* returns the name  
17901 associated with the current login activity; and *getpwuid(getuid())* returns the name associated  
17902 with the real user ID of the process.

17903 The *getpwnam\_r()* function is thread-safe and returns values in a user-supplied buffer instead of  
17904 possibly using a static data area that may be overwritten by each call.

17905 **RATIONALE**

17906 None.

17907 **FUTURE DIRECTIONS**

17908 None.

17909 **SEE ALSO**

17910 *getpwuid()*, the Base Definitions volume of IEEE Std 1003.1-2001, *<limits.h>*, *<pwd.h>*,  
17911 *<sys/types.h>*

17912 **CHANGE HISTORY**

17913 First released in Issue 1. Derived from System V Release 2.0.

17914 **Issue 5**

17915 Normative text previously in the APPLICATION USAGE section is moved to the RETURN  
17916 VALUE section.

17917 The *getpwnam\_r()* function is included for alignment with the POSIX Threads Extension.

17918 A note indicating that the *getpwnam()* function need not be reentrant is added to the  
17919 DESCRIPTION.

17920 **Issue 6**

17921 The *getpwnam\_r()* function is marked as part of the Thread-Safe Functions option.

17922 The Open Group Corrigendum U028/3 is applied, correcting text in the DESCRIPTION  
17923 describing matching the *name*.

- 17924 In the SYNOPSIS, the optional include of the `<sys/types.h>` header is removed.
- 17925 In the DESCRIPTION, the note about reentrancy is expanded to cover thread-safety.
- 17926 The following new requirements on POSIX implementations derive from alignment with the  
17927 Single UNIX Specification:
- 17928 • The requirement to include `<sys/types.h>` has been removed. Although `<sys/types.h>` was  
17929 required for conforming implementations of previous POSIX specifications, it was not  
17930 required for UNIX applications.
  - 17931 • In the RETURN VALUE section, the requirement to set *errno* on error is added.
  - 17932 • The [EMFILE], [ENFILE], and [ENXIO] optional error conditions are added.
- 17933 The APPLICATION USAGE section is updated to include a note on the thread-safe function and  
17934 its avoidance of possibly using a static data area.
- 17935 IEEE PASC Interpretation 1003.1 #116 is applied, changing the description of the size of the  
17936 buffer from *bufsize* characters to bytes.

## 17937 NAME

17938 getpwuid, getpwuid\_r — search user database for a user ID

## 17939 SYNOPSIS

17940 #include <pwd.h>

17941 struct passwd \*getpwuid(uid\_t uid);

17942 TSF int getpwuid\_r(uid\_t uid, struct passwd \*pwd, char \*buffer,

17943 size\_t bufsize, struct passwd \*\*result);

17944

## 17945 DESCRIPTION

17946 The *getpwuid()* function shall search the user database for an entry with a matching *uid*.

17947 The *getpwuid()* function need not be reentrant. A function that is not required to be reentrant is  
17948 not required to be thread-safe.

17949 Applications wishing to check for error situations should set *errno* to 0 before calling *getpwuid()*.  
17950 If *getpwuid()* returns a null pointer and *errno* is set to non-zero, an error occurred.

17951 TSF The *getpwuid\_r()* function shall update the **passwd** structure pointed to by *pwd* and store a  
17952 pointer to that structure at the location pointed to by *result*. The structure shall contain an entry  
17953 from the user database with a matching *uid*. Storage referenced by the structure is allocated  
17954 from the memory provided with the *buffer* parameter, which is *bufsize* bytes in size. The  
17955 maximum size needed for this buffer can be determined with the `{_SC_GETPW_R_SIZE_MAX}`  
17956 *sysconf()* parameter. A NULL pointer shall be returned at the location pointed to by *result* on  
17957 error or if the requested entry is not found.

## 17958 RETURN VALUE

17959 The *getpwuid()* function shall return a pointer to a **struct passwd** with the structure as defined in  
17960 <**pwd.h**> with a matching entry if found. A null pointer shall be returned if the requested entry  
17961 is not found, or an error occurs. On error, *errno* shall be set to indicate the error.

17962 The return value may point to a static area which is overwritten by a subsequent call to  
17963 *getpwent()*, *getpwnam()*, or *getpwuid()*.

17964 TSF If successful, the *getpwuid\_r()* function shall return zero; otherwise, an error number shall be  
17965 returned to indicate the error.

## 17966 ERRORS

17967 The *getpwuid()* and *getpwuid\_r()* functions may fail if:

17968 [EIO] An I/O error has occurred.

17969 [EINTR] A signal was caught during *getpwuid()*.

17970 [EMFILE] `{OPEN_MAX}` file descriptors are currently open in the calling process.

17971 [ENFILE] The maximum allowable number of files is currently open in the system.

17972 The *getpwuid\_r()* function may fail if:

17973 TSF [ERANGE] Insufficient storage was supplied via *buffer* and *bufsize* to contain the data to  
17974 be referenced by the resulting **passwd** structure.

17975 **EXAMPLES**17976 **Getting an Entry for the Root User**

17977 The following example gets the user database entry for the user with user ID 0 (root).

```
17978 #include <sys/types.h>
17979 #include <pwd.h>
17980 ...
17981 uid_t id = 0;
17982 struct passwd *pwd;
17983 pwd = getpwuid(id);
```

17984 **Finding the Name for the Effective User ID**

17985 The following example defines *pws* as a pointer to a structure of type **passwd**, which is used to  
 17986 store the structure pointer returned by the call to the *getpwuid()* function. The *geteuid()* function  
 17987 shall return the effective user ID of the calling process; this is used as the search criteria for the  
 17988 *getpwuid()* function. The call to *getpwuid()* shall return a pointer to the structure containing that  
 17989 user ID value.

```
17990 #include <unistd.h>
17991 #include <sys/types.h>
17992 #include <pwd.h>
17993 ...
17994 struct passwd *pws;
17995 pws = getpwuid(geteuid());
```

17996 **Finding an Entry in the User Database**

17997 The following example uses *getpwuid()* to search the user database for a user ID that was  
 17998 previously stored in a **stat** structure, then prints out the user name if it is found. If the user is not  
 17999 found, the program prints the numeric value of the user ID for the entry.

```
18000 #include <sys/types.h>
18001 #include <pwd.h>
18002 #include <stdio.h>
18003 ...
18004 struct stat statbuf;
18005 struct passwd *pwd;
18006 ...
18007 if ((pwd = getpwuid(statbuf.st_uid)) != NULL)
18008     printf(" %-8.8s", pwd->pw_name);
18009 else
18010     printf(" %-8d", statbuf.st_uid);
```

18011 **APPLICATION USAGE**

18012 Three names associated with the current process can be determined: *getpwuid(geteuid())* returns  
 18013 the name associated with the effective user ID of the process; *getlogin()* returns the name  
 18014 associated with the current login activity; and *getpwuid(getuid())* returns the name associated  
 18015 with the real user ID of the process.

18016 The *getpwuid\_r()* function is thread-safe and returns values in a user-supplied buffer instead of  
 18017 possibly using a static data area that may be overwritten by each call.

18018 **RATIONALE**

18019           None.

18020 **FUTURE DIRECTIONS**

18021           None.

18022 **SEE ALSO**

18023           *getpwnam()*, *geteuid()*, *getuid()*, *getlogin()*, the Base Definitions volume of IEEE Std 1003.1-2001,  
18024           <limits.h>, <pwd.h>, <sys/types.h>

18025 **CHANGE HISTORY**

18026           First released in Issue 1. Derived from System V Release 2.0.

18027 **Issue 5**

18028           Normative text previously in the APPLICATION USAGE section is moved to the RETURN  
18029           VALUE section.

18030           The *getpwuid\_r()* function is included for alignment with the POSIX Threads Extension.

18031           A note indicating that the *getpwuid()* function need not be reentrant is added to the  
18032           DESCRIPTION.

18033 **Issue 6**

18034           The *getpwuid\_r()* function is marked as part of the Thread-Safe Functions option.

18035           The Open Group Corrigendum U028/3 is applied, correcting text in the DESCRIPTION  
18036           describing matching the *uid*.

18037           In the SYNOPSIS, the optional include of the <sys/types.h> header is removed.

18038           In the DESCRIPTION, the note about reentrancy is expanded to cover thread-safety.

18039           The following new requirements on POSIX implementations derive from alignment with the  
18040           Single UNIX Specification:

18041           

- The requirement to include <sys/types.h> has been removed. Although <sys/types.h> was  
18042           required for conforming implementations of previous POSIX specifications, it was not  
18043           required for UNIX applications.

18044           

- In the RETURN VALUE section, the requirement to set *errno* on error is added.

18045           

- The [EIO], [EINTR], [EMFILE], and [ENFILE] optional error conditions are added.

18046           The APPLICATION USAGE section is updated to include a note on the thread-safe function and  
18047           its avoidance of possibly using a static data area.

18048           IEEE PASC Interpretation 1003.1 #116 is applied, changing the description of the size of the  
18049           buffer from *bufsize* characters to bytes.

18050 **NAME**

18051 getrlimit, setrlimit — control maximum resource consumption

18052 **SYNOPSIS**18053 xSI `#include <sys/resource.h>`18054 `int getrlimit(int resource, struct rlimit *rlp);`18055 `int setrlimit(int resource, const struct rlimit *rlp);`

18056

18057 **DESCRIPTION**18058 The *getrlimit()* function shall get, and the *setrlimit()* function shall set, limits on the consumption  
18059 of a variety of resources.18060 Each call to either *getrlimit()* or *setrlimit()* identifies a specific resource to be operated upon as  
18061 well as a resource limit. A resource limit is represented by an **rlimit** structure. The *rlim\_cur*  
18062 member specifies the current or soft limit and the *rlim\_max* member specifies the maximum or  
18063 hard limit. Soft limits may be changed by a process to any value that is less than or equal to the  
18064 hard limit. A process may (irreversibly) lower its hard limit to any value that is greater than or  
18065 equal to the soft limit. Only a process with appropriate privileges can raise a hard limit. Both  
18066 hard and soft limits can be changed in a single call to *setrlimit()* subject to the constraints  
18067 described above.18068 The value RLIM\_INFINITY, defined in `<sys/resource.h>`, shall be considered to be larger than  
18069 any other limit value. If a call to *getrlimit()* returns RLIM\_INFINITY for a resource, it means the  
18070 implementation shall not enforce limits on that resource. Specifying RLIM\_INFINITY as any  
18071 resource limit value on a successful call to *setrlimit()* shall inhibit enforcement of that resource  
18072 limit.

18073 The following resources are defined:

18074 **RLIMIT\_CORE** This is the maximum size of a **core** file, in bytes, that may be created by a  
18075 process. A limit of 0 shall prevent the creation of a **core** file. If this limit is  
18076 exceeded, the writing of a **core** file shall terminate at this size.18077 **RLIMIT\_CPU** This is the maximum amount of CPU time, in seconds, used by a process.  
18078 If this limit is exceeded, SIGXCPU shall be generated for the process. If  
18079 the process is catching or ignoring SIGXCPU, or all threads belonging to  
18080 that process are blocking SIGXCPU, the behavior is unspecified.18081 **RLIMIT\_DATA** This is the maximum size of a process' data segment, in bytes. If this limit  
18082 is exceeded, the *malloc()* function shall fail with *errno* set to [ENOMEM].18083 **RLIMIT\_FSIZE** This is the maximum size of a file, in bytes, that may be created by a  
18084 process. If a write or truncate operation would cause this limit to be  
18085 exceeded, SIGXFSZ shall be generated for the thread. If the thread is  
18086 blocking, or the process is catching or ignoring SIGXFSZ, continued  
18087 attempts to increase the size of a file from end-of-file to beyond the limit  
18088 shall fail with *errno* set to [EFBIG].18089 **RLIMIT\_NOFILE** This is a number one greater than the maximum value that the system  
18090 may assign to a newly-created descriptor. If this limit is exceeded,  
18091 functions that allocate new file descriptors may fail with *errno* set to  
18092 [EMFILE]. This limit constrains the number of file descriptors that a  
18093 process may allocate.18094 **RLIMIT\_STACK** This is the maximum size of a process' stack, in bytes. The  
18095 implementation does not automatically grow the stack beyond this limit.

18096 If this limit is exceeded, SIGSEGV shall be generated for the thread. If the  
 18097 thread is blocking SIGSEGV, or the process is ignoring or catching  
 18098 SIGSEGV and has not made arrangements to use an alternate stack, the  
 18099 disposition of SIGSEGV shall be set to SIG\_DFL before it is generated.

18100 RLIMIT\_AS This is the maximum size of a process' total available memory, in bytes. If  
 18101 this limit is exceeded, the *malloc()* and *mmap()* functions shall fail with  
 18102 *errno* set to [ENOMEM]. In addition, the automatic stack growth fails  
 18103 with the effects outlined above.

18104 When using the *getrlimit()* function, if a resource limit can be represented correctly in an object  
 18105 of type **rlim\_t**, then its representation is returned; otherwise, if the value of the resource limit is  
 18106 equal to that of the corresponding saved hard limit, the value returned shall be  
 18107 RLIM\_SAVED\_MAX; otherwise, the value returned shall be RLIM\_SAVED\_CUR.

18108 When using the *setrlimit()* function, if the requested new limit is RLIM\_INFINITY, the new limit  
 18109 shall be “no limit”; otherwise, if the requested new limit is RLIM\_SAVED\_MAX, the new limit  
 18110 shall be the corresponding saved hard limit; otherwise, if the requested new limit is  
 18111 RLIM\_SAVED\_CUR, the new limit shall be the corresponding saved soft limit; otherwise, the  
 18112 new limit shall be the requested value. In addition, if the corresponding saved limit can be  
 18113 represented correctly in an object of type **rlim\_t** then it shall be overwritten with the new limit.

18114 The result of setting a limit to RLIM\_SAVED\_MAX or RLIM\_SAVED\_CUR is unspecified unless  
 18115 a previous call to *getrlimit()* returned that value as the soft or hard limit for the corresponding  
 18116 resource limit.

18117 The determination of whether a limit can be correctly represented in an object of type **rlim\_t** is  
 18118 implementation-defined. For example, some implementations permit a limit whose value is  
 18119 greater than RLIM\_INFINITY and others do not.

18120 The *exec* family of functions shall cause resource limits to be saved.

18121 **RETURN VALUE**

18122 Upon successful completion, *getrlimit()* and *setrlimit()* shall return 0. Otherwise, these functions  
 18123 shall return -1 and set *errno* to indicate the error.

18124 **ERRORS**

18125 The *getrlimit()* and *setrlimit()* functions shall fail if:

18126 [EINVAL] An invalid *resource* was specified; or in a *setrlimit()* call, the new *rlim\_cur*  
 18127 exceeds the new *rlim\_max*.

18128 [EPERM] The limit specified to *setrlimit()* would have raised the maximum limit value,  
 18129 and the calling process does not have appropriate privileges.

18130 The *setrlimit()* function may fail if:

18131 [EINVAL] The limit specified cannot be lowered because current usage is already higher  
 18132 than the limit.

18133 **EXAMPLES**

18134 None.

18135 **APPLICATION USAGE**

18136 If a process attempts to set the hard limit or soft limit for RLIMIT\_NOFILE to less than the value  
18137 of `{_POSIX_OPEN_MAX}` from `<limits.h>`, unexpected behavior may occur.

18138 **RATIONALE**

18139 None.

18140 **FUTURE DIRECTIONS**

18141 None.

18145 **CHANGE HISTORY**

18146 First released in Issue 4, Version 2.

18147 **Issue 5**

18148 Moved from X/OPEN UNIX extension to BASE.

18149 An APPLICATION USAGE section is added.

18150 Large File Summit extensions are added.

18151 **NAME**

18152        getrusage — get information about resource utilization

18153 **SYNOPSIS**

18154 XSI        #include &lt;sys/resource.h&gt;

18155        int getrusage(int *who*, struct rusage \**r\_usage*);

18156

18157 **DESCRIPTION**

18158        The *getrusage()* function shall provide measures of the resources used by the current process or  
 18159        its terminated and waited-for child processes. If the value of the *who* argument is  
 18160        RUSAGE\_SELF, information shall be returned about resources used by the current process. If the  
 18161        value of the *who* argument is RUSAGE\_CHILDREN, information shall be returned about  
 18162        resources used by the terminated and waited-for children of the current process. If the child is  
 18163        never waited for (for example, if the parent has SA\_NOCLDWAIT set or sets SIGCHLD to  
 18164        SIG\_IGN), the resource information for the child process is discarded and not included in the  
 18165        resource information provided by *getrusage()*.

18166        The *r\_usage* argument is a pointer to an object of type **struct rusage** in which the returned  
 18167        information is stored.

18168 **RETURN VALUE**

18169        Upon successful completion, *getrusage()* shall return 0; otherwise, -1 shall be returned and *errno*  
 18170        set to indicate the error.

18171 **ERRORS**18172        The *getrusage()* function shall fail if:18173        [EINVAL]        The value of the *who* argument is not valid.18174 **EXAMPLES**18175        **Using getrusage()**

18176        The following example returns information about the resources used by the current process.

18177        #include &lt;sys/resource.h&gt;

18178        ...

18179        int who = RUSAGE\_SELF;

18180        struct rusage usage;

18181        int ret;

18182        ret = getrusage(who, &amp;usage);

18183 **APPLICATION USAGE**

18184        None.

18185 **RATIONALE**

18186        None.

18187 **FUTURE DIRECTIONS**

18188        None.

18189 **SEE ALSO**18190        *exit()*, *sigaction()*, *time()*, *times()*, *wait()*, the Base Definitions volume of IEEE Std 1003.1-2001,

18191        &lt;sys/resource.h&gt;

18192 **CHANGE HISTORY**

18193           First released in Issue 4, Version 2.

18194 **Issue 5**

18195           Moved from X/OPEN UNIX extension to BASE.

18196 **NAME**

18197       gets — get a string from a stdin stream

18198 **SYNOPSIS**

18199       #include <stdio.h>

18200       char \*gets(char \*s);

18201 **DESCRIPTION**

18202 CX       The functionality described on this reference page is aligned with the ISO C standard. Any  
18203       conflict between the requirements described here and the ISO C standard is unintentional. This  
18204       volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

18205       The *gets()* function shall read bytes from the standard input stream, *stdin*, into the array pointed  
18206       to by *s*, until a <newline> is read or an end-of-file condition is encountered. Any <newline> shall  
18207       be discarded and a null byte shall be placed immediately after the last byte read into the array.

18208 CX       The *gets()* function may mark the *st\_atime* field of the file associated with *stream* for update. The  
18209       *st\_atime* field shall be marked for update by the first successful execution of *fgetc()*, *fgets()*,  
18210       *fread()*, *getc()*, *getchar()*, *gets()*, *fscanf()*, or *scanf()* using *stream* that returns data not supplied by  
18211       a prior call to *ungetc()*.

18212 **RETURN VALUE**

18213       Upon successful completion, *gets()* shall return *s*. If the stream is at end-of-file, the end-of-file  
18214       indicator for the stream shall be set and *gets()* shall return a null pointer. If a read error occurs,  
18215 CX       the error indicator for the stream shall be set, *gets()* shall return a null pointer, and set *errno* to  
18216       indicate the error.

18217 **ERRORS**

18218       Refer to *fgetc()*.

18219 **EXAMPLES**

18220       None.

18221 **APPLICATION USAGE**

18222       Reading a line that overflows the array pointed to by *s* results in undefined behavior. The use of  
18223       *fgets()* is recommended.

18224       Since the user cannot specify the length of the buffer passed to *gets()*, use of this function is  
18225       discouraged. The length of the string read is unlimited. It is possible to overflow this buffer in  
18226       such a way as to cause applications to fail, or possible system security violations.

18227       It is recommended that the *fgets()* function should be used to read input lines.

18228 **RATIONALE**

18229       None.

18230 **FUTURE DIRECTIONS**

18231       None.

18232 **SEE ALSO**

18233       *feof()*, *ferror()*, *fgets()*, the Base Definitions volume of IEEE Std 1003.1-2001, <stdio.h>

18234 **CHANGE HISTORY**

18235       First released in Issue 1. Derived from Issue 1 of the SVID.

18236 **Issue 6**

18237       Extensions beyond the ISO C standard are marked.

18238 **NAME**

18239        getservbyname, getservbyport, getservent — network services database functions

18240 **SYNOPSIS**

18241        #include <netdb.h>

18242        struct servent \*getservbyname(const char \*name, const char \*proto);

18243        struct servent \*getservbyport(int port, const char \*proto);

18244        struct servent \*getservent(void);

18245 **DESCRIPTION**

18246        Refer to *endservent()*.

18247 **NAME**

18248 getsid — get the process group ID of a session leader

18249 **SYNOPSIS**18250 XSI `#include <unistd.h>`18251 `pid_t getsid(pid_t pid);`

18252

18253 **DESCRIPTION**18254 The *getsid()* function shall obtain the process group ID of the process that is the session leader of  
18255 the process specified by *pid*. If *pid* is (**pid\_t**)0, it specifies the calling process.18256 **RETURN VALUE**18257 Upon successful completion, *getsid()* shall return the process group ID of the session leader of  
18258 the specified process. Otherwise, it shall return (**pid\_t**)-1 and set *errno* to indicate the error.18259 **ERRORS**18260 The *getsid()* function shall fail if:18261 [EPERM] The process specified by *pid* is not in the same session as the calling process,  
18262 and the implementation does not allow access to the process group ID of the  
18263 session leader of that process from the calling process.18264 [ESRCH] There is no process with a process ID equal to *pid*.18265 **EXAMPLES**

18266 None.

18267 **APPLICATION USAGE**

18268 None.

18269 **RATIONALE**

18270 None.

18271 **FUTURE DIRECTIONS**

18272 None.

18273 **SEE ALSO**18274 *exec*, *fork()*, *getpid()*, *getpgid()*, *setpgid()*, *setsid()*, the Base Definitions volume of  
18275 IEEE Std 1003.1-2001, <**unistd.h**>18276 **CHANGE HISTORY**

18277 First released in Issue 4, Version 2.

18278 **Issue 5**

18279 Moved from X/OPEN UNIX extension to BASE.

18280 **NAME**

18281           getsockname — get the socket name

18282 **SYNOPSIS**

18283           #include <sys/socket.h>

18284           int getsockname(int *socket*, struct sockaddr \*restrict *address*,  
18285                           socklen\_t \*restrict *address\_len*);

18286 **DESCRIPTION**

18287           The *getsockname()* function shall retrieve the locally-bound name of the specified socket, store  
18288           this address in the **sockaddr** structure pointed to by the *address* argument, and store the length of  
18289           this address in the object pointed to by the *address\_len* argument.

18290           If the actual length of the address is greater than the length of the supplied **sockaddr** structure,  
18291           the stored address shall be truncated.

18292           If the socket has not been bound to a local name, the value stored in the object pointed to by  
18293           *address* is unspecified.

18294 **RETURN VALUE**

18295           Upon successful completion, 0 shall be returned, the *address* argument shall point to the address  
18296           of the socket, and the *address\_len* argument shall point to the length of the address. Otherwise, -1  
18297           shall be returned and *errno* set to indicate the error.

18298 **ERRORS**

18299           The *getsockname()* function shall fail if:

18300           [EBADF]           The *socket* argument is not a valid file descriptor.

18301           [ENOTSOCK]       The *socket* argument does not refer to a socket.

18302           [EOPNOTSUPP]     The operation is not supported for this socket's protocol.

18303           The *getsockname()* function may fail if:

18304           [EINVAL]           The socket has been shut down.

18305           [ENOBUFS]         Insufficient resources were available in the system to complete the function.

18306 **EXAMPLES**

18307           None.

18308 **APPLICATION USAGE**

18309           None.

18310 **RATIONALE**

18311           None.

18312 **FUTURE DIRECTIONS**

18313           None.

18314 **SEE ALSO**

18315           *accept()*, *bind()*, *getpeername()*, *socket()*, the Base Definitions volume of IEEE Std 1003.1-2001,  
18316           <sys/socket.h>

18317 **CHANGE HISTORY**

18318           First released in Issue 6. Derived from the XNS, Issue 5.2 specification.

18319           The **restrict** keyword is added to the *getsockname()* prototype for alignment with the  
18320           ISO/IEC 9899:1999 standard.

18321 **NAME**

18322 getsockopt — get the socket options

18323 **SYNOPSIS**

18324 #include &lt;sys/socket.h&gt;

```
18325 int getsockopt(int socket, int level, int option_name,
18326               void *restrict option_value, socklen_t *restrict option_len);
```

18327 **DESCRIPTION**18328 The *getsockopt()* function manipulates options associated with a socket.

18329 The *getsockopt()* function shall retrieve the value for the option specified by the *option\_name*  
 18330 argument for the socket specified by the *socket* argument. If the size of the option value is greater  
 18331 than *option\_len*, the value stored in the object pointed to by the *option\_value* argument shall be  
 18332 silently truncated. Otherwise, the object pointed to by the *option\_len* argument shall be modified  
 18333 to indicate the actual length of the value.

18334 The *level* argument specifies the protocol level at which the option resides. To retrieve options at  
 18335 the socket level, specify the *level* argument as SOL\_SOCKET. To retrieve options at other levels,  
 18336 supply the appropriate level identifier for the protocol controlling the option. For example, to  
 18337 indicate that an option is interpreted by the TCP (Transmission Control Protocol), set *level* to  
 18338 IPPROTO\_TCP as defined in the <netinet/in.h> header.

18339 The socket in use may require the process to have appropriate privileges to use the *getsockopt()*  
 18340 function.

18341 The *option\_name* argument specifies a single option to be retrieved. It can be one of the following  
 18342 values defined in <sys/socket.h>:

18343 SO\_DEBUG Reports whether debugging information is being recorded. This option  
 18344 shall store an **int** value. This is a Boolean option.

18345 SO\_ACCEPTCONN Reports whether socket listening is enabled. This option shall store an **int**  
 18346 value. This is a Boolean option.

18347 SO\_BROADCAST Reports whether transmission of broadcast messages is supported, if this  
 18348 is supported by the protocol. This option shall store an **int** value. This is a  
 18349 Boolean option.

18350 SO\_REUSEADDR Reports whether the rules used in validating addresses supplied to *bind()*  
 18351 should allow reuse of local addresses, if this is supported by the protocol.  
 18352 This option shall store an **int** value. This is a Boolean option.

18353 SO\_KEEPALIVE Reports whether connections are kept active with periodic transmission  
 18354 of messages, if this is supported by the protocol.

18355 If the connected socket fails to respond to these messages, the connection  
 18356 shall be broken and threads writing to that socket shall be notified with a  
 18357 SIGPIPE signal. This option shall store an **int** value. This is a Boolean  
 18358 option.

18359 SO\_LINGER Reports whether the socket lingers on *close()* if data is present. If  
 18360 SO\_LINGER is set, the system blocks the process during *close()* until it  
 18361 can transmit the data or until the end of the interval indicated by the  
 18362 *l\_linger* member, whichever comes first. If SO\_LINGER is not specified,  
 18363 and *close()* is issued, the system handles the call in a way that allows the  
 18364 process to continue as quickly as possible. This option shall store a **linger**  
 18365 structure.

|       |              |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|-------|--------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 18366 | SO_OOBINLINE | Reports whether the socket leaves received out-of-band data (data marked urgent) inline. This option shall store an <b>int</b> value. This is a Boolean option.                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| 18367 |              |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

| 18382 | SO_RCVLOWAT  | Reports the minimum number of bytes to process for socket input operations. The default value for SO_RCVLOWAT is 1. If SO_RCVLOWAT is set to a larger value, blocking receive calls normally wait until they have received the smaller of the low water mark value or the requested amount. (They may return less than the low water mark if an error occurs, a signal is caught, or the type of data next in the receive queue is different from that returned; for example, out-of-band data.) This option shall store an <b>int</b> value. Note that not all implementations allow this option to be retrieved. |

| 18391 | SO_RCVTIMEO  | Reports the timeout value for input operations. This option shall store a <b>timeval</b> structure with the number of seconds and microseconds specifying the limit on how long to wait for an input operation to complete. If a receive operation has blocked for this much time without receiving additional data, it shall return with a partial count or <i>errno</i> set to [EAGAIN] or [EWOULDBLOCK] if no data was received. The default for this option is zero, which indicates that a receive operation shall not time out. Note that not all implementations allow this option to be retrieved.         |

| 18404 | SO_SNDTIMEO  | Reports the timeout value specifying the amount of time that an output function blocks because flow control prevents data from being sent. If a send operation has blocked for this time, it shall return with a partial count or with <i>errno</i> set to [EAGAIN] or [EWOULDBLOCK] if no data was sent. The default for this option is zero, which indicates that a send operation shall not time out. The option shall store a <b>timeval</b> structure. Note that not all implementations allow this option to be retrieved.                                                                                   |
| 18405 |              |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

|       |              | For Boolean options, a zero value indicates that the option is disabled and a non-zero value indicates that the option is enabled.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

- 18413 Options at other protocol levels vary in format and name.
- 18414 The socket in use may require the process to have appropriate privileges to use the *getsockopt()*  
18415 function.
- 18416 **RETURN VALUE**
- 18417 Upon successful completion, *getsockopt()* shall return 0; otherwise, -1 shall be returned and *errno*  
18418 set to indicate the error.
- 18419 **ERRORS**
- 18420 The *getsockopt()* function shall fail if:
- 18421 [EBADF] The *socket* argument is not a valid file descriptor.
- 18422 [EINVAL] The specified option is invalid at the specified socket level.
- 18423 [ENOPROTOOPT]
- 18424 The option is not supported by the protocol.
- 18425 [ENOTSOCK] The *socket* argument does not refer to a socket.
- 18426 The *getsockopt()* function may fail if:
- 18427 [EACCES] The calling process does not have the appropriate privileges.
- 18428 [EINVAL] The socket has been shut down.
- 18429 [ENOBUFS] Insufficient resources are available in the system to complete the function.

- 18441 **CHANGE HISTORY**
- 18442 First released in Issue 6. Derived from the XNS, Issue 5.2 specification.
- 18443 The **restrict** keyword is added to the *getsockopt()* prototype for alignment with the  
18444 ISO/IEC 9899:1999 standard.

18445 **NAME**

18446       getsubopt — parse suboption arguments from a string

18447 **SYNOPSIS**

18448 XSI       #include &lt;stdlib.h&gt;

18449       int getsubopt(char \*\*optionp, char \* const \*tokens, char \*\*valuep);

18450

18451 **DESCRIPTION**18452       The *getsubopt()* function shall parse suboption arguments in a flag argument. Such options often  
18453 result from the use of *getopt()*.18454       The *getsubopt()* argument *optionp* is a pointer to a pointer to the option argument string. The  
18455 suboption arguments shall be separated by commas and each may consist of either a single  
18456 token, or a token-value pair separated by an equal sign.18457       The *keylistp* argument shall be a pointer to a vector of strings. The end of the vector is identified  
18458 by a null pointer. Each entry in the vector is one of the possible tokens that might be found in  
18459 *\*optionp*. Since commas delimit suboption arguments in *optionp*, they should not appear in any of  
18460 the strings pointed to by *keylistp*. Similarly, because an equal sign separates a token from its  
18461 value, the application should not include an equal sign in any of the strings pointed to by  
18462 *keylistp*.18463       The *valuep* argument is the address of a value string pointer.18464       If a comma appears in *optionp*, it shall be interpreted as a suboption separator. After commas  
18465 have been processed, if there are one or more equal signs in a suboption string, the first equal  
18466 sign in any suboption string shall be interpreted as a separator between a token and a value.  
18467 Subsequent equal signs in a suboption string shall be interpreted as part of the value.18468       If the string at *\*optionp* contains only one suboption argument (equivalently, no commas),  
18469 *getsubopt()* shall update *\*optionp* to point to the null character at the end of the string. Otherwise,  
18470 it shall isolate the suboption argument by replacing the comma separator with a null character,  
18471 and shall update *\*optionp* to point to the start of the next suboption argument. If the suboption  
18472 argument has an associated value (equivalently, contains an equal sign), *getsubopt()* shall update  
18473 *\*valuep* to point to the value's first character. Otherwise, it shall set *\*valuep* to a null pointer. The  
18474 calling application may use this information to determine whether the presence or absence of a  
18475 value for the suboption is an error.18476       Additionally, when *getsubopt()* fails to match the suboption argument with a token in the *keylistp*  
18477 array, the calling application should decide if this is an error, or if the unrecognized option  
18478 should be processed in another way.18479 **RETURN VALUE**18480       The *getsubopt()* function shall return the index of the matched token string, or -1 if no token  
18481 strings were matched.18482 **ERRORS**

18483       No errors are defined.

## 18484 EXAMPLES

```
18485     #include <stdio.h>
18486     #include <stdlib.h>
18487
18487     int do_all;
18488     const char *type;
18489     int read_size;
18490     int write_size;
18491     int read_only;
18492
18492     enum
18493     {
18494         RO_OPTION = 0,
18495         RW_OPTION,
18496         READ_SIZE_OPTION,
18497         WRITE_SIZE_OPTION
18498     };
18499
18499     const char *mount_opts[] =
18500     {
18501         [RO_OPTION] = "ro",
18502         [RW_OPTION] = "rw",
18503         [READ_SIZE_OPTION] = "rsize",
18504         [WRITE_SIZE_OPTION] = "wsize",
18505         NULL
18506     };
18507
18507     int
18508     main(int argc, char *argv[])
18509     {
18510         char *subopts, *value;
18511         int opt;
18512
18512         while ((opt = getopt(argc, argv, "at:o:")) != -1)
18513             switch(opt)
18514             {
18515                 case 'a':
18516                     do_all = 1;
18517                     break;
18518                 case 't':
18519                     type = optarg;
18520                     break;
18521                 case 'o':
18522                     subopts = optarg;
18523                     while (*subopts != '\0')
18524                         switch(getsubopt(&subopts, mount_opts, &value))
18525                         {
18526                             case RO_OPTION:
18527                                 read_only = 1;
18528                                 break;
18529                             case RW_OPTION:
18530                                 read_only = 0;
18531                                 break;
18532                             case READ_SIZE_OPTION:
```

```

18533         if (value == NULL)
18534             abort();
18535         read_size = atoi(value);
18536         break;
18537     case WRITE_SIZE_OPTION:
18538         if (value == NULL)
18539             abort();
18540         write_size = atoi(value);
18541         break;
18542     default:
18543         /* Unknown suboption. */
18544         printf("Unknown suboption '%s'\n", value);
18545         break;
18546     }
18547     break;
18548 default:
18549     abort();
18550 }
18551     /* Do the real work. */
18552     return 0;
18553 }

```

#### 18554 Parsing Suboptions

18555 The following example uses the *getsubopt()* function to parse a *value* argument in the *optarg*  
 18556 external variable returned by a call to *getopt()*.

```

18557 #include <stdlib.h>
18558 ...
18559 char *tokens[] = {"HOME", "PATH", "LOGNAME", (char *) NULL };
18560 char *value;
18561 int opt, index;
18562 while ((opt = getopt(argc, argv, "e:")) != -1) {
18563     switch(opt) {
18564     case 'e' :
18565         while ((index = getsubopt(&optarg, tokens, &value)) != -1) {
18566             switch(index) {
18567             ...
18568             }
18569             break;
18570         ...
18571     }
18572 }
18573 ...

```

#### 18574 APPLICATION USAGE

18575 None.

#### 18576 RATIONALE

18577 None.

18578 **FUTURE DIRECTIONS**

18579           None.

18580 **SEE ALSO**

18581           *getopt()*, the Base Definitions volume of IEEE Std 1003.1-2001, <stdlib.h>

18582 **CHANGE HISTORY**

18583           First released in Issue 4, Version 2.

18584 **Issue 5**

18585           Moved from X/OPEN UNIX extension to BASE.

18586 **NAME**

18587           gettimeofday — get the date and time

18588 **SYNOPSIS**

```
18589 xSI       #include <sys/time.h>
```

```
18590       int gettimeofday(struct timeval *restrict tp, void *restrict tzp);
```

18591

18592 **DESCRIPTION**

18593       The *gettimeofday()* function shall obtain the current time, expressed as seconds and  
18594       microseconds since the Epoch, and store it in the **timeval** structure pointed to by *tp*. The  
18595       resolution of the system clock is unspecified.

18596       If *tzp* is not a null pointer, the behavior is unspecified.

18597 **RETURN VALUE**

18598       The *gettimeofday()* function shall return 0 and no value shall be reserved to indicate an error.

18599 **ERRORS**

18600       No errors are defined.

18601 **EXAMPLES**

18602       None.

18603 **APPLICATION USAGE**

18604       None.

18605 **RATIONALE**

18606       None.

18607 **FUTURE DIRECTIONS**

18608       None.

18609 **SEE ALSO**

18610       *ctime()*, *ftime()*, the Base Definitions volume of IEEE Std 1003.1-2001, <sys/time.h>

18611 **CHANGE HISTORY**

18612       First released in Issue 4, Version 2.

18613 **Issue 5**

18614       Moved from X/OPEN UNIX extension to BASE.

18615 **Issue 6**

18616       The DESCRIPTION is updated to refer to “seconds since the Epoch” rather than “seconds since  
18617       00:00:00 UTC (Coordinated Universal Time), January 1 1970” for consistency with other *time*  
18618       functions.

18619       The **restrict** keyword is added to the *gettimeofday()* prototype for alignment with the  
18620       ISO/IEC 9899:1999 standard.

18621 **NAME**

18622           getuid — get a real user ID

18623 **SYNOPSIS**

18624           #include <unistd.h>

18625           uid\_t getuid(void);

18626 **DESCRIPTION**

18627           The *getuid()* function shall return the real user ID of the calling process.

18628 **RETURN VALUE**

18629           The *getuid()* function shall always be successful and no return value is reserved to indicate the error.

18631 **ERRORS**

18632           No errors are defined.

18633 **EXAMPLES**18634           **Setting the Effective User ID to the Real User ID**

18635           The following example sets the effective user ID and the real user ID of the current process to the real user ID of the caller.

```
18636
18637           #include <unistd.h>
18638           #include <sys/types.h>
18639           ...
18640           setreuid(getuid(), getuid());
18641           ...
```

18642 **APPLICATION USAGE**

18643           None.

18644 **RATIONALE**

18645           None.

18646 **FUTURE DIRECTIONS**

18647           None.

18648 **SEE ALSO**

18649           *getegid()*, *geteuid()*, *getgid()*, *setegid()*, *seteuid()*, *setgid()*, *setregid()*, *setreuid()*, *setuid()*, the Base Definitions volume of IEEE Std 1003.1-2001, <sys/types.h>, <unistd.h>

18651 **CHANGE HISTORY**

18652           First released in Issue 1. Derived from Issue 1 of the SVID.

18653 **Issue 6**

18654           In the SYNOPSIS, the optional include of the <sys/types.h> header is removed.

18655           The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:

- 18656
- 18657           • The requirement to include <sys/types.h> has been removed. Although <sys/types.h> was required for conforming implementations of previous POSIX specifications, it was not required for UNIX applications.
- 18658
- 18659

18660 **NAME**

18661 getutxent, getutxid, getutxline — get user accounting database entries

18662 **SYNOPSIS**18663 XSI `#include <utmpx.h>`18664 `struct utmpx *getutxent(void);`18665 `struct utmpx *getutxid(const struct utmpx *id);`18666 `struct utmpx *getutxline(const struct utmpx *line);`

18667

18668 **DESCRIPTION**18669 Refer to *endutxent()*.

18670 **NAME**

18671           getwc — get a wide character from a stream

18672 **SYNOPSIS**

18673           #include <stdio.h>

18674           #include <wchar.h>

18675           wint\_t getwc(FILE \*stream);

18676 **DESCRIPTION**

18677 cx       The functionality described on this reference page is aligned with the ISO C standard. Any  
18678       conflict between the requirements described here and the ISO C standard is unintentional. This  
18679       volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

18680       The *getwc()* function shall be equivalent to *fgetwc()*, except that if it is implemented as a macro it  
18681       may evaluate *stream* more than once, so the argument should never be an expression with side  
18682       effects.

18683 **RETURN VALUE**

18684       Refer to *fgetwc()*.

18685 **ERRORS**

18686       Refer to *fgetwc()*.

18687 **EXAMPLES**

18688       None.

18689 **APPLICATION USAGE**

18690       Since it may be implemented as a macro, *getwc()* may treat incorrectly a *stream* argument with  
18691       side effects. In particular, *getwc(\*f++)* does not necessarily work as expected. Therefore, use of  
18692       this function is not recommended; *fgetwc()* should be used instead.

18693 **RATIONALE**

18694       None.

18695 **FUTURE DIRECTIONS**

18696       None.

18697 **SEE ALSO**

18698       *fgetwc()*, the Base Definitions volume of IEEE Std 1003.1-2001, <stdio.h>, <wchar.h>

18699 **CHANGE HISTORY**

18700       First released as a World-wide Portability Interface in Issue 4. Derived from the MSE working  
18701       draft.

18702 **Issue 5**

18703       The Optional Header (OH) marking is removed from <stdio.h>.

18704 **NAME**

18705           getwchar — get a wide character from a stdin stream

18706 **SYNOPSIS**

18707           #include <wchar.h>

18708           wint\_t getwchar(void);

18709 **DESCRIPTION**

18710 **CX**       The functionality described on this reference page is aligned with the ISO C standard. Any  
18711           conflict between the requirements described here and the ISO C standard is unintentional. This  
18712           volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

18713           The *getwchar()* function shall be equivalent to *getwc(stdin)*.

18714 **RETURN VALUE**

18715           Refer to *fgetwc()*.

18716 **ERRORS**

18717           Refer to *fgetwc()*.

18718 **EXAMPLES**

18719           None.

18720 **APPLICATION USAGE**

18721           If the **wint\_t** value returned by *getwchar()* is stored into a variable of type **wchar\_t** and then  
18722           compared against the **wint\_t** macro **WEOF**, the result may be incorrect. Only the **wint\_t** type is  
18723           guaranteed to be able to represent any wide character and **WEOF**.

18724 **RATIONALE**

18725           None.

18726 **FUTURE DIRECTIONS**

18727           None.

18728 **SEE ALSO**

18729           *fgetwc()*, *getwc()*, the Base Definitions volume of IEEE Std 1003.1-2001, <**wchar.h**>

18730 **CHANGE HISTORY**

18731           First released as a World-wide Portability Interface in Issue 4. Derived from the MSE working  
18732           draft.

18733 **NAME**

18734 getwd — get the current working directory pathname (**LEGACY**)

18735 **SYNOPSIS**

```
18736 XSI #include <unistd.h>
```

```
18737 char *getwd(char *path_name);
```

18738

18739 **DESCRIPTION**

18740 The *getwd()* function shall determine an absolute pathname of the current working directory of  
18741 the calling process, and copy a string containing that pathname into the array pointed to by the  
18742 *path\_name* argument.

18743 If the length of the pathname of the current working directory is greater than ( $\{\text{PATH\_MAX}\}+1$ )  
18744 including the null byte, *getwd()* shall fail and return a null pointer.

18745 **RETURN VALUE**

18746 Upon successful completion, a pointer to the string containing the absolute pathname of the  
18747 current working directory shall be returned. Otherwise, *getwd()* shall return a null pointer and  
18748 the contents of the array pointed to by *path\_name* are undefined.

18749 **ERRORS**

18750 No errors are defined.

18751 **EXAMPLES**

18752 None.

18753 **APPLICATION USAGE**

18754 For applications portability, the *getcwd()* function should be used to determine the current  
18755 working directory instead of *getwd()*.

18756 **RATIONALE**

18757 Since the user cannot specify the length of the buffer passed to *getwd()*, use of this function is  
18758 discouraged. The length of a pathname described in  $\{\text{PATH\_MAX}\}$  is file system-dependent and  
18759 may vary from one mount point to another, or might even be unlimited. It is possible to  
18760 overflow this buffer in such a way as to cause applications to fail, or possible system security  
18761 violations.

18762 It is recommended that the *getcwd()* function should be used to determine the current working  
18763 directory.

18764 **FUTURE DIRECTIONS**

18765 This function may be withdrawn in a future version.

18766 **SEE ALSO**

18767 *getcwd()*, the Base Definitions volume of IEEE Std 1003.1-2001, <unistd.h>

18768 **CHANGE HISTORY**

18769 First released in Issue 4, Version 2.

18770 **Issue 5**

18771 Moved from X/OPEN UNIX extension to BASE.

18772 **Issue 6**

18773 This function is marked LEGACY.

## 18774 NAME

18775 glob, globfree — generate pathnames matching a pattern

## 18776 SYNOPSIS

18777 #include &lt;glob.h&gt;

18778 int glob(const char \*restrict *pattern*, int *flags*,18779 int (\**errfunc*)(const char \**epath*, int *eerrno*),18780 glob\_t \*restrict *pglob*);18781 void globfree(glob\_t \**pglob*);

## 18782 DESCRIPTION

18783 The *glob()* function is a pathname generator that shall implement the rules defined in the Shell  
 18784 and Utilities volume of IEEE Std 1003.1-2001, Section 2.13, Pattern Matching Notation, with  
 18785 optional support for rule 3 in the Shell and Utilities volume of IEEE Std 1003.1-2001, Section  
 18786 2.13.3, Patterns Used for Filename Expansion.

18787 The structure type **glob\_t** is defined in <**glob.h**> and includes at least the following members:

18788

18789

| Member Type | Member Name     | Description                                            |
|-------------|-----------------|--------------------------------------------------------|
| size_t      | <i>gl_pathc</i> | Count of paths matched by <i>pattern</i> .             |
| char **     | <i>gl_pathv</i> | Pointer to a list of matched pathnames.                |
| size_t      | <i>gl_offs</i>  | Slots to reserve at the beginning of <i>gl_pathv</i> . |

18790

18791

18792

18793 The argument *pattern* is a pointer to a pathname pattern to be expanded. The *glob()* function  
 18794 shall match all accessible pathnames against this pattern and develop a list of all pathnames that  
 18795 match. In order to have access to a pathname, *glob()* requires search permission on every  
 18796 component of a path except the last, and read permission on each directory of any filename  
 18797 component of *pattern* that contains any of the following special characters: '\*', '?', and '['.

18798 The *glob()* function shall store the number of matched pathnames into *pglob->gl\_pathc* and a  
 18799 pointer to a list of pointers to pathnames into *pglob->gl\_pathv*. The pathnames shall be in sort  
 18800 order as defined by the current setting of the *LC\_COLLATE* category; see the Base Definitions  
 18801 volume of IEEE Std 1003.1-2001, Section 7.3.2, *LC\_COLLATE*. The first pointer after the last  
 18802 pathname shall be a null pointer. If the pattern does not match any pathnames, the returned  
 18803 number of matched paths is set to 0, and the contents of *pglob->gl\_pathv* are implementation-  
 18804 defined.

18805 It is the caller's responsibility to create the structure pointed to by *pglob*. The *glob()* function shall  
 18806 allocate other space as needed, including the memory pointed to by *gl\_pathv*. The *globfree()*  
 18807 function shall free any space associated with *pglob* from a previous call to *glob()*.

18808 The *flags* argument is used to control the behavior of *glob()*. The value of *flags* is a bitwise-  
 18809 inclusive OR of zero or more of the following constants, which are defined in <**glob.h**>:

- 18810 **GLOB\_APPEND** Append pathnames generated to the ones from a previous call to *glob()*.
- 18811 **GLOB\_DOOFFS** Make use of *pglob->gl\_offs*. If this flag is set, *pglob->gl\_offs* is used to  
 18812 specify how many null pointers to add to the beginning of  
 18813 *pglob->gl\_pathv*. In other words, *pglob->gl\_pathv* shall point to  
 18814 *pglob->gl\_offs* null pointers, followed by *pglob->gl\_pathc* pathname  
 18815 pointers, followed by a null pointer.
- 18816 **GLOB\_ERR** Cause *glob()* to return when it encounters a directory that it cannot open  
 18817 or read. Ordinarily, *glob()* continues to find matches.

|       |               |                                                                                                                                                                                                                                                                                                      |
|-------|---------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 18818 | GLOB_MARK     | Each pathname that is a directory that matches <i>pattern</i> shall have a slash appended.                                                                                                                                                                                                           |
| 18819 |               |                                                                                                                                                                                                                                                                                                      |
| 18820 | GLOB_NOCHECK  | Supports rule 3 in the Shell and Utilities volume of IEEE Std 1003.1-2001, Section 2.13.3, Patterns Used for Filename Expansion. If <i>pattern</i> does not match any pathname, then <i>glob()</i> shall return a list consisting of only <i>pattern</i> , and the number of matched pathnames is 1. |
| 18821 |               |                                                                                                                                                                                                                                                                                                      |
| 18822 |               |                                                                                                                                                                                                                                                                                                      |
| 18823 |               |                                                                                                                                                                                                                                                                                                      |
| 18824 | GLOB_NOESCAPE | Disable backslash escaping.                                                                                                                                                                                                                                                                          |
| 18825 | GLOB_NOSORT   | Ordinarily, <i>glob()</i> sorts the matching pathnames according to the current setting of the <i>LC_COLLATE</i> category; see the Base Definitions volume of IEEE Std 1003.1-2001, Section 7.3.2, <i>LC_COLLATE</i> . When this flag is used, the order of pathnames returned is unspecified.       |
| 18826 |               |                                                                                                                                                                                                                                                                                                      |
| 18827 |               |                                                                                                                                                                                                                                                                                                      |
| 18828 |               |                                                                                                                                                                                                                                                                                                      |

18829 The GLOB\_APPEND flag can be used to append a new set of pathnames to those found in a  
 18830 previous call to *glob()*. The following rules apply to applications when two or more calls to  
 18831 *glob()* are made with the same value of *pglob* and without intervening calls to *globfree()*:

- 18832 1. The first such call shall not set GLOB\_APPEND. All subsequent calls shall set it.
- 18833 2. All the calls shall set GLOB\_DOOFFS, or all shall not set it.
- 18834 3. After the second call, *pglob->gl\_pathv* points to a list containing the following:
  - 18835 a. Zero or more null pointers, as specified by GLOB\_DOOFFS and *pglob->gl\_offs*.
  - 18836 b. Pointers to the pathnames that were in the *pglob->gl\_pathv* list before the call, in the  
 18837 same order as before.
  - 18838 c. Pointers to the new pathnames generated by the second call, in the specified order.
- 18839 4. The count returned in *pglob->gl\_pathc* shall be the total number of pathnames from the two  
 18840 calls.
- 18841 5. The application can change any of the fields after a call to *glob()*. If it does, the application  
 18842 shall reset them to the original value before a subsequent call, using the same *pglob* value,  
 18843 to *globfree()* or *glob()* with the GLOB\_APPEND flag.

18844 If, during the search, a directory is encountered that cannot be opened or read and *errfunc* is not  
 18845 a null pointer, *glob()* calls *(\*errfunc())* with two arguments:

- 18846 1. The *epath* argument is a pointer to the path that failed.
- 18847 2. The *errno* argument is the value of *errno* from the failure, as set by *opendir()*, *readdir()*, or  
 18848 *stat()*. (Other values may be used to report other errors not explicitly documented for  
 18849 those functions.)

18850 If *(\*errfunc())* is called and returns non-zero, or if the GLOB\_ERR flag is set in *flags*, *glob()* shall  
 18851 stop the scan and return GLOB\_ABORTED after setting *gl\_pathc* and *gl\_pathv* in *pglob* to reflect  
 18852 the paths already scanned. If GLOB\_ERR is not set and either *errfunc* is a null pointer or  
 18853 *(\*errfunc())* returns 0, the error shall be ignored.

18854 The *glob()* function shall not fail because of large files.

#### 18855 RETURN VALUE

18856 Upon successful completion, *glob()* shall return 0. The argument *pglob->gl\_pathc* shall return the  
 18857 number of matched pathnames and the argument *pglob->gl\_pathv* shall contain a pointer to a  
 18858 null-terminated list of matched and sorted pathnames. However, if *pglob->gl\_pathc* is 0, the  
 18859 content of *pglob->gl\_pathv* is undefined.

18860 The *globfree()* function shall not return a value.

18861 If *glob()* terminates due to an error, it shall return one of the non-zero constants defined in  
18862 <glob.h>. The arguments *pglob->gl\_pathc* and *pglob->gl\_pathv* are still set as defined above.

### 18863 ERRORS

18864 The *glob()* function shall fail and return the corresponding value if:

18865 GLOB\_ABORTED The scan was stopped because GLOB\_ERR was set or (*\*errfunc()*)  
18866 returned non-zero.

18867 GLOB\_NOMATCH The pattern does not match any existing pathname, and  
18868 GLOB\_NOCHECK was not set in flags.

18869 GLOB\_NOSPACE An attempt to allocate memory failed.

### 18870 EXAMPLES

18871 One use of the GLOB\_DOOFFS flag is by applications that build an argument list for use with  
18872 *execv()*, *execve()*, or *execvp()*. Suppose, for example, that an application wants to do the  
18873 equivalent of:

```
18874 ls -l *.c
```

18875 but for some reason:

```
18876 system("ls -l *.c")
```

18877 is not acceptable. The application could obtain approximately the same result using the  
18878 sequence:

```
18879 globbuf.gl_offs = 2;  
18880 glob("*.c", GLOB_DOOFFS, NULL, &globbuf);  
18881 globbuf.gl_pathv[0] = "ls";  
18882 globbuf.gl_pathv[1] = "-l";  
18883 execvp("ls", &globbuf.gl_pathv[0]);
```

18884 Using the same example:

```
18885 ls -l *.c *.h
```

18886 could be approximately simulated using GLOB\_APPEND as follows:

```
18887 globbuf.gl_offs = 2;  
18888 glob("*.c", GLOB_DOOFFS, NULL, &globbuf);  
18889 glob("*.h", GLOB_DOOFFS|GLOB_APPEND, NULL, &globbuf);  
18890 ...
```

### 18891 APPLICATION USAGE

18892 This function is not provided for the purpose of enabling utilities to perform pathname  
18893 expansion on their arguments, as this operation is performed by the shell, and utilities are  
18894 explicitly not expected to redo this. Instead, it is provided for applications that need to do  
18895 pathname expansion on strings obtained from other sources, such as a pattern typed by a user or  
18896 read from a file.

18897 If a utility needs to see if a pathname matches a given pattern, it can use *fnmatch()*.

18898 Note that *gl\_pathc* and *gl\_pathv* have meaning even if *glob()* fails. This allows *glob()* to report  
18899 partial results in the event of an error. However, if *gl\_pathc* is 0, *gl\_pathv* is unspecified even if  
18900 *glob()* did not return an error.

18901 The GLOB\_NOCHECK option could be used when an application wants to expand a pathname  
18902 if wildcards are specified, but wants to treat the pattern as just a string otherwise. The *sh* utility

18903 might use this for option-arguments, for example.

18904 The new pathnames generated by a subsequent call with GLOB\_APPEND are not sorted  
 18905 together with the previous pathnames. This mirrors the way that the shell handles pathname  
 18906 expansion when multiple expansions are done on a command line.

18907 Applications that need tilde and parameter expansion should use *wordexp()*.

#### 18908 RATIONALE

18909 It was claimed that the GLOB\_DOOFFS flag is unnecessary because it could be simulated using:

```
18910 new = (char **)malloc((n + pglob->gl_pathc + 1)
18911     * sizeof(char *));
18912 (void) memcpy(new+n, pglob->gl_pathv,
18913     pglob->gl_pathc * sizeof(char *));
18914 (void) memset(new, 0, n * sizeof(char *));
18915 free(pglob->gl_pathv);
18916 pglob->gl_pathv = new;
```

18917 However, this assumes that the memory pointed to by *gl\_pathv* is a block that was separately  
 18918 created using *malloc()*. This is not necessarily the case. An application should make no  
 18919 assumptions about how the memory referenced by fields in *pglob* was allocated. It might have  
 18920 been obtained from *malloc()* in a large chunk and then carved up within *glob()*, or it might have  
 18921 been created using a different memory allocator. It is not the intent of the standard developers to  
 18922 specify or imply how the memory used by *glob()* is managed.

18923 The GLOB\_APPEND flag would be used when an application wants to expand several different  
 18924 patterns into a single list.

#### 18925 FUTURE DIRECTIONS

18926 None.

#### 18927 SEE ALSO

18928 *exec*, *fnmatch()*, *opendir()*, *readdir()*, *stat()*, *wordexp()*, the Base Definitions volume of  
 18929 IEEE Std 1003.1-2001, <**glob.h**>, the Shell and Utilities volume of IEEE Std 1003.1-2001

#### 18930 CHANGE HISTORY

18931 First released in Issue 4. Derived from the ISO POSIX-2 standard.

#### 18932 Issue 5

18933 Moved from POSIX2 C-language Binding to BASE.

#### 18934 Issue 6

18935 The DESCRIPTION is updated to avoid use of the term “must” for application requirements.

18936 The **restrict** keyword is added to the *glob()* prototype for alignment with the ISO/IEC 9899:1999  
 18937 standard.

18938 **NAME**

18939 gmtime, gmtime\_r — convert a time value to a broken-down UTC time

18940 **SYNOPSIS**

18941 #include &lt;time.h&gt;

18942 struct tm \*gmtime(const time\_t \*timer);

18943 TSF struct tm \*gmtime\_r(const time\_t \*restrict timer,

18944 struct tm \*restrict result);

18945

18946 **DESCRIPTION**

18947 CX For *gmtime()*: The functionality described on this reference page is aligned with the ISO C  
 18948 standard. Any conflict between the requirements described here and the ISO C standard is  
 18949 unintentional. This volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

18950 The *gmtime()* function shall convert the time in seconds since the Epoch pointed to by *timer* into  
 18951 a broken-down time, expressed as Coordinated Universal Time (UTC).

18952 CX The relationship between a time in seconds since the Epoch used as an argument to *gmtime()*  
 18953 and the **tm** structure (defined in the <time.h> header) is that the result shall be as specified in the  
 18954 expression given in the definition of seconds since the Epoch (see the Base Definitions volume of  
 18955 IEEE Std 1003.1-2001, Section 4.14, Seconds Since the Epoch), where the names in the structure  
 18956 and in the expression correspond.

18957 TSF The same relationship shall apply for *gmtime\_r()*.

18958 CX The *gmtime()* function need not be reentrant. A function that is not required to be reentrant is not  
 18959 required to be thread-safe.

18960 The *asctime()*, *ctime()*, *gmtime()*, and *localtime()* functions shall return values in one of two static  
 18961 objects: a broken-down time structure and an array of type **char**. Execution of any of the  
 18962 functions may overwrite the information returned in either of these objects by any of the other  
 18963 functions.

18964 TSF The *gmtime\_r()* function shall convert the time in seconds since the Epoch pointed to by *timer*  
 18965 into a broken-down time expressed as Coordinated Universal Time (UTC). The broken-down  
 18966 time is stored in the structure referred to by *result*. The *gmtime\_r()* function shall also return the  
 18967 address of the same structure.

18968 **RETURN VALUE**

18969 The *gmtime()* function shall return a pointer to a **struct tm**.

18970 TSF Upon successful completion, *gmtime\_r()* shall return the address of the structure pointed to by  
 18971 the argument *result*. If an error is detected, or UTC is not available, *gmtime\_r()* shall return a null  
 18972 pointer.

18973 **ERRORS**

18974 No errors are defined.

18975 **EXAMPLES**

18976 None.

18977 **APPLICATION USAGE**

18978 The *gmtime\_r()* function is thread-safe and returns values in a user-supplied buffer instead of  
18979 possibly using a static data area that may be overwritten by each call.

18980 **RATIONALE**

18981 None.

18982 **FUTURE DIRECTIONS**

18983 None.

18984 **SEE ALSO**

18985 *asctime()*, *clock()*, *ctime()*, *difftime()*, *localtime()*, *mktime()*, *strftime()*, *strptime()*, *time()*, *utime()*,  
18986 the Base Definitions volume of IEEE Std 1003.1-2001, <**time.h**>

18987 **CHANGE HISTORY**

18988 First released in Issue 1. Derived from Issue 1 of the SVID.

18989 **Issue 5**

18990 A note indicating that the *gmtime()* function need not be reentrant is added to the  
18991 DESCRIPTION.

18992 The *gmtime\_r()* function is included for alignment with the POSIX Threads Extension.18993 **Issue 6**18994 The *gmtime\_r()* function is marked as part of the Thread-Safe Functions option.

18995 Extensions beyond the ISO C standard are marked.

18996 The APPLICATION USAGE section is updated to include a note on the thread-safe function and  
18997 its avoidance of possibly using a static data area.

18998 The **restrict** keyword is added to the *gmtime\_r()* prototype for alignment with the  
18999 ISO/IEC 9899:1999 standard.

19000 **NAME**

19001 grantpt — grant access to the slave pseudo-terminal device

19002 **SYNOPSIS**

19003 XSI #include &lt;stdlib.h&gt;

19004 int grantpt(int *fildes*);

19005

19006 **DESCRIPTION**

19007 The *grantpt()* function shall change the mode and ownership of the slave pseudo-terminal  
19008 device associated with its master pseudo-terminal counterpart. The *fildes* argument is a file  
19009 descriptor that refers to a master pseudo-terminal device. The user ID of the slave shall be set to  
19010 the real UID of the calling process and the group ID shall be set to an unspecified group ID. The  
19011 permission mode of the slave pseudo-terminal shall be set to readable and writable by the  
19012 owner, and writable by the group.

19013 The behavior of the *grantpt()* function is unspecified if the application has installed a signal  
19014 handler to catch SIGCHLD signals.

19015 **RETURN VALUE**

19016 Upon successful completion, *grantpt()* shall return 0; otherwise, it shall return -1 and set *errno* to  
19017 indicate the error.

19018 **ERRORS**19019 The *grantpt()* function may fail if:19020 [EBADF] The *fildes* argument is not a valid open file descriptor.19021 [EINVAL] The *fildes* argument is not associated with a master pseudo-terminal device.

19022 [EACCES] The corresponding slave pseudo-terminal device could not be accessed.

19023 **EXAMPLES**

19024 None.

19025 **APPLICATION USAGE**

19026 None.

19027 **RATIONALE**

19028 None.

19029 **FUTURE DIRECTIONS**

19030 None.

19031 **SEE ALSO**19032 *open()*, *ptsname()*, *unlockpt()*, the Base Definitions volume of IEEE Std 1003.1-2001, <stdlib.h>19033 **CHANGE HISTORY**

19034 First released in Issue 4, Version 2.

19035 **Issue 5**

19036 Moved from X/OPEN UNIX extension to BASE.

19037 The last paragraph of the DESCRIPTION is moved from the APPLICATION USAGE section.

19038 **NAME**

19039 h\_errno — error return value for network database operations

19040 **SYNOPSIS**

```
19041 OB #include <netdb.h>
```

19042

19043 **DESCRIPTION**

19044 This method of returning errors is used only in connection with obsolescent functions.

19045 The <netdb.h> header provides a declaration of *h\_errno* as a modifiable lvalue of type **int**.

19046 It is unspecified whether *h\_errno* is a macro or an identifier declared with external linkage. If a  
19047 macro definition is suppressed in order to access an actual object, or a program defines an  
19048 identifier with the name *h\_errno*, the behavior is undefined.

19049 **RETURN VALUE**

19050 None.

19051 **ERRORS**

19052 No errors are defined.

19053 **EXAMPLES**

19054 None.

19055 **APPLICATION USAGE**

19056 Applications should obtain the definition of *h\_errno* by the inclusion of the <netdb.h> header.

19057 **RATIONALE**

19058 None.

19059 **FUTURE DIRECTIONS**

19060 *h\_errno* may be withdrawn in a future version.

19061 **SEE ALSO**

19062 *endhostent()*, *errno*, the Base Definitions volume of IEEE Std 1003.1-2001, <netdb.h>

19063 **CHANGE HISTORY**

19064 First released in Issue 6. Derived from the XNS, Issue 5.2 specification.

19065 **NAME**

19066           hcreate, hdestroy, hsearch — manage hash search table

19067 **SYNOPSIS**

```
19068 xSI       #include <search.h>
19069           int hcreate(size_t nel);
19070           void hdestroy(void);
19071           ENTRY *hsearch(ENTRY item, ACTION action);
19072
```

19073 **DESCRIPTION**19074           The *hcreate()*, *hdestroy()*, and *hsearch()* functions shall manage hash search tables.

19075           The *hcreate()* function shall allocate sufficient space for the table, and the application shall ensure it is called before *hsearch()* is used. The *nel* argument is an estimate of the maximum number of entries that the table shall contain. This number may be adjusted upward by the algorithm in order to obtain certain mathematically favorable circumstances.

19079           The *hdestroy()* function shall dispose of the search table, and may be followed by another call to *hcreate()*. After the call to *hdestroy()*, the data can no longer be considered accessible.

19081           The *hsearch()* function is a hash-table search routine. It shall return a pointer into a hash table indicating the location at which an entry can be found. The *item* argument is a structure of type **ENTRY** (defined in the *<search.h>* header) containing two pointers: *item.key* points to the comparison key (a **char** \*), and *item.data* (a **void** \*) points to any other data to be associated with that key. The comparison function used by *hsearch()* is *strcmp()*. The *action* argument is a member of an enumeration type **ACTION** indicating the disposition of the entry if it cannot be found in the table. **ENTER** indicates that the item should be inserted in the table at an appropriate point. **FIND** indicates that no entry should be made. Unsuccessful resolution is indicated by the return of a null pointer.

19090           These functions need not be reentrant. A function that is not required to be reentrant is not required to be thread-safe.

19092 **RETURN VALUE**

19093           The *hcreate()* function shall return 0 if it cannot allocate sufficient space for the table; otherwise, it shall return non-zero.

19095           The *hdestroy()* function shall not return a value.

19096           The *hsearch()* function shall return a null pointer if either the action is **FIND** and the item could not be found or the action is **ENTER** and the table is full.

19098 **ERRORS**

19099           The *hcreate()* and *hsearch()* functions may fail if:

19100           [ENOMEM]       Insufficient storage space is available.

19101 **EXAMPLES**

19102           The following example reads in strings followed by two numbers and stores them in a hash table, discarding duplicates. It then reads in strings and finds the matching entry in the hash table and prints it out.

```
19105       #include <stdio.h>
19106       #include <search.h>
19107       #include <string.h>
19108       struct info {           /* This is the info stored in the table */
19109           int age, room;       /* other than the key. */
```

```

19110     };
19111     #define NUM_EMPL    5000    /* # of elements in search table. */
19112     int main(void)
19113     {
19114         char string_space[NUM_EMPL*20];    /* Space to store strings. */
19115         struct info info_space[NUM_EMPL]; /* Space to store employee info. */
19116         char *str_ptr = string_space;    /* Next space in string_space. */
19117         struct info *info_ptr = info_space;
19118                                         /* Next space in info_space. */
19119         ENTRY item;
19120         ENTRY *found_item; /* Name to look for in table. */
19121         char name_to_find[30];
19122
19123         int i = 0;
19124
19125         /* Create table; no error checking is performed. */
19126         (void) hcreate(NUM_EMPL);
19127         while (scanf("%s%d%d", str_ptr, &info_ptr->age,
19128                     &info_ptr->room) != EOF && i++ < NUM_EMPL) {
19129             /* Put information in structure, and structure in item. */
19130             item.key = str_ptr;
19131             item.data = info_ptr;
19132             str_ptr += strlen(str_ptr) + 1;
19133             info_ptr++;
19134
19135             /* Put item into table. */
19136             (void) hsearch(item, ENTER);
19137         }
19138
19139         /* Access table. */
19140         item.key = name_to_find;
19141         while (scanf("%s", item.key) != EOF) {
19142             if ((found_item = hsearch(item, FIND)) != NULL) {
19143                 /* If item is in the table. */
19144                 (void)printf("found %s, age = %d, room = %d\n",
19145                             found_item->key,
19146                             ((struct info *)found_item->data)->age,
19147                             ((struct info *)found_item->data)->room);
19148             } else
19149                 (void)printf("no such employee %s\n", name_to_find);
19150         }
19151         return 0;
19152     }

```

#### 19149 APPLICATION USAGE

19150 The *hcreate()* and *hsearch()* functions may use *malloc()* to allocate space.

#### 19151 RATIONALE

19152 None.

19153 **FUTURE DIRECTIONS**

19154       None.

19155 **SEE ALSO**19156       *bsearch()*, *lsearch()*, *malloc()*, *strcmp()*, *tsearch()*, the Base Definitions volume of  
19157       IEEE Std 1003.1-2001, <**search.h**>19158 **CHANGE HISTORY**

19159       First released in Issue 1. Derived from Issue 1 of the SVID.

19160 **Issue 6**

19161       The DESCRIPTION is updated to avoid use of the term “must” for application requirements.

19162       A note indicating that this function need not be reentrant is added to the DESCRIPTION.

19163 **NAME**

19164       htonl, htons, ntohl, ntohs — convert values between host and network byte order

19165 **SYNOPSIS**

```
19166       #include <arpa/inet.h>

19167       uint32_t htonl(uint32_t hostlong);
19168       uint16_t htons(uint16_t hostshort);
19169       uint32_t ntohl(uint32_t netlong);
19170       uint16_t ntohs(uint16_t netshort);
```

19171 **DESCRIPTION**

19172       These functions shall convert 16-bit and 32-bit quantities between network byte order and host  
19173       byte order.

19174       On some implementations, these functions are defined as macros.

19175       The **uint32\_t** and **uint16\_t** types are defined in **<inttypes.h>**.

19176 **RETURN VALUE**

19177       The *htonl()* and *htons()* functions shall return the argument value converted from host to  
19178       network byte order.

19179       The *ntohl()* and *ntohs()* functions shall return the argument value converted from network to  
19180       host byte order.

19181 **ERRORS**

19182       No errors are defined.

19183 **EXAMPLES**

19184       None.

19185 **APPLICATION USAGE**

19186       These functions are most often used in conjunction with IPv4 addresses and ports as returned by  
19187       *gethostent()* and *getservent()*.

19188 **RATIONALE**

19189       None.

19190 **FUTURE DIRECTIONS**

19191       None.

19192 **SEE ALSO**

19193       *endhostent()*, *endservent()*, the Base Definitions volume of IEEE Std 1003.1-2001, **<inttypes.h>**,  
19194       **<arpa/inet.h>**

19195 **CHANGE HISTORY**

19196       First released in Issue 6. Derived from the XNS, Issue 5.2 specification.

19197 **NAME**

19198       hypot, hypotf, hypotl — Euclidean distance function

19199 **SYNOPSIS**

19200       #include &lt;math.h&gt;

19201       double hypot(double x, double y);

19202       float hypotf(float x, float y);

19203       long double hypotl(long double x, long double y);

19204 **DESCRIPTION**

19205 **CX**       The functionality described on this reference page is aligned with the ISO C standard. Any  
 19206 conflict between the requirements described here and the ISO C standard is unintentional. This  
 19207 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

19208       These functions shall compute the value of the square root of  $x^2+y^2$  without undue overflow or  
 19209 underflow.

19210       An application wishing to check for error situations should set *errno* to zero and call  
 19211 *feclearexcept*(FE\_ALL\_EXCEPT) before calling these functions. On return, if *errno* is non-zero or  
 19212 *fetestexcept*(FE\_INVALID | FE\_DIVBYZERO | FE\_OVERFLOW | FE\_UNDERFLOW) is non-  
 19213 zero, an error has occurred.

19214 **RETURN VALUE**

19215       Upon successful completion, these functions shall return the length of the hypotenuse of a  
 19216 right-angled triangle with sides of length *x* and *y*.

19217       If the correct value would cause overflow, a range error shall occur and *hypot()*, *hypotf()*, and  
 19218 *hypotl()* shall return the value of the macro HUGE\_VAL, HUGE\_VALF, and HUGE\_VALL,  
 19219 respectively.

19220 **MX**       If *x* or *y* is  $\pm\text{Inf}$ ,  $+\text{Inf}$  shall be returned (even if one of *x* or *y* is NaN).

19221       If *x* or *y* is NaN, and the other is not  $\pm\text{Inf}$ , a NaN shall be returned.

19222       If both arguments are subnormal and the correct result is subnormal, a range error may occur  
 19223 and the correct result is returned.

19224 **ERRORS**

19225       These functions shall fail if:

19226       Range Error       The result overflows.

19227                       If the integer expression (math\_errhandling & MATH\_ERRNO) is non-zero,  
 19228 then *errno* shall be set to [ERANGE]. If the integer expression  
 19229 (math\_errhandling & MATH\_ERREXCEPT) is non-zero, then the overflow  
 19230 floating-point exception shall be raised.

19231       These functions may fail if:

19232 **MX**       Range Error       The result underflows.

19233                       If the integer expression (math\_errhandling & MATH\_ERRNO) is non-zero,  
 19234 then *errno* shall be set to [ERANGE]. If the integer expression  
 19235 (math\_errhandling & MATH\_ERREXCEPT) is non-zero, then the underflow  
 19236 floating-point exception shall be raised.

19237 **EXAMPLES**

19238 None.

19239 **APPLICATION USAGE**19240 *hypot(x,y)*, *hypot(y,x)*, and *hypot(x,-y)* are equivalent.19241 *hypot(x, ±0)* is equivalent to *fabs(x)*.19242 Underflow only happens when both *x* and *y* are subnormal and the (inexact) result is also  
19243 subnormal.19244 These functions take precautions against overflow during intermediate steps of the  
19245 computation.19246 On error, the expressions (`math_errhandling & MATH_ERRNO`) and (`math_errhandling &`  
19247 `MATH_ERREXCEPT`) are independent of each other, but at least one of them must be non-zero.19248 **RATIONALE**

19249 None.

19250 **FUTURE DIRECTIONS**

19251 None.

19252 **SEE ALSO**19253 *feclearexcept()*, *fetestexcept()*, *isnan()*, *sqrt()*, the Base Definitions volume of IEEE Std 1003.1-2001,  
19254 Section 4.18, Treatment of Error Conditions for Mathematical Functions, <**math.h**>19255 **CHANGE HISTORY**

19256 First released in Issue 1. Derived from Issue 1 of the SVID.

19257 **Issue 5**19258 The DESCRIPTION is updated to indicate how an application should check for an error. This  
19259 text was previously published in the APPLICATION USAGE section.19260 **Issue 6**19261 The *hypot()* function is no longer marked as an extension.19262 The *hypotf()* and *hypotl()* functions are added for alignment with the ISO/IEC 9899:1999  
19263 standard.19264 The DESCRIPTION, RETURN VALUE, ERRORS, and APPLICATION USAGE sections are  
19265 revised to align with the ISO/IEC 9899:1999 standard.19266 IEC 60559:1989 standard floating-point extensions over the ISO/IEC 9899:1999 standard are  
19267 marked.

## 19268 NAME

19269 iconv — codeset conversion function

## 19270 SYNOPSIS

19271 XSI 

```
#include <iconv.h>
```

```
19272 size_t iconv(iconv_t cd, char **restrict inbuf,
19273             size_t *restrict inbytesleft, char **restrict outbuf,
19274             size_t *restrict outbytesleft);
19275
```

## 19276 DESCRIPTION

19277 The *iconv()* function shall convert the sequence of characters from one codeset, in the array  
 19278 specified by *inbuf*, into a sequence of corresponding characters in another codeset, in the array  
 19279 specified by *outbuf*. The codesets are those specified in the *iconv\_open()* call that returned the  
 19280 conversion descriptor, *cd*. The *inbuf* argument points to a variable that points to the first  
 19281 character in the input buffer and *inbytesleft* indicates the number of bytes to the end of the buffer  
 19282 to be converted. The *outbuf* argument points to a variable that points to the first available byte in  
 19283 the output buffer and *outbytesleft* indicates the number of the available bytes to the end of the  
 19284 buffer.

19285 For state-dependent encodings, the conversion descriptor *cd* is placed into its initial shift state by  
 19286 a call for which *inbuf* is a null pointer, or for which *inbuf* points to a null pointer. When *iconv()*  
 19287 is called in this way, and if *outbuf* is not a null pointer or a pointer to a null pointer, and *outbytesleft*  
 19288 points to a positive value, *iconv()* shall place, into the output buffer, the byte sequence to change  
 19289 the output buffer to its initial shift state. If the output buffer is not large enough to hold the  
 19290 entire reset sequence, *iconv()* shall fail and set *errno* to [E2BIG]. Subsequent calls with *inbuf* as  
 19291 other than a null pointer or a pointer to a null pointer cause the conversion to take place from  
 19292 the current state of the conversion descriptor.

19293 If a sequence of input bytes does not form a valid character in the specified codeset, conversion  
 19294 shall stop after the previous successfully converted character. If the input buffer ends with an  
 19295 incomplete character or shift sequence, conversion shall stop after the previous successfully  
 19296 converted bytes. If the output buffer is not large enough to hold the entire converted input,  
 19297 conversion shall stop just prior to the input bytes that would cause the output buffer to  
 19298 overflow. The variable pointed to by *inbuf* shall be updated to point to the byte following the last  
 19299 byte successfully used in the conversion. The value pointed to by *inbytesleft* shall be  
 19300 decremented to reflect the number of bytes still not converted in the input buffer. The variable  
 19301 pointed to by *outbuf* shall be updated to point to the byte following the last byte of converted  
 19302 output data. The value pointed to by *outbytesleft* shall be decremented to reflect the number of  
 19303 bytes still available in the output buffer. For state-dependent encodings, the conversion  
 19304 descriptor shall be updated to reflect the shift state in effect at the end of the last successfully  
 19305 converted byte sequence.

19306 If *iconv()* encounters a character in the input buffer that is valid, but for which an identical  
 19307 character does not exist in the target codeset, *iconv()* shall perform an implementation-defined  
 19308 conversion on this character.

## 19309 RETURN VALUE

19310 The *iconv()* function shall update the variables pointed to by the arguments to reflect the extent  
 19311 of the conversion and return the number of non-identical conversions performed. If the entire  
 19312 string in the input buffer is converted, the value pointed to by *inbytesleft* shall be 0. If the input  
 19313 conversion is stopped due to any conditions mentioned above, the value pointed to by *inbytesleft*  
 19314 shall be non-zero and *errno* shall be set to indicate the condition. If an error occurs, *iconv()* shall  
 19315 return (*size\_t*)-1 and set *errno* to indicate the error.

19316 **ERRORS**

19317 The *iconv()* function shall fail if:

19318 [EILSEQ] Input conversion stopped due to an input byte that does not belong to the  
19319 input codeset.

19320 [E2BIG] Input conversion stopped due to lack of space in the output buffer.

19321 [EINVAL] Input conversion stopped due to an incomplete character or shift sequence at  
19322 the end of the input buffer.

19323 The *iconv()* function may fail if:

19324 [EBADF] The *cd* argument is not a valid open conversion descriptor.

19325 **EXAMPLES**

19326 None.

19327 **APPLICATION USAGE**

19328 The *inbuf* argument indirectly points to the memory area which contains the conversion input  
19329 data. The *outbuf* argument indirectly points to the memory area which is to contain the result of  
19330 the conversion. The objects indirectly pointed to by *inbuf* and *outbuf* are not restricted to  
19331 containing data that is directly representable in the ISO C standard language **char** data type. The  
19332 type of *inbuf* and *outbuf*, **char \*\***, does not imply that the objects pointed to are interpreted as  
19333 null-terminated C strings or arrays of characters. Any interpretation of a byte sequence that  
19334 represents a character in a given character set encoding scheme is done internally within the  
19335 codeset converters. For example, the area pointed to indirectly by *inbuf* and/or *outbuf* can  
19336 contain all zero octets that are not interpreted as string terminators but as coded character data  
19337 according to the respective codeset encoding scheme. The type of the data (**char**, **short**, **long**, and  
19338 so on) read or stored in the objects is not specified, but may be inferred for both the input and  
19339 output data by the converters determined by the *fromcode* and *toctype* arguments of *iconv\_open()*.

19340 Regardless of the data type inferred by the converter, the size of the remaining space in both  
19341 input and output objects (the *inbytesleft* and *outbytesleft* arguments) is always measured in bytes.

19342 For implementations that support the conversion of state-dependent encodings, the conversion  
19343 descriptor must be able to accurately reflect the shift-state in effect at the end of the last  
19344 successful conversion. It is not required that the conversion descriptor itself be updated, which  
19345 would require it to be a pointer type. Thus, implementations are free to implement the  
19346 descriptor as a handle (other than a pointer type) by which the conversion information can be  
19347 accessed and updated.

19348 **RATIONALE**

19349 None.

19350 **FUTURE DIRECTIONS**

19351 None.

19352 **SEE ALSO**

19353 *iconv\_open()*, *iconv\_close()*, the Base Definitions volume of IEEE Std 1003.1-2001, <**iconv.h**>

19354 **CHANGE HISTORY**

19355 First released in Issue 4. Derived from the HP-UX Manual.

19356 **Issue 6**

19357 The SYNOPSIS has been corrected to align with the <**iconv.h**> reference page.

19358 The **restrict** keyword is added to the *iconv()* prototype for alignment with the  
19359 ISO/IEC 9899:1999 standard.

19360 **NAME**

19361 iconv\_close — codeset conversion deallocation function

19362 **SYNOPSIS**

```
19363 xSI #include <iconv.h>
```

```
19364 int iconv_close(iconv_t cd);
```

19365

19366 **DESCRIPTION**

19367 The *iconv\_close()* function shall deallocate the conversion descriptor *cd* and all other associated  
19368 resources allocated by *iconv\_open()*.

19369 If a file descriptor is used to implement the type **iconv\_t**, that file descriptor shall be closed.

19370 **RETURN VALUE**

19371 Upon successful completion, 0 shall be returned; otherwise, -1 shall be returned and *errno* set to  
19372 indicate the error.

19373 **ERRORS**

19374 The *iconv\_close()* function may fail if:

19375 [EBADF] The conversion descriptor is invalid.

19376 **EXAMPLES**

19377 None.

19378 **APPLICATION USAGE**

19379 None.

19380 **RATIONALE**

19381 None.

19382 **FUTURE DIRECTIONS**

19383 None.

19384 **SEE ALSO**

19385 *iconv()*, *iconv\_open()*, the Base Definitions volume of IEEE Std 1003.1-2001, <**iconv.h**>

19386 **CHANGE HISTORY**

19387 First released in Issue 4. Derived from the HP-UX Manual.

19388 **NAME**

19389 iconv\_open — codeset conversion allocation function

19390 **SYNOPSIS**19391 xSI `#include <iconv.h>`19392 `iconv_t iconv_open(const char *tocode, const char *fromcode);`

19393

19394 **DESCRIPTION**

19395 The *iconv\_open()* function shall return a conversion descriptor that describes a conversion from  
 19396 the codeset specified by the string pointed to by the *fromcode* argument to the codeset specified  
 19397 by the string pointed to by the *tocode* argument. For state-dependent encodings, the conversion  
 19398 descriptor shall be in a codeset-dependent initial shift state, ready for immediate use with  
 19399 *iconv()*.

19400 Settings of *fromcode* and *tocode* and their permitted combinations are implementation-defined.

19401 A conversion descriptor shall remain valid until it is closed by *iconv\_close()* or an implicit close.

19402 If a file descriptor is used to implement conversion descriptors, the FD\_CLOEXEC flag shall be  
 19403 set; see <fcntl.h>.

19404 **RETURN VALUE**

19405 Upon successful completion, *iconv\_open()* shall return a conversion descriptor for use on  
 19406 subsequent calls to *iconv()*. Otherwise, *iconv\_open()* shall return **(iconv\_t)-1** and set *errno* to  
 19407 indicate the error.

19408 **ERRORS**

19409 The *iconv\_open()* function may fail if:

19410 [EMFILE] {OPEN\_MAX} file descriptors are currently open in the calling process.

19411 [ENFILE] Too many files are currently open in the system.

19412 [ENOMEM] Insufficient storage space is available.

19413 [EINVAL] The conversion specified by *fromcode* and *tocode* is not supported by the  
 19414 implementation.

19415 **EXAMPLES**

19416 None.

19417 **APPLICATION USAGE**

19418 Some implementations of *iconv\_open()* use *malloc()* to allocate space for internal buffer areas.  
 19419 The *iconv\_open()* function may fail if there is insufficient storage space to accommodate these  
 19420 buffers.

19421 Conforming applications must assume that conversion descriptors are not valid after a call to  
 19422 one of the *exec* functions.

19423 Application developers should consult the system documentation to determine the supported  
 19424 codesets and their naming schemes.

19425 **RATIONALE**

19426 None.

19427 **FUTURE DIRECTIONS**

19428 None.

19429 **SEE ALSO**

19430 *iconv()*, *iconv\_close()*, the Base Definitions volume of IEEE Std 1003.1-2001, <fcntl.h>, <iconv.h>

19431 **CHANGE HISTORY**

19432 First released in Issue 4. Derived from the HP-UX Manual.

19433 **NAME**

19434 if\_freenameindex — free memory allocated by if\_nameindex

19435 **SYNOPSIS**

19436 #include <net/if.h>

19437 void if\_freenameindex(struct if\_nameindex \*ptr);

19438 **DESCRIPTION**

19439 The *if\_freenameindex()* function shall free the memory allocated by *if\_nameindex()*. The *ptr*  
19440 argument shall be a pointer that was returned by *if\_nameindex()*. After *if\_freenameindex()* has  
19441 been called, the application shall not use the array of which *ptr* is the address.

19442 **RETURN VALUE**

19443 None.

19444 **ERRORS**

19445 No errors are defined.

19446 **EXAMPLES**

19447 None.

19448 **APPLICATION USAGE**

19449 None.

19450 **RATIONALE**

19451 None.

19452 **FUTURE DIRECTIONS**

19453 None.

19456 volume of IEEE Std 1003.1-2001, <net/if.h>

19457 **CHANGE HISTORY**

19458 First released in Issue 6. Derived from the XNS, Issue 5.2 specification.

19459 **NAME**

19460 if\_indextoname — map a network interface index to its corresponding name

19461 **SYNOPSIS**

19462 #include <net/if.h>

19463 char \*if\_indextoname(unsigned *ifindex*, char \**ifname*);

19464 **DESCRIPTION**

19465 The *if\_indextoname()* function shall map an interface index to its corresponding name.

19466 When this function is called, *ifname* shall point to a buffer of at least {IFNAMSIZ} bytes. The  
19467 function shall place in this buffer the name of the interface with index *ifindex*.

19468 **RETURN VALUE**

19469 If *ifindex* is an interface index, then the function shall return the value supplied in *ifname*, which  
19470 points to a buffer now containing the interface name. Otherwise, the function shall return a  
19471 NULL pointer and set *errno* to indicate the error.

19472 **ERRORS**

19473 The *if\_indextoname()* function shall fail if:

19474 [ENXIO] The interface does not exist.

19475 **EXAMPLES**

19476 None.

19477 **APPLICATION USAGE**

19478 None.

19479 **RATIONALE**

19480 None.

19481 **FUTURE DIRECTIONS**

19482 None.

19483 **SEE ALSO**

19484 *getsockopt()*, *if\_freenameindex()*, *if\_nameindex()*, *if\_nametoindex()*, *setsockopt()*, the Base  
19485 Definitions volume of IEEE Std 1003.1-2001, <net/if.h>

19486 **CHANGE HISTORY**

19487 First released in Issue 6. Derived from the XNS, Issue 5.2 specification.

19488 **NAME**

19489 if\_nameindex — return all network interface names and indexes

19490 **SYNOPSIS**

19491 #include <net/if.h>

19492 struct if\_nameindex \*if\_nameindex(void);

19493 **DESCRIPTION**

19494 The *if\_nameindex()* function shall return an array of *if\_nameindex* structures, one structure per  
19495 interface. The end of the array is indicated by a structure with an *if\_index* field of zero and an  
19496 *if\_name* field of NULL.

19497 Applications should call *if\_freenameindex()* to release the memory that may be dynamically  
19498 allocated by this function, after they have finished using it.

19499 **RETURN VALUE**

19500 An array of structures identifying local interfaces. A NULL pointer is returned upon an error,  
19501 with *errno* set to indicate the error.

19502 **ERRORS**

19503 The *if\_nameindex()* function may fail if:

19504 [ENOBUFS] Insufficient resources are available to complete the function.

19505 **EXAMPLES**

19506 None.

19507 **APPLICATION USAGE**

19508 None.

19509 **RATIONALE**

19510 None.

19511 **FUTURE DIRECTIONS**

19512 None.

19513 **SEE ALSO**

19514 *getsockopt()*, *if\_freenameindex()*, *if\_indextoname()*, *if\_nametoindex()*, *setsockopt()*, the Base  
19515 Definitions volume of IEEE Std 1003.1-2001, <net/if.h>

19516 **CHANGE HISTORY**

19517 First released in Issue 6. Derived from the XNS, Issue 5.2 specification.

19518 **NAME**

19519 if\_nametoindex — map a network interface name to its corresponding index

19520 **SYNOPSIS**

19521 #include <net/if.h>

19522 unsigned if\_nametoindex(const char \*ifname);

19523 **DESCRIPTION**

19524 The *if\_nametoindex()* function shall return the interface index corresponding to name *ifname*.

19525 **RETURN VALUE**

19526 The corresponding index if *ifname* is the name of an interface; otherwise, zero.

19527 **ERRORS**

19528 No errors are defined.

19529 **EXAMPLES**

19530 None.

19531 **APPLICATION USAGE**

19532 None.

19533 **RATIONALE**

19534 None.

19535 **FUTURE DIRECTIONS**

19536 None.

19537 **SEE ALSO**

19538 *getsockopt()*, *if\_freenameindex()*, *if\_indextoname()*, *if\_nameindex()*, *setsockopt()*, the Base  
19539 Definitions volume of IEEE Std 1003.1-2001, <net/if.h>

19540 **CHANGE HISTORY**

19541 First released in Issue 6. Derived from the XNS, Issue 5.2 specification.

19542 **NAME**

19543           ilogb, ilogbf, ilogbl — return an unbiased exponent

19544 **SYNOPSIS**

```
19545           #include <math.h>

19546           int ilogb(double x);
19547           int ilogbf(float x);
19548           int ilogbl(long double x);
```

19549 **DESCRIPTION**

19550 **CX**       The functionality described on this reference page is aligned with the ISO C standard. Any  
 19551 conflict between the requirements described here and the ISO C standard is unintentional. This  
 19552 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

19553       These functions shall return the exponent part of their argument  $x$ . Formally, the return value is  
 19554 the integral part of  $\log_r |x|$  as a signed integral value, for non-zero  $x$ , where  $r$  is the radix of the  
 19555 machine's floating-point arithmetic, which is the value of `FLT_RADIX` defined in `<float.h>`.

19556       An application wishing to check for error situations should set `errno` to zero and call  
 19557 `feclearexcept(FE_ALL_EXCEPT)` before calling these functions. On return, if `errno` is non-zero or  
 19558 `fetestexcept(FE_INVALID | FE_DIVBYZERO | FE_OVERFLOW | FE_UNDERFLOW)` is non-  
 19559 zero, an error has occurred.

19560 **RETURN VALUE**

19561       Upon successful completion, these functions shall return the exponent part of  $x$  as a signed  
 19562 integer value. They are equivalent to calling the corresponding `logb()` function and casting the  
 19563 returned value to type `int`.

19564 **XSI**       If  $x$  is 0, a domain error shall occur, and the value `FP_ILOGB0` shall be returned.

19565 **XSI**       If  $x$  is  $\pm\text{Inf}$ , a domain error shall occur, and the value `{INT_MAX}` shall be returned.

19566 **XSI**       If  $x$  is a NaN, a domain error shall occur, and the value `FP_ILOGBNAN` shall be returned.

19567 **XSI**       If the correct value is greater than `{INT_MAX}`, `{INT_MAX}` shall be returned and a domain error  
 19568 shall occur.

19569       If the correct value is less than `{INT_MIN}`, `{INT_MIN}` shall be returned and a domain error  
 19570 shall occur.

19571 **ERRORS**

19572       These functions shall fail if:

|                  |                     |                                                                                                              |
|------------------|---------------------|--------------------------------------------------------------------------------------------------------------|
| 19573 <b>XSI</b> | <b>Domain Error</b> | The $x$ argument is zero, NaN, or $\pm\text{Inf}$ , or the correct value is not representable as an integer. |
|------------------|---------------------|--------------------------------------------------------------------------------------------------------------|

|       |                                                                                                                                                                                                                                                                                                              |
|-------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 19575 | If the integer expression <code>(math_errhandling &amp; MATH_ERRNO)</code> is non-zero, then <code>errno</code> shall be set to <code>[EDOM]</code> . If the integer expression <code>(math_errhandling &amp; MATH_ERREXCEPT)</code> is non-zero, then the invalid floating-point exception shall be raised. |
|-------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

19579 **EXAMPLES**

19580 None.

19581 **APPLICATION USAGE**

19582 On error, the expressions (math\_errhandling & MATH\_ERRNO) and (math\_errhandling &  
19583 MATH\_ERREXCEPT) are independent of each other, but at least one of them must be non-zero.

19584 **RATIONALE**

19585 The errors come from taking the expected floating-point value and converting it to **int**, which is  
19586 an invalid operation in IEEE Std 754-1985 (since overflow, infinity, and NaN are not  
19587 representable in a type **int**), so should be a domain error.

19588 There are no known implementations that overflow. For overflow to happen, {INT\_MAX} must  
19589 be less than  $LDBL\_MAX\_EXP * \log_2(\text{FLT\_RADIX})$  or {INT\_MIN} must be greater than  
19590  $LDBL\_MIN\_EXP * \log_2(\text{FLT\_RADIX})$  if subnormals are not supported, or {INT\_MIN} must be  
19591 greater than  $(LDBL\_MIN\_EXP - LDBL\_MANT\_DIG) * \log_2(\text{FLT\_RADIX})$  if subnormals are  
19592 supported.

19593 **FUTURE DIRECTIONS**

19594 None.

19595 **SEE ALSO**

19597 Section 4.18, Treatment of Error Conditions for Mathematical Functions, <float.h>, <math.h>

19598 **CHANGE HISTORY**

19599 First released in Issue 4, Version 2.

19600 **Issue 5**

19601 Moved from X/OPEN UNIX extension to BASE.

19602 **Issue 6**19603 The *ilogb()* function is no longer marked as an extension.

19604 The *ilogbf()* and *ilogbl()* functions are added for alignment with the ISO/IEC 9899:1999  
19605 standard.

19606 The RETURN VALUE section is revised for alignment with the ISO/IEC 9899:1999 standard.

19607 XSI extensions are marked.

19608 **NAME**

19609 imaxabs — return absolute value

19610 **SYNOPSIS**

19611 #include &lt;inttypes.h&gt;

19612 intmax\_t imaxabs(intmax\_t j);

19613 **DESCRIPTION**

19614 cx The functionality described on this reference page is aligned with the ISO C standard. Any  
19615 conflict between the requirements described here and the ISO C standard is unintentional. This  
19616 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

19617 The *imaxabs()* function shall compute the absolute value of an integer *j*. If the result cannot be  
19618 represented, the behavior is undefined.

19619 **RETURN VALUE**19620 The *imaxabs()* function shall return the absolute value.19621 **ERRORS**

19622 No errors are defined.

19623 **EXAMPLES**

19624 None.

19625 **APPLICATION USAGE**

19626 The absolute value of the most negative number cannot be represented in two's complement.

19627 **RATIONALE**

19628 None.

19629 **FUTURE DIRECTIONS**

19630 None.

19631 **SEE ALSO**19632 *imaxdiv()*, the Base Definitions volume of IEEE Std 1003.1-2001, <inttypes.h>19633 **CHANGE HISTORY**

19634 First released in Issue 6. Derived from the ISO/IEC 9899:1999 standard.

19635 **NAME**

19636 imaxdiv — return quotient and remainder

19637 **SYNOPSIS**

19638 #include &lt;inttypes.h&gt;

19639 imaxdiv\_t imaxdiv(intmax\_t numer, intmax\_t denom);

19640 **DESCRIPTION**

19641 cx The functionality described on this reference page is aligned with the ISO C standard. Any  
19642 conflict between the requirements described here and the ISO C standard is unintentional. This  
19643 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

19644 The *imaxdiv()* function shall compute *numer* / *denom* and *numer* % *denom* in a single operation.19645 **RETURN VALUE**

19646 The *imaxdiv()* function shall return a structure of type **imaxdiv\_t**, comprising both the quotient  
19647 and the remainder. The structure shall contain (in either order) the members *quot* (the quotient)  
19648 and *rem* (the remainder), each of which has type **intmax\_t**.

19649 If either part of the result cannot be represented, the behavior is undefined.

19650 **ERRORS**

19651 No errors are defined.

19652 **EXAMPLES**

19653 None.

19654 **APPLICATION USAGE**

19655 None.

19656 **RATIONALE**

19657 None.

19658 **FUTURE DIRECTIONS**

19659 None.

19660 **SEE ALSO**19661 *imaxabs()*, the Base Definitions volume of IEEE Std 1003.1-2001, <inttypes.h>19662 **CHANGE HISTORY**

19663 First released in Issue 6. Derived from the ISO/IEC 9899:1999 standard.

19664 **NAME**

19665 index — character string operations (**LEGACY**)

19666 **SYNOPSIS**

```
19667 xsi #include <strings.h>
```

```
19668 char *index(const char *s, int c);
```

19669

19670 **DESCRIPTION**

19671 The *index()* function shall be equivalent to *strchr()*.

19672 **RETURN VALUE**

19673 See *strchr()*.

19674 **ERRORS**

19675 See *strchr()*.

19676 **EXAMPLES**

19677 None.

19678 **APPLICATION USAGE**

19679 The *strchr()* function is preferred over this function.

19680 For maximum portability, it is recommended to replace the function call to *index()* as follows:

```
19681 #define index(a,b) strchr((a),(b))
```

19682 **RATIONALE**

19683 None.

19684 **FUTURE DIRECTIONS**

19685 This function may be withdrawn in a future version.

19686 **SEE ALSO**

19687 *strchr()*, the Base Definitions volume of IEEE Std 1003.1-2001, <**strings.h**>

19688 **CHANGE HISTORY**

19689 First released in Issue 4, Version 2.

19690 **Issue 5**

19691 Moved from X/OPEN UNIX extension to BASE.

19692 **Issue 6**

19693 This function is marked LEGACY.

19694 **NAME**

19695       inet\_addr, inet\_ntoa — IPv4 address manipulation

19696 **SYNOPSIS**

19697       #include &lt;arpa/inet.h&gt;

19698       in\_addr\_t inet\_addr(const char \*cp);

19699       char \*inet\_ntoa(struct in\_addr in);

19700 **DESCRIPTION**19701       The *inet\_addr()* function shall convert the string pointed to by *cp*, in the standard IPv4 dotted decimal notation, to an integer value suitable for use as an Internet address.19703       The *inet\_ntoa()* function shall convert the Internet host address specified by *in* to a string in the Internet standard dot notation.19705       The *inet\_ntoa()* function need not be reentrant. A function that is not required to be reentrant is not required to be thread-safe.

19707       All Internet addresses shall be returned in network order (bytes ordered from left to right).

19708       Values specified using IPv4 dotted decimal notation take one of the following forms:

19709       a.b.c.d     When four parts are specified, each shall be interpreted as a byte of data and  
19710                   assigned, from left to right, to the four bytes of an Internet address.19711       a.b.c       When a three-part address is specified, the last part shall be interpreted as a 16-bit  
19712                   quantity and placed in the rightmost two bytes of the network address. This makes  
19713                   the three-part address format convenient for specifying Class B network addresses  
19714                   as "128.net.host".19715       a.b         When a two-part address is supplied, the last part shall be interpreted as a 24-bit  
19716                   quantity and placed in the rightmost three bytes of the network address. This  
19717                   makes the two-part address format convenient for specifying Class A network  
19718                   addresses as "net.host".19719       a           When only one part is given, the value shall be stored directly in the network  
19720                   address without any byte rearrangement.19721       All numbers supplied as parts in IPv4 dotted decimal notation may be decimal, octal, or  
19722       hexadecimal, as specified in the ISO C standard (that is, a leading 0x or 0X implies hexadecimal;  
19723       otherwise, a leading '0' implies octal; otherwise, the number is interpreted as decimal).19724 **RETURN VALUE**19725       Upon successful completion, *inet\_addr()* shall return the Internet address. Otherwise, it shall  
19726       return (**in\_addr\_t**)(-1).19727       The *inet\_ntoa()* function shall return a pointer to the network address in Internet standard dot  
19728       notation.19729 **ERRORS**

19730       No errors are defined.

19731 **EXAMPLES**

19732           None.

19733 **APPLICATION USAGE**19734           The return value of *inet\_ntoa()* may point to static data that may be overwritten by subsequent  
19735           calls to *inet\_ntoa()*.19736 **RATIONALE**

19737           None.

19738 **FUTURE DIRECTIONS**

19739           None.

19740 **SEE ALSO**19741           *endhostent()*, *endnetent()*, the Base Definitions volume of IEEE Std 1003.1-2001, <**arpa/inet.h**>19742 **CHANGE HISTORY**

19743           First released in Issue 6. Derived from the XNS, Issue 5.2 specification.

## 19744 NAME

19745 inet\_ntop, inet\_pton — convert IPv4 and IPv6 addresses between binary and text form

## 19746 SYNOPSIS

19747 #include <arpa/inet.h>

19748 const char \*inet\_ntop(int af, const void \*restrict src,  
19749 char \*restrict dst, socklen\_t size);

19750 int inet\_pton(int af, const char \*restrict src, void \*restrict dst);

## 19751 DESCRIPTION

19752 The *inet\_ntop()* function shall convert a numeric address into a text string suitable for  
19753 IP6 presentation. The *af* argument shall specify the family of the address. This can be AF\_INET or  
19754 AF\_INET6. The *src* argument points to a buffer holding an IPv4 address if the *af* argument is  
19755 IP6 AF\_INET, or an IPv6 address if the *af* argument is AF\_INET6. The *dst* argument points to a  
19756 buffer where the function stores the resulting text string; it shall not be NULL. The *size* argument  
19757 specifies the size of this buffer, which shall be large enough to hold the text string  
19758 IP6 (INET\_ADDRSTRLEN characters for IPv4, INET6\_ADDRSTRLEN characters for IPv6).

19759 The *inet\_pton()* function shall convert an address in its standard text presentation form into its  
19760 IP6 numeric binary form. The *af* argument shall specify the family of the address. The AF\_INET and  
19761 AF\_INET6 address families shall be supported. The *src* argument points to the string being  
19762 passed in. The *dst* argument points to a buffer into which the function stores the numeric  
19763 IP6 address; this shall be large enough to hold the numeric address (32 bits for AF\_INET, 128 bits for  
19764 AF\_INET6).

19765 If the *af* argument of *inet\_pton()* is AF\_INET, the *src* string shall be in the standard IPv4 dotted-  
19766 decimal form:

19767 ddd.ddd.ddd.ddd

19768 where "ddd" is a one to three digit decimal number between 0 and 255 (see *inet\_addr()*). The  
19769 *inet\_pton()* function does not accept other formats (such as the octal numbers, hexadecimal  
19770 numbers, and fewer than four numbers that *inet\_addr()* accepts).

19771 IP6 If the *af* argument of *inet\_pton()* is AF\_INET6, the *src* string shall be in one of the following  
19772 standard IPv6 text forms:

19773 1. The preferred form is "x:x:x:x:x:x:x:x", where the 'x's are the hexadecimal values  
19774 of the eight 16-bit pieces of the address. Leading zeros in individual fields can be omitted,  
19775 but there shall be at least one numeral in every field.

19776 2. A string of contiguous zero fields in the preferred form can be shown as ":::". The ":::"  
19777 can only appear once in an address. Unspecified addresses ("0:0:0:0:0:0:0:0") may  
19778 be represented simply as "::".

19779 3. A third form that is sometimes more convenient when dealing with a mixed environment  
19780 of IPv4 and IPv6 nodes is "x:x:x:x:x:x.d.d.d.d", where the 'x's are the  
19781 hexadecimal values of the six high-order 16-bit pieces of the address, and the 'd's are the  
19782 decimal values of the four low-order 8-bit pieces of the address (standard IPv4  
19783 representation).

19784 **Note:** A more extensive description of the standard representations of IPv6 addresses can be found in  
19785 RFC 2373.

19786

19787 **RETURN VALUE**

19788 The *inet\_ntop()* function shall return a pointer to the buffer containing the text string if the  
19789 conversion succeeds, and NULL otherwise, and set *errno* to indicate the error.

19790 The *inet\_pton()* function shall return 1 if the conversion succeeds, with the address pointed to by  
19791 *dst* in network byte order. It shall return 0 if the input is not a valid IPv4 dotted-decimal string or  
19792 a valid IPv6 address string, or -1 with *errno* set to [EAFNOSUPPORT] if the *af* argument is  
19793 unknown.

19794 **ERRORS**

19795 The *inet\_ntop()* and *inet\_pton()* functions shall fail if:

19796 [EAFNOSUPPORT]

19797 The *af* argument is invalid.

19798 [ENOSPC] The size of the *inet\_ntop()* result buffer is inadequate.

19799 **EXAMPLES**

19800 None.

19801 **APPLICATION USAGE**

19802 None.

19803 **RATIONALE**

19804 None.

19805 **FUTURE DIRECTIONS**

19806 None.

19808 The Base Definitions volume of IEEE Std 1003.1-2001, <**arpa/inet.h**>

19809 **CHANGE HISTORY**

19810 First released in Issue 6. Derived from the XNS, Issue 5.2 specification.

19811 IPv6 extensions are marked.

19812 The **restrict** keyword is added to the *inet\_ntop()* and *inet\_pton()* prototypes for alignment with  
19813 the ISO/IEC 9899:1999 standard.

19814 **NAME**

19815       initstate, random, setstate, srandom — pseudo-random number functions

19816 **SYNOPSIS**

```

19817 xSI       #include <stdlib.h>
19818       char *initstate(unsigned seed, char *state, size_t size);
19819       long random(void);
19820       char *setstate(const char *state);
19821       void srandom(unsigned seed);
19822

```

19823 **DESCRIPTION**

19824       The *random()* function shall use a non-linear additive feedback random-number generator  
 19825       employing a default state array size of 31 **long** integers to return successive pseudo-random  
 19826       numbers in the range from 0 to  $2^{31}-1$ . The period of this random-number generator is  
 19827       approximately  $16 \times (2^{31}-1)$ . The size of the state array determines the period of the random-  
 19828       number generator. Increasing the state array size shall increase the period.

19829       With 256 bytes of state information, the period of the random-number generator shall be greater  
 19830       than  $2^{69}$ .

19831       Like *rand()*, *random()* shall produce by default a sequence of numbers that can be duplicated by  
 19832       calling *srandom()* with 1 as the seed.

19833       The *srandom()* function shall initialize the current state array using the value of *seed*.

19834       The *initstate()* and *setstate()* functions handle restarting and changing random-number  
 19835       generators. The *initstate()* function allows a state array, pointed to by the *state* argument, to be  
 19836       initialized for future use. The *size* argument, which specifies the size in bytes of the state array,  
 19837       shall be used by *initstate()* to decide what type of random-number generator to use; the larger  
 19838       the state array, the more random the numbers. Values for the amount of state information are 8,  
 19839       32, 64, 128, and 256 bytes. Other values greater than 8 bytes are rounded down to the nearest one  
 19840       of these values. If *initstate()* is called with  $8 \leq \text{size} < 32$ , then *random()* shall use a simple linear  
 19841       congruential random number generator. The *seed* argument specifies a starting point for the  
 19842       random-number sequence and provides for restarting at the same point. The *initstate()* function  
 19843       shall return a pointer to the previous state information array.

19844       If *initstate()* has not been called, then *random()* shall behave as though *initstate()* had been called  
 19845       with *seed*=1 and *size*=128.

19846       Once a state has been initialized, *setstate()* allows switching between state arrays. The array  
 19847       defined by the *state* argument shall be used for further random-number generation until  
 19848       *initstate()* is called or *setstate()* is called again. The *setstate()* function shall return a pointer to the  
 19849       previous state array.

19850 **RETURN VALUE**

19851       If *initstate()* is called with *size* less than 8, it shall return NULL.

19852       The *random()* function shall return the generated pseudo-random number.

19853       The *srandom()* function shall not return a value.

19854       Upon successful completion, *initstate()* and *setstate()* shall return a pointer to the previous state  
 19855       array; otherwise, a null pointer shall be returned.

19856 **ERRORS**

19857 No errors are defined.

19858 **EXAMPLES**

19859 None.

19860 **APPLICATION USAGE**

19861 After initialization, a state array can be restarted at a different point in one of two ways:

- 19862 1. The *initstate()* function can be used, with the desired seed, state array, and size of the  
19863 array.
- 19864 2. The *setstate()* function, with the desired state, can be used, followed by *srandom()* with the  
19865 desired seed. The advantage of using both of these functions is that the size of the state  
19866 array does not have to be saved once it is initialized.

19867 Although some implementations of *random()* have written messages to standard error, such  
19868 implementations do not conform to IEEE Std 1003.1-2001.

19869 Issue 5 restored the historical behavior of this function.

19870 Threaded applications should use *rand\_r()*, *erand48()*, *nrand48()*, or *jrand48()* instead of  
19871 *random()* when an independent random number sequence in multiple threads is required.19872 **RATIONALE**

19873 None.

19874 **FUTURE DIRECTIONS**

19875 None.

19876 **SEE ALSO**19877 *drand48()*, *rand()*, the Base Definitions volume of IEEE Std 1003.1-2001, <**stdlib.h**>19878 **CHANGE HISTORY**

19879 First released in Issue 4, Version 2.

19880 **Issue 5**

19881 Moved from X/OPEN UNIX extension to BASE.

19882 In the DESCRIPTION, the phrase “values smaller than 8” is replaced with “values greater than  
19883 or equal to 8, or less than 32”, “*size*<8” is replaced with “ $8 \leq \textit{size} < 32$ ”, and a new first paragraph  
19884 is added to the RETURN VALUE section. A note is added to the APPLICATION USAGE  
19885 indicating that these changes restore the historical behavior of the function.

19886 **Issue 6**

19887 In the DESCRIPTION, duplicate text “For values greater than or equal to 8 . . .” is removed.

19888 **NAME**

19889           insque, remque — insert or remove an element in a queue

19890 **SYNOPSIS**

```
19891 xSI       #include <search.h>
19892           void insque(void *element, void *pred);
19893           void remque(void *element);
```

19894

19895 **DESCRIPTION**

19896       The *insque()* and *remque()* functions shall manipulate queues built from doubly-linked lists. The  
 19897       queue can be either circular or linear. An application using *insque()* or *remque()* shall ensure it  
 19898       defines a structure in which the first two members of the structure are pointers to the same type  
 19899       of structure, and any further members are application-specific. The first member of the structure  
 19900       is a forward pointer to the next entry in the queue. The second member is a backward pointer to  
 19901       the previous entry in the queue. If the queue is linear, the queue is terminated with null  
 19902       pointers. The names of the structure and of the pointer members are not subject to any special  
 19903       restriction.

19904       The *insque()* function shall insert the element pointed to by *element* into a queue immediately  
 19905       after the element pointed to by *pred*.

19906       The *remque()* function shall remove the element pointed to by *element* from a queue.

19907       If the queue is to be used as a linear list, invoking *insque(&element, NULL)*, where *element* is the  
 19908       initial element of the queue, shall initialize the forward and backward pointers of *element* to null  
 19909       pointers.

19910       If the queue is to be used as a circular list, the application shall ensure it initializes the forward  
 19911       pointer and the backward pointer of the initial element of the queue to the element's own  
 19912       address.

19913 **RETURN VALUE**19914       The *insque()* and *remque()* functions do not return a value.19915 **ERRORS**

19916       No errors are defined.

19917 **EXAMPLES**19918       **Creating a Linear Linked List**

19919       The following example creates a linear linked list.

```
19920       #include <search.h>
19921       ...
19922       struct myque element1;
19923       struct myque element2;
19924       char *data1 = "DATA1";
19925       char *data2 = "DATA2";
19926       ...
19927       element1.data = data1;
19928       element2.data = data2;
19929       insque (&element1, NULL);
19930       insque (&element2, &element1);
```

19931 **Creating a Circular Linked List**

19932 The following example creates a circular linked list.

```

19933 #include <search.h>
19934 ...
19935 struct myque element1;
19936 struct myque element2;

19937 char *data1 = "DATA1";
19938 char *data2 = "DATA2";
19939 ...
19940 element1.data = data1;
19941 element2.data = data2;

19942 element1.fwd = &element1;
19943 element1.bck = &element1;

19944 insque (&element2, &element1);

```

19945 **Removing an Element**19946 The following example removes the element pointed to by *element1*.

```

19947 #include <search.h>
19948 ...
19949 struct myque element1;
19950 ...
19951 remque (&element1);

```

19952 **APPLICATION USAGE**

19953 The historical implementations of these functions described the arguments as being of type  
 19954 **struct qelem** \* rather than as being of type **void** \* as defined here. In those implementations,  
 19955 **struct qelem** was commonly defined in **<search.h>** as:

```

19956 struct qelem {
19957     struct qelem *q_forw;
19958     struct qelem *q_back;
19959 };

```

19960 Applications using these functions, however, were never able to use this structure directly since  
 19961 it provided no room for the actual data contained in the elements. Most applications defined  
 19962 structures that contained the two pointers as the initial elements and also provided space for, or  
 19963 pointers to, the object's data. Applications that used these functions to update more than one  
 19964 type of table also had the problem of specifying two or more different structures with the same  
 19965 name, if they literally used **struct qelem** as specified.

19966 As described here, the implementations were actually expecting a structure type where the first  
 19967 two members were forward and backward pointers to structures. With C compilers that didn't  
 19968 provide function prototypes, applications used structures as specified in the DESCRIPTION  
 19969 above and the compiler did what the application expected.

19970 If this method had been carried forward with an ISO C standard compiler and the historical  
 19971 function prototype, most applications would have to be modified to cast pointers to the  
 19972 structures actually used to be pointers to **struct qelem** to avoid compilation warnings. By  
 19973 specifying **void** \* as the argument type, applications do not need to change (unless they  
 19974 specifically referenced **struct qelem** and depended on it being defined in **<search.h>**).

19975 **RATIONALE**

19976           None.

19977 **FUTURE DIRECTIONS**

19978           None.

19979 **SEE ALSO**

19980           The Base Definitions volume of IEEE Std 1003.1-2001, <search.h>

19981 **CHANGE HISTORY**

19982           First released in Issue 4, Version 2.

19983 **Issue 5**

19984           Moved from X/OPEN UNIX extension to BASE.

19985 **Issue 6**

19986           The DESCRIPTION is updated to avoid use of the term “must” for application requirements.

## 19987 NAME

19988           ioctl — control a STREAMS device (**STREAMS**)

## 19989 SYNOPSIS

19990 XSR       #include &lt;stropts.h&gt;

19991           int ioctl(int *fildev*, int *request*, ... /\* *arg* \*/);

19992

## 19993 DESCRIPTION

19994       The *ioctl()* function shall perform a variety of control functions on STREAMS devices. For non-  
 19995       STREAMS devices, the functions performed by this call are unspecified. The *request* argument  
 19996       and an optional third argument (with varying type) shall be passed to and interpreted by the  
 19997       appropriate part of the STREAM associated with *fildev*.

19998       The *fildev* argument is an open file descriptor that refers to a device.

19999       The *request* argument selects the control function to be performed and shall depend on the  
 20000       STREAMS device being addressed.

20001       The *arg* argument represents additional information that is needed by this specific STREAMS  
 20002       device to perform the requested function. The type of *arg* depends upon the particular control  
 20003       request, but it shall be either an integer or a pointer to a device-specific data structure.

20004       The *ioctl()* commands applicable to STREAMS, their arguments, and error conditions that apply  
 20005       to each individual command are described below.

20006       The following *ioctl()* commands, with error values indicated, are applicable to all STREAMS  
 20007       files:

20008       I\_PUSH           Pushes the module whose name is pointed to by *arg* onto the top of the  
 20009                          current STREAM, just below the STREAM head. It then calls the *open()*  
 20010                          function of the newly-pushed module.

20011                        The *ioctl()* function with the I\_PUSH command shall fail if:

20012                        [EINVAL]           Invalid module name.

20013                        [ENXIO]           Open function of new module failed.

20014                        [ENXIO]           Hangup received on *fildev*.

20015       I\_POP           Removes the module just below the STREAM head of the STREAM pointed to  
 20016                          by *fildev*. The *arg* argument should be 0 in an I\_POP request.

20017                        The *ioctl()* function with the I\_POP command shall fail if:

20018                        [EINVAL]           No module present in the STREAM.

20019                        [ENXIO]           Hangup received on *fildev*.

20020       I\_LOOK          Retrieves the name of the module just below the STREAM head of the  
 20021                          STREAM pointed to by *fildev*, and places it in a character string pointed to by  
 20022                          *arg*. The buffer pointed to by *arg* should be at least FMNAMESZ+1 bytes long,  
 20023                          where FMNAMESZ is defined in <stropts.h>.

20024                        The *ioctl()* function with the I\_LOOK command shall fail if:

20025                        [EINVAL]           No module present in the STREAM.

20026       I\_FLUSH          Flushes read and/or write queues, depending on the value of *arg*. Valid *arg*  
 20027                          values are:

|       |                                                                                  |                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|-------|----------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 20028 | FLUSHR                                                                           | Flush all read queues.                                                                                                                                                                                                                                                                                                                                                                                                                |
| 20029 | FLUSHW                                                                           | Flush all write queues.                                                                                                                                                                                                                                                                                                                                                                                                               |
| 20030 | FLUSHRW                                                                          | Flush all read and all write queues.                                                                                                                                                                                                                                                                                                                                                                                                  |
| 20031 | The <i>ioctl()</i> function with the <code>L_FLUSH</code> command shall fail if: |                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| 20032 | [EINVAL]                                                                         | Invalid <i>arg</i> value.                                                                                                                                                                                                                                                                                                                                                                                                             |

| 20097 |          | [EINVAL]  | <i>arg</i> does not contain a valid module name.                                                                                                                                                                                                                                                                                                                                                                                                                         |
| 20098 | I_PEEK   |           | Retrieves the information in the first message on the STREAM head read queue without taking the message off the queue. It is analogous to <i>getmsg()</i> except that this command does not remove the message from the queue. The <i>arg</i> argument points to a <i>strpeek</i> structure.                                                                                                                                                                             |
| 20099 |          |           |                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| 20100 |          |           |                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| 20101 |          |           |                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| 20102 |          |           | The application shall ensure that the <i>maxlen</i> member in the <i>ctlbuf</i> and <i>databuf</i> <i>strbuf</i> structures is set to the number of bytes of control information and/or data information, respectively, to retrieve. The <i>flags</i> member may be marked RS_HIPRI or 0, as described by <i>getmsg()</i> . If the process sets <i>flags</i> to RS_HIPRI, for example, I_PEEK shall only look for a high-priority message on the STREAM head read queue. |
| 20103 |          |           |                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| 20104 |          |           |                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

| 20106 |          |           |                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| 20107 |          |           |                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| 20108 |          |           | I_PEEK returns 1 if a message was retrieved, and returns 0 if no message was found on the STREAM head read queue, or if the RS_HIPRI flag was set in <i>flags</i> and a high-priority message was not present on the STREAM head read queue. It does not wait for a message to arrive. On return, <i>ctlbuf</i> specifies information in the control buffer, <i>databuf</i> specifies information in the data buffer, and <i>flags</i> contains the value RS_HIPRI or 0. |
| 20109 |          |           |                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| 20110 |          |           |                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| 20111 |          |           |                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| 20112 |          |           |                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| 20113 |          |           |                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| 20114 | I_SRDOPT |           | Sets the read mode using the value of the argument <i>arg</i> . Read modes are described in <i>read()</i> . Valid <i>arg</i> flags are:                                                                                                                                                                                                                                                                                                                                  |
| 20115 |          |           |                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

|       |            |           |                                                                                               |
|-------|------------|-----------|-----------------------------------------------------------------------------------------------|
| 20116 |            | RNORM     | Byte-stream mode, the default.                                                                |
| 20117 |            | RMSGD     | Message-discard mode.                                                                         |
| 20118 |            | RMSGN     | Message-nondiscard mode.                                                                      |
| 20119 |            |           | The bitwise-inclusive OR of RMSGD and RMSGN shall return [EINVAL]. The                        |
| 20120 |            |           | bitwise-inclusive OR of RNORM and either RMSGD or RMSGN shall result in                       |
| 20121 |            |           | the other flag overriding RNORM which is the default.                                         |
| 20122 |            |           | In addition, treatment of control messages by the STREAM head may be                          |
| 20123 |            |           | changed by setting any of the following flags in <i>arg</i> :                                 |
| 20124 |            | RPROTNORM | Fail <i>read()</i> with [EBADMSG] if a message containing a                                   |
| 20125 |            |           | control part is at the front of the STREAM head read queue.                                   |
| 20126 |            | RPROTDAT  | Deliver the control part of a message as data when a                                          |
| 20127 |            |           | process issues a <i>read()</i> .                                                              |
| 20128 |            | RPROTDIS  | Discard the control part of a message, delivering any data                                    |
| 20129 |            |           | portion, when a process issues a <i>read()</i> .                                              |
| 20130 |            |           | The <i>ioctl()</i> function with the L_SRDOPT command shall fail if:                          |
| 20131 |            | [EINVAL]  | The <i>arg</i> argument is not valid.                                                         |
| 20132 | I_GRDOPT   |           | Returns the current read mode setting, as described above, in an <b>int</b> pointed to        |
| 20133 |            |           | by the argument <i>arg</i> . Read modes are described in <i>read()</i> .                      |
| 20134 | I_NREAD    |           | Counts the number of data bytes in the data part of the first message on the                  |
| 20135 |            |           | STREAM head read queue and places this value in the <b>int</b> pointed to by <i>arg</i> .     |
| 20136 |            |           | The return value for the command shall be the number of messages on the                       |
| 20137 |            |           | STREAM head read queue. For example, if 0 is returned in <i>arg</i> , but the <i>ioctl()</i>  |
| 20138 |            |           | return value is greater than 0, this indicates that a zero-length message is next             |
| 20139 |            |           | on the queue.                                                                                 |
| 20140 | I_FDINSERT |           | Creates a message from specified buffer(s), adds information about another                    |
| 20141 |            |           | STREAM, and sends the message downstream. The message contains a                              |
| 20142 |            |           | control part and an optional data part. The data and control parts to be sent                 |
| 20143 |            |           | are distinguished by placement in separate buffers, as described below. The                   |
| 20144 |            |           | <i>arg</i> argument points to a <b>strfdinsert</b> structure.                                 |
| 20145 |            |           | The application shall ensure that the <i>len</i> member in the <b>ctlbuf strbuf</b> structure |
| 20146 |            |           | is set to the size of a <b>t_uscalar_t</b> plus the number of bytes of control                |
| 20147 |            |           | information to be sent with the message. The <i>fildev</i> member specifies the file          |
| 20148 |            |           | descriptor of the other STREAM, and the <i>offset</i> member, which must be                   |
| 20149 |            |           | suitably aligned for use as a <b>t_uscalar_t</b> , specifies the offset from the start of     |
| 20150 |            |           | the control buffer where I_FDINSERT shall store a <b>t_uscalar_t</b> whose                    |
| 20151 |            |           | interpretation is specific to the STREAM end. The application shall ensure that               |
| 20152 |            |           | the <i>len</i> member in the <b>databuf strbuf</b> structure is set to the number of bytes of |
| 20153 |            |           | data information to be sent with the message, or to 0 if no data part is to be                |
| 20154 |            |           | sent.                                                                                         |
| 20155 |            |           | The <i>flags</i> member specifies the type of message to be created. A normal                 |
| 20156 |            |           | message is created if <i>flags</i> is set to 0, and a high-priority message is created if     |
| 20157 |            |           | <i>flags</i> is set to RS_HIPRI. For non-priority messages, I_FDINSERT shall block if         |
| 20158 |            |           | the STREAM write queue is full due to internal flow control conditions. For                   |
| 20159 |            |           | priority messages, I_FDINSERT does not block on this condition. For non-                      |
| 20160 |            |           | priority messages, I_FDINSERT does not block when the write queue is full                     |

20161 and O\_NONBLOCK is set. Instead, it fails and sets *errno* to [EAGAIN].

20162 I\_FDINSERT also blocks, unless prevented by lack of internal resources,  
 20163 waiting for the availability of message blocks in the STREAM, regardless of  
 20164 priority or whether O\_NONBLOCK has been specified. No partial message is  
 20165 sent.

20166 The *ioctl()* function with the I\_FDINSERT command shall fail if:

20167 [EAGAIN] A non-priority message is specified, the O\_NONBLOCK  
 20168 flag is set, and the STREAM write queue is full due to  
 20169 internal flow control conditions.

20170 [EAGAIN] or [ENOSR]  
 20171 Buffers cannot be allocated for the message that is to be  
 20172 created.

20173 [EINVAL] One of the following:

20174 — The *fildev* member of the **strfdinsert** structure is not a  
 20175 valid, open STREAM file descriptor.

20176 — The size of a **t\_uscalar\_t** plus *offset* is greater than the *len*  
 20177 member for the buffer specified through **ctlbuf**.

20178 — The *offset* member does not specify a properly-aligned  
 20179 location in the data buffer.

20180 — An undefined value is stored in *flags*.

20181 [ENXIO] Hangupt received on the STREAM identified by either the  
 20182 *fildev* argument or the *fildev* member of the **strfdinsert**  
 20183 structure.

20184 [ERANGE] The *len* member for the buffer specified through **databuf**  
 20185 does not fall within the range specified by the maximum  
 20186 and minimum packet sizes of the topmost STREAM  
 20187 module; or the *len* member for the buffer specified through  
 20188 **databuf** is larger than the maximum configured size of the  
 20189 data part of a message; or the *len* member for the buffer  
 20190 specified through **ctlbuf** is larger than the maximum  
 20191 configured size of the control part of a message.

20192 I\_STR Constructs an internal STREAMS *ioctl()* message from the data pointed to by  
 20193 *arg*, and sends that message downstream.

20194 This mechanism is provided to send *ioctl()* requests to downstream modules  
 20195 and drivers. It allows information to be sent with *ioctl()*, and returns to the  
 20196 process any information sent upstream by the downstream recipient. I\_STR  
 20197 shall block until the system responds with either a positive or negative  
 20198 acknowledgement message, or until the request times out after some period of  
 20199 time. If the request times out, it shall fail with *errno* set to [ETIME].

20200 At most, one I\_STR can be active on a STREAM. Further I\_STR calls shall  
 20201 block until the active I\_STR completes at the STREAM head. The default  
 20202 timeout interval for these requests is 15 seconds. The O\_NONBLOCK flag has  
 20203 no effect on this call.

20204 To send requests downstream, the application shall ensure that *arg* points to a  
 20205 **striocctl** structure.

|       |          |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

| 20206 |          | The <i>ic_cmd</i> member is the internal <i>ioctl()</i> command intended for a downstream module or driver and <i>ic_timeout</i> is the number of seconds (−1=infinite, 0=use implementation-defined timeout interval, >0=as specified) an I_STR request shall wait for acknowledgement before timing out. <i>ic_len</i> is the number of bytes in the data argument, and <i>ic_dp</i> is a pointer to the data argument. The <i>ic_len</i> member has two uses: on input, it contains the length of the data argument passed in, and on return from the command, it contains the number of bytes being returned to the process (the buffer pointed to by <i>ic_dp</i> should be large enough to contain the maximum amount of data that any module or the driver in the STREAM can return). |

| 20276 | I_LIST   |                     | Allows the process to list all the module names on the STREAM, up to and including the topmost driver name. If <i>arg</i> is a null pointer, the return value shall be the number of modules, including the driver, that are on the STREAM pointed to by <i>fildev</i> . This lets the process allocate enough space for the module names. Otherwise, it should point to a <b>str_list</b> structure.                                                                                                                                                                                                                                                                      |

| 20281 |          |                     | The <i>sl_nmods</i> member indicates the number of entries the process has allocated in the array. Upon return, the <i>sl_modlist</i> member of the <b>str_list</b> structure shall contain the list of module names, and the number of entries that have been filled into the <i>sl_modlist</i> array is found in the <i>sl_nmods</i> member (the number includes the number of modules including the driver). The return value from <i>ioctl()</i> shall be 0. The entries are filled in starting at the top of the STREAM and continuing downstream until either the end of the STREAM is reached, or the number of requested modules ( <i>sl_nmods</i> ) is satisfied. |

| 20293 | I_ATMARK |                     | Allows the process to see if the message at the head of the STREAM head read queue is marked by some module downstream. The <i>arg</i> argument determines                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| 20294 |          |                     |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

|       |             |                                                                                           |
|-------|-------------|-------------------------------------------------------------------------------------------|
| 20295 |             | how the checking is done when there may be multiple marked messages on                    |
| 20296 |             | the STREAM head read queue. It may take on the following values:                          |
| 20297 |             | ANYMARK      Check if the message is marked.                                              |
| 20298 |             | LASTMARK     Check if the message is the last one marked on the queue.                    |
| 20299 |             | The bitwise-inclusive OR of the flags ANYMARK and LASTMARK is                             |
| 20300 |             | permitted.                                                                                |
| 20301 |             | The return value shall be 1 if the mark condition is satisfied; otherwise, the            |
| 20302 |             | value shall be 0.                                                                         |
| 20303 |             | The <i>ioctl()</i> function with the L_ATMARK command shall fail if:                      |
| 20304 |             | [EINVAL]      Invalid <i>arg</i> value.                                                   |
| 20305 | I_CKBAND    | Checks if the message of a given priority band exists on the STREAM head                  |
| 20306 |             | read queue. This shall return 1 if a message of the given priority exists, 0 if no        |
| 20307 |             | such message exists, or -1 on error. <i>arg</i> should be of type <b>int</b> .            |
| 20308 |             | The <i>ioctl()</i> function with the L_CKBAND command shall fail if:                      |
| 20309 |             | [EINVAL]      Invalid <i>arg</i> value.                                                   |
| 20310 | I_GETBAND   | Returns the priority band of the first message on the STREAM head read                    |
| 20311 |             | queue in the integer referenced by <i>arg</i> .                                           |
| 20312 |             | The <i>ioctl()</i> function with the L_GETBAND command shall fail if:                     |
| 20313 |             | [ENODATA]     No message on the STREAM head read queue.                                   |
| 20314 | I_CANPUT    | Checks if a certain band is writable. <i>arg</i> is set to the priority band in question. |
| 20315 |             | The return value shall be 0 if the band is flow-controlled, 1 if the band is              |
| 20316 |             | writable, or -1 on error.                                                                 |
| 20317 |             | The <i>ioctl()</i> function with the L_CANPUT command shall fail if:                      |
| 20318 |             | [EINVAL]      Invalid <i>arg</i> value.                                                   |
| 20319 | I_SETCLTIME | This request allows the process to set the time the STREAM head shall delay               |
| 20320 |             | when a STREAM is closing and there is data on the write queues. Before                    |
| 20321 |             | closing each module or driver, if there is data on its write queue, the STREAM            |
| 20322 |             | head shall delay for the specified amount of time to allow the data to drain. If,         |
| 20323 |             | after the delay, data is still present, it shall be flushed. The <i>arg</i> argument is a |
| 20324 |             | pointer to an integer specifying the number of milliseconds to delay, rounded             |
| 20325 |             | up to the nearest valid value. If I_SETCLTIME is not performed on a STREAM,               |
| 20326 |             | an implementation-defined default timeout interval is used.                               |
| 20327 |             | The <i>ioctl()</i> function with the L_SETCLTIME command shall fail if:                   |
| 20328 |             | [EINVAL]      Invalid <i>arg</i> value.                                                   |
| 20329 | I_GETCLTIME | Returns the close time delay in the integer pointed to by <i>arg</i> .                    |

20330 **Multiplexed STREAMS Configurations**

20331 The following commands are used for connecting and disconnecting multiplexed STREAMS  
20332 configurations. These commands use an implementation-defined default timeout interval.

20333 **I\_LINK** Connects two STREAMs, where *filde*s is the file descriptor of the STREAM  
20334 connected to the multiplexing driver, and *arg* is the file descriptor of the  
20335 STREAM connected to another driver. The STREAM designated by *arg* is  
20336 connected below the multiplexing driver. I\_LINK requires the multiplexing  
20337 driver to send an acknowledgement message to the STREAM head regarding  
20338 the connection. This call shall return a multiplexer ID number (an identifier  
20339 used to disconnect the multiplexer; see I\_UNLINK) on success, and -1 on  
20340 failure.

20341 The *ioctl()* function with the I\_LINK command shall fail if:

20342 [ENXIO] Hangup received on *filde*s.  
20343 [ETIME] Timeout before acknowledgement message was received at  
20344 STREAM head.  
20345 [EAGAIN] or [ENOSR]  
20346 Unable to allocate STREAMS storage to perform the  
20347 I\_LINK.  
20348 [EBADF] The *arg* argument is not a valid, open file descriptor.  
20349 [EINVAL] The *filde*s argument does not support multiplexing; or *arg* is  
20350 not a STREAM or is already connected downstream from a  
20351 multiplexer; or the specified I\_LINK operation would  
20352 connect the STREAM head in more than one place in the  
20353 multiplexed STREAM.

20354 An I\_LINK can also fail while waiting for the multiplexing driver to  
20355 acknowledge the request, if a message indicating an error or a hangup is  
20356 received at the STREAM head of *filde*s. In addition, an error code can be  
20357 returned in the positive or negative acknowledgement message. For these  
20358 cases, I\_LINK fails with *errno* set to the value in the message.

20359 **I\_UNLINK** Disconnects the two STREAMs specified by *filde*s and *arg*. *filde*s is the file  
20360 descriptor of the STREAM connected to the multiplexing driver. The *arg*  
20361 argument is the multiplexer ID number that was returned by the I\_LINK  
20362 *ioctl()* command when a STREAM was connected downstream from the  
20363 multiplexing driver. If *arg* is MUXID\_ALL, then all STREAMs that were  
20364 connected to *filde*s shall be disconnected. As in I\_LINK, this command  
20365 requires acknowledgement.

20366 The *ioctl()* function with the I\_UNLINK command shall fail if:

20367 [ENXIO] Hangup received on *filde*s.  
20368 [ETIME] Timeout before acknowledgement message was received at  
20369 STREAM head.  
20370 [EAGAIN] or [ENOSR]  
20371 Unable to allocate buffers for the acknowledgement  
20372 message.  
20373 [EINVAL] Invalid multiplexer ID number.

|       |                     |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|-------|---------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 20374 |                     | An I_UNLINK can also fail while waiting for the multiplexing driver to acknowledge the request if a message indicating an error or a hangup is received at the STREAM head of <i>filde</i> s. In addition, an error code can be returned in the positive or negative acknowledgement message. For these cases, I_UNLINK shall fail with <i>errno</i> set to the value in the message.                                                                                                                                                                                                                                                                                                                                                                                                                   |
| 20375 |                     |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| 20376 |                     |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| 20377 |                     |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| 20378 |                     |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| 20379 | I_PLINK             | Creates a <i>persistent connection</i> between two STREAMS, where <i>filde</i> s is the file descriptor of the STREAM connected to the multiplexing driver, and <i>arg</i> is the file descriptor of the STREAM connected to another driver. This call shall create a persistent connection which can exist even if the file descriptor <i>filde</i> s associated with the upper STREAM to the multiplexing driver is closed. The STREAM designated by <i>arg</i> gets connected via a persistent connection below the multiplexing driver. I_PLINK requires the multiplexing driver to send an acknowledgement message to the STREAM head. This call shall return a multiplexer ID number (an identifier that may be used to disconnect the multiplexer; see I_PUNLINK) on success, and -1 on failure. |

| 20402 |                     | An I_PLINK can also fail while waiting for the multiplexing driver to acknowledge the request, if a message indicating an error or a hangup is received at the STREAM head of <i>filde</i> s. In addition, an error code can be returned in the positive or negative acknowledgement message. For these cases, I_PLINK shall fail with <i>errno</i> set to the value in the message.                                                                                                                                                                                                                                                                                                                                                                                                                    |

| 20406 |                     |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| 20407 | I_PUNLINK           | Disconnects the two STREAMS specified by <i>filde</i> s and <i>arg</i> from a persistent connection. The <i>filde</i> s argument is the file descriptor of the STREAM connected to the multiplexing driver. The <i>arg</i> argument is the multiplexer ID number that was returned by the I_PLINK <i>ioctl</i> () command when a STREAM was connected downstream from the multiplexing driver. If <i>arg</i> is MUXID_ALL, then all STREAMS which are persistent connections to <i>filde</i> s shall be disconnected. As in I_PLINK, this command requires the multiplexing driver to acknowledge the request.                                                                                                                                                                                          |

| 20416 | [ENXIO]             | Hangup received on <i>filde</i> s.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| 20417 | [ETIME]             | Timeout before acknowledgement message was received at STREAM head.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| 20418 |                     |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

20419 [EAGAIN] or [ENOSR]  
 20420 Unable to allocate buffers for the acknowledgement  
 20421 message.  
 20422 [EINVAL] Invalid multiplexer ID number.  
 20423 An I\_PUNLINK can also fail while waiting for the multiplexing driver to  
 20424 acknowledge the request if a message indicating an error or a hangup is  
 20425 received at the STREAM head of *fildev*. In addition, an error code can be  
 20426 returned in the positive or negative acknowledgement message. For these  
 20427 cases, I\_PUNLINK shall fail with *errno* set to the value in the message.

20428 **RETURN VALUE**

20429 Upon successful completion, *ioctl()* shall return a value other than  $-1$  that depends upon the  
 20430 STREAMS device control function. Otherwise, it shall return  $-1$  and set *errno* to indicate the  
 20431 error.

20432 **ERRORS**

20433 Under the following general conditions, *ioctl()* shall fail if:

20434 [EBADF] The *fildev* argument is not a valid open file descriptor.  
 20435 [EINTR] A signal was caught during the *ioctl()* operation.  
 20436 [EINVAL] The STREAM or multiplexer referenced by *fildev* is linked (directly or  
 20437 indirectly) downstream from a multiplexer.

20438 If an underlying device driver detects an error, then *ioctl()* shall fail if:

20439 [EINVAL] The *request* or *arg* argument is not valid for this device.  
 20440 [EIO] Some physical I/O error has occurred.  
 20441 [ENOTTY] The *fildev* argument is not associated with a STREAMS device that accepts  
 20442 control functions.  
 20443 [ENXIO] The *request* and *arg* arguments are valid for this device driver, but the service  
 20444 requested cannot be performed on this particular sub-device.  
 20445 [ENODEV] The *fildev* argument refers to a valid STREAMS device, but the corresponding  
 20446 device driver does not support the *ioctl()* function.

20447 If a STREAM is connected downstream from a multiplexer, any *ioctl()* command except  
 20448 I\_UNLINK and I\_PUNLINK shall set *errno* to [EINVAL].

20449 **EXAMPLES**

20450 None.

20451 **APPLICATION USAGE**

20452 The implementation-defined timeout interval for STREAMS has historically been 15 seconds.

20453 **RATIONALE**

20454 None.

20455 **FUTURE DIRECTIONS**

20456 None.

20457 **SEE ALSO**

20458 Section 2.6 (on page 38), *close()*, *fcntl()*, *getmsg()*, *open()*, *pipe()*, *poll()*, *putmsg()*, *read()*,  
 20459 *sigaction()*, *write()*, the Base Definitions volume of IEEE Std 1003.1-2001, <**stropts.h**>

20460 **CHANGE HISTORY**

20461 First released in Issue 4, Version 2.

20462 **Issue 5**

20463 Moved from X/OPEN UNIX extension to BASE.

20464 **Issue 6**

20465 The Open Group Corrigendum U028/4 is applied, correcting text in the L\_FDINSERT [EINVAL] case to refer to *ctlbuf*.

20467 This function is marked as part of the XSI STREAMS Option Group.

20468 The DESCRIPTION is updated to avoid use of the term “must” for application requirements.

20469 **NAME**

20470 isalnum — test for an alphanumeric character

20471 **SYNOPSIS**

20472 #include <ctype.h>

20473 int isalnum(int c);

20474 **DESCRIPTION**

20475 *cx* The functionality described on this reference page is aligned with the ISO C standard. Any  
20476 conflict between the requirements described here and the ISO C standard is unintentional. This  
20477 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

20478 The *isalnum()* function shall test whether *c* is a character of class **alpha** or **digit** in the program's  
20479 current locale; see the Base Definitions volume of IEEE Std 1003.1-2001, Chapter 7, Locale.

20480 The *c* argument is an **int**, the value of which the application shall ensure is representable as an  
20481 **unsigned char** or equal to the value of the macro EOF. If the argument has any other value, the  
20482 behavior is undefined.

20483 **RETURN VALUE**

20484 The *isalnum()* function shall return non-zero if *c* is an alphanumeric character; otherwise, it shall  
20485 return 0.

20486 **ERRORS**

20487 No errors are defined.

20488 **EXAMPLES**

20489 None.

20490 **APPLICATION USAGE**

20491 To ensure applications portability, especially across natural languages, only this function and  
20492 those listed in the SEE ALSO section should be used for character classification.

20493 **RATIONALE**

20494 None.

20495 **FUTURE DIRECTIONS**

20496 None.

20497 **SEE ALSO**

20498 *isalpha()*, *iscntrl()*, *isdigit()*, *isgraph()*, *islower()*, *isprint()*, *ispunct()*, *isspace()*, *isupper()*, *isxdigit()*,  
20499 *setlocale()*, the Base Definitions volume of IEEE Std 1003.1-2001, Chapter 7, Locale, <ctype.h>,  
20500 <stdio.h>

20501 **CHANGE HISTORY**

20502 First released in Issue 1. Derived from Issue 1 of the SVID.

20503 **Issue 6**

20504 The DESCRIPTION is updated to avoid use of the term “must” for application requirements.

20505 **NAME**

20506           isalpha — test for an alphabetic character

20507 **SYNOPSIS**

20508           #include <ctype.h>

20509           int isalpha(int c);

20510 **DESCRIPTION**

20511 cx       The functionality described on this reference page is aligned with the ISO C standard. Any  
20512       conflict between the requirements described here and the ISO C standard is unintentional. This  
20513       volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

20514       The *isalpha()* function shall test whether *c* is a character of class **alpha** in the program's current  
20515       locale; see the Base Definitions volume of IEEE Std 1003.1-2001, Chapter 7, Locale.

20516       The *c* argument is an **int**, the value of which the application shall ensure is representable as an  
20517       **unsigned char** or equal to the value of the macro EOF. If the argument has any other value, the  
20518       behavior is undefined.

20519 **RETURN VALUE**

20520       The *isalpha()* function shall return non-zero if *c* is an alphabetic character; otherwise, it shall  
20521       return 0.

20522 **ERRORS**

20523       No errors are defined.

20524 **EXAMPLES**

20525       None.

20526 **APPLICATION USAGE**

20527       To ensure applications portability, especially across natural languages, only this function and  
20528       those listed in the SEE ALSO section should be used for character classification.

20529 **RATIONALE**

20530       None.

20531 **FUTURE DIRECTIONS**

20532       None.

20533 **SEE ALSO**

20534       *isalnum()*, *isctrl()*, *isdigit()*, *isgraph()*, *islower()*, *isprint()*, *ispunct()*, *isspace()*, *isupper()*,  
20535       *isxdigit()*, *setlocale()*, the Base Definitions volume of IEEE Std 1003.1-2001, Chapter 7, Locale,  
20536       <ctype.h>, <stdio.h>

20537 **CHANGE HISTORY**

20538       First released in Issue 1. Derived from Issue 1 of the SVID.

20539 **Issue 6**

20540       The DESCRIPTION is updated to avoid use of the term “must” for application requirements.

20541 **NAME**

20542           isascii — test for a 7-bit US-ASCII character

20543 **SYNOPSIS**

20544 xSI       #include &lt;ctype.h&gt;

20545           int isascii(int c);

20546

20547 **DESCRIPTION**20548           The *isascii()* function shall test whether *c* is a 7-bit US-ASCII character code.20549           The *isascii()* function is defined on all integer values.20550 **RETURN VALUE**20551           The *isascii()* function shall return non-zero if *c* is a 7-bit US-ASCII character code between 0 and

20552           octal 0177 inclusive; otherwise, it shall return 0.

20553 **ERRORS**

20554           No errors are defined.

20555 **EXAMPLES**

20556           None.

20557 **APPLICATION USAGE**

20558           None.

20559 **RATIONALE**

20560           None.

20561 **FUTURE DIRECTIONS**

20562           None.

20563 **SEE ALSO**

20564           The Base Definitions volume of IEEE Std 1003.1-2001, &lt;ctype.h&gt;

20565 **CHANGE HISTORY**

20566           First released in Issue 1. Derived from Issue 1 of the SVID.

20567 **NAME**20568 isastream — test a file descriptor (**STREAMS**)20569 **SYNOPSIS**

20570 XSR #include &lt;stropts.h&gt;

20571 int isastream(int *fildev*);

20572

20573 **DESCRIPTION**20574 The *isastream()* function shall test whether *fildev*, an open file descriptor, is associated with a  
20575 STREAMS-based file.20576 **RETURN VALUE**20577 Upon successful completion, *isastream()* shall return 1 if *fildev* refers to a STREAMS-based file  
20578 and 0 if not. Otherwise, *isastream()* shall return -1 and set *errno* to indicate the error.20579 **ERRORS**20580 The *isastream()* function shall fail if:20581 [EBADF] The *fildev* argument is not a valid open file descriptor.20582 **EXAMPLES**

20583 None.

20584 **APPLICATION USAGE**

20585 None.

20586 **RATIONALE**

20587 None.

20588 **FUTURE DIRECTIONS**

20589 None.

20590 **SEE ALSO**

20591 The Base Definitions volume of IEEE Std 1003.1-2001, &lt;stropts.h&gt;

20592 **CHANGE HISTORY**

20593 First released in Issue 4, Version 2.

20594 **Issue 5**

20595 Moved from X/OPEN UNIX extension to BASE.

20596 **NAME**

20597           isatty — test for a terminal device

20598 **SYNOPSIS**

20599           #include <unistd.h>

20600           int isatty(int *fildev*);

20601 **DESCRIPTION**

20602           The *isatty()* function shall test whether *fildev*, an open file descriptor, is associated with a  
20603           terminal device.

20604 **RETURN VALUE**

20605           The *isatty()* function shall return 1 if *fildev* is associated with a terminal; otherwise, it shall return  
20606           0 and may set *errno* to indicate the error.

20607 **ERRORS**

20608           The *isatty()* function may fail if:

20609           [EBADF]           The *fildev* argument is not a valid open file descriptor.

20610           [ENOTTY]         The *fildev* argument is not associated with a terminal.

20611 **EXAMPLES**

20612           None.

20613 **APPLICATION USAGE**

20614           The *isatty()* function does not necessarily indicate that a human being is available for interaction  
20615           via *fildev*. It is quite possible that non-terminal devices are connected to the communications  
20616           line.

20617 **RATIONALE**

20618           None.

20619 **FUTURE DIRECTIONS**

20620           None.

20621 **SEE ALSO**

20622           The Base Definitions volume of IEEE Std 1003.1-2001, <unistd.h>

20623 **CHANGE HISTORY**

20624           First released in Issue 1. Derived from Issue 1 of the SVID.

20625 **Issue 6**

20626           The following new requirements on POSIX implementations derive from alignment with the  
20627           Single UNIX Specification:

- 20628           • The optional setting of *errno* to indicate an error is added.
- 20629           • The [EBADF] and [ENOTTY] optional error conditions are added.

20630 **NAME**

20631           isblank — test for a blank character

20632 **SYNOPSIS**

20633           #include <ctype.h>

20634           int isblank(int c);

20635 **DESCRIPTION**

20636 **CX**       The functionality described on this reference page is aligned with the ISO C standard. Any  
20637           conflict between the requirements described here and the ISO C standard is unintentional. This  
20638           volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

20639           The *isblank()* function shall test whether *c* is a character of class **blank** in the program's current  
20640           locale; see the Base Definitions volume of IEEE Std 1003.1-2001, Chapter 7, Locale.

20641           The *c* argument is a type **int**, the value of which the application shall ensure is a character  
20642           representable as an **unsigned char** or equal to the value of the macro EOF. If the argument has  
20643           any other value, the behavior is undefined.

20644 **RETURN VALUE**

20645           The *isblank()* function shall return non-zero if *c* is a <blank>; otherwise, it shall return 0.

20646 **ERRORS**

20647           No errors are defined.

20648 **EXAMPLES**

20649           None.

20650 **APPLICATION USAGE**

20651           To ensure applications portability, especially across natural languages, only this function and  
20652           those listed in the SEE ALSO section should be used for character classification.

20653 **RATIONALE**

20654           None.

20655 **FUTURE DIRECTIONS**

20656           None.

20657 **SEE ALSO**

20658           *isalnum()*, *isalpha()*, *iscntrl()*, *isdigit()*, *isgraph()*, *islower()*, *isprint()*, *ispunct()*, *isspace()*, *isupper()*,  
20659           *isxdigit()*, *setlocale()*, the Base Definitions volume of IEEE Std 1003.1-2001, Chapter 7, Locale,  
20660           <ctype.h>

20661 **CHANGE HISTORY**

20662           First released in Issue 6. Derived from the ISO/IEC 9899:1999 standard.

20663 **NAME**

20664 isctrl — test for a control character

20665 **SYNOPSIS**

20666 #include &lt;ctype.h&gt;

20667 int isctrl(int c);

20668 **DESCRIPTION**

20669 cx The functionality described on this reference page is aligned with the ISO C standard. Any  
20670 conflict between the requirements described here and the ISO C standard is unintentional. This  
20671 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

20672 The *isctrl()* function shall test whether *c* is a character of class **cntrl** in the program's current  
20673 locale; see the Base Definitions volume of IEEE Std 1003.1-2001, Chapter 7, Locale.

20674 The *c* argument is a type **int**, the value of which the application shall ensure is a character  
20675 representable as an **unsigned char** or equal to the value of the macro EOF. If the argument has  
20676 any other value, the behavior is undefined.

20677 **RETURN VALUE**20678 The *isctrl()* function shall return non-zero if *c* is a control character; otherwise, it shall return 0.20679 **ERRORS**

20680 No errors are defined.

20681 **EXAMPLES**

20682 None.

20683 **APPLICATION USAGE**

20684 To ensure applications portability, especially across natural languages, only this function and  
20685 those listed in the SEE ALSO section should be used for character classification.

20686 **RATIONALE**

20687 None.

20688 **FUTURE DIRECTIONS**

20689 None.

20690 **SEE ALSO**

20691 *isalnum()*, *isalpha()*, *isdigit()*, *isgraph()*, *islower()*, *isprint()*, *ispunct()*, *isspace()*, *isupper()*,  
20692 *isxdigit()*, *setlocale()*, the Base Definitions volume of IEEE Std 1003.1-2001, Chapter 7, Locale,  
20693 <ctype.h>

20694 **CHANGE HISTORY**

20695 First released in Issue 1. Derived from Issue 1 of the SVID.

20696 **Issue 6**

20697 The DESCRIPTION is updated to avoid use of the term “must” for application requirements.

20698 **NAME**

20699           isdigit — test for a decimal digit

20700 **SYNOPSIS**

20701           #include &lt;ctype.h&gt;

20702           int isdigit(int c);

20703 **DESCRIPTION**

20704 **CX**       The functionality described on this reference page is aligned with the ISO C standard. Any  
20705 conflict between the requirements described here and the ISO C standard is unintentional. This  
20706 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

20707       The *isdigit()* function shall test whether *c* is a character of class **digit** in the program's current  
20708 locale; see the Base Definitions volume of IEEE Std 1003.1-2001, Chapter 7, Locale.

20709       The *c* argument is an **int**, the value of which the application shall ensure is a character  
20710 representable as an **unsigned char** or equal to the value of the macro EOF. If the argument has  
20711 any other value, the behavior is undefined.

20712 **RETURN VALUE**20713       The *isdigit()* function shall return non-zero if *c* is a decimal digit; otherwise, it shall return 0.20714 **ERRORS**

20715       No errors are defined.

20716 **EXAMPLES**

20717       None.

20718 **APPLICATION USAGE**

20719       To ensure applications portability, especially across natural languages, only this function and  
20720 those listed in the SEE ALSO section should be used for character classification.

20721 **RATIONALE**

20722       None.

20723 **FUTURE DIRECTIONS**

20724       None.

20725 **SEE ALSO**

20726       *isalnum()*, *isalpha()*, *iscntrl()*, *isgraph()*, *islower()*, *isprint()*, *ispunct()*, *isspace()*, *isupper()*,  
20727 *isxdigit()*, the Base Definitions volume of IEEE Std 1003.1-2001, Chapter 7, Locale, <ctype.h>

20728 **CHANGE HISTORY**

20729       First released in Issue 1. Derived from Issue 1 of the SVID.

20730 **Issue 6**

20731       The DESCRIPTION is updated to avoid use of the term “must” for application requirements.

20732 **NAME**

20733 isfinite — test for finite value

20734 **SYNOPSIS**

20735 #include &lt;math.h&gt;

20736 int isfinite(real-floating x);

20737 **DESCRIPTION**

20738 cx The functionality described on this reference page is aligned with the ISO C standard. Any  
20739 conflict between the requirements described here and the ISO C standard is unintentional. This  
20740 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

20741 The *isfinite()* macro shall determine whether its argument has a finite value (zero, subnormal, or  
20742 normal, and not infinite or NaN). First, an argument represented in a format wider than its  
20743 semantic type is converted to its semantic type. Then determination is based on the type of the  
20744 argument.

20745 **RETURN VALUE**20746 The *isfinite()* macro shall return a non-zero value if and only if its argument has a finite value.20747 **ERRORS**

20748 No errors are defined.

20749 **EXAMPLES**

20750 None.

20751 **APPLICATION USAGE**

20752 None.

20753 **RATIONALE**

20754 None.

20755 **FUTURE DIRECTIONS**

20756 None.

20757 **SEE ALSO**

20758 *fpclassify()*, *isinf()*, *isnan()*, *isnormal()*, *signbit()*, the Base Definitions volume of  
20759 IEEE Std 1003.1-2001 <math.h>

20760 **CHANGE HISTORY**

20761 First released in Issue 6. Derived from the ISO/IEC 9899:1999 standard.

20762 **NAME**

20763 isgraph — test for a visible character

20764 **SYNOPSIS**

20765 #include &lt;ctype.h&gt;

20766 int isgraph(int c);

20767 **DESCRIPTION**

20768 cx The functionality described on this reference page is aligned with the ISO C standard. Any  
20769 conflict between the requirements described here and the ISO C standard is unintentional. This  
20770 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

20771 The *isgraph()* function shall test whether *c* is a character of class **graph** in the program's current  
20772 locale; see the Base Definitions volume of IEEE Std 1003.1-2001, Chapter 7, Locale.

20773 The *c* argument is an **int**, the value of which the application shall ensure is a character  
20774 representable as an **unsigned char** or equal to the value of the macro EOF. If the argument has  
20775 any other value, the behavior is undefined.

20776 **RETURN VALUE**

20777 The *isgraph()* function shall return non-zero if *c* is a character with a visible representation;  
20778 otherwise, it shall return 0.

20779 **ERRORS**

20780 No errors are defined.

20781 **EXAMPLES**

20782 None.

20783 **APPLICATION USAGE**

20784 To ensure applications portability, especially across natural languages, only this function and  
20785 those listed in the SEE ALSO section should be used for character classification.

20786 **RATIONALE**

20787 None.

20788 **FUTURE DIRECTIONS**

20789 None.

20790 **SEE ALSO**

20791 *isalnum()*, *isalpha()*, *iscntrl()*, *isdigit()*, *islower()*, *isprint()*, *ispunct()*, *isspace()*, *isupper()*, *isxdigit()*,  
20792 *setlocale()*, the Base Definitions volume of IEEE Std 1003.1-2001, Chapter 7, Locale, <ctype.h>

20793 **CHANGE HISTORY**

20794 First released in Issue 1. Derived from Issue 1 of the SVID.

20795 **Issue 6**

20796 The DESCRIPTION is updated to avoid use of the term “must” for application requirements.

20797 **NAME**20798        **isgreater** — test if *x* greater than *y*20799 **SYNOPSIS**

20800        #include &lt;math.h&gt;

20801        int isgreater(real-floating *x*, real-floating *y*);20802 **DESCRIPTION**

20803 **CX**        The functionality described on this reference page is aligned with the ISO C standard. Any  
20804 conflict between the requirements described here and the ISO C standard is unintentional. This  
20805 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

20806        The *isgreater()* macro shall determine whether its first argument is greater than its second  
20807 argument. The value of *isgreater(x, y)* shall be equal to  $(x) > (y)$ ; however, unlike  $(x) > (y)$ ,  
20808 *isgreater(x, y)* shall not raise the invalid floating-point exception when *x* and *y* are unordered.

20809 **RETURN VALUE**20810        Upon successful completion, the *isgreater()* macro shall return the value of  $(x) > (y)$ .20811        If *x* or *y* is NaN, 0 shall be returned.20812 **ERRORS**

20813        No errors are defined.

20814 **EXAMPLES**

20815        None.

20816 **APPLICATION USAGE**

20817        The relational and equality operators support the usual mathematical relationships between  
20818 numeric values. For any ordered pair of numeric values, exactly one of the relationships (less,  
20819 greater, and equal) is true. Relational operators may raise the invalid floating-point exception  
20820 when argument values are NaNs. For a NaN and a numeric value, or for two NaNs, just the  
20821 unordered relationship is true. This macro is a quiet (non-floating-point exception raising)  
20822 version of a relational operator. It facilitates writing efficient code that accounts for NaNs  
20823 without suffering the invalid floating-point exception. In the SYNOPSIS section, **real-floating**  
20824 indicates that the argument shall be an expression of **real-floating** type.

20825 **RATIONALE**

20826        None.

20827 **FUTURE DIRECTIONS**

20828        None.

20829 **SEE ALSO**

20830        *isgreaterequal()*, *isless()*, *islessequal()*, *islessgreater()*, *isunordered()*, the Base Definitions volume of  
20831 IEEE Std 1003.1-2001 <math.h>

20832 **CHANGE HISTORY**

20833        First released in Issue 6. Derived from the ISO/IEC 9899:1999 standard.

20834 **NAME**

20835           isgreaterequal — test if *x* is greater than or equal to *y*

20836 **SYNOPSIS**

20837           #include <math.h>

20838           int isgreaterequal(real-floating *x*, real-floating *y*);

20839 **DESCRIPTION**

20840 *CX*       The functionality described on this reference page is aligned with the ISO C standard. Any  
20841 conflict between the requirements described here and the ISO C standard is unintentional. This  
20842 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

20843       The *isgreaterequal()* macro shall determine whether its first argument is greater than or equal to  
20844 its second argument. The value of *isgreaterequal(x, y)* shall be equal to  $(x) \geq (y)$ ; however, unlike  
20845  $(x) \geq (y)$ , *isgreaterequal(x, y)* shall not raise the invalid floating-point exception when *x* and *y* are  
20846 unordered.

20847 **RETURN VALUE**

20848       Upon successful completion, the *isgreaterequal()* macro shall return the value of  $(x) \geq (y)$ .

20849       If *x* or *y* is NaN, 0 shall be returned.

20850 **ERRORS**

20851       No errors are defined.

20852 **EXAMPLES**

20853       None.

20854 **APPLICATION USAGE**

20855       The relational and equality operators support the usual mathematical relationships between  
20856 numeric values. For any ordered pair of numeric values, exactly one of the relationships (less,  
20857 greater, and equal) is true. Relational operators may raise the invalid floating-point exception  
20858 when argument values are NaNs. For a NaN and a numeric value, or for two NaNs, just the  
20859 unordered relationship is true. This macro is a quiet (non-floating-point exception raising)  
20860 version of a relational operator. It facilitates writing efficient code that accounts for NaNs  
20861 without suffering the invalid floating-point exception. In the SYNOPSIS section, **real-floating**  
20862 indicates that the argument shall be an expression of **real-floating** type.

20863 **RATIONALE**

20864       None.

20865 **FUTURE DIRECTIONS**

20866       None.

20867 **SEE ALSO**

20898       IEEE Std 1003.1-2001 <math.h>

20899 **CHANGE HISTORY**

20900       First released in Issue 6. Derived from the ISO/IEC 9899:1999 standard.

20901 **NAME**20902           isless — test if *x* is less than *y*20903 **SYNOPSIS**

20904           #include &lt;math.h&gt;

20905           int isless(real-floating *x*, real-floating *y*);20906 **DESCRIPTION**

20907 *cx*       The functionality described on this reference page is aligned with the ISO C standard. Any  
20908 conflict between the requirements described here and the ISO C standard is unintentional. This  
20909 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

20910       The *isless()* macro shall determine whether its first argument is less than its second argument.  
20911       The value of *isless(x, y)* shall be equal to  $(x) < (y)$ ; however, unlike  $(x) < (y)$ , *isless(x, y)* shall not  
20912 raise the invalid floating-point exception when *x* and *y* are unordered.

20913 **RETURN VALUE**20914       Upon successful completion, the *isless()* macro shall return the value of  $(x) < (y)$ .20915       If *x* or *y* is NaN, 0 shall be returned.20916 **ERRORS**

20917       No errors are defined.

20918 **EXAMPLES**

20919       None.

20920 **APPLICATION USAGE**

20921       The relational and equality operators support the usual mathematical relationships between  
20922 numeric values. For any ordered pair of numeric values, exactly one of the relationships (less,  
20923 greater, and equal) is true. Relational operators may raise the invalid floating-point exception  
20924 when argument values are NaNs. For a NaN and a numeric value, or for two NaNs, just the  
20925 unordered relationship is true. This macro is a quiet (non-floating-point exception raising)  
20926 version of a relational operator. It facilitates writing efficient code that accounts for NaNs  
20927 without suffering the invalid floating-point exception. In the SYNOPSIS section, **real-floating**  
20928 indicates that the argument shall be an expression of **real-floating** type.

20929 **RATIONALE**

20930       None.

20931 **FUTURE DIRECTIONS**

20932       None.

20934       *isgreater()*, *isgreaterequal()*, *islessequal()*, *islessgreater()*, *isunordered()*, the Base Definitions volume  
20935 of IEEE Std 1003.1-2001, <math.h>

20936 **CHANGE HISTORY**

20937       First released in Issue 6. Derived from the ISO/IEC 9899:1999 standard.

## 20938 NAME

20939 islessequal — test if *x* is less than or equal to *y*

## 20940 SYNOPSIS

20941 #include <math.h>

20942 int islessequal(real-floating *x*, real-floating *y*);

## 20943 DESCRIPTION

20944 cx The functionality described on this reference page is aligned with the ISO C standard. Any  
20945 conflict between the requirements described here and the ISO C standard is unintentional. This  
20946 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

20947 The *islessequal()* macro shall determine whether its first argument is less than or equal to its  
20948 second argument. The value of *islessequal(x, y)* shall be equal to  $(x) \leq (y)$ ; however, unlike  
20949  $(x) \leq (y)$ , *islessequal(x, y)* shall not raise the invalid floating-point exception when *x* and *y* are  
20950 unordered.

## 20951 RETURN VALUE

20952 Upon successful completion, the *islessequal()* macro shall return the value of  $(x) \leq (y)$ .

20953 If *x* or *y* is NaN, 0 shall be returned.

## 20954 ERRORS

20955 No errors are defined.

## 20956 EXAMPLES

20957 None.

## 20958 APPLICATION USAGE

20959 The relational and equality operators support the usual mathematical relationships between  
20960 numeric values. For any ordered pair of numeric values, exactly one of the relationships (less,  
20961 greater, and equal) is true. Relational operators may raise the invalid floating-point exception  
20962 when argument values are NaNs. For a NaN and a numeric value, or for two NaNs, just the  
20963 unordered relationship is true. This macro is a quiet (non-floating-point exception raising)  
20964 version of a relational operator. It facilitates writing efficient code that accounts for NaNs  
20965 without suffering the invalid floating-point exception. In the SYNOPSIS section, **real-floating**  
20966 indicates that the argument shall be an expression of **real-floating** type.

## 20967 RATIONALE

20968 None.

## 20969 FUTURE DIRECTIONS

20970 None.

## 20971 SEE ALSO

20972 *isgreater()*, *isgreaterequal()*, *isless()*, *islessgreater()*, *isunordered()*, the Base Definitions volume of  
20973 IEEE Std 1003.1-2001 <math.h>

## 20974 CHANGE HISTORY

20975 First released in Issue 6. Derived from the ISO/IEC 9899:1999 standard.

20976 **NAME**20977 `islessgreater` — test if  $x$  is less than or greater than  $y$ 20978 **SYNOPSIS**20979 `#include <math.h>`20980 `int islessgreater(real-floating  $x$ , real-floating  $y$ );`20981 **DESCRIPTION**

20982 *cx* The functionality described on this reference page is aligned with the ISO C standard. Any  
 20983 conflict between the requirements described here and the ISO C standard is unintentional. This  
 20984 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

20985 The *islessgreater()* macro shall determine whether its first argument is less than or greater than  
 20986 its second argument. The *islessgreater( $x$ ,  $y$ )* macro is similar to  $(x) < (y) \ || \ (x) > (y)$ ; however,  
 20987 *islessgreater( $x$ ,  $y$ )* shall not raise the invalid floating-point exception when  $x$  and  $y$  are unordered  
 20988 (nor shall it evaluate  $x$  and  $y$  twice).

20989 **RETURN VALUE**

20990 Upon successful completion, the *islessgreater()* macro shall return the value of  
 20991  $(x) < (y) \ || \ (x) > (y)$ .

20992 If  $x$  or  $y$  is NaN, 0 shall be returned.20993 **ERRORS**

20994 No errors are defined.

20995 **EXAMPLES**

20996 None.

20997 **APPLICATION USAGE**

20998 The relational and equality operators support the usual mathematical relationships between  
 20999 numeric values. For any ordered pair of numeric values, exactly one of the relationships (less,  
 21000 greater, and equal) is true. Relational operators may raise the invalid floating-point exception  
 21001 when argument values are NaNs. For a NaN and a numeric value, or for two NaNs, just the  
 21002 unordered relationship is true. This macro is a quiet (non-floating-point exception raising)  
 21003 version of a relational operator. It facilitates writing efficient code that accounts for NaNs  
 21004 without suffering the invalid floating-point exception. In the SYNOPSIS section, **real-floating**  
 21005 indicates that the argument shall be an expression of **real-floating** type.

21006 **RATIONALE**

21007 None.

21008 **FUTURE DIRECTIONS**

21009 None.

21010 **SEE ALSO**

21011 *isgreater()*, *isgreaterequal()*, *isless()*, *islessequal()*, *isunordered()*, the Base Definitions volume of  
 21012 IEEE Std 1003.1-2001 **<math.h>**

21013 **CHANGE HISTORY**

21014 First released in Issue 6. Derived from the ISO/IEC 9899:1999 standard.

21015 **NAME**

21016 islower — test for a lowercase letter

21017 **SYNOPSIS**

21018 #include &lt;ctype.h&gt;

21019 int islower(int c);

21020 **DESCRIPTION**

21021 cx The functionality described on this reference page is aligned with the ISO C standard. Any  
21022 conflict between the requirements described here and the ISO C standard is unintentional. This  
21023 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

21024 The *islower()* function shall test whether *c* is a character of class **lower** in the program's current  
21025 locale; see the Base Definitions volume of IEEE Std 1003.1-2001, Chapter 7, Locale.

21026 The *c* argument is an **int**, the value of which the application shall ensure is a character  
21027 representable as an **unsigned char** or equal to the value of the macro EOF. If the argument has  
21028 any other value, the behavior is undefined.

21029 **RETURN VALUE**21030 The *islower()* function shall return non-zero if *c* is a lowercase letter; otherwise, it shall return 0.21031 **ERRORS**

21032 No errors are defined.

21033 **EXAMPLES**21034 **Testing for a Lowercase Letter**

21035 The following example tests whether the value is a lowercase letter, based on the locale of the  
21036 user, then uses it as part of a key value.

```
21037 #include <ctype.h>
21038 #include <stdlib.h>
21039 #include <locale.h>
21040 ...
21041 char *keyst;
21042 int elementlen, len;
21043 char c;
21044 ...
21045 setlocale(LC_ALL, "");
21046 ...
21047 len = 0;
21048 while (len < elementlen) {
21049     c = (char) (rand() % 256);
21050     ...
21051     if (islower(c))
21052         keyst[len++] = c;
21053 }
21054 ...
```

21055 **APPLICATION USAGE**

21056 To ensure applications portability, especially across natural languages, only this function and  
21057 those listed in the SEE ALSO section should be used for character classification.

21058 **RATIONALE**

21059           None.

21060 **FUTURE DIRECTIONS**

21061           None.

21062 **SEE ALSO**

21063           *isalnum()*, *isalpha()*, *iscntrl()*, *isdigit()*, *isgraph()*, *isprint()*, *ispunct()*, *isspace()*, *isupper()*,

21065           <ctype.h>

21066 **CHANGE HISTORY**

21067           First released in Issue 1. Derived from Issue 1 of the SVID.

21068 **Issue 6**

21069           The DESCRIPTION is updated to avoid use of the term “must” for application requirements.

21070           An example is added.

21071 **NAME**

21072       isnan — test for a NaN

21073 **SYNOPSIS**

21074       #include &lt;math.h&gt;

21075       int isnan(real-floating x);

21076 **DESCRIPTION**

21077 *cx*     The functionality described on this reference page is aligned with the ISO C standard. Any  
21078     conflict between the requirements described here and the ISO C standard is unintentional. This  
21079     volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

21080     The *isnan()* macro shall determine whether its argument value is a NaN. First, an argument  
21081     represented in a format wider than its semantic type is converted to its semantic type. Then  
21082     determination is based on the type of the argument.

21083 **RETURN VALUE**21084       The *isnan()* macro shall return a non-zero value if and only if its argument has a NaN value.21085 **ERRORS**

21086       No errors are defined.

21087 **EXAMPLES**

21088       None.

21089 **APPLICATION USAGE**

21090       None.

21091 **RATIONALE**

21092       None.

21093 **FUTURE DIRECTIONS**

21094       None.

21095 **SEE ALSO**

21096       *fpclassify()*, *isfinite()*, *isinf()*, *isnormal()*, *signbit()*, the Base Definitions volume of  
21097       IEEE Std 1003.1-2001, <math.h>

21098 **CHANGE HISTORY**

21099       First released in Issue 3.

21100 **Issue 5**

21101       The DESCRIPTION is updated to indicate the return value when NaN is not supported. This  
21102       text was previously published in the APPLICATION USAGE section.

21103 **Issue 6**

21104       Entry re-written for alignment with the ISO/IEC 9899:1999 standard.

21105 **NAME**

21106           isnormal — test for a normal value

21107 **SYNOPSIS**

21108           #include &lt;math.h&gt;

21109           int isnormal(real-floating x);

21110 **DESCRIPTION**

21111 cx       The functionality described on this reference page is aligned with the ISO C standard. Any  
21112       conflict between the requirements described here and the ISO C standard is unintentional. This  
21113       volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

21114       The *isnormal()* macro shall determine whether its argument value is normal (neither zero,  
21115       subnormal, infinite, nor NaN). First, an argument represented in a format wider than its  
21116       semantic type is converted to its semantic type. Then determination is based on the type of the  
21117       argument.

21118 **RETURN VALUE**

21119       The *isnormal()* macro shall return a non-zero value if and only if its argument has a normal  
21120       value.

21121 **ERRORS**

21122       No errors are defined.

21123 **EXAMPLES**

21124       None.

21125 **APPLICATION USAGE**

21126       None.

21127 **RATIONALE**

21128       None.

21129 **FUTURE DIRECTIONS**

21130       None.

21131 **SEE ALSO**

21132       *fpclassify()*, *isfinite()*, *isinf()*, *isnan()*, *signbit()*, the Base Definitions volume of  
21133       IEEE Std 1003.1-2001, <math.h>

21134 **CHANGE HISTORY**

21135       First released in Issue 6. Derived from the ISO/IEC 9899:1999 standard.

21136 **NAME**

21137 isprint — test for a printable character

21138 **SYNOPSIS**

21139 #include &lt;ctype.h&gt;

21140 int isprint(int c);

21141 **DESCRIPTION**

21142 **CX** The functionality described on this reference page is aligned with the ISO C standard. Any  
21143 conflict between the requirements described here and the ISO C standard is unintentional. This  
21144 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

21145 The *isprint()* function shall test whether *c* is a character of class **print** in the program's current  
21146 locale; see the Base Definitions volume of IEEE Std 1003.1-2001, Chapter 7, Locale.

21147 The *c* argument is an **int**, the value of which the application shall ensure is a character  
21148 representable as an **unsigned char** or equal to the value of the macro EOF. If the argument has  
21149 any other value, the behavior is undefined.

21150 **RETURN VALUE**

21151 The *isprint()* function shall return non-zero if *c* is a printable character; otherwise, it shall return  
21152 0.

21153 **ERRORS**

21154 No errors are defined.

21155 **EXAMPLES**

21156 None.

21157 **APPLICATION USAGE**

21158 To ensure applications portability, especially across natural languages, only this function and  
21159 those listed in the SEE ALSO section should be used for character classification.

21160 **RATIONALE**

21161 None.

21162 **FUTURE DIRECTIONS**

21163 None.

21164 **SEE ALSO**

21165 *isalnum()*, *isalpha()*, *iscntrl()*, *isdigit()*, *isgraph()*, *islower()*, *ispunct()*, *isspace()*, *isupper()*,  
21166 *isxdigit()*, *setlocale()*, the Base Definitions volume of IEEE Std 1003.1-2001, Chapter 7, Locale,  
21167 <ctype.h>

21168 **CHANGE HISTORY**

21169 First released in Issue 1. Derived from Issue 1 of the SVID.

21170 **Issue 6**

21171 The DESCRIPTION is updated to avoid use of the term “must” for application requirements.

21172 **NAME**

21173           ispunct — test for a punctuation character

21174 **SYNOPSIS**

21175           #include &lt;ctype.h&gt;

21176           int ispunct(int c);

21177 **DESCRIPTION**

21178 **CX**       The functionality described on this reference page is aligned with the ISO C standard. Any  
21179 conflict between the requirements described here and the ISO C standard is unintentional. This  
21180 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

21181       The *ispunct()* function shall test whether *c* is a character of class **punct** in the program's current  
21182 locale; see the Base Definitions volume of IEEE Std 1003.1-2001, Chapter 7, Locale.

21183       The *c* argument is an **int**, the value of which the application shall ensure is a character  
21184 representable as an **unsigned char** or equal to the value of the macro EOF. If the argument has  
21185 any other value, the behavior is undefined.

21186 **RETURN VALUE**

21187       The *ispunct()* function shall return non-zero if *c* is a punctuation character; otherwise, it shall  
21188 return 0.

21189 **ERRORS**

21190       No errors are defined.

21191 **EXAMPLES**

21192       None.

21193 **APPLICATION USAGE**

21194       To ensure applications portability, especially across natural languages, only this function and  
21195 those listed in the SEE ALSO section should be used for character classification.

21196 **RATIONALE**

21197       None.

21198 **FUTURE DIRECTIONS**

21199       None.

21200 **SEE ALSO**

21201       *isalnum()*, *isalpha()*, *iscntrl()*, *isdigit()*, *isgraph()*, *islower()*, *isprint()*, *isspace()*, *isupper()*, *isxdigit()*,  
21202 *setlocale()*, the Base Definitions volume of IEEE Std 1003.1-2001, Chapter 7, Locale, <ctype.h>

21203 **CHANGE HISTORY**

21204       First released in Issue 1. Derived from Issue 1 of the SVID.

21205 **Issue 6**

21206       The DESCRIPTION is updated to avoid use of the term “must” for application requirements.

21207 **NAME**

21208           isspace — test for a white-space character

21209 **SYNOPSIS**

21210           #include <ctype.h>

21211           int isspace(int c);

21212 **DESCRIPTION**

21213 **CX**       The functionality described on this reference page is aligned with the ISO C standard. Any  
21214       conflict between the requirements described here and the ISO C standard is unintentional. This  
21215       volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

21216       The *isspace()* function shall test whether *c* is a character of class **space** in the program's current  
21217       locale; see the Base Definitions volume of IEEE Std 1003.1-2001, Chapter 7, Locale.

21218       The *c* argument is an **int**, the value of which the application shall ensure is a character  
21219       representable as an **unsigned char** or equal to the value of the macro EOF. If the argument has  
21220       any other value, the behavior is undefined.

21221 **RETURN VALUE**

21222       The *isspace()* function shall return non-zero if *c* is a white-space character; otherwise, it shall  
21223       return 0.

21224 **ERRORS**

21225       No errors are defined.

21226 **EXAMPLES**

21227       None.

21228 **APPLICATION USAGE**

21229       To ensure applications portability, especially across natural languages, only this function and  
21230       those listed in the SEE ALSO section should be used for character classification.

21231 **RATIONALE**

21232       None.

21233 **FUTURE DIRECTIONS**

21234       None.

21235 **SEE ALSO**

21236       *isalnum()*, *isalpha()*, *iscntrl()*, *isdigit()*, *isgraph()*, *islower()*, *isprint()*, *ispunct()*, *isupper()*,  
21237       *isxdigit()*, *setlocale()*, the Base Definitions volume of IEEE Std 1003.1-2001, Chapter 7, Locale,  
21238       <ctype.h>

21239 **CHANGE HISTORY**

21240       First released in Issue 1. Derived from Issue 1 of the SVID.

21241 **Issue 6**

21242       The DESCRIPTION is updated to avoid use of the term “must” for application requirements.

21243 **NAME**

21244           isunordered — test if arguments are unordered

21245 **SYNOPSIS**

21246           #include <math.h>

21247           int isunordered(real-floating x, real-floating y);

21248 **DESCRIPTION**

21249 **CX**       The functionality described on this reference page is aligned with the ISO C standard. Any  
21250 conflict between the requirements described here and the ISO C standard is unintentional. This  
21251 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

21252       The *isunordered()* macro shall determine whether its arguments are unordered.

21253 **RETURN VALUE**

21254       Upon successful completion, the *isunordered()* macro shall return 1 if its arguments are  
21255 unordered, and 0 otherwise.

21256       If *x* or *y* is NaN, 0 shall be returned.

21257 **ERRORS**

21258       No errors are defined.

21259 **EXAMPLES**

21260       None.

21261 **APPLICATION USAGE**

21262       The relational and equality operators support the usual mathematical relationships between  
21263 numeric values. For any ordered pair of numeric values, exactly one of the relationships (less,  
21264 greater, and equal) is true. Relational operators may raise the invalid floating-point exception  
21265 when argument values are NaNs. For a NaN and a numeric value, or for two NaNs, just the  
21266 unordered relationship is true. This macro is a quiet (non-floating-point exception raising)  
21267 version of a relational operator. It facilitates writing efficient code that accounts for NaNs  
21268 without suffering the invalid floating-point exception. In the SYNOPSIS section, **real-floating**  
21269 indicates that the argument shall be an expression of **real-floating** type.

21270 **RATIONALE**

21271       None.

21272 **FUTURE DIRECTIONS**

21273       None.

21274 **SEE ALSO**

21275       *isgreater()*, *isgreaterequal()*, *isless()*, *islessequal()*, *islessgreater()*, the Base Definitions volume of  
21276 IEEE Std 1003.1-2001, <math.h>

21277 **CHANGE HISTORY**

21278       First released in Issue 6. Derived from the ISO/IEC 9899:1999 standard.

21279 **NAME**

21280 isupper — test for an uppercase letter

21281 **SYNOPSIS**

21282 #include <ctype.h>

21283 int isupper(int c);

21284 **DESCRIPTION**

21285 *cx* The functionality described on this reference page is aligned with the ISO C standard. Any  
21286 conflict between the requirements described here and the ISO C standard is unintentional. This  
21287 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

21288 The *isupper()* function shall test whether *c* is a character of class **upper** in the program's current  
21289 locale; see the Base Definitions volume of IEEE Std 1003.1-2001, Chapter 7, Locale.

21290 The *c* argument is an **int**, the value of which the application shall ensure is a character  
21291 representable as an **unsigned char** or equal to the value of the macro EOF. If the argument has  
21292 any other value, the behavior is undefined.

21293 **RETURN VALUE**

21294 The *isupper()* function shall return non-zero if *c* is an uppercase letter; otherwise, it shall return 0.

21295 **ERRORS**

21296 No errors are defined.

21297 **EXAMPLES**

21298 None.

21299 **APPLICATION USAGE**

21300 To ensure applications portability, especially across natural languages, only this function and  
21301 those listed in the SEE ALSO section should be used for character classification.

21302 **RATIONALE**

21303 None.

21304 **FUTURE DIRECTIONS**

21305 None.

21306 **SEE ALSO**

21307 *isalnum()*, *isalpha()*, *iscntrl()*, *isdigit()*, *isgraph()*, *islower()*, *isprint()*, *ispunct()*, *isspace()*, *isxdigit()*,  
21308 *setlocale()*, the Base Definitions volume of IEEE Std 1003.1-2001, Chapter 7, Locale, <ctype.h>

21309 **CHANGE HISTORY**

21310 First released in Issue 1. Derived from Issue 1 of the SVID.

21311 **Issue 6**

21312 The DESCRIPTION is updated to avoid use of the term “must” for application requirements.

21313 **NAME**

21314 iswalnum — test for an alphanumeric wide-character code

21315 **SYNOPSIS**

21316 #include &lt;wctype.h&gt;

21317 int iswalnum(wint\_t wc);

21318 **DESCRIPTION**

21319 **CX** The functionality described on this reference page is aligned with the ISO C standard. Any  
 21320 conflict between the requirements described here and the ISO C standard is unintentional. This  
 21321 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

21322 The *iswalnum()* function shall test whether *wc* is a wide-character code representing a character  
 21323 of class **alpha** or **digit** in the program's current locale; see the Base Definitions volume of  
 21324 IEEE Std 1003.1-2001, Chapter 7, Locale.

21325 The *wc* argument is a **wint\_t**, the value of which the application shall ensure is a wide-character  
 21326 code corresponding to a valid character in the current locale, or equal to the value of the macro  
 21327 WEOF. If the argument has any other value, the behavior is undefined.

21328 **RETURN VALUE**

21329 The *iswalnum()* function shall return non-zero if *wc* is an alphanumeric wide-character code;  
 21330 otherwise, it shall return 0.

21331 **ERRORS**

21332 No errors are defined.

21333 **EXAMPLES**

21334 None.

21335 **APPLICATION USAGE**

21336 To ensure applications portability, especially across natural languages, only this function and  
 21337 those listed in the SEE ALSO section should be used for classification of wide-character codes.

21338 **RATIONALE**

21339 None.

21340 **FUTURE DIRECTIONS**

21341 None.

21342 **SEE ALSO**

21343 *iswalphabet()*, *iswcntrl()*, *iswctype()*, *iswdigit()*, *iswgraph()*, *iswlower()*, *iswprint()*, *iswpunct()*,  
 21344 *iswspace()*, *iswupper()*, *iswxdigit()*, *setlocale()*, the Base Definitions volume of  
 21345 IEEE Std 1003.1-2001, Chapter 7, Locale, <stdio.h>, <wchar.h>, <wctype.h>

21346 **CHANGE HISTORY**

21347 First released as a World-wide Portability Interface in Issue 4.

21348 **Issue 5**

21349 The following change has been made in this issue for alignment with  
 21350 ISO/IEC 9899:1990/Amendment 1:1995 (E):

- 21351 • The SYNOPSIS has been changed to indicate that this function and associated data types are  
 21352 now made visible by inclusion of the <wctype.h> header rather than <wchar.h>.

21353 **Issue 6**

21354 The DESCRIPTION is updated to avoid use of the term “must” for application requirements.

21355 **NAME**

21356 iswalpha — test for an alphabetic wide-character code

21357 **SYNOPSIS**

21358 #include <wctype.h>

21359 int iswalpha(wint\_t wc);

21360 **DESCRIPTION**

21361 cx The functionality described on this reference page is aligned with the ISO C standard. Any  
21362 conflict between the requirements described here and the ISO C standard is unintentional. This  
21363 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

21364 The *iswalpha()* function shall test whether *wc* is a wide-character code representing a character of  
21365 class **alpha** in the program's current locale; see the Base Definitions volume of  
21366 IEEE Std 1003.1-2001, Chapter 7, Locale.

21367 The *wc* argument is a **wint\_t**, the value of which the application shall ensure is a wide-character  
21368 code corresponding to a valid character in the current locale, or equal to the value of the macro  
21369 WEOF. If the argument has any other value, the behavior is undefined.

21370 **RETURN VALUE**

21371 The *iswalpha()* function shall return non-zero if *wc* is an alphabetic wide-character code;  
21372 otherwise, it shall return 0.

21373 **ERRORS**

21374 No errors are defined.

21375 **EXAMPLES**

21376 None.

21377 **APPLICATION USAGE**

21378 To ensure applications portability, especially across natural languages, only this function and  
21379 those listed in the SEE ALSO section should be used for classification of wide-character codes.

21380 **RATIONALE**

21381 None.

21382 **FUTURE DIRECTIONS**

21383 None.

21384 **SEE ALSO**

21385 *iswalnum()*, *iswcntrl()*, *iswctype()*, *iswdigit()*, *iswgraph()*, *iswlower()*, *iswprint()*, *iswpunct()*,  
21386 *iswspace()*, *iswupper()*, *iswxdigit()*, *setlocale()*, the Base Definitions volume of  
21387 IEEE Std 1003.1-2001, Chapter 7, Locale, <stdio.h>, <wchar.h>, <wctype.h>

21388 **CHANGE HISTORY**

21389 First released in Issue 4.

21390 **Issue 5**

21391 The following change has been made in this issue for alignment with  
21392 ISO/IEC 9899:1990/Amendment 1:1995 (E):

- 21393 • The SYNOPSIS has been changed to indicate that this function and associated data types are  
21394 now made visible by inclusion of the <wctype.h> header rather than <wchar.h>.

21395 **Issue 6**

21396 The DESCRIPTION is updated to avoid use of the term “must” for application requirements.

21397 **NAME**

21398           iswblank — test for a blank wide-character code

21399 **SYNOPSIS**

21400           #include <wctype.h>

21401           int iswblank(wint\_t wc);

21402 **DESCRIPTION**

21403 **CX**       The functionality described on this reference page is aligned with the ISO C standard. Any  
21404       conflict between the requirements described here and the ISO C standard is unintentional. This  
21405       volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

21406       The *iswblank()* function shall test whether *wc* is a wide-character code representing a character of  
21407       class **blank** in the program's current locale; see the Base Definitions volume of  
21408       IEEE Std 1003.1-2001, Chapter 7, Locale.

21409       The *wc* argument is a **wint\_t**, the value of which the application shall ensure is a wide-character  
21410       code corresponding to a valid character in the current locale, or equal to the value of the macro  
21411       WEOF. If the argument has any other value, the behavior is undefined.

21412 **RETURN VALUE**

21413       The *iswblank()* function shall return non-zero if *wc* is a blank wide-character code; otherwise, it  
21414       shall return 0.

21415 **ERRORS**

21416       No errors are defined.

21417 **EXAMPLES**

21418       None.

21419 **APPLICATION USAGE**

21420       To ensure applications portability, especially across natural languages, only this function and  
21421       those listed in the SEE ALSO section should be used for classification of wide-character codes.

21422 **RATIONALE**

21423       None.

21424 **FUTURE DIRECTIONS**

21425       None.

21426 **SEE ALSO**

21427       *iswalnum()*, *iswalpha()*, *iswcntrl()*, *iswctype()*, *iswdigit()*, *iswgraph()*, *iswlower()*, *iswprint()*,  
21428       *iswpunct()*, *iswspace()*, *iswupper()*, *iswxdigit()*, *setlocale()*, the Base Definitions volume of  
21429       IEEE Std 1003.1-2001, Chapter 7, Locale, <stdio.h>, <wchar.h>, <wctype.h>

21430 **CHANGE HISTORY**

21431       First released in Issue 6. Derived from the ISO/IEC 9899:1999 standard.

21432 **NAME**

21433 iswcntrl — test for a control wide-character code

21434 **SYNOPSIS**

21435 #include <wctype.h>

21436 int iswcntrl(wint\_t wc);

21437 **DESCRIPTION**

21438 **CX** The functionality described on this reference page is aligned with the ISO C standard. Any  
21439 conflict between the requirements described here and the ISO C standard is unintentional. This  
21440 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

21441 The *iswcntrl()* function shall test whether *wc* is a wide-character code representing a character of  
21442 class **cntrl** in the program's current locale; see the Base Definitions volume of  
21443 IEEE Std 1003.1-2001, Chapter 7, Locale.

21444 The *wc* argument is a **wint\_t**, the value of which the application shall ensure is a wide-character  
21445 code corresponding to a valid character in the current locale, or equal to the value of the macro  
21446 WEOF. If the argument has any other value, the behavior is undefined.

21447 **RETURN VALUE**

21448 The *iswcntrl()* function shall return non-zero if *wc* is a control wide-character code; otherwise, it  
21449 shall return 0.

21450 **ERRORS**

21451 No errors are defined.

21452 **EXAMPLES**

21453 None.

21454 **APPLICATION USAGE**

21455 To ensure applications portability, especially across natural languages, only this function and  
21456 those listed in the SEE ALSO section should be used for classification of wide-character codes.

21457 **RATIONALE**

21458 None.

21459 **FUTURE DIRECTIONS**

21460 None.

21461 **SEE ALSO**

21462 *iswalnum()*, *iswalpha()*, *iswctype()*, *iswdigit()*, *iswgraph()*, *iswlower()*, *iswprint()*, *iswpunct()*,  
21463 *iswspace()*, *iswupper()*, *iswxdigit()*, *setlocale()*, the Base Definitions volume of  
21464 IEEE Std 1003.1-2001, Chapter 7, Locale, <**wchar.h**>, <**wctype.h**>

21465 **CHANGE HISTORY**

21466 First released in Issue 4.

21467 **Issue 5**

21468 The following change has been made in this issue for alignment with  
21469 ISO/IEC 9899:1990/Amendment 1:1995 (E):

- 21470 • The SYNOPSIS has been changed to indicate that this function and associated data types are  
21471 now made visible by inclusion of the <**wctype.h**> header rather than <**wchar.h**>.

21472 **Issue 6**

21473 The DESCRIPTION is updated to avoid use of the term “must” for application requirements.

21474 **NAME**

21475 iswctype — test character for a specified class

21476 **SYNOPSIS**

21477 #include &lt;wctype.h&gt;

21478 int iswctype(wint\_t *wc*, wctype\_t *charclass*);21479 **DESCRIPTION**

21480 **CX** The functionality described on this reference page is aligned with the ISO C standard. Any  
 21481 conflict between the requirements described here and the ISO C standard is unintentional. This  
 21482 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

21483 The *iswctype()* function shall determine whether the wide-character code *wc* has the character  
 21484 class *charclass*, returning true or false. The *iswctype()* function is defined on WEOF and wide-  
 21485 character codes corresponding to the valid character encodings in the current locale. If the *wc*  
 21486 argument is not in the domain of the function, the result is undefined. If the value of *charclass* is  
 21487 invalid (that is, not obtained by a call to *wctype()* or *charclass* is invalidated by a subsequent call  
 21488 to *setlocale()* that has affected category *LC\_CTYPE*) the result is unspecified.

21489 **RETURN VALUE**21490 The *iswctype()* function shall return non-zero (true) if and only if *wc* has the property described21491 **CX** by *charclass*. If *charclass* is 0, *iswctype()* shall return 0.21492 **ERRORS**

21493 No errors are defined.

21494 **EXAMPLES**21495 **Testing for a Valid Character**

```
21496 #include <wctype.h>
21497 ...
21498 int yes_or_no;
21499 wint_t wc;
21500 wctype_t valid_class;
21501 ...
21502 if ((valid_class=wctype("vowel")) == (wctype_t)0)
21503     /* Invalid character class. */
21504     yes_or_no=iswctype(wc,valid_class);
```

21505 **APPLICATION USAGE**

21506 The twelve strings "alnum", "alpha", "blank", "cntrl", "digit", "graph", "lower",  
 21507 "print", "punct", "space", "upper", and "xdigit" are reserved for the standard  
 21508 character classes. In the table below, the functions in the left column are equivalent to the  
 21509 functions in the right column.

|       |                     |                                      |
|-------|---------------------|--------------------------------------|
| 21510 | <i>iswalnum(wc)</i> | <i>iswctype(wc, wctype("alnum"))</i> |
| 21511 | <i>iswalpha(wc)</i> | <i>iswctype(wc, wctype("alpha"))</i> |
| 21512 | <i>iswblank(wc)</i> | <i>iswctype(wc, wctype("blank"))</i> |
| 21513 | <i>iswcntrl(wc)</i> | <i>iswctype(wc, wctype("cntrl"))</i> |
| 21514 | <i>iswdigit(wc)</i> | <i>iswctype(wc, wctype("digit"))</i> |
| 21515 | <i>iswgraph(wc)</i> | <i>iswctype(wc, wctype("graph"))</i> |
| 21516 | <i>iswlower(wc)</i> | <i>iswctype(wc, wctype("lower"))</i> |
| 21517 | <i>iswprint(wc)</i> | <i>iswctype(wc, wctype("print"))</i> |
| 21518 | <i>iswpunct(wc)</i> | <i>iswctype(wc, wctype("punct"))</i> |
| 21519 | <i>iswspace(wc)</i> | <i>iswctype(wc, wctype("space"))</i> |

21520            `iswupper(wc)`      `iswctype(wc, wctype("upper"))`  
21521            `iswxdigit(wc)`      `iswctype(wc, wctype("xdigit"))`

21522 **RATIONALE**

21523            None.

21524 **FUTURE DIRECTIONS**

21525            None.

21526 **SEE ALSO**

21527            `iswalnum()`, `iswalpha()`, `iswcntrl()`, `iswdigit()`, `iswgraph()`, `iswlower()`, `iswprint()`, `iswpunct()`,  
21528            `iswspace()`, `iswupper()`, `iswxdigit()`, `setlocale()`, `wctype()`, the Base Definitions volume of  
21529            IEEE Std 1003.1-2001, `<wchar.h>`, `<wctype.h>`

21530 **CHANGE HISTORY**

21531            First released as World-wide Portability Interfaces in Issue 4.

21532 **Issue 5**

21533            The following change has been made in this issue for alignment with  
21534            ISO/IEC 9899:1990/Amendment 1:1995 (E):

- 21535            • The SYNOPSIS has been changed to indicate that this function and associated data types are  
21536            now made visible by inclusion of the `<wctype.h>` header rather than `<wchar.h>`.

21537 **Issue 6**

21538            The behavior of  $n=0$  is now described.

21539            An example is added.

21540            A new function, `iswblank()`, is added to the list in the APPLICATION USAGE.

21541 **NAME**

21542           iswdigit — test for a decimal digit wide-character code

21543 **SYNOPSIS**

21544           #include &lt;wctype.h&gt;

21545           int iswdigit(wint\_t wc);

21546 **DESCRIPTION**

21547 *cx*       The functionality described on this reference page is aligned with the ISO C standard. Any  
 21548 conflict between the requirements described here and the ISO C standard is unintentional. This  
 21549 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

21550       The *iswdigit()* function shall test whether *wc* is a wide-character code representing a character of  
 21551 class **digit** in the program's current locale; see the Base Definitions volume of  
 21552 IEEE Std 1003.1-2001, Chapter 7, Locale.

21553       The *wc* argument is a **wint\_t**, the value of which the application shall ensure is a wide-character  
 21554 code corresponding to a valid character in the current locale, or equal to the value of the macro  
 21555 WEOF. If the argument has any other value, the behavior is undefined.

21556 **RETURN VALUE**

21557       The *iswdigit()* function shall return non-zero if *wc* is a decimal digit wide-character code;  
 21558 otherwise, it shall return 0.

21559 **ERRORS**

21560       No errors are defined.

21561 **EXAMPLES**

21562       None.

21563 **APPLICATION USAGE**

21564       To ensure applications portability, especially across natural languages, only this function and  
 21565 those listed in the SEE ALSO section should be used for classification of wide-character codes.

21566 **RATIONALE**

21567       None.

21568 **FUTURE DIRECTIONS**

21569       None.

21570 **SEE ALSO**

21571       *iswalnum()*, *iswalpha()*, *iswcntrl()*, *iswctype()*, *iswgraph()*, *iswlower()*, *iswprint()*, *iswpunct()*,  
 21572 *iswspace()*, *iswupper()*, *iswxdigit()*, *setlocale()*, the Base Definitions volume of  
 21573 IEEE Std 1003.1-2001, Chapter 7, Locale, <**wchar.h**>, <**wctype.h**>

21574 **CHANGE HISTORY**

21575       First released in Issue 4.

21576 **Issue 5**

21577       The following change has been made in this issue for alignment with  
 21578 ISO/IEC 9899:1990/Amendment 1:1995 (E):

- 21579       • The SYNOPSIS has been changed to indicate that this function and associated data types are  
 21580 now made visible by inclusion of the <**wctype.h**> header rather than <**wchar.h**>.

21581 **Issue 6**

21582       The DESCRIPTION is updated to avoid use of the term “must” for application requirements.

21583 **NAME**

21584 iswgraph — test for a visible wide-character code

21585 **SYNOPSIS**

21586 #include <wctype.h>

21587 int iswgraph(wint\_t wc);

21588 **DESCRIPTION**

21589 cx The functionality described on this reference page is aligned with the ISO C standard. Any  
21590 conflict between the requirements described here and the ISO C standard is unintentional. This  
21591 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

21592 The *iswgraph()* function shall test whether *wc* is a wide-character code representing a character  
21593 of class **graph** in the program's current locale; see the Base Definitions volume of  
21594 IEEE Std 1003.1-2001, Chapter 7, Locale.

21595 The *wc* argument is a **wint\_t**, the value of which the application shall ensure is a wide-character  
21596 code corresponding to a valid character in the current locale, or equal to the value of the macro  
21597 WEOF. If the argument has any other value, the behavior is undefined.

21598 **RETURN VALUE**

21599 The *iswgraph()* function shall return non-zero if *wc* is a wide-character code with a visible  
21600 representation; otherwise, it shall return 0.

21601 **ERRORS**

21602 No errors are defined.

21603 **EXAMPLES**

21604 None.

21605 **APPLICATION USAGE**

21606 To ensure applications portability, especially across natural languages, only this function and  
21607 those listed in the SEE ALSO section should be used for classification of wide-character codes.

21608 **RATIONALE**

21609 None.

21610 **FUTURE DIRECTIONS**

21611 None.

21612 **SEE ALSO**

21613 *iswalnum()*, *iswalpha()*, *iswcntrl()*, *iswctype()*, *iswdigit()*, *iswlower()*, *iswprint()*, *iswpunct()*,  
21614 *iswspace()*, *iswupper()*, *iswxdigit()*, *setlocale()*, the Base Definitions volume of  
21615 IEEE Std 1003.1-2001, Chapter 7, Locale, <**wchar.h**>, <**wctype.h**>

21616 **CHANGE HISTORY**

21617 First released in Issue 4.

21618 **Issue 5**

21619 The following change has been made in this issue for alignment with  
21620 ISO/IEC 9899:1990/Amendment 1:1995 (E):

- 21621 • The SYNOPSIS has been changed to indicate that this function and associated data types are  
21622 now made visible by inclusion of the <**wctype.h**> header rather than <**wchar.h**>.

21623 **Issue 6**

21624 The DESCRIPTION is updated to avoid use of the term “must” for application requirements.

21625 **NAME**

21626           iswlower — test for a lowercase letter wide-character code

21627 **SYNOPSIS**

21628           #include <wctype.h>

21629           int iswlower(wint\_t wc);

21630 **DESCRIPTION**

21631 cx       The functionality described on this reference page is aligned with the ISO C standard. Any  
21632 conflict between the requirements described here and the ISO C standard is unintentional. This  
21633 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

21634       The *iswlower()* function shall test whether *wc* is a wide-character code representing a character  
21635 of class **lower** in the program's current locale; see the Base Definitions volume of  
21636 IEEE Std 1003.1-2001, Chapter 7, Locale.

21637       The *wc* argument is a **wint\_t**, the value of which the application shall ensure is a wide-character  
21638 code corresponding to a valid character in the current locale, or equal to the value of the macro  
21639 WEOF. If the argument has any other value, the behavior is undefined.

21640 **RETURN VALUE**

21641       The *iswlower()* function shall return non-zero if *wc* is a lowercase letter wide-character code;  
21642 otherwise, it shall return 0.

21643 **ERRORS**

21644       No errors are defined.

21645 **EXAMPLES**

21646       None.

21647 **APPLICATION USAGE**

21648       To ensure applications portability, especially across natural languages, only this function and  
21649 those listed in the SEE ALSO section should be used for classification of wide-character codes.

21650 **RATIONALE**

21651       None.

21652 **FUTURE DIRECTIONS**

21653       None.

21654 **SEE ALSO**

21655       *iswalnum()*, *iswalpha()*, *iswcntrl()*, *iswctype()*, *iswdigit()*, *iswgraph()*, *iswprint()*, *iswpunct()*,  
21656 *iswspace()*, *iswupper()*, *iswxdigit()*, *setlocale()*, the Base Definitions volume of  
21657 IEEE Std 1003.1-2001, Chapter 7, Locale, <**wchar.h**>, <**wctype.h**>

21658 **CHANGE HISTORY**

21659       First released in Issue 4.

21660 **Issue 5**

21661       The following change has been made in this issue for alignment with  
21662 ISO/IEC 9899:1990/Amendment 1:1995 (E):

- 21663       • The SYNOPSIS has been changed to indicate that this function and associated data types are  
21664       now made visible by inclusion of the <**wctype.h**> header rather than <**wchar.h**>.

21665 **Issue 6**

21666       The DESCRIPTION is updated to avoid use of the term “must” for application requirements.

21667 **NAME**

21668           iswprint — test for a printable wide-character code

21669 **SYNOPSIS**

21670           #include <wctype.h>

21671           int iswprint(wint\_t wc);

21672 **DESCRIPTION**

21673 **CX**       The functionality described on this reference page is aligned with the ISO C standard. Any  
21674 conflict between the requirements described here and the ISO C standard is unintentional. This  
21675 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

21676       The *iswprint()* function shall test whether *wc* is a wide-character code representing a character of  
21677 class **print** in the program's current locale; see the Base Definitions volume of  
21678 IEEE Std 1003.1-2001, Chapter 7, Locale.

21679       The *wc* argument is a **wint\_t**, the value of which the application shall ensure is a wide-character  
21680 code corresponding to a valid character in the current locale, or equal to the value of the macro  
21681 WEOF. If the argument has any other value, the behavior is undefined.

21682 **RETURN VALUE**

21683       The *iswprint()* function shall return non-zero if *wc* is a printable wide-character code; otherwise,  
21684 it shall return 0.

21685 **ERRORS**

21686       No errors are defined.

21687 **EXAMPLES**

21688       None.

21689 **APPLICATION USAGE**

21690       To ensure applications portability, especially across natural languages, only this function and  
21691 those listed in the SEE ALSO section should be used for classification of wide-character codes.

21692 **RATIONALE**

21693       None.

21694 **FUTURE DIRECTIONS**

21695       None.

21696 **SEE ALSO**

21697       *iswalnum()*, *iswalpha()*, *iswcntrl()*, *iswctype()*, *iswdigit()*, *iswgraph()*, *iswlower()*, *iswpunct()*,  
21698 *iswspace()*, *iswupper()*, *iswxdigit()*, *setlocale()*, the Base Definitions volume of  
21699 IEEE Std 1003.1-2001, Chapter 7, Locale, <**wchar.h**>, <**wctype.h**>

21700 **CHANGE HISTORY**

21701       First released in Issue 4.

21702 **Issue 5**

21703       The following change has been made in this issue for alignment with  
21704 ISO/IEC 9899:1990/Amendment 1:1995 (E):

- 21705       • The SYNOPSIS has been changed to indicate that this function and associated data types are  
21706       now made visible by inclusion of the <**wctype.h**> header rather than <**wchar.h**>.

21707 **Issue 6**

21708       The DESCRIPTION is updated to avoid use of the term “must” for application requirements.

21709 **NAME**

21710 iswpunct — test for a punctuation wide-character code

21711 **SYNOPSIS**

21712 #include &lt;wctype.h&gt;

21713 int iswpunct(wint\_t wc);

21714 **DESCRIPTION**

21715 **CX** The functionality described on this reference page is aligned with the ISO C standard. Any  
 21716 conflict between the requirements described here and the ISO C standard is unintentional. This  
 21717 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

21718 The *iswpunct()* function shall test whether *wc* is a wide-character code representing a character  
 21719 of class **punct** in the program's current locale; see the Base Definitions volume of  
 21720 IEEE Std 1003.1-2001, Chapter 7, Locale.

21721 The *wc* argument is a **wint\_t**, the value of which the application shall ensure is a wide-character  
 21722 code corresponding to a valid character in the current locale, or equal to the value of the macro  
 21723 WEOF. If the argument has any other value, the behavior is undefined.

21724 **RETURN VALUE**

21725 The *iswpunct()* function shall return non-zero if *wc* is a punctuation wide-character code;  
 21726 otherwise, it shall return 0.

21727 **ERRORS**

21728 No errors are defined.

21729 **EXAMPLES**

21730 None.

21731 **APPLICATION USAGE**

21732 To ensure applications portability, especially across natural languages, only this function and  
 21733 those listed in the SEE ALSO section should be used for classification of wide-character codes.

21734 **RATIONALE**

21735 None.

21736 **FUTURE DIRECTIONS**

21737 None.

21743 First released in Issue 4.

21744 **Issue 5**

21745 The following change has been made in this issue for alignment with  
 21746 ISO/IEC 9899:1990/Amendment 1:1995 (E):

- 21747 • The SYNOPSIS has been changed to indicate that this function and associated data types are  
 21748 now made visible by inclusion of the <**wctype.h**> header rather than <**wchar.h**>.

21749 **Issue 6**

21750 The DESCRIPTION is updated to avoid use of the term “must” for application requirements.

21751 **NAME**

21752           iswspace — test for a white-space wide-character code

21753 **SYNOPSIS**

21754           #include &lt;wctype.h&gt;

21755           int iswspace(wint\_t wc);

21756 **DESCRIPTION**

21757 **CX**       The functionality described on this reference page is aligned with the ISO C standard. Any  
 21758 conflict between the requirements described here and the ISO C standard is unintentional. This  
 21759 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

21760       The *iswspace()* function shall test whether *wc* is a wide-character code representing a character of  
 21761 class **space** in the program's current locale; see the Base Definitions volume of  
 21762 IEEE Std 1003.1-2001, Chapter 7, Locale.

21763       The *wc* argument is a **wint\_t**, the value of which the application shall ensure is a wide-character  
 21764 code corresponding to a valid character in the current locale, or equal to the value of the macro  
 21765 WEOF. If the argument has any other value, the behavior is undefined.

21766 **RETURN VALUE**

21767       The *iswspace()* function shall return non-zero if *wc* is a white-space wide-character code;  
 21768 otherwise, it shall return 0.

21769 **ERRORS**

21770       No errors are defined.

21771 **EXAMPLES**

21772       None.

21773 **APPLICATION USAGE**

21774       To ensure applications portability, especially across natural languages, only this function and  
 21775 those listed in the SEE ALSO section should be used for classification of wide-character codes.

21776 **RATIONALE**

21777       None.

21778 **FUTURE DIRECTIONS**

21779       None.

21780 **SEE ALSO**

 21782 *iswpunct()*, *iswupper()*, *iswxdigit()*, *setlocale()*, the Base Definitions volume of  
 21783 IEEE Std 1003.1-2001, Chapter 7, Locale, <**wchar.h**>, <**wctype.h**>

21784 **CHANGE HISTORY**

21785       First released in Issue 4.

21786 **Issue 5**

21787       The following change has been made in this issue for alignment with  
 21788 ISO/IEC 9899:1990/Amendment 1:1995 (E):

- 21789       • The SYNOPSIS has been changed to indicate that this function and associated data types are  
 21790 now made visible by inclusion of the <**wctype.h**> header rather than <**wchar.h**>.

21791 **Issue 6**

21792       The DESCRIPTION is updated to avoid use of the term “must” for application requirements.

21793 **NAME**

21794 iswupper — test for an uppercase letter wide-character code

21795 **SYNOPSIS**

21796 #include &lt;wctype.h&gt;

21797 int iswupper(wint\_t wc);

21798 **DESCRIPTION**

21799 cx The functionality described on this reference page is aligned with the ISO C standard. Any  
 21800 conflict between the requirements described here and the ISO C standard is unintentional. This  
 21801 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

21802 The *iswupper()* function shall test whether *wc* is a wide-character code representing a character  
 21803 of class **upper** in the program's current locale; see the Base Definitions volume of  
 21804 IEEE Std 1003.1-2001, Chapter 7, Locale.

21805 The *wc* argument is a **wint\_t**, the value of which the application shall ensure is a wide-character  
 21806 code corresponding to a valid character in the current locale, or equal to the value of the macro  
 21807 WEOF. If the argument has any other value, the behavior is undefined.

21808 **RETURN VALUE**

21809 The *iswupper()* function shall return non-zero if *wc* is an uppercase letter wide-character code;  
 21810 otherwise, it shall return 0.

21811 **ERRORS**

21812 No errors are defined.

21813 **EXAMPLES**

21814 None.

21815 **APPLICATION USAGE**

21816 To ensure applications portability, especially across natural languages, only this function and  
 21817 those listed in the SEE ALSO section should be used for classification of wide-character codes.

21818 **RATIONALE**

21819 None.

21820 **FUTURE DIRECTIONS**

21821 None.

21822 **SEE ALSO**

21823 *iswalnum()*, *iswalpha()*, *iswcntrl()*, *iswctype()*, *iswdigit()*, *iswgraph()*, *iswlower()*, *iswprint()*,  
 21824 *iswpunct()*, *iswspace()*, *iswxdigit()*, *setlocale()*, the Base Definitions volume of  
 21825 IEEE Std 1003.1-2001, Chapter 7, Locale, <**wchar.h**>, <**wctype.h**>

21826 **CHANGE HISTORY**

21827 First released in Issue 4.

21828 **Issue 5**

21829 The following change has been made in this issue for alignment with  
 21830 ISO/IEC 9899:1990/Amendment 1:1995 (E):

- 21831 • The SYNOPSIS has been changed to indicate that this function and associated data types are  
 21832 now made visible by inclusion of the <**wctype.h**> header rather than <**wchar.h**>.

21833 **Issue 6**

21834 The DESCRIPTION is updated to avoid use of the term “must” for application requirements.

21835 **NAME**

21836 iswxdigit — test for a hexadecimal digit wide-character code

21837 **SYNOPSIS**

21838 #include <wctype.h>

21839 int iswxdigit(wint\_t wc);

21840 **DESCRIPTION**

21841 cx The functionality described on this reference page is aligned with the ISO C standard. Any  
21842 conflict between the requirements described here and the ISO C standard is unintentional. This  
21843 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

21844 The *iswxdigit()* function shall test whether *wc* is a wide-character code representing a character  
21845 of class **xdigit** in the program's current locale; see the Base Definitions volume of  
21846 IEEE Std 1003.1-2001, Chapter 7, Locale.

21847 The *wc* argument is a **wint\_t**, the value of which the application shall ensure is a wide-character  
21848 code corresponding to a valid character in the current locale, or equal to the value of the macro  
21849 WEOF. If the argument has any other value, the behavior is undefined.

21850 **RETURN VALUE**

21851 The *iswxdigit()* function shall return non-zero if *wc* is a hexadecimal digit wide-character code;  
21852 otherwise, it shall return 0.

21853 **ERRORS**

21854 No errors are defined.

21855 **EXAMPLES**

21856 None.

21857 **APPLICATION USAGE**

21858 To ensure applications portability, especially across natural languages, only this function and  
21859 those listed in the SEE ALSO section should be used for classification of wide-character codes.

21860 **RATIONALE**

21861 None.

21862 **FUTURE DIRECTIONS**

21863 None.

21864 **SEE ALSO**

21865 *iswalnum()*, *iswalpha()*, *iswcntrl()*, *iswctype()*, *iswdigit()*, *iswgraph()*, *iswlower()*, *iswprint()*,  
21866 *iswpunct()*, *iswspace()*, *iswupper()*, *setlocale()*, the Base Definitions volume of  
21867 IEEE Std 1003.1-2001, Chapter 7, Locale, <**wchar.h**>, <**wctype.h**>

21868 **CHANGE HISTORY**

21869 First released in Issue 4.

21870 **Issue 5**

21871 The following change has been made in this issue for alignment with  
21872 ISO/IEC 9899:1990/Amendment 1:1995 (E):

- 21873 • The SYNOPSIS has been changed to indicate that this function and associated data types are  
21874 now made visible by inclusion of the <**wctype.h**> header rather than <**wchar.h**>.

21875 **Issue 6**

21876 The DESCRIPTION is updated to avoid use of the term “must” for application requirements.

21877 **NAME**

21878 isxdigit — test for a hexadecimal digit

21879 **SYNOPSIS**

21880 #include <ctype.h>

21881 int isxdigit(int c);

21882 **DESCRIPTION**

21883 cx The functionality described on this reference page is aligned with the ISO C standard. Any  
21884 conflict between the requirements described here and the ISO C standard is unintentional. This  
21885 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

21886 The *isxdigit()* function shall test whether *c* is a character of class **xdigit** in the program's current  
21887 locale; see the Base Definitions volume of IEEE Std 1003.1-2001, Chapter 7, Locale.

21888 The *c* argument is an **int**, the value of which the application shall ensure is a character  
21889 representable as an **unsigned char** or equal to the value of the macro EOF. If the argument has  
21890 any other value, the behavior is undefined.

21891 **RETURN VALUE**

21892 The *isxdigit()* function shall return non-zero if *c* is a hexadecimal digit; otherwise, it shall return  
21893 0.

21894 **ERRORS**

21895 No errors are defined.

21896 **EXAMPLES**

21897 None.

21898 **APPLICATION USAGE**

21899 To ensure applications portability, especially across natural languages, only this function and  
21900 those listed in the SEE ALSO section should be used for character classification.

21901 **RATIONALE**

21902 None.

21903 **FUTURE DIRECTIONS**

21904 None.

21905 **SEE ALSO**

21906 *isalnum()*, *isalpha()*, *iscntrl()*, *isdigit()*, *isgraph()*, *islower()*, *isprint()*, *ispunct()*, *isspace()*, *isupper()*,  
21907 the Base Definitions volume of IEEE Std 1003.1-2001, Chapter 7, Locale, <ctype.h>

21908 **CHANGE HISTORY**

21909 First released in Issue 1. Derived from Issue 1 of the SVID.

21910 **Issue 6**

21911 The DESCRIPTION is updated to avoid use of the term “must” for application requirements.

21912 **NAME**

21913           j0, j1, jn — Bessel functions of the first kind

21914 **SYNOPSIS**

```
21915 xSI       #include <math.h>
21916           double j0(double x);
21917           double j1(double x);
21918           double jn(int n, double x);
21919
```

21920 **DESCRIPTION**

21921           The *j0()*, *j1()*, and *jn()* functions shall compute Bessel functions of *x* of the first kind of orders 0, 1, and *n*, respectively.

21923           An application wishing to check for error situations should set *errno* to zero and call *feclearexcept*(*FE\_ALL\_EXCEPT*) before calling these functions. On return, if *errno* is non-zero or *fetestexcept*(*FE\_INVALID* | *FE\_DIVBYZERO* | *FE\_OVERFLOW* | *FE\_UNDERFLOW*) is non-zero, an error has occurred.

21927 **RETURN VALUE**

21928           Upon successful completion, these functions shall return the relevant Bessel value of *x* of the first kind.

21930           If the *x* argument is too large in magnitude, or the correct result would cause underflow, 0 shall be returned and a range error may occur.

21932           If *x* is NaN, a NaN shall be returned.

21933 **ERRORS**

21934           These functions may fail if:

21935           Range Error       The value of *x* was too large in magnitude, or an underflow occurred.

21936                               If the integer expression (*math\_errhandling* & *MATH\_ERRNO*) is non-zero, then *errno* shall be set to [ERANGE]. If the integer expression (*math\_errhandling* & *MATH\_ERREXCEPT*) is non-zero, then the underflow floating-point exception shall be raised.

21940           No other errors shall occur.

21941 **EXAMPLES**

21942           None.

21943 **APPLICATION USAGE**

21944           On error, the expressions (*math\_errhandling* & *MATH\_ERRNO*) and (*math\_errhandling* & *MATH\_ERREXCEPT*) are independent of each other, but at least one of them must be non-zero.

21946 **RATIONALE**

21947           None.

21948 **FUTURE DIRECTIONS**

21949           None.

21950 **SEE ALSO**

21951           *feclearexcept()*, *fetestexcept()*, *isnan()*, *y0()*, the Base Definitions volume of IEEE Std 1003.1-2001, Section 4.18, Treatment of Error Conditions for Mathematical Functions, <**math.h**>

21953 **CHANGE HISTORY**

21954 First released in Issue 1. Derived from Issue 1 of the SVID.

21955 **Issue 5**

21956 The DESCRIPTION is updated to indicate how an application should check for an error. This  
21957 text was previously published in the APPLICATION USAGE section.

21958 **Issue 6**

21959 The may fail [EDOM] error is removed for the case for NaN.

21960 The RETURN VALUE and ERRORS sections are reworked for alignment of the error handling  
21961 with the ISO/IEC 9899:1999 standard.

21962 **NAME**

21963           jrand48 — generate a uniformly distributed pseudo-random long signed integer

21964 **SYNOPSIS**

21965 xSI       #include <stdlib.h>

21966           long jrand48(unsigned short xsubi[3]);

21967

21968 **DESCRIPTION**

21969           Refer to *drand48()*.

21970 **NAME**

21971 kill — send a signal to a process or a group of processes

21972 **SYNOPSIS**

21973 cx #include &lt;signal.h&gt;

21974 int kill(pid\_t pid, int sig);

21975

21976 **DESCRIPTION**

21977 The *kill()* function shall send a signal to a process or a group of processes specified by *pid*. The  
 21978 signal to be sent is specified by *sig* and is either one from the list given in <signal.h> or 0. If *sig* is  
 21979 0 (the null signal), error checking is performed but no signal is actually sent. The null signal can  
 21980 be used to check the validity of *pid*.

21981 For a process to have permission to send a signal to a process designated by *pid*, unless the  
 21982 sending process has appropriate privileges, the real or effective user ID of the sending process  
 21983 shall match the real or saved set-user-ID of the receiving process.

21984 If *pid* is greater than 0, *sig* shall be sent to the process whose process ID is equal to *pid*.

21985 If *pid* is 0, *sig* shall be sent to all processes (excluding an unspecified set of system processes)  
 21986 whose process group ID is equal to the process group ID of the sender, and for which the  
 21987 process has permission to send a signal.

21988 If *pid* is -1, *sig* shall be sent to all processes (excluding an unspecified set of system processes) for  
 21989 which the process has permission to send that signal.

21990 If *pid* is negative, but not -1, *sig* shall be sent to all processes (excluding an unspecified set of  
 21991 system processes) whose process group ID is equal to the absolute value of *pid*, and for which  
 21992 the process has permission to send a signal.

21993 If the value of *pid* causes *sig* to be generated for the sending process, and if *sig* is not blocked for  
 21994 the calling thread and if no other thread has *sig* unblocked or is waiting in a *sigwait()* function  
 21995 for *sig*, either *sig* or at least one pending unblocked signal shall be delivered to the sending  
 21996 thread before *kill()* returns.

21997 The user ID tests described above shall not be applied when sending SIGCONT to a process that  
 21998 is a member of the same session as the sending process.

21999 An implementation that provides extended security controls may impose further  
 22000 implementation-defined restrictions on the sending of signals, including the null signal. In  
 22001 particular, the system may deny the existence of some or all of the processes specified by *pid*.

22002 The *kill()* function is successful if the process has permission to send *sig* to any of the processes  
 22003 specified by *pid*. If *kill()* fails, no signal shall be sent.

22004 **RETURN VALUE**

22005 Upon successful completion, 0 shall be returned. Otherwise, -1 shall be returned and *errno* set to  
 22006 indicate the error.

22007 **ERRORS**

22008 The *kill()* function shall fail if:

22009 [EINVAL] The value of the *sig* argument is an invalid or unsupported signal number.

22010 [EPERM] The process does not have permission to send the signal to any receiving  
 22011 process.

22012 [ESRCH] No process or process group can be found corresponding to that specified by  
 22013 *pid*.

22014 **EXAMPLES**

22015 None.

22016 **APPLICATION USAGE**

22017 None.

22018 **RATIONALE**

22019 The semantics for permission checking for *kill()* differed between System V and most other  
 22020 implementations, such as Version 7 or 4.3 BSD. The semantics chosen for this volume of  
 22021 IEEE Std 1003.1-2001 agree with System V. Specifically, a set-user-ID process cannot protect  
 22022 itself against signals (or at least not against SIGKILL) unless it changes its real user ID. This  
 22023 choice allows the user who starts an application to send it signals even if it changes its effective  
 22024 user ID. The other semantics give more power to an application that wants to protect itself from  
 22025 the user who ran it.

22026 Some implementations provide semantic extensions to the *kill()* function when the absolute  
 22027 value of *pid* is greater than some maximum, or otherwise special, value. Negative values are a  
 22028 flag to *kill()*. Since most implementations return [ESRCH] in this case, this behavior is not  
 22029 included in this volume of IEEE Std 1003.1-2001, although a conforming implementation could  
 22030 provide such an extension.

22031 The implementation-defined processes to which a signal cannot be sent may include the  
 22032 scheduler or *init*.

22033 There was initially strong sentiment to specify that, if *pid* specifies that a signal be sent to the  
 22034 calling process and that signal is not blocked, that signal would be delivered before *kill()*  
 22035 returns. This would permit a process to call *kill()* and be guaranteed that the call never return.  
 22036 However, historical implementations that provide only the *signal()* function make only the  
 22037 weaker guarantee in this volume of IEEE Std 1003.1-2001, because they only deliver one signal  
 22038 each time a process enters the kernel. Modifications to such implementations to support the  
 22039 *sigaction()* function generally require entry to the kernel following return from a signal-catching  
 22040 function, in order to restore the signal mask. Such modifications have the effect of satisfying the  
 22041 stronger requirement, at least when *sigaction()* is used, but not necessarily when *signal()* is used.  
 22042 The developers of this volume of IEEE Std 1003.1-2001 considered making the stronger  
 22043 requirement except when *signal()* is used, but felt this would be unnecessarily complex.  
 22044 Implementors are encouraged to meet the stronger requirement whenever possible. In practice,  
 22045 the weaker requirement is the same, except in the rare case when two signals arrive during a  
 22046 very short window. This reasoning also applies to a similar requirement for *sigprocmask()*.

22047 In 4.2 BSD, the SIGCONT signal can be sent to any descendant process regardless of user-ID  
 22048 security checks. This allows a job control shell to continue a job even if processes in the job have  
 22049 altered their user IDs (as in the *su* command). In keeping with the addition of the concept of  
 22050 sessions, similar functionality is provided by allowing the SIGCONT signal to be sent to any  
 22051 process in the same session regardless of user ID security checks. This is less restrictive than BSD  
 22052 in the sense that ancestor processes (in the same session) can now be the recipient. It is more  
 22053 restrictive than BSD in the sense that descendant processes that form new sessions are now  
 22054 subject to the user ID checks. A similar relaxation of security is not necessary for the other job  
 22055 control signals since those signals are typically sent by the terminal driver in recognition of  
 22056 special characters being typed; the terminal driver bypasses all security checks.

22057 In secure implementations, a process may be restricted from sending a signal to a process having  
 22058 a different security label. In order to prevent the existence or nonexistence of a process from  
 22059 being used as a covert channel, such processes should appear nonexistent to the sender; that is,  
 22060 [ESRCH] should be returned, rather than [EPERM], if *pid* refers only to such processes.

22061 Existing implementations vary on the result of a *kill()* with *pid* indicating an inactive process (a  
 22062 terminated process that has not been waited for by its parent). Some indicate success on such a  
 22063 call (subject to permission checking), while others give an error of [ESRCH]. Since the definition  
 22064 of process lifetime in this volume of IEEE Std 1003.1-2001 covers inactive processes, the  
 22065 [ESRCH] error as described is inappropriate in this case. In particular, this means that an  
 22066 application cannot have a parent process check for termination of a particular child with *kill()*.  
 22067 (Usually this is done with the null signal; this can be done reliably with *waitpid()*.)

22068 There is some belief that the name *kill()* is misleading, since the function is not always intended  
 22069 to cause process termination. However, the name is common to all historical implementations,  
 22070 and any change would be in conflict with the goal of minimal changes to existing application  
 22071 code.

#### 22072 FUTURE DIRECTIONS

22073 None.

#### 22074 SEE ALSO

22075 *getpid()*, *raise()*, *setsid()*, *sigaction()*, *sigqueue()*, the Base Definitions volume of  
 22076 IEEE Std 1003.1-2001, <signal.h>, <sys/types.h>

#### 22077 CHANGE HISTORY

22078 First released in Issue 1. Derived from Issue 1 of the SVID.

#### 22079 Issue 5

22080 The DESCRIPTION is updated for alignment with the POSIX Threads Extension.

#### 22081 Issue 6

22082 In the SYNOPSIS, the optional include of the <sys/types.h> header is removed.

22083 The following new requirements on POSIX implementations derive from alignment with the  
 22084 Single UNIX Specification:

- 22085 • In the DESCRIPTION, the second paragraph is reworded to indicate that the saved set-user-  
 22086 ID of the calling process is checked in place of its effective user ID. This is a FIPS  
 22087 requirement.
- 22088 • The requirement to include <sys/types.h> has been removed. Although <sys/types.h> was  
 22089 required for conforming implementations of previous POSIX specifications, it was not  
 22090 required for UNIX applications.
- 22091 • The behavior when *pid* is  $-1$  is now specified. It was previously explicitly unspecified in the  
 22092 POSIX.1-1988 standard.

22093 The DESCRIPTION is updated to avoid use of the term “must” for application requirements.

22094 **NAME**

22095 killpg — send a signal to a process group

22096 **SYNOPSIS**

22097 XSI #include <signal.h>

22098 int killpg(pid\_t pgrp, int sig);

22099

22100 **DESCRIPTION**

22101 The *killpg()* function shall send the signal specified by *sig* to the process group specified by *pgrp*.

22102 If *pgrp* is greater than 1, *killpg(pgrp, sig)* shall be equivalent to *kill(-pgrp, sig)*. If *pgrp* is less than or  
22103 equal to 1, the behavior of *killpg()* is undefined.

22104 **RETURN VALUE**

22105 Refer to *kill()*.

22106 **ERRORS**

22107 Refer to *kill()*.

22108 **EXAMPLES**

22109 None.

22110 **APPLICATION USAGE**

22111 None.

22112 **RATIONALE**

22113 None.

22114 **FUTURE DIRECTIONS**

22115 None.

22116 **SEE ALSO**

22117 *getpgid()*, *getpid()*, *kill()*, *raise()*, the Base Definitions volume of IEEE Std 1003.1-2001, <**signal.h**>

22118 **CHANGE HISTORY**

22119 First released in Issue 4, Version 2.

22120 **Issue 5**

22121 Moved from X/OPEN UNIX extension to BASE.

22122 **NAME**

22123        l64a — convert a 32-bit integer to a radix-64 ASCII string

22124 **SYNOPSIS**

22125 xSI     #include &lt;stdlib.h&gt;

22126        char \*l64a(long value);

22127

22128 **DESCRIPTION**22129        Refer to *a64l()*.

## 22130 NAME

22131 labs, llabs — return a long integer absolute value

## 22132 SYNOPSIS

22133 #include <stdlib.h>

22134 long labs(long *i*);

22135 long long llabs(long long *i*);

## 22136 DESCRIPTION

22137 **CX** The functionality described on this reference page is aligned with the ISO C standard. Any  
22138 conflict between the requirements described here and the ISO C standard is unintentional. This  
22139 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

22140 The *labs()* function shall compute the absolute value of the **long** integer operand *i*. The *llabs()*  
22141 function shall compute the absolute value of the **long long** integer operand *i*. If the result cannot  
22142 be represented, the behavior is undefined.

## 22143 RETURN VALUE

22144 The *labs()* function shall return the absolute value of the **long** integer operand. The *llabs()*  
22145 function shall return the absolute value of the **long long** integer operand.

## 22146 ERRORS

22147 No errors are defined.

## 22148 EXAMPLES

22149 None.

## 22150 APPLICATION USAGE

22151 None.

## 22152 RATIONALE

22153 None.

## 22154 FUTURE DIRECTIONS

22155 None.

## 22156 SEE ALSO

22157 *abs()*, the Base Definitions volume of IEEE Std 1003.1-2001, <stdlib.h>

## 22158 CHANGE HISTORY

22159 First released in Issue 4. Derived from the ISO C standard.

## 22160 Issue 6

22161 The *llabs()* function is added for alignment with the ISO/IEC 9899:1999 standard.

22162 **NAME**

22163 lchown — change the owner and group of a symbolic link

22164 **SYNOPSIS**

22165 xSI #include &lt;unistd.h&gt;

22166 int lchown(const char \*path, uid\_t owner, gid\_t group);

22167

22168 **DESCRIPTION**

22169 The *lchown()* function shall be equivalent to *chown()*, except in the case where the named file is a  
 22170 symbolic link. In this case, *lchown()* shall change the ownership of the symbolic link file itself,  
 22171 while *chown()* changes the ownership of the file or directory to which the symbolic link refers.

22172 **RETURN VALUE**

22173 Upon successful completion, *lchown()* shall return 0. Otherwise, it shall return -1 and set *errno* to  
 22174 indicate an error.

22175 **ERRORS**22176 The *lchown()* function shall fail if:22177 [EACCES] Search permission is denied on a component of the path prefix of *path*.

22178 [EINVAL] The owner or group ID is not a value supported by the implementation.

22179 [ELOOP] A loop exists in symbolic links encountered during resolution of the *path*  
 22180 argument.

22181 [ENAMETOOLONG]

22182 The length of a pathname exceeds {PATH\_MAX} or a pathname component is  
 22183 longer than {NAME\_MAX}.

22184 [ENOENT] A component of *path* does not name an existing file or *path* is an empty string.22185 [ENOTDIR] A component of the path prefix of *path* is not a directory.

22186 [EOPNOTSUPP] The *path* argument names a symbolic link and the implementation does not  
 22187 support setting the owner or group of a symbolic link.

22188 [EPERM] The effective user ID does not match the owner of the file and the process  
 22189 does not have appropriate privileges.

22190 [EROFS] The file resides on a read-only file system.

22191 The *lchown()* function may fail if:

22192 [EIO] An I/O error occurred while reading or writing to the file system.

22193 [EINTR] A signal was caught during execution of the function.

22194 [ELOOP] More than {SYMLOOP\_MAX} symbolic links were encountered during  
 22195 resolution of the *path* argument.

22196 [ENAMETOOLONG]

22197 Pathname resolution of a symbolic link produced an intermediate result  
 22198 whose length exceeds {PATH\_MAX}.

22199 **EXAMPLES**22200 **Changing the Current Owner of a File**

22201 The following example shows how to change the ownership of the symbolic link named  
22202 **/modules/pass1** to the user ID associated with “jones” and the group ID associated with “cnd”.

22203 The numeric value for the user ID is obtained by using the *getpwnam()* function. The numeric  
22204 value for the group ID is obtained by using the *getgrnam()* function.

```
22205 #include <sys/types.h>
22206 #include <unistd.h>
22207 #include <pwd.h>
22208 #include <grp.h>

22209 struct passwd *pwd;
22210 struct group *grp;
22211 char *path = "/modules/pass1";
22212 ...
22213 pwd = getpwnam("jones");
22214 grp = getgrnam("cnd");
22215 lchown(path, pwd->pw_uid, grp->gr_gid);
```

22216 **APPLICATION USAGE**

22217 On implementations which support symbolic links as directory entries rather than files, *lchown()*  
22218 may fail.

22219 **RATIONALE**

22220 None.

22221 **FUTURE DIRECTIONS**

22222 None.

22223 **SEE ALSO**

22224 *chown()*, *symlink()*, the Base Definitions volume of IEEE Std 1003.1-2001, **<unistd.h>**

22225 **CHANGE HISTORY**

22226 First released in Issue 4, Version 2.

22227 **Issue 5**

22228 Moved from X/OPEN UNIX extension to BASE.

22229 **Issue 6**

22230 The wording of the mandatory [ELOOP] error condition is updated, and a second optional  
22231 [ELOOP] error condition is added.

22232 The Open Group Base Resolution bwg2001-013 is applied, adding wording to the  
22233 APPLICATION USAGE.

22234 **NAME**

22235        lcong48 — seed a uniformly distributed pseudo-random signed long integer generator

22236 **SYNOPSIS**

22237 XSI        #include <stdlib.h>

22238        void lcong48(unsigned short param[7]);

22239

22240 **DESCRIPTION**

22241        Refer to *drand48()*.

22242 **NAME**

22243 ldexp, ldexpf, ldexpl — load exponent of a floating-point number

22244 **SYNOPSIS**

22245 #include &lt;math.h&gt;

22246 double ldexp(double x, int exp);

22247 float ldexpf(float x, int exp);

22248 long double ldexpl(long double x, int exp);

22249 **DESCRIPTION**

22250 **CX** The functionality described on this reference page is aligned with the ISO C standard. Any  
 22251 conflict between the requirements described here and the ISO C standard is unintentional. This  
 22252 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

22253 These functions shall compute the quantity  $x * 2^{exp}$ .

22254 An application wishing to check for error situations should set *errno* to zero and call  
 22255 *feclearexcept*(FE\_ALL\_EXCEPT) before calling these functions. On return, if *errno* is non-zero or  
 22256 *fetestexcept*(FE\_INVALID | FE\_DIVBYZERO | FE\_OVERFLOW | FE\_UNDERFLOW) is non-  
 22257 zero, an error has occurred.

22258 **RETURN VALUE**22259 Upon successful completion, these functions shall return *x* multiplied by 2, raised to the power  
22260 *exp*.

22261 If these functions would cause overflow, a range error shall occur and *ldexp*(*x*), *ldexpf*(*x*), and  
 22262 *ldexpl*(*x*) shall return ±HUGE\_VAL, ±HUGE\_VALF, and ±HUGE\_VALL (according to the sign of  
 22263 *x*), respectively.

22264 If the correct value would cause underflow, and is not representable, a range error may occur,  
 22265 **MX** and either 0.0 (if supported), or an implementation-defined value shall be returned.

22266 **MX** If *x* is NaN, a NaN shall be returned.22267 If *x* is ±0 or ±Inf, *x* shall be returned.22268 If *exp* is 0, *x* shall be returned.

22269 If the correct value would cause underflow, and is representable, a range error may occur and  
 22270 the correct value shall be returned.

22271 **ERRORS**

22272 These functions shall fail if:

22273 **Range Error** The result overflows.

22274 If the integer expression (math\_errhandling & MATH\_ERRNO) is non-zero,  
 22275 then *errno* shall be set to [ERANGE]. If the integer expression  
 22276 (math\_errhandling & MATH\_ERREXCEPT) is non-zero, then the overflow  
 22277 floating-point exception shall be raised.

22278 These functions may fail if:

22279 **Range Error** The result underflows.

22280 If the integer expression (math\_errhandling & MATH\_ERRNO) is non-zero,  
 22281 then *errno* shall be set to [ERANGE]. If the integer expression  
 22282 (math\_errhandling & MATH\_ERREXCEPT) is non-zero, then the underflow  
 22283 floating-point exception shall be raised.

22284 **EXAMPLES**

22285 None.

22286 **APPLICATION USAGE**

22287 On error, the expressions `(math_errhandling & MATH_ERRNO)` and `(math_errhandling &`  
22288 `MATH_ERREXCEPT)` are independent of each other, but at least one of them must be non-zero.

22289 **RATIONALE**

22290 None.

22291 **FUTURE DIRECTIONS**

22292 None.

22293 **SEE ALSO**

22295 IEEE Std 1003.1-2001, Section 4.18, Treatment of Error Conditions for Mathematical Functions,  
22296 `<math.h>`

22297 **CHANGE HISTORY**

22298 First released in Issue 1. Derived from Issue 1 of the SVID.

22299 **Issue 5**

22300 The DESCRIPTION is updated to indicate how an application should check for an error. This  
22301 text was previously published in the APPLICATION USAGE section.

22302 **Issue 6**

22303 The `ldexpf()` and `ldexpl()` functions are added for alignment with the ISO/IEC 9899:1999  
22304 standard.

22305 The DESCRIPTION, RETURN VALUE, ERRORS, and APPLICATION USAGE sections are  
22306 revised to align with the ISO/IEC 9899:1999 standard.

22307 IEC 60559:1989 standard floating-point extensions over the ISO/IEC 9899:1999 standard are  
22308 marked.

22309 **NAME**

22310 `ldiv`, `lldiv` — compute quotient and remainder of a long division

22311 **SYNOPSIS**

22312 `#include <stdlib.h>`

22313 `ldiv_t ldiv(long numer, long denom);`

22314 `lldiv_t lldiv(long long numer, long long denom);`

22315 **DESCRIPTION**

22316 **CX** The functionality described on this reference page is aligned with the ISO C standard. Any  
 22317 conflict between the requirements described here and the ISO C standard is unintentional. This  
 22318 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

22319 These functions shall compute the quotient and remainder of the division of the numerator  
 22320 *numer* by the denominator *denom*. If the division is inexact, the resulting quotient is the **long**  
 22321 integer (for the *ldiv()* function) or **long long** integer (for the *lldiv()* function) of lesser magnitude  
 22322 that is the nearest to the algebraic quotient. If the result cannot be represented, the behavior is  
 22323 undefined; otherwise, *quot \* denom + rem* shall equal *numer*.

22324 **RETURN VALUE**

22325 The *ldiv()* function shall return a structure of type **ldiv\_t**, comprising both the quotient and the  
 22326 remainder. The structure shall include the following members, in any order:

22327 `long quot; /* Quotient */`

22328 `long rem; /* Remainder */`

22329 The *lldiv()* function shall return a structure of type **lldiv\_t**, comprising both the quotient and the  
 22330 remainder. The structure shall include the following members, in any order:

22331 `long long quot; /* Quotient */`

22332 `long long rem; /* Remainder */`

22333 **ERRORS**

22334 No errors are defined.

22335 **EXAMPLES**

22336 None.

22337 **APPLICATION USAGE**

22338 None.

22339 **RATIONALE**

22340 None.

22341 **FUTURE DIRECTIONS**

22342 None.

22343 **SEE ALSO**

22344 *div()*, the Base Definitions volume of IEEE Std 1003.1-2001, `<stdlib.h>`

22345 **CHANGE HISTORY**

22346 First released in Issue 4. Derived from the ISO C standard.

22347 **Issue 6**

22348 The *lldiv()* function is added for alignment with the ISO/IEC 9899:1999 standard.

22349 **NAME**

22350 lfind — find entry in a linear search table

22351 **SYNOPSIS**

22352 XSI #include &lt;search.h&gt;

22353 void \*lfind(const void \*key, const void \*base, size\_t \*nelp,  
22354 size\_t width, int (\*compar)(const void \*, const void \*));  
2235522356 **DESCRIPTION**22357 Refer to *lsearch()*.

## 22358 NAME

22359 lgamma, lgammaf, lgammal — log gamma function

## 22360 SYNOPSIS

22361 #include &lt;math.h&gt;

22362 double lgamma(double x);

22363 float lgammaf(float x);

22364 long double lgammal(long double x);

22365 XSI extern int signgam;

22366

## 22367 DESCRIPTION

22368 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
 22369 conflict between the requirements described here and the ISO C standard is unintentional. This  
 22370 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

22371 These functions shall compute  $\log_e |\Gamma(x)|$  where  $\Gamma(x)$  is defined as  $\int_0^{\infty} e^{-t} t^{x-1} dt$ . The argument  $x$   
 22372 need not be a non-positive integer ( $\Gamma(x)$  is defined over the reals, except the non-positive  
 22373 integers).  
 22374

22375 XSI The sign of  $\Gamma(x)$  is returned in the external integer *signgam*.

22376 CX These functions need not be reentrant. A function that is not required to be reentrant is not  
 22377 required to be thread-safe.

22378 An application wishing to check for error situations should set *errno* to zero and call  
 22379 *feclearexcept*(FE\_ALL\_EXCEPT) before calling these functions. On return, if *errno* is non-zero or  
 22380 *fetestexcept*(FE\_INVALID | FE\_DIVBYZERO | FE\_OVERFLOW | FE\_UNDERFLOW) is non-  
 22381 zero, an error has occurred.

## 22382 RETURN VALUE

22383 Upon successful completion, these functions shall return the logarithmic gamma of  $x$ .

22384 If  $x$  is a non-positive integer, a pole error shall occur and *lgamma*(), *lgammaf*(), and *lgammal*()  
 22385 shall return +HUGE\_VAL, +HUGE\_VALF, and +HUGE\_VALL, respectively.

22386 If the correct value would cause overflow, a range error shall occur and *lgamma*(), *lgammaf*(),  
 22387 and *lgammal*() shall return ±HUGE\_VAL, ±HUGE\_VALF, and ±HUGE\_VALL (having the same  
 22388 sign as the correct value), respectively.

22389 MX If  $x$  is NaN, a NaN shall be returned.22390 If  $x$  is 1 or 2, +0 shall be returned.22391 If  $x$  is ±Inf, +Inf shall be returned.

## 22392 ERRORS

22393 These functions shall fail if:

22394 Pole Error The  $x$  argument is a negative integer or zero.

22395 If the integer expression (math\_errhandling & MATH\_ERRNO) is non-zero,  
 22396 then *errno* shall be set to [ERANGE]. If the integer expression  
 22397 (math\_errhandling & MATH\_ERREXCEPT) is non-zero, then the divide-by-  
 22398 zero floating-point exception shall be raised.

22399 Range Error The result overflows.

22400 If the integer expression (`math_errhandling & MATH_ERRNO`) is non-zero,  
22401 then *errno* shall be set to [ERANGE]. If the integer expression  
22402 (`math_errhandling & MATH_ERREXCEPT`) is non-zero, then the overflow  
22403 floating-point exception shall be raised.

22404 **EXAMPLES**

22405 None.

22406 **APPLICATION USAGE**

22407 On error, the expressions (`math_errhandling & MATH_ERRNO`) and (`math_errhandling &`  
22408 `MATH_ERREXCEPT`) are independent of each other, but at least one of them must be non-zero.

22409 **RATIONALE**

22410 None.

22411 **FUTURE DIRECTIONS**

22412 None.

22413 **SEE ALSO**

22414 *exp()*, *feclearexcept()*, *fetestexcept()*, *isnan()*, the Base Definitions volume of IEEE Std 1003.1-2001,  
22415 Section 4.18, Treatment of Error Conditions for Mathematical Functions, <**math.h**>

22416 **CHANGE HISTORY**

22417 First released in Issue 3.

22418 **Issue 5**

22419 The DESCRIPTION is updated to indicate how an application should check for an error. This  
22420 text was previously published in the APPLICATION USAGE section.

22421 A note indicating that this function need not be reentrant is added to the DESCRIPTION.

22422 **Issue 6**

22423 The *lgamma()* function is no longer marked as an extension.

22424 The *lgammaf()* and *lgammal()* functions are added for alignment with the ISO/IEC 9899:1999  
22425 standard.

22426 The DESCRIPTION, RETURN VALUE, ERRORS, and APPLICATION USAGE sections are  
22427 revised to align with the ISO/IEC 9899:1999 standard.

22428 IEC 60559:1989 standard floating-point extensions over the ISO/IEC 9899:1999 standard are  
22429 marked.

22430 XSI extensions are marked.

## 22431 NAME

22432 link — link to a file

## 22433 SYNOPSIS

22434 #include &lt;unistd.h&gt;

22435 int link(const char \*path1, const char \*path2);

## 22436 DESCRIPTION

22437 The *link()* function shall create a new link (directory entry) for the existing file, *path1*.22438 The *path1* argument points to a pathname naming an existing file. The *path2* argument points to  
22439 a pathname naming the new directory entry to be created. The *link()* function shall atomically  
22440 create a new link for the existing file and the link count of the file shall be incremented by one.22441 If *path1* names a directory, *link()* shall fail unless the process has appropriate privileges and the  
22442 implementation supports using *link()* on directories.22443 Upon successful completion, *link()* shall mark for update the *st\_ctime* field of the file. Also, the  
22444 *st\_ctime* and *st\_mtime* fields of the directory that contains the new entry shall be marked for  
22445 update.22446 If *link()* fails, no link shall be created and the link count of the file shall remain unchanged.22447 The implementation may require that the calling process has permission to access the existing  
22448 file.

## 22449 RETURN VALUE

22450 Upon successful completion, 0 shall be returned. Otherwise, -1 shall be returned and *errno* set to  
22451 indicate the error.

## 22452 ERRORS

22453 The *link()* function shall fail if:22454 [EACCES] A component of either path prefix denies search permission, or the requested  
22455 link requires writing in a directory that denies write permission, or the calling  
22456 process does not have permission to access the existing file and this is  
22457 required by the implementation.22458 [EEXIST] The *path2* argument resolves to an existing file or refers to a symbolic link.22459 [ELOOP] A loop exists in symbolic links encountered during resolution of the *path1* or  
22460 *path2* argument.22461 [EMLINK] The number of links to the file named by *path1* would exceed {LINK\_MAX}.

22462 [ENAMETOOLONG]

22463 The length of the *path1* or *path2* argument exceeds {PATH\_MAX} or a  
22464 pathname component is longer than {NAME\_MAX}.22465 [ENOENT] A component of either path prefix does not exist; the file named by *path1* does  
22466 not exist; or *path1* or *path2* points to an empty string.

22467 [ENOSPC] The directory to contain the link cannot be extended.

22468 [ENOTDIR] A component of either path prefix is not a directory.

22469 [EPERM] The file named by *path1* is a directory and either the calling process does not  
22470 have appropriate privileges or the implementation prohibits using *link()* on  
22471 directories.

- 22472 [EROFS] The requested link requires writing in a directory on a read-only file system.
- 22473 [EXDEV] The link named by *path2* and the file named by *path1* are on different file  
22474 systems and the implementation does not support links between file systems.
- 22475 XSR [EXDEV] *path1* refers to a named STREAM.
- 22476 The *link()* function may fail if:
- 22477 [ELOOP] More than {SYMLOOP\_MAX} symbolic links were encountered during  
22478 resolution of the *path1* or *path2* argument.
- 22479 [ENAMETOOLONG]  
22480 As a result of encountering a symbolic link in resolution of the *path1* or *path2*  
22481 argument, the length of the substituted pathname string exceeded  
22482 {PATH\_MAX}.

22483 **EXAMPLES**22484 **Creating a Link to a File**

22485 The following example shows how to create a link to a file named `/home/cnd/mod1` by creating a  
22486 new directory entry named `/modules/pass1`.

```
22487 #include <unistd.h>
22488 char *path1 = "/home/cnd/mod1";
22489 char *path2 = "/modules/pass1";
22490 int status;
22491 ...
22492 status = link (path1, path2);
```

22493 **Creating a Link to a File Within a Program**

22494 In the following program example, the *link()* function links the `/etc/passwd` file (defined as  
22495 **PASSWDFILE**) to a file named `/etc/opasswd` (defined as **SAVEFILE**), which is used to save the  
22496 current password file. Then, after removing the current password file (defined as  
22497 **PASSWDFILE**), the new password file is saved as the current password file using the *link()*  
22498 function again.

```
22499 #include <unistd.h>
22500 #define LOCKFILE "/etc/ptmp"
22501 #define PASSWDFILE "/etc/passwd"
22502 #define SAVEFILE "/etc/opasswd"
22503 ...
22504 /* Save current password file */
22505 link (PASSWDFILE, SAVEFILE);
22506
22507 /* Remove current password file. */
22508 unlink (PASSWDFILE);
22509
22510 /* Save new password file as current password file. */
22511 link (LOCKFILE, PASSWDFILE);
```

**22510 APPLICATION USAGE**

22511 Some implementations do allow links between file systems.

**22512 RATIONALE**

22513 Linking to a directory is restricted to the superuser in most historical implementations because  
22514 this capability may produce loops in the file hierarchy or otherwise corrupt the file system. This  
22515 volume of IEEE Std 1003.1-2001 continues that philosophy by prohibiting *link()* and *unlink()*  
22516 from doing this. Other functions could do it if the implementor designed such an extension.

22517 Some historical implementations allow linking of files on different file systems. Wording was  
22518 added to explicitly allow this optional behavior.

22519 The exception for cross-file system links is intended to apply only to links that are  
22520 programmatically indistinguishable from “hard” links.

**22521 FUTURE DIRECTIONS**

22522 None.

**22523 SEE ALSO**

22524 *symlink()*, *unlink()*, the Base Definitions volume of IEEE Std 1003.1-2001, <**unistd.h**>

**22525 CHANGE HISTORY**

22526 First released in Issue 1. Derived from Issue 1 of the SVID.

**22527 Issue 6**

22528 The following new requirements on POSIX implementations derive from alignment with the  
22529 Single UNIX Specification:

- 22530 • The [ELOOP] mandatory error condition is added.
- 22531 • A second [ENAMETOOLONG] is added as an optional error condition.

22532 The following changes were made to align with the IEEE P1003.1a draft standard:

- 22533 • An explanation is added of the action when *path2* refers to a symbolic link.
- 22534 • The [ELOOP] optional error condition is added.

## 22535 NAME

22536 lio\_listio — list directed I/O (**REALTIME**)

## 22537 SYNOPSIS

22538 AIO #include &lt;aio.h&gt;

```
22539 int lio_listio(int mode, struct aiocb *restrict const list[restrict],
22540               int nent, struct sigevent *restrict sig);
```

22541

## 22542 DESCRIPTION

22543 The *lio\_listio()* function shall initiate a list of I/O requests with a single function call.

22544 The *mode* argument takes one of the values LIO\_WAIT or LIO\_NOWAIT declared in <aio.h> and  
 22545 determines whether the function returns when the I/O operations have been completed, or as  
 22546 soon as the operations have been queued. If the *mode* argument is LIO\_WAIT, the function shall  
 22547 wait until all I/O is complete and the *sig* argument shall be ignored.

22548 If the *mode* argument is LIO\_NOWAIT, the function shall return immediately, and asynchronous  
 22549 notification shall occur, according to the *sig* argument, when all the I/O operations complete. If  
 22550 *sig* is NULL, then no asynchronous notification shall occur. If *sig* is not NULL, asynchronous  
 22551 notification occurs as specified in Section 2.4.1 (on page 28) when all the requests in *list* have  
 22552 completed.

22553 The I/O requests enumerated by *list* are submitted in an unspecified order.

22554 The *list* argument is an array of pointers to **aiocb** structures. The array contains *nent* elements.  
 22555 The array may contain NULL elements, which shall be ignored.

22556 The *aio\_lio\_opcode* field of each **aiocb** structure specifies the operation to be performed. The  
 22557 supported operations are LIO\_READ, LIO\_WRITE, and LIO\_NOP; these symbols are defined in  
 22558 <aio.h>. The LIO\_NOP operation causes the list entry to be ignored. If the *aio\_lio\_opcode*  
 22559 element is equal to LIO\_READ, then an I/O operation is submitted as if by a call to *aio\_read()*  
 22560 with the *aiocbp* equal to the address of the **aiocb** structure. If the *aio\_lio\_opcode* element is equal  
 22561 to LIO\_WRITE, then an I/O operation is submitted as if by a call to *aio\_write()* with the *aiocbp*  
 22562 equal to the address of the **aiocb** structure.

22563 The *aio\_fildes* member specifies the file descriptor on which the operation is to be performed.22564 The *aio\_buf* member specifies the address of the buffer to or from which the data is transferred.22565 The *aio\_nbytes* member specifies the number of bytes of data to be transferred.

22566 The members of the **aiocb** structure further describe the I/O operation to be performed, in a  
 22567 manner identical to that of the corresponding **aiocb** structure when used by the *aio\_read()* and  
 22568 *aio\_write()* functions.

22569 The *nent* argument specifies how many elements are members of the list; that is, the length of the  
 22570 array.

22571 The behavior of this function is altered according to the definitions of synchronized I/O data  
 22572 integrity completion and synchronized I/O file integrity completion if synchronized I/O is  
 22573 enabled on the file associated with *aio\_fildes*.

22574 For regular files, no data transfer shall occur past the offset maximum established in the open  
 22575 file description associated with *aiocbp->aio\_fildes*.

## 22576 RETURN VALUE

22577 If the *mode* argument has the value LIO\_NOWAIT, the *lio\_listio()* function shall return the value  
 22578 zero if the I/O operations are successfully queued; otherwise, the function shall return the value  
 22579  $-1$  and set *errno* to indicate the error.

22580 If the *mode* argument has the value LIO\_WAIT, the *lio\_listio()* function shall return the value  
 22581 zero when all the indicated I/O has completed successfully. Otherwise, *lio\_listio()* shall return a  
 22582 value of  $-1$  and set *errno* to indicate the error.

22583 In either case, the return value only indicates the success or failure of the *lio\_listio()* call itself,  
 22584 not the status of the individual I/O requests. In some cases one or more of the I/O requests  
 22585 contained in the list may fail. Failure of an individual request does not prevent completion of  
 22586 any other individual request. To determine the outcome of each I/O request, the application  
 22587 shall examine the error status associated with each **aiocb** control block. The error statuses so  
 22588 returned are identical to those returned as the result of an *aio\_read()* or *aio\_write()* function.

## 22589 ERRORS

22590 The *lio\_listio()* function shall fail if:

22591 [EAGAIN] The resources necessary to queue all the I/O requests were not available. The  
 22592 application may check the error status for each **aiocb** to determine the  
 22593 individual request(s) that failed.

22594 [EAGAIN] The number of entries indicated by *nent* would cause the system-wide limit  
 22595 {AIO\_MAX} to be exceeded.

22596 [EINVAL] The *mode* argument is not a proper value, or the value of *nent* was greater than  
 22597 {AIO\_LISTIO\_MAX}.

22598 [EINTR] A signal was delivered while waiting for all I/O requests to complete during  
 22599 an LIO\_WAIT operation. Note that, since each I/O operation invoked by  
 22600 *lio\_listio()* may possibly provoke a signal when it completes, this error return  
 22601 may be caused by the completion of one (or more) of the very I/O operations  
 22602 being awaited. Outstanding I/O requests are not canceled, and the application  
 22603 shall examine each list element to determine whether the request was  
 22604 initiated, canceled, or completed.

22605 [EIO] One or more of the individual I/O operations failed. The application may  
 22606 check the error status for each **aiocb** structure to determine the individual  
 22607 request(s) that failed.

22608 In addition to the errors returned by the *lio\_listio()* function, if the *lio\_listio()* function succeeds  
 22609 or fails with errors of [EAGAIN], [EINTR], or [EIO], then some of the I/O specified by the list  
 22610 may have been initiated. If the *lio\_listio()* function fails with an error code other than [EAGAIN],  
 22611 [EINTR], or [EIO], no operations from the list shall have been initiated. The I/O operation  
 22612 indicated by each list element can encounter errors specific to the individual read or write  
 22613 function being performed. In this event, the error status for each **aiocb** control block contains the  
 22614 associated error code. The error codes that can be set are the same as would be set by a *read()* or  
 22615 *write()* function, with the following additional error codes possible:

22616 [EAGAIN] The requested I/O operation was not queued due to resource limitations.

22617 [ECANCELED] The requested I/O was canceled before the I/O completed due to an explicit  
 22618 *aio\_cancel()* request.

22619 [EFBIG] The *aiocbp->aio\_lio\_opcode* is LIO\_WRITE, the file is a regular file,  
 22620 *aiocbp->aio\_nbytes* is greater than 0, and the *aiocbp->aio\_offset* is greater than or  
 22621 equal to the offset maximum in the open file description associated with

22622 *aiocbp-> aio\_fildes*.

22623 [EINPROGRESS] The requested I/O is in progress.

22624 [EOVERFLOW] The *aiocbp-> aio\_lio\_opcode* is LIO\_READ, the file is a regular file,  
 22625 *aiocbp-> aio\_nbytes* is greater than 0, and the *aiocbp-> aio\_offset* is before the  
 22626 end-of-file and is greater than or equal to the offset maximum in the open file  
 22627 description associated with *aiocbp-> aio\_fildes*.

**22628 EXAMPLES**

22629 None.

**22630 APPLICATION USAGE**

22631 None.

**22632 RATIONALE**

22633 Although it may appear that there are inconsistencies in the specified circumstances for error  
 22634 codes, the [EIO] error condition applies when any circumstance relating to an individual  
 22635 operation makes that operation fail. This might be due to a badly formulated request (for  
 22636 example, the *aio\_lio\_opcode* field is invalid, and *aio\_error()* returns [EINVAL]) or might arise from  
 22637 application behavior (for example, the file descriptor is closed before the operation is initiated,  
 22638 and *aio\_error()* returns [EBADF]).

22639 The limitation on the set of error codes returned when operations from the list shall have been  
 22640 initiated enables applications to know when operations have been started and whether  
 22641 *aio\_error()* is valid for a specific operation.

**22642 FUTURE DIRECTIONS**

22643 None.

**22644 SEE ALSO**

**22647 CHANGE HISTORY**

22648 First released in Issue 5. Included for alignment with the POSIX Realtime Extension.

22649 Large File Summit extensions are added.

**22650 Issue 6**

22651 The [ENOSYS] error condition has been removed as stubs need not be provided if an  
 22652 implementation does not support the Asynchronous Input and Output option.

22653 The *lio\_listio()* function is marked as part of the Asynchronous Input and Output option.

22654 The following new requirements on POSIX implementations derive from alignment with the  
 22655 Single UNIX Specification:

22656 • In the DESCRIPTION, text is added to indicate that for regular files no data transfer occurs  
 22657 past the offset maximum established in the open file description associated with  
 22658 *aiocbp-> aio\_fildes*. This change is to support large files.

22659 • The [EBIG] and [EOVERFLOW] error conditions are defined. This change is to support large  
 22660 files.

22661 The DESCRIPTION is updated to avoid use of the term “must” for application requirements.

22662 The **restrict** keyword is added to the *lio\_listio()* prototype for alignment with the  
 22663 ISO/IEC 9899:1999 standard.

22664 **NAME**

22665 listen — listen for socket connections and limit the queue of incoming connections

22666 **SYNOPSIS**

22667 #include <sys/socket.h>

22668 int listen(int *socket*, int *backlog*);

22669 **DESCRIPTION**

22670 The *listen()* function shall mark a connection-mode socket, specified by the *socket* argument, as  
22671 accepting connections.

22672 The *backlog* argument provides a hint to the implementation which the implementation shall use  
22673 to limit the number of outstanding connections in the socket's listen queue. Implementations  
22674 may impose a limit on *backlog* and silently reduce the specified value. Normally, a larger *backlog*  
22675 argument value shall result in a larger or equal length of the listen queue. Implementations shall  
22676 support values of *backlog* up to SOMAXCONN, defined in <sys/socket.h>.

22677 The implementation may include incomplete connections in its listen queue. The limits on the  
22678 number of incomplete connections and completed connections queued may be different.

22679 The implementation may have an upper limit on the length of the listen queue—either global or  
22680 per accepting socket. If *backlog* exceeds this limit, the length of the listen queue is set to the limit.

22681 If *listen()* is called with a *backlog* argument value that is less than 0, the function behaves as if it  
22682 had been called with a *backlog* argument value of 0.

22683 A *backlog* argument of 0 may allow the socket to accept connections, in which case the length of  
22684 the listen queue may be set to an implementation-defined minimum value.

22685 The socket in use may require the process to have appropriate privileges to use the *listen()*  
22686 function.

22687 **RETURN VALUE**

22688 Upon successful completions, *listen()* shall return 0; otherwise, -1 shall be returned and *errno* set  
22689 to indicate the error.

22690 **ERRORS**

22691 The *listen()* function shall fail if:

22692 [EBADF] The *socket* argument is not a valid file descriptor.

22693 [EDESTADDRREQ]

22694 The socket is not bound to a local address, and the protocol does not support  
22695 listening on an unbound socket.

22696 [EINVAL] The *socket* is already connected.

22697 [ENOTSOCK] The *socket* argument does not refer to a socket.

22698 [EOPNOTSUPP] The socket protocol does not support *listen()*.

22699 The *listen()* function may fail if:

22700 [EACCES] The calling process does not have the appropriate privileges.

22701 [EINVAL] The *socket* has been shut down.

22702 [ENOBUFS] Insufficient resources are available in the system to complete the call.

22703 **EXAMPLES**

22704 None.

22705 **APPLICATION USAGE**

22706 None.

22707 **RATIONALE**

22708 None.

22709 **FUTURE DIRECTIONS**

22710 None.

22711 **SEE ALSO**22712 *accept()*, *connect()*, *socket()*, the Base Definitions volume of IEEE Std 1003.1-2001, <sys/socket.h>22713 **CHANGE HISTORY**

22714 First released in Issue 6. Derived from the XNS, Issue 5.2 specification.

22715 The DESCRIPTION is updated to describe the relationship of SOMAXCONN and the *backlog*  
22716 argument.

22717 **NAME**

22718       llabs — return a long integer absolute value

22719 **SYNOPSIS**

22720       #include <stdlib.h>

22721       long long llabs(long long *i*);

22722 **DESCRIPTION**

22723       Refer to *labs()*.

22724 **NAME**22725        `lldiv` — compute quotient and remainder of a long division22726 **SYNOPSIS**22727        `#include <stdlib.h>`22728        `lldiv_t lldiv(long long numer, long long denom);`22729 **DESCRIPTION**22730        Refer to `ldiv()`.

22731 **NAME**

22732 llrint, llrintf, llrintl, — round to the nearest integer value using current rounding direction

22733 **SYNOPSIS**

```
22734 #include <math.h>

22735 long long llrint(double x);
22736 long long llrintf(float x);
22737 long long llrintl(long double x);
```

22738 **DESCRIPTION**

22739 **CX** The functionality described on this reference page is aligned with the ISO C standard. Any  
 22740 conflict between the requirements described here and the ISO C standard is unintentional. This  
 22741 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

22742 These functions shall round their argument to the nearest integer value, rounding according to  
 22743 the current rounding direction.

22744 An application wishing to check for error situations should set *errno* to zero and call  
 22745 *feclearexcept*(FE\_ALL\_EXCEPT) before calling these functions. On return, if *errno* is non-zero or  
 22746 *fetetestexcept*(FE\_INVALID | FE\_DIVBYZERO | FE\_OVERFLOW | FE\_UNDERFLOW) is non-  
 22747 zero, an error has occurred.

22748 **RETURN VALUE**

22749 Upon successful completion, these functions shall return the rounded integer value.

22750 **MX** If *x* is NaN, a domain error shall occur, and an unspecified value is returned.

22751 If *x* is +Inf, a domain error shall occur and an unspecified value is returned.

22752 If *x* is -Inf, a domain error shall occur and an unspecified value is returned.

22753 If the correct value is positive and too large to represent as a **long long**, a domain error shall  
 22754 occur and an unspecified value is returned.

22755 If the correct value is negative and too large to represent as a **long long**, a domain error shall  
 22756 occur and an unspecified value is returned.

22757 **ERRORS**

22758 These functions shall fail if:

22759 **MX** Domain Error The *x* argument is NaN or ±Inf, or the correct value is not representable as an  
 22760 integer.

22761 If the integer expression (math\_errhandling & MATH\_ERRNO) is non-zero,  
 22762 then *errno* shall be set to [EDOM]. If the integer expression (math\_errhandling  
 22763 & MATH\_ERREXCEPT) is non-zero, then the invalid floating-point exception  
 22764 shall be raised.

22765 **EXAMPLES**

22766 None.

22767 **APPLICATION USAGE**

22768 On error, the expressions (math\_errhandling & MATH\_ERRNO) and (math\_errhandling &  
 22769 MATH\_ERREXCEPT) are independent of each other, but at least one of them must be non-zero.

22770 **RATIONALE**

22771 These functions provide floating-to-integer conversions. They round according to the current  
 22772 rounding direction. If the rounded value is outside the range of the return type, the numeric  
 22773 result is unspecified and the invalid floating-point exception is raised. When they raise no other  
 22774 floating-point exception and the result differs from the argument, they raise the inexact

22775 floating-point exception.

22776 **FUTURE DIRECTIONS**

22777 None.

22778 **SEE ALSO**

22779 *feclearexcept()*, *fetetestexcept()*, *lrint()*, the Base Definitions volume of IEEE Std 1003.1-2001, Section  
22780 4.18, Treatment of Error Conditions for Mathematical Functions, <math.h>

22781 **CHANGE HISTORY**

22782 First released in Issue 6. Derived from the ISO/IEC 9899:1999 standard.

## 22783 NAME

22784 llround, llroundf, llroundl, — round to nearest integer value

## 22785 SYNOPSIS

22786 #include <math.h>

22787 long long llround(double x);

22788 long long llroundf(float x);

22789 long long llroundl(long double x);

## 22790 DESCRIPTION

22791 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
22792 conflict between the requirements described here and the ISO C standard is unintentional. This  
22793 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

22794 These functions shall round their argument to the nearest integer value, rounding halfway cases  
22795 away from zero, regardless of the current rounding direction.

22796 An application wishing to check for error situations should set *errno* to zero and call  
22797 *feclearexcept*(FE\_ALL\_EXCEPT) before calling these functions. On return, if *errno* is non-zero or  
22798 *fetestexcept*(FE\_INVALID | FE\_DIVBYZERO | FE\_OVERFLOW | FE\_UNDERFLOW) is non-  
22799 zero, an error has occurred.

## 22800 RETURN VALUE

22801 Upon successful completion, these functions shall return the rounded integer value.

22802 MX If *x* is NaN, a domain error shall occur, and an unspecified value is returned.

22803 If *x* is +Inf, a domain error shall occur and an unspecified value is returned.

22804 If *x* is -Inf, a domain error shall occur and an unspecified value is returned.

22805 If the correct value is positive and too large to represent as a **long long**, a domain error shall  
22806 occur and an unspecified value is returned.

22807 If the correct value is negative and too large to represent as a **long long**, a domain error shall  
22808 occur and an unspecified value is returned.

## 22809 ERRORS

22810 These functions shall fail if:

22811 MX Domain Error The *x* argument is NaN or ±Inf, or the correct value is not representable as an  
22812 integer.

22813 If the integer expression (math\_errhandling & MATH\_ERRNO) is non-zero,  
22814 then *errno* shall be set to [EDOM]. If the integer expression (math\_errhandling  
22815 & MATH\_ERREXCEPT) is non-zero, then the invalid floating-point exception  
22816 shall be raised.

## 22817 EXAMPLES

22818 None.

## 22819 APPLICATION USAGE

22820 On error, the expressions (math\_errhandling & MATH\_ERRNO) and (math\_errhandling &  
22821 MATH\_ERREXCEPT) are independent of each other, but at least one of them must be non-zero.

## 22822 RATIONALE

22823 These functions differ from the *llrint*() functions in that the default rounding direction for the  
22824 *llround*() functions round halfway cases away from zero and need not raise the inexact floating-  
22825 point exception for non-integer arguments that round to within the range of the return type.

22826 **FUTURE DIRECTIONS**

22827 None.

22828 **SEE ALSO**

22829 *feclearexcept()*, *fetetestexcept()*, *llround()*, the Base Definitions volume of IEEE Std 1003.1-2001,  
22830 Section 4.18, Treatment of Error Conditions for Mathematical Functions, <math.h>

22831 **CHANGE HISTORY**

22832 First released in Issue 6. Derived from the ISO/IEC 9899:1999 standard.

## 22833 NAME

22834 localeconv — return locale-specific information

## 22835 SYNOPSIS

22836 #include &lt;locale.h&gt;

22837 struct lconv \*localeconv(void);

## 22838 DESCRIPTION

22839 cx The functionality described on this reference page is aligned with the ISO C standard. Any  
 22840 conflict between the requirements described here and the ISO C standard is unintentional. This  
 22841 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

22842 The *localeconv()* function shall set the components of an object with the type **struct lconv** with  
 22843 the values appropriate for the formatting of numeric quantities (monetary and otherwise)  
 22844 according to the rules of the current locale.

22845 The members of the structure with type **char \*** are pointers to strings, any of which (except  
 22846 **decimal\_point**) can point to " ", to indicate that the value is not available in the current locale or  
 22847 is of zero length. The members with type **char** are non-negative numbers, any of which can be  
 22848 {CHAR\_MAX} to indicate that the value is not available in the current locale.

22849 The members include the following:

22850 **char \*decimal\_point**

22851 The radix character used to format non-monetary quantities.

22852 **char \*thousands\_sep**

22853 The character used to separate groups of digits before the decimal-point character in  
 22854 formatted non-monetary quantities.

22855 **char \*grouping**

22856 A string whose elements taken as one-byte integer values indicate the size of each group of  
 22857 digits in formatted non-monetary quantities.

22858 **char \*int\_curr\_symbol**

22859 The international currency symbol applicable to the current locale. The first three  
 22860 characters contain the alphabetic international currency symbol in accordance with those  
 22861 specified in the ISO 4217:1995 standard. The fourth character (immediately preceding the  
 22862 null byte) is the character used to separate the international currency symbol from the  
 22863 monetary quantity.

22864 **char \*currency\_symbol**

22865 The local currency symbol applicable to the current locale.

22866 **char \*mon\_decimal\_point**

22867 The radix character used to format monetary quantities.

22868 **char \*mon\_thousands\_sep**

22869 The separator for groups of digits before the decimal-point in formatted monetary  
 22870 quantities.

22871 **char \*mon\_grouping**

22872 A string whose elements taken as one-byte integer values indicate the size of each group of  
 22873 digits in formatted monetary quantities.

22874 **char \*positive\_sign**

22875 The string used to indicate a non-negative valued formatted monetary quantity.

- 22876 **char \*negative\_sign**  
 22877 The string used to indicate a negative valued formatted monetary quantity.
- 22878 **char int\_frac\_digits**  
 22879 The number of fractional digits (those after the decimal-point) to be displayed in an  
 22880 internationally formatted monetary quantity.
- 22881 **char frac\_digits**  
 22882 The number of fractional digits (those after the decimal-point) to be displayed in a  
 22883 formatted monetary quantity.
- 22884 **char p\_cs\_precedes**  
 22885 Set to 1 if the **currency\_symbol** or **int\_curr\_symbol** precedes the value for a non-negative  
 22886 formatted monetary quantity. Set to 0 if the symbol succeeds the value.
- 22887 **char p\_sep\_by\_space**  
 22888 Set to 0 if no space separates the **currency\_symbol** or **int\_curr\_symbol** from the value for a  
 22889 non-negative formatted monetary quantity. Set to 1 if a space separates the symbol from the  
 22890 value; and set to 2 if a space separates the symbol and the sign string, if adjacent. XSI
- 22891 **char n\_cs\_precedes**  
 22892 Set to 1 if the **currency\_symbol** or **int\_curr\_symbol** precedes the value for a negative  
 22893 formatted monetary quantity. Set to 0 if the symbol succeeds the value.
- 22894 **char n\_sep\_by\_space**  
 22895 Set to 0 if no space separates the **currency\_symbol** or **int\_curr\_symbol** from the value for a  
 22896 negative formatted monetary quantity. Set to 1 if a space separates the symbol from the  
 22897 value; and set to 2 if a space separates the symbol and the sign string, if adjacent. XSI
- 22898 **char p\_sign\_posn**  
 22899 Set to a value indicating the positioning of the **positive\_sign** for a non-negative formatted  
 22900 monetary quantity.
- 22901 **char n\_sign\_posn**  
 22902 Set to a value indicating the positioning of the **negative\_sign** for a negative formatted  
 22903 monetary quantity.
- 22904 **char int\_p\_cs\_precedes**  
 22905 Set to 1 or 0 if the **int\_curr\_symbol** respectively precedes or succeeds the value for a non-  
 22906 negative internationally formatted monetary quantity.
- 22907 **char int\_n\_cs\_precedes**  
 22908 Set to 1 or 0 if the **int\_curr\_symbol** respectively precedes or succeeds the value for a  
 22909 negative internationally formatted monetary quantity.
- 22910 **char int\_p\_sep\_by\_space**  
 22911 Set to a value indicating the separation of the **int\_curr\_symbol**, the sign string, and the  
 22912 value for a non-negative internationally formatted monetary quantity.
- 22913 **char int\_n\_sep\_by\_space**  
 22914 Set to a value indicating the separation of the **int\_curr\_symbol**, the sign string, and the  
 22915 value for a negative internationally formatted monetary quantity.
- 22916 **char int\_p\_sign\_posn**  
 22917 Set to a value indicating the positioning of the **positive\_sign** for a non-negative  
 22918 internationally formatted monetary quantity.
- 22919 **char int\_n\_sign\_posn**  
 22920 Set to a value indicating the positioning of the **negative\_sign** for a negative internationally

- 22921 formatted monetary quantity.
- 22922 The elements of **grouping** and **mon\_grouping** are interpreted according to the following:
- 22923 {CHAR\_MAX} No further grouping is to be performed.
- 22924 0 The previous element is to be repeatedly used for the remainder of the digits.
- 22925 *other* The integer value is the number of digits that comprise the current group. The  
22926 next element is examined to determine the size of the next group of digits  
22927 before the current group.
- 22928 The values of **p\_sep\_by\_space**, **n\_sep\_by\_space**, **int\_p\_sep\_by\_space**, and **int\_n\_sep\_by\_space**  
22929 are interpreted according to the following:
- 22930 0 No space separates the currency symbol and value.
- 22931 1 If the currency symbol and sign string are adjacent, a space separates them from the value;  
22932 otherwise, a space separates the currency symbol from the value.
- 22933 2 If the currency symbol and sign string are adjacent, a space separates them; otherwise, a  
22934 space separates the sign string from the value.
- 22935 For **int\_p\_sep\_by\_space** and **int\_n\_sep\_by\_space**, the fourth character of **int\_curr\_symbol** is  
22936 used instead of a space.
- 22937 The values of **p\_sign\_posn**, **n\_sign\_posn**, **int\_p\_sign\_posn**, and **int\_n\_sign\_posn** are  
22938 interpreted according to the following:
- 22939 0 Parentheses surround the quantity and **currency\_symbol** or **int\_curr\_symbol**.
- 22940 1 The sign string precedes the quantity and **currency\_symbol** or **int\_curr\_symbol**.
- 22941 2 The sign string succeeds the quantity and **currency\_symbol** or **int\_curr\_symbol**.
- 22942 3 The sign string immediately precedes the **currency\_symbol** or **int\_curr\_symbol**.
- 22943 4 The sign string immediately succeeds the **currency\_symbol** or **int\_curr\_symbol**.
- 22944 The implementation shall behave as if no function in this volume of IEEE Std 1003.1-2001 calls  
22945 *localeconv()*.
- 22946 CX The *localeconv()* function need not be reentrant. A function that is not required to be reentrant is  
22947 not required to be thread-safe.
- 22948 **RETURN VALUE**
- 22949 The *localeconv()* function shall return a pointer to the filled-in object. The application shall not  
22950 modify the structure pointed to by the return value which may be overwritten by a subsequent  
22951 call to *localeconv()*. In addition, calls to *setlocale()* with the categories *LC\_ALL*, *LC\_MONETARY*,  
22952 or *LC\_NUMERIC* may overwrite the contents of the structure.
- 22953 **ERRORS**
- 22954 No errors are defined.

22955 **EXAMPLES**

22956 None.

22957 **APPLICATION USAGE**

22958 The following table illustrates the rules which may be used by four countries to format monetary  
 22959 quantities.

| Country     | Positive Format            | Negative Format             | International Format |
|-------------|----------------------------|-----------------------------|----------------------|
| Italy       | L.1.230                    | -L.1.230                    | ITL.1.230            |
| Netherlands | F 1.234,56                 | F -1.234,56                 | NLG 1.234,56         |
| Norway      | kr1.234,56                 | kr1.234,56-                 | NOK 1.234,56         |
| Switzerland | SFr <sub>s</sub> .1,234.56 | SFr <sub>s</sub> .1,234.56C | CHF 1,234.56         |

22965 For these four countries, the respective values for the monetary members of the structure  
 22966 returned by *localeconv()* are:

|                                 | Italy   | Netherlands | Norway | Switzerland           |
|---------------------------------|---------|-------------|--------|-----------------------|
| 22967 <b>int_curr_symbol</b>    | "ITL. " | "NLG "      | "NOK " | "CHF "                |
| 22968 <b>currency_symbol</b>    | "L. "   | "F "        | "kr "  | "SFr <sub>s</sub> . " |
| 22969 <b>mon_decimal_point</b>  | " "     | ","         | ","    | ."                    |
| 22970 <b>mon_thousands_sep</b>  | "."     | "."         | "."    | ","                   |
| 22971 <b>mon_grouping</b>       | "\3 "   | "\3 "       | "\3 "  | "\3 "                 |
| 22972 <b>positive_sign</b>      | " "     | " "         | " "    | " "                   |
| 22973 <b>negative_sign</b>      | "- "    | "- "        | "- "   | "C "                  |
| 22974 <b>int_frac_digits</b>    | 0       | 2           | 2      | 2                     |
| 22975 <b>frac_digits</b>        | 0       | 2           | 2      | 2                     |
| 22976 <b>p_cs_precedes</b>      | 1       | 1           | 1      | 1                     |
| 22977 <b>p_sep_by_space</b>     | 0       | 1           | 0      | 0                     |
| 22978 <b>n_cs_precedes</b>      | 1       | 1           | 1      | 1                     |
| 22979 <b>n_sep_by_space</b>     | 0       | 1           | 0      | 0                     |
| 22980 <b>p_sign_posn</b>        | 1       | 1           | 1      | 1                     |
| 22981 <b>n_sign_posn</b>        | 1       | 4           | 2      | 2                     |
| 22982 <b>int_p_cs_precedes</b>  | 1       | 1           | 1      | 1                     |
| 22983 <b>int_n_cs_precedes</b>  | 1       | 1           | 1      | 1                     |
| 22984 <b>int_p_sep_by_space</b> | 0       | 0           | 0      | 0                     |
| 22985 <b>int_n_sep_by_space</b> | 0       | 0           | 0      | 0                     |
| 22986 <b>int_p_sign_posn</b>    | 1       | 1           | 1      | 1                     |
| 22987 <b>int_n_sign_posn</b>    | 1       | 4           | 4      | 2                     |

22989 **RATIONALE**

22997 **CHANGE HISTORY**

22998 First released in Issue 4. Derived from the ANSI C standard.

22999 **Issue 6**

- 23000 A note indicating that this function need not be reentrant is added to the DESCRIPTION.
- 23001 The RETURN VALUE section is rewritten to avoid use of the term “must”.
- 23002 This reference page is updated for alignment with the ISO/IEC 9899: 1999 standard.
- 23003 ISO/IEC 9899: 1999 standard, Technical Corrigendum No. 1 is incorporated.

23004 **NAME**

23005 localtime, localtime\_r — convert a time value to a broken-down local time

23006 **SYNOPSIS**

23007 #include <time.h>

23008 struct tm \*localtime(const time\_t \*timer);

23009 TSF struct tm \*localtime\_r(const time\_t \*restrict timer,

23010 struct tm \*restrict result);

23011

23012 **DESCRIPTION**

23013 CX For *localtime()*: The functionality described on this reference page is aligned with the ISO C  
 23014 standard. Any conflict between the requirements described here and the ISO C standard is  
 23015 unintentional. This volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

23016 The *localtime()* function shall convert the time in seconds since the Epoch pointed to by *timer*  
 23017 into a broken-down time, expressed as a local time. The function corrects for the timezone and  
 23018 CX any seasonal time adjustments. Local timezone information is used as though *localtime()* calls  
 23019 *tzset()*.

23020 The relationship between a time in seconds since the Epoch used as an argument to *localtime()*  
 23021 and the **tm** structure (defined in the <time.h> header) is that the result shall be as specified in the  
 23022 expression given in the definition of seconds since the Epoch (see the Base Definitions volume of  
 23023 IEEE Std 1003.1-2001, Section 4.14, Seconds Since the Epoch) corrected for timezone and any  
 23024 seasonal time adjustments, where the names in the structure and in the expression correspond.

23025 TSF The same relationship shall apply for *localtime\_r()*.

23026 CX The *localtime()* function need not be reentrant. A function that is not required to be reentrant is  
 23027 not required to be thread-safe.

23028 The *asctime()*, *ctime()*, *gmtime()*, and *localtime()* functions shall return values in one of two static  
 23029 objects: a broken-down time structure and an array of type **char**. Execution of any of the  
 23030 functions may overwrite the information returned in either of these objects by any of the other  
 23031 functions.

23032 TSF The *localtime\_r()* function shall convert the time in seconds since the Epoch pointed to by *timer*  
 23033 into a broken-down time stored in the structure to which *result* points. The *localtime\_r()* function  
 23034 shall also return a pointer to that same structure.

23035 Unlike *localtime()*, the reentrant version is not required to set *tzname*.

23036 **RETURN VALUE**

23037 The *localtime()* function shall return a pointer to the broken-down time structure.

23038 TSF Upon successful completion, *localtime\_r()* shall return a pointer to the structure pointed to by  
 23039 the argument *result*.

23040 **ERRORS**

23041 No errors are defined.

## 23042 EXAMPLES

23043 **Getting the Local Date and Time**

23044 The following example uses the *time()* function to calculate the time elapsed, in seconds, since  
 23045 January 1, 1970 0:00 UTC (the Epoch), *localtime()* to convert that value to a broken-down time,  
 23046 and *asctime()* to convert the broken-down time values into a printable string.

```
23047 #include <stdio.h>
23048 #include <time.h>
23049 int main(void)
23050 {
23051     time_t result;
23052     result = time(NULL);
23053     printf("%s%ju secs since the Epoch\n",
23054           asctime(localtime(&result)),
23055           (uintmax_t)result);
23056     return(0);
23057 }
```

23058 This example writes the current time to *stdout* in a form like this:

```
23059 Wed Jun 26 10:32:15 1996
23060 835810335 secs since the Epoch
```

23061 **Getting the Modification Time for a File**

23062 The following example gets the modification time for a file. The *localtime()* function converts the  
 23063 **time\_t** value of the last modification date, obtained by a previous call to *stat()*, into a **tm**  
 23064 structure that contains the year, month, day, and so on.

```
23065 #include <time.h>
23066 ...
23067 struct stat statbuf;
23068 ...
23069 tm = localtime(&statbuf.st_mtime);
23070 ...
```

23071 **Timing an Event**

23072 The following example gets the current time, converts it to a string using *localtime()* and  
 23073 *asctime()*, and prints it to standard output using *fputs()*. It then prints the number of minutes to  
 23074 an event being timed.

```
23075 #include <time.h>
23076 #include <stdio.h>
23077 ...
23078 time_t now;
23079 int minutes_to_event;
23080 ...
23081 time(&now);
23082 printf("The time is ");
23083 fputs(asctime(localtime(&now)), stdout);
23084 printf("There are still %d minutes to the event.\n",
```

23085                   minutes\_to\_event);

23086                   ...

23087 **APPLICATION USAGE**

23088                   The *localtime\_r()* function is thread-safe and returns values in a user-supplied buffer instead of  
23089                   possibly using a static data area that may be overwritten by each call.

23090 **RATIONALE**

23091                   None.

23092 **FUTURE DIRECTIONS**

23093                   None.

23094 **SEE ALSO**

23095                   *asctime()*, *clock()*, *ctime()*, *difftime()*, *getdate()*, *gmtime()*, *mktime()*, *strftime()*, *strptime()*, *time()*,  
23096                   *utime()*, the Base Definitions volume of IEEE Std 1003.1-2001, <**time.h**>

23097 **CHANGE HISTORY**

23098                   First released in Issue 1. Derived from Issue 1 of the SVID.

23099 **Issue 5**

23100                   A note indicating that the *localtime()* function need not be reentrant is added to the  
23101                   DESCRIPTION.

23102                   The *localtime\_r()* function is included for alignment with the POSIX Threads Extension.

23103 **Issue 6**

23104                   The *localtime\_r()* function is marked as part of the Thread-Safe Functions option.

23105                   Extensions beyond the ISO C standard are marked.

23106                   The APPLICATION USAGE section is updated to include a note on the thread-safe function and  
23107                   its avoidance of possibly using a static data area.

23108                   The **restrict** keyword is added to the *localtime\_r()* prototype for alignment with the  
23109                   ISO/IEC 9899:1999 standard.

23110                   Examples are added.

## 23111 NAME

23112 lockf — record locking on files

## 23113 SYNOPSIS

23114 XSI #include &lt;unistd.h&gt;

23115 int lockf(int *fildes*, int *function*, off\_t *size*);

23116

## 23117 DESCRIPTION

23118 The *lockf()* function shall lock sections of a file with advisory-mode locks. Calls to *lockf()* from  
 23119 other threads which attempt to lock the locked file section shall either return an error value or  
 23120 block until the section becomes unlocked. All the locks for a process are removed when the  
 23121 process terminates. Record locking with *lockf()* shall be supported for regular files and may be  
 23122 supported for other files.

23123 The *fildes* argument is an open file descriptor. To establish a lock with this function, the file  
 23124 descriptor shall be opened with write-only permission (O\_WRONLY) or with read/write  
 23125 permission (O\_RDWR).

23126 The *function* argument is a control value which specifies the action to be taken. The permissible  
 23127 values for *function* are defined in <unistd.h> as follows:

23128

23129

23130

23131

23132

23133

| Function | Description                                  |
|----------|----------------------------------------------|
| F_ULOCK  | Unlock locked sections.                      |
| F_LOCK   | Lock a section for exclusive use.            |
| F_TLOCK  | Test and lock a section for exclusive use.   |
| F_TEST   | Test a section for locks by other processes. |

23134 F\_TEST shall detect if a lock by another process is present on the specified section.

23135 F\_LOCK and F\_TLOCK shall both lock a section of a file if the section is available.

23136 F\_ULOCK shall remove locks from a section of the file.

23137 The *size* argument is the number of contiguous bytes to be locked or unlocked. The section to be  
 23138 locked or unlocked starts at the current offset in the file and extends forward for a positive *size*  
 23139 or backward for a negative *size* (the preceding bytes up to but not including the current offset).  
 23140 If *size* is 0, the section from the current offset through the largest possible file offset shall be  
 23141 locked (that is, from the current offset through the present or any future end-of-file). An area  
 23142 need not be allocated to the file to be locked because locks may exist past the end-of-file.

23143 The sections locked with F\_LOCK or F\_TLOCK may, in whole or in part, contain or be contained  
 23144 by a previously locked section for the same process. When this occurs, or if adjacent locked  
 23145 sections would occur, the sections shall be combined into a single locked section. If the request  
 23146 would cause the number of locks to exceed a system-imposed limit, the request shall fail.

23147 F\_LOCK and F\_TLOCK requests differ only by the action taken if the section is not available.  
 23148 F\_LOCK shall block the calling thread until the section is available. F\_TLOCK shall cause the  
 23149 function to fail if the section is already locked by another process.

23150 File locks shall be released on first close by the locking process of any file descriptor for the file.

23151 F\_ULOCK requests may release (wholly or in part) one or more locked sections controlled by the  
 23152 process. Locked sections shall be unlocked starting at the current file offset through *size* bytes or  
 23153 to the end-of-file if *size* is (off\_t)0. When all of a locked section is not released (that is, when the  
 23154 beginning or end of the area to be unlocked falls within a locked section), the remaining portions  
 23155 of that section shall remain locked by the process. Releasing the center portion of a locked

23156 section shall cause the remaining locked beginning and end portions to become two separate  
 23157 locked sections. If the request would cause the number of locks in the system to exceed a  
 23158 system-imposed limit, the request shall fail.

23159 A potential for deadlock occurs if the threads of a process controlling a locked section are  
 23160 blocked by accessing another process' locked section. If the system detects that deadlock would  
 23161 occur, *lockf()* shall fail with an [EDEADLK] error.

23162 The interaction between *fcntl()* and *lockf()* locks is unspecified.

23163 Blocking on a section shall be interrupted by any signal.

23164 An F\_ULOCK request in which *size* is non-zero and the offset of the last byte of the requested  
 23165 section is the maximum value for an object of type *off\_t*, when the process has an existing lock  
 23166 in which *size* is 0 and which includes the last byte of the requested section, shall be treated as a  
 23167 request to unlock from the start of the requested section with a size equal to 0. Otherwise, an  
 23168 F\_ULOCK request shall attempt to unlock only the requested section.

23169 Attempting to lock a section of a file that is associated with a buffered stream produces  
 23170 unspecified results.

#### 23171 RETURN VALUE

23172 Upon successful completion, *lockf()* shall return 0. Otherwise, it shall return -1, set *errno* to  
 23173 indicate an error, and existing locks shall not be changed.

#### 23174 ERRORS

23175 The *lockf()* function shall fail if:

23176 [EBADF] The *fildev* argument is not a valid open file descriptor; or *function* is F\_LOCK  
 23177 or F\_TLOCK and *fildev* is not a valid file descriptor open for writing.

23178 [EACCES] or [EAGAIN]

23179 The *function* argument is F\_TLOCK or F\_TEST and the section is already  
 23180 locked by another process.

23181 [EDEADLK] The *function* argument is F\_LOCK and a deadlock is detected.

23182 [EINTR] A signal was caught during execution of the function.

23183 [EINVAL] The *function* argument is not one of F\_LOCK, F\_TLOCK, F\_TEST, or  
 23184 F\_ULOCK; or *size* plus the current file offset is less than 0.

23185 [EOVERFLOW] The offset of the first, or if *size* is not 0 then the last, byte in the requested  
 23186 section cannot be represented correctly in an object of type *off\_t*.

23187 The *lockf()* function may fail if:

23188 [EAGAIN] The *function* argument is F\_LOCK or F\_TLOCK and the file is mapped with  
 23189 *mmap()*.

23190 [EDEADLK] or [ENOLCK]

23191 The *function* argument is F\_LOCK, F\_TLOCK, or F\_ULOCK, and the request  
 23192 would cause the number of locks to exceed a system-imposed limit.

23193 [EOPNOTSUPP] or [EINVAL]

23194 The implementation does not support the locking of files of the type indicated  
 23195 by the *fildev* argument.

23196 **EXAMPLES**23197 **Locking a Portion of a File**

23198 In the following example, a file named `/home/cnd/mod1` is being modified. Other processes that  
 23199 use locking are prevented from changing it during this process. Only the first 10 000 bytes are  
 23200 locked, and the lock call fails if another process has any part of this area locked already.

```
23201 #include <fcntl.h>
23202 #include <unistd.h>
23203 int fildes;
23204 int status;
23205 ...
23206 fildes = open("/home/cnd/mod1", O_RDWR);
23207 status = lockf(fildes, F_TLOCK, (off_t)10000);
```

23208 **APPLICATION USAGE**

23209 Record-locking should not be used in combination with the *fopen()*, *fread()*, *fwrite()*, and other  
 23210 *stdio* functions. Instead, the more primitive, non-buffered functions (such as *open()*) should be  
 23211 used. Unexpected results may occur in processes that do buffering in the user address space. The  
 23212 process may later read/write data which is/was locked. The *stdio* functions are the most  
 23213 common source of unexpected buffering.

23214 The *alarm()* function may be used to provide a timeout facility in applications requiring it.

23215 **RATIONALE**

23216 None.

23217 **FUTURE DIRECTIONS**

23218 None.

23219 **SEE ALSO**

 23221 Definitions volume of IEEE Std 1003.1-2001, `<unistd.h>`

23222 **CHANGE HISTORY**

23223 First released in Issue 4, Version 2.

23224 **Issue 5**

23225 Moved from X/OPEN UNIX extension to BASE.

23226 Large File Summit extensions are added. In particular, the description of [EINVAL] is clarified  
 23227 and moved from optional to mandatory status.

23228 A note is added to the DESCRIPTION indicating the effects of attempting to lock a section of a  
 23229 file that is associated with a buffered stream.

23230 **Issue 6**

23231 The DESCRIPTION is updated to avoid use of the term “must” for application requirements.

23232 **NAME**

23233 log, logf, logl — natural logarithm function

23234 **SYNOPSIS**

23235 #include &lt;math.h&gt;

23236 double log(double x);

23237 float logf(float x);

23238 long double logl(long double x);

23239 **DESCRIPTION**

23240 **CX** The functionality described on this reference page is aligned with the ISO C standard. Any  
 23241 conflict between the requirements described here and the ISO C standard is unintentional. This  
 23242 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

23243 These functions shall compute the natural logarithm of their argument  $x$ ,  $\log_e(x)$ .

23244 An application wishing to check for error situations should set *errno* to zero and call  
 23245 *feclearexcept*(FE\_ALL\_EXCEPT) before calling these functions. On return, if *errno* is non-zero or  
 23246 *fetestexcept*(FE\_INVALID | FE\_DIVBYZERO | FE\_OVERFLOW | FE\_UNDERFLOW) is non-  
 23247 zero, an error has occurred.

23248 **RETURN VALUE**23249 Upon successful completion, these functions shall return the natural logarithm of  $x$ .

23250 If  $x$  is  $\pm 0$ , a pole error shall occur and *log()*, *logf()*, and *logl()* shall return `-HUGE_VAL`,  
 23251 `-HUGE_VALF`, and `-HUGE_VALL`, respectively.

23252 **MX** For finite values of  $x$  that are less than 0, or if  $x$  is `-Inf`, a domain error shall occur, and either a  
 23253 NaN (if supported), or an implementation-defined value shall be returned.

23254 **MX** If  $x$  is NaN, a NaN shall be returned.23255 If  $x$  is 1, `+0` shall be returned.23256 If  $x$  is `+Inf`,  $x$  shall be returned.23257 **ERRORS**

23258 These functions shall fail if:

23259 **MX** Domain Error The finite value of  $x$  is negative, or  $x$  is `-Inf`.

23260 If the integer expression (*math\_errhandling* & *MATH\_ERRNO*) is non-zero,  
 23261 then *errno* shall be set to [EDOM]. If the integer expression (*math\_errhandling*  
 23262 & *MATH\_ERREXCEPT*) is non-zero, then the invalid floating-point exception  
 23263 shall be raised.

23264 Pole Error The value of  $x$  is zero.

23265 If the integer expression (*math\_errhandling* & *MATH\_ERRNO*) is non-zero,  
 23266 then *errno* shall be set to [ERANGE]. If the integer expression  
 23267 (*math\_errhandling* & *MATH\_ERREXCEPT*) is non-zero, then the divide-by-  
 23268 zero floating-point exception shall be raised.

23269 **EXAMPLES**

23270 None.

23271 **APPLICATION USAGE**

23272 On error, the expressions (math\_errhandling & MATH\_ERRNO) and (math\_errhandling &  
23273 MATH\_ERREXCEPT) are independent of each other, but at least one of them must be non-zero.

23274 **RATIONALE**

23275 None.

23276 **FUTURE DIRECTIONS**

23277 None.

23278 **SEE ALSO**

23279 *exp()*, *feclearexcept()*, *fetetestexcept()*, *isnan()*, *log10()*, *log1p()*, the Base Definitions volume of  
23280 IEEE Std 1003.1-2001, Section 4.18, Treatment of Error Conditions for Mathematical Functions,

23282 **CHANGE HISTORY**

23283 First released in Issue 1. Derived from Issue 1 of the SVID.

23284 **Issue 5**

23285 The DESCRIPTION is updated to indicate how an application should check for an error. This  
23286 text was previously published in the APPLICATION USAGE section.

23287 **Issue 6**

23288 The DESCRIPTION is updated to avoid use of the term “must” for application requirements.

23289 The *logf()* and *logl()* functions are added for alignment with the ISO/IEC 9899:1999 standard.

23290 The DESCRIPTION, RETURN VALUE, ERRORS, and APPLICATION USAGE sections are  
23291 revised to align with the ISO/IEC 9899:1999 standard.

23292 IEC 60559:1989 standard floating-point extensions over the ISO/IEC 9899:1999 standard are  
23293 marked.

23294 **NAME**

23295 log10, log10f, log10l — base 10 logarithm function

23296 **SYNOPSIS**

23297 #include &lt;math.h&gt;

23298 double log10(double x);

23299 float log10f(float x);

23300 long double log10l(long double x);

23301 **DESCRIPTION**

23302 **CX** The functionality described on this reference page is aligned with the ISO C standard. Any  
 23303 conflict between the requirements described here and the ISO C standard is unintentional. This  
 23304 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

23305 These functions shall compute the base 10 logarithm of their argument  $x$ ,  $\log_{10}(x)$ .

23306 An application wishing to check for error situations should set *errno* to zero and call  
 23307 *feclearexcept*(FE\_ALL\_EXCEPT) before calling these functions. On return, if *errno* is non-zero or  
 23308 *fetestexcept*(FE\_INVALID | FE\_DIVBYZERO | FE\_OVERFLOW | FE\_UNDERFLOW) is non-  
 23309 zero, an error has occurred.

23310 **RETURN VALUE**23311 Upon successful completion, these functions shall return the base 10 logarithm of  $x$ .

23312 If  $x$  is  $\pm 0$ , a pole error shall occur and *log10()*, *log10f()*, and *log10l()* shall return `-HUGE_VAL`,  
 23313 `-HUGE_VALF`, and `-HUGE_VALL`, respectively.

23314 **MX** For finite values of  $x$  that are less than 0, or if  $x$  is `-Inf`, a domain error shall occur, and either a  
 23315 NaN (if supported), or an implementation-defined value shall be returned.

23316 **MX** If  $x$  is NaN, a NaN shall be returned.23317 If  $x$  is 1, `+0` shall be returned.23318 If  $x$  is `+Inf`, `+Inf` shall be returned.23319 **ERRORS**

23320 These functions shall fail if:

23321 **MX** Domain Error The finite value of  $x$  is negative, or  $x$  is `-Inf`.

23322 If the integer expression (math\_errhandling & MATH\_ERRNO) is non-zero,  
 23323 then *errno* shall be set to [EDOM]. If the integer expression (math\_errhandling  
 23324 & MATH\_ERREXCEPT) is non-zero, then the invalid floating-point exception  
 23325 shall be raised.

23326 Pole Error The value of  $x$  is zero.

23327 If the integer expression (math\_errhandling & MATH\_ERRNO) is non-zero,  
 23328 then *errno* shall be set to [ERANGE]. If the integer expression  
 23329 (math\_errhandling & MATH\_ERREXCEPT) is non-zero, then the divide-by-  
 23330 zero floating-point exception shall be raised.

23331 **EXAMPLES**

23332 None.

23333 **APPLICATION USAGE**

23334 On error, the expressions (math\_errhandling & MATH\_ERRNO) and (math\_errhandling &  
23335 MATH\_ERREXCEPT) are independent of each other, but at least one of them must be non-zero.

23336 **RATIONALE**

23337 None.

23338 **FUTURE DIRECTIONS**

23339 None.

23340 **SEE ALSO**

23344 **CHANGE HISTORY**

23345 First released in Issue 1. Derived from Issue 1 of the SVID.

23346 **Issue 5**

23347 The DESCRIPTION is updated to indicate how an application should check for an error. This  
23348 text was previously published in the APPLICATION USAGE section.

23349 **Issue 6**

23350 The DESCRIPTION is updated to avoid use of the term “must” for application requirements.

23351 The *log10f()* and *log10l()* functions are added for alignment with the ISO/IEC 9899:1999  
23352 standard.

23353 The DESCRIPTION, RETURN VALUE, ERRORS, and APPLICATION USAGE sections are  
23354 revised to align with the ISO/IEC 9899:1999 standard.

23355 IEC 60559:1989 standard floating-point extensions over the ISO/IEC 9899:1999 standard are  
23356 marked.

23357 **NAME**

23358 log1p, log1pf, log1pl — compute a natural logarithm

23359 **SYNOPSIS**

23360 #include &lt;math.h&gt;

23361 double log1p(double x);

23362 float log1pf(float x);

23363 long double log1pl(long double x);

23364 **DESCRIPTION**

23365 **CX** The functionality described on this reference page is aligned with the ISO C standard. Any  
 23366 conflict between the requirements described here and the ISO C standard is unintentional. This  
 23367 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

23368 These functions shall compute  $\log_e(1.0 + x)$ .

23369 An application wishing to check for error situations should set *errno* to zero and call  
 23370 *feclearexcept*(FE\_ALL\_EXCEPT) before calling these functions. On return, if *errno* is non-zero or  
 23371 *fetestexcept*(FE\_INVALID | FE\_DIVBYZERO | FE\_OVERFLOW | FE\_UNDERFLOW) is non-  
 23372 zero, an error has occurred.

23373 **RETURN VALUE**23374 Upon successful completion, these functions shall return the natural logarithm of  $1.0 + x$ .

23375 If  $x$  is  $-1$ , a pole error shall occur and *log1p()*, *log1pf()*, and *log1pl()* shall return  $-\text{HUGE\_VAL}$ ,  
 23376  $-\text{HUGE\_VALF}$ , and  $-\text{HUGE\_VALL}$ , respectively.

23377 **MX** For finite values of  $x$  that are less than  $-1$ , or if  $x$  is  $-\text{Inf}$ , a domain error shall occur, and either a  
 23378 NaN (if supported), or an implementation-defined value shall be returned.

23379 **MX** If  $x$  is NaN, a NaN shall be returned.23380 If  $x$  is  $\pm 0$ , or  $+\text{Inf}$ ,  $x$  shall be returned.23381 If  $x$  is subnormal, a range error may occur and  $x$  should be returned.23382 **ERRORS**

23383 These functions shall fail if:

23384 **MX** Domain Error The finite value of  $x$  is less than  $-1$ , or  $x$  is  $-\text{Inf}$ .

23385 If the integer expression (math\_errhandling & MATH\_ERRNO) is non-zero,  
 23386 then *errno* shall be set to [EDOM]. If the integer expression (math\_errhandling  
 23387 & MATH\_ERREXCEPT) is non-zero, then the invalid floating-point exception  
 23388 shall be raised.

23389 Pole Error The value of  $x$  is  $-1$ .

23390 If the integer expression (math\_errhandling & MATH\_ERRNO) is non-zero,  
 23391 then *errno* shall be set to [ERANGE]. If the integer expression  
 23392 (math\_errhandling & MATH\_ERREXCEPT) is non-zero, then the divide-by-  
 23393 zero floating-point exception shall be raised.

23394 These functions may fail if:

23395 **MX** Range Error The value of  $x$  is subnormal.

23396 If the integer expression (math\_errhandling & MATH\_ERRNO) is non-zero,  
 23397 then *errno* shall be set to [ERANGE]. If the integer expression  
 23398 (math\_errhandling & MATH\_ERREXCEPT) is non-zero, then the underflow  
 23399 floating-point exception shall be raised.

23400 **EXAMPLES**

23401 None.

23402 **APPLICATION USAGE**

23403 On error, the expressions (math\_errhandling & MATH\_ERRNO) and (math\_errhandling &  
23404 MATH\_ERREXCEPT) are independent of each other, but at least one of them must be non-zero.

23405 **RATIONALE**

23406 None.

23411 4.18, Treatment of Error Conditions for Mathematical Functions, <math.h>

23412 **CHANGE HISTORY**

23413 First released in Issue 4, Version 2.

23414 **Issue 5**

23415 Moved from X/OPEN UNIX extension to BASE.

23416 **Issue 6**

23417 The DESCRIPTION is updated to avoid use of the term “must” for application requirements.

23418 The *log1p()* function is no longer marked as an extension.

23419 The *log1pf()* and *log1pl()* functions are added for alignment with the ISO/IEC 9899:1999  
23420 standard.

23421 The DESCRIPTION, RETURN VALUE, ERRORS, and APPLICATION USAGE sections are  
23422 revised to align with the ISO/IEC 9899:1999 standard.

23423 IEC 60559:1989 standard floating-point extensions over the ISO/IEC 9899:1999 standard are  
23424 marked.

23425 **NAME**

23426 log2, log2f, log2l — compute base 2 logarithm functions

23427 **SYNOPSIS**

23428 #include &lt;math.h&gt;

23429 double log2(double x);

23430 float log2f(float x);

23431 long double log2l(long double x);

23432 **DESCRIPTION**

23433 **CX** The functionality described on this reference page is aligned with the ISO C standard. Any  
 23434 conflict between the requirements described here and the ISO C standard is unintentional. This  
 23435 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

23436 These functions shall compute the base 2 logarithm of their argument  $x$ ,  $\log_2(x)$ .

23437 An application wishing to check for error situations should set *errno* to zero and call  
 23438 *feclearexcept*(FE\_ALL\_EXCEPT) before calling these functions. On return, if *errno* is non-zero or  
 23439 *fetestexcept*(FE\_INVALID | FE\_DIVBYZERO | FE\_OVERFLOW | FE\_UNDERFLOW) is non-  
 23440 zero, an error has occurred.

23441 **RETURN VALUE**23442 Upon successful completion, these functions shall return the base 2 logarithm of  $x$ .

23443 If  $x$  is  $\pm 0$ , a pole error shall occur and *log2()*, *log2f()*, and *log2l()* shall return `-HUGE_VAL`,  
 23444 `-HUGE_VALF`, and `-HUGE_VALL`, respectively.

23445 **MX** For finite values of  $x$  that are less than 0, or if  $x$  is `-Inf`, a domain error shall occur, and either a  
 23446 NaN (if supported), or an implementation-defined value shall be returned.

23447 **MX** If  $x$  is NaN, a NaN shall be returned.23448 If  $x$  is 1, `+0` shall be returned.23449 If  $x$  is `+Inf`,  $x$  shall be returned.23450 **ERRORS**

23451 These functions shall fail if:

23452 **MX** Domain Error The finite value of  $x$  is less than zero, or  $x$  is `-Inf`.

23453 If the integer expression (*math\_errhandling* & MATH\_ERRNO) is non-zero,  
 23454 then *errno* shall be set to [EDOM]. If the integer expression (*math\_errhandling*  
 23455 & MATH\_ERREXCEPT) is non-zero, then the invalid floating-point exception  
 23456 shall be raised.

23457 Pole Error The value of  $x$  is zero.

23458 If the integer expression (*math\_errhandling* & MATH\_ERRNO) is non-zero,  
 23459 then *errno* shall be set to [ERANGE]. If the integer expression  
 23460 (*math\_errhandling* & MATH\_ERREXCEPT) is non-zero, then the divide-by-  
 23461 zero floating-point exception shall be raised.

**23462 EXAMPLES**

23463           None.

**23464 APPLICATION USAGE**

23465           On error, the expressions (math\_errhandling & MATH\_ERRNO) and (math\_errhandling &  
23466           MATH\_ERREXCEPT) are independent of each other, but at least one of them must be non-zero.

**23467 RATIONALE**

23468           None.

**23469 FUTURE DIRECTIONS**

23470           None.

**23471 SEE ALSO**

23472           *feclearexcept()*, *fetestexcept()*, *log()*, the Base Definitions volume of IEEE Std 1003.1-2001, Section  
23473           4.18, Treatment of Error Conditions for Mathematical Functions, <math.h>

**23474 CHANGE HISTORY**

23475           First released in Issue 6. Derived from the ISO/IEC 9899:1999 standard.

23476 **NAME**

23477 logb, logbf, logbl — radix-independent exponent

23478 **SYNOPSIS**

23479 #include &lt;math.h&gt;

23480 double logb(double x);

23481 float logbf(float x);

23482 long double logbl(long double x);

23483 **DESCRIPTION**

23484 **CX** The functionality described on this reference page is aligned with the ISO C standard. Any  
 23485 conflict between the requirements described here and the ISO C standard is unintentional. This  
 23486 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

23487 These functions shall compute the exponent of  $x$ , which is the integral part of  $\log_r |x|$ , as a  
 23488 signed floating-point value, for non-zero  $x$ , where  $r$  is the radix of the machine's floating-point  
 23489 arithmetic, which is the value of FLT\_RADIX defined in the <float.h> header.

23490 If  $x$  is subnormal it is treated as though it were normalized; thus for finite positive  $x$ :

23491  $1 \leq x * \text{FLT\_RADIX}^{-\text{logb}(x)} < \text{FLT\_RADIX}$ 

23492 An application wishing to check for error situations should set *errno* to zero and call  
 23493 *feclearexcept*(FE\_ALL\_EXCEPT) before calling these functions. On return, if *errno* is non-zero or  
 23494 *fetestexcept*(FE\_INVALID | FE\_DIVBYZERO | FE\_OVERFLOW | FE\_UNDERFLOW) is non-  
 23495 zero, an error has occurred.

23496 **RETURN VALUE**23497 Upon successful completion, these functions shall return the exponent of  $x$ .

23498 If  $x$  is  $\pm 0$ , a pole error shall occur and *logb*(), *logbf*(), and *logbl*() shall return  $-\text{HUGE\_VAL}$ ,  
 23499  $-\text{HUGE\_VALF}$ , and  $-\text{HUGE\_VALL}$ , respectively.

23500 **MX** If  $x$  is NaN, a NaN shall be returned.23501 If  $x$  is  $\pm\text{Inf}$ ,  $+\text{Inf}$  shall be returned.23502 **ERRORS**

23503 These functions shall fail if:

23504 Pole Error The value of  $x$  is  $\pm 0$ .

23505 If the integer expression (math\_errhandling & MATH\_ERRNO) is non-zero,  
 23506 then *errno* shall be set to [ERANGE]. If the integer expression  
 23507 (math\_errhandling & MATH\_ERREXCEPT) is non-zero, then the divide-by-  
 23508 zero floating-point exception shall be raised.

23509 **EXAMPLES**

23510 None.

23511 **APPLICATION USAGE**

23512 On error, the expressions (math\_errhandling & MATH\_ERRNO) and (math\_errhandling &  
 23513 MATH\_ERREXCEPT) are independent of each other, but at least one of them must be non-zero.

23514 **RATIONALE**

23515 None.

23523 **Issue 5**

23524 Moved from X/OPEN UNIX extension to BASE.

23525 **Issue 6**23526 The *logb()* function is no longer marked as an extension.23527 The *logbf()* and *logbl()* functions are added for alignment with the ISO/IEC 9899:1999 standard.23528 The DESCRIPTION, RETURN VALUE, ERRORS, and APPLICATION USAGE sections are  
23529 revised to align with the ISO/IEC 9899:1999 standard.23530 IEC 60559:1989 standard floating-point extensions over the ISO/IEC 9899:1999 standard are  
23531 marked.

23532 **NAME**

23533 logf, logl — natural logarithm function

23534 **SYNOPSIS**

23535 #include &lt;math.h&gt;

23536 float logf(float x);

23537 long double logl(long double x);

23538 **DESCRIPTION**23539 Refer to *log()*.

## 23540 NAME

23541 longjmp — non-local goto

## 23542 SYNOPSIS

23543 #include &lt;setjmp.h&gt;

23544 void longjmp(jmp\_buf env, int val);

## 23545 DESCRIPTION

23546 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
 23547 conflict between the requirements described here and the ISO C standard is unintentional. This  
 23548 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

23549 The *longjmp()* function shall restore the environment saved by the most recent invocation of  
 23550 *setjmp()* in the same thread, with the corresponding **jmp\_buf** argument. If there is no such  
 23551 invocation, or if the function containing the invocation of *setjmp()* has terminated execution in  
 23552 the interim, or if the invocation of *setjmp()* was within the scope of an identifier with variably  
 23553 CX modified type and execution has left that scope in the interim, the behavior is undefined. It is  
 23554 unspecified whether *longjmp()* restores the signal mask, leaves the signal mask unchanged, or  
 23555 restores it to its value at the time *setjmp()* was called.

23556 All accessible objects have values, and all other components of the abstract machine have state  
 23557 (for example, floating-point status flags and open files), as of the time *longjmp()* was called,  
 23558 except that the values of objects of automatic storage duration are unspecified if they meet all  
 23559 the following conditions:

- 23560 • They are local to the function containing the corresponding *setjmp()* invocation.
- 23561 • They do not have volatile-qualified type.
- 23562 • They are changed between the *setjmp()* invocation and *longjmp()* call.

23563 CX As it bypasses the usual function call and return mechanisms, *longjmp()* shall execute correctly  
 23564 in contexts of interrupts, signals, and any of their associated functions. However, if *longjmp()* is  
 23565 invoked from a nested signal handler (that is, from a function invoked as a result of a signal  
 23566 raised during the handling of another signal), the behavior is undefined.

23567 The effect of a call to *longjmp()* where initialization of the **jmp\_buf** structure was not performed  
 23568 in the calling thread is undefined.

## 23569 RETURN VALUE

23570 After *longjmp()* is completed, program execution continues as if the corresponding invocation of  
 23571 *setjmp()* had just returned the value specified by *val*. The *longjmp()* function shall not cause  
 23572 *setjmp()* to return 0; if *val* is 0, *setjmp()* shall return 1.

## 23573 ERRORS

23574 No errors are defined.

## 23575 EXAMPLES

23576 None.

## 23577 APPLICATION USAGE

23578 Applications whose behavior depends on the value of the signal mask should not use *longjmp()*  
 23579 and *setjmp()*, since their effect on the signal mask is unspecified, but should instead use the  
 23580 *siglongjmp()* and *sigsetjmp()* functions (which can save and restore the signal mask under  
 23581 application control).

23582 **RATIONALE**

23583       None.

23584 **FUTURE DIRECTIONS**

23585       None.

23586 **SEE ALSO**23587       *setjmp()*, *sigaction()*, *siglongjmp()*, *sigsetjmp()*, the Base Definitions volume of  
23588       IEEE Std 1003.1-2001, <**setjmp.h**>23589 **CHANGE HISTORY**

23590       First released in Issue 1. Derived from Issue 1 of the SVID.

23591 **Issue 5**

23592       The DESCRIPTION is updated for alignment with the POSIX Threads Extension.

23593 **Issue 6**

23594       Extensions beyond the ISO C standard are marked.

23595       The following new requirements on POSIX implementations derive from alignment with the  
23596       Single UNIX Specification:

- 23597
- The DESCRIPTION now explicitly makes *longjmp()*'s effect on the signal mask unspecified.

23598       The DESCRIPTION is updated for alignment with the ISO/IEC 9899:1999 standard.

23599 **NAME**

23600 lrand48 — generate uniformly distributed pseudo-random non-negative long integers

23601 **SYNOPSIS**

```
23602 xSI #include <stdlib.h>
```

```
23603 long lrand48(void);
```

23604

23605 **DESCRIPTION**

23606 Refer to *drand48()*.

23607 **NAME**

23608 lrint, lrintf, lrintl — round to nearest integer value using current rounding direction

23609 **SYNOPSIS**

```
23610 #include <math.h>
23611 long lrint(double x);
23612 long lrintf(float x);
23613 long lrintl(long double x);
```

23614 **DESCRIPTION**

23615 **CX** The functionality described on this reference page is aligned with the ISO C standard. Any  
 23616 conflict between the requirements described here and the ISO C standard is unintentional. This  
 23617 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

23618 These functions shall round their argument to the nearest integer value, rounding according to  
 23619 the current rounding direction.

23620 An application wishing to check for error situations should set *errno* to zero and call  
 23621 *feclearexcept*(FE\_ALL\_EXCEPT) before calling these functions. On return, if *errno* is non-zero or  
 23622 *fetestexcept*(FE\_INVALID | FE\_DIVBYZERO | FE\_OVERFLOW | FE\_UNDERFLOW) is non-  
 23623 zero, an error has occurred.

23624 **RETURN VALUE**

23625 Upon successful completion, these functions shall return the rounded integer value.

23626 **MX** If *x* is NaN, a domain error shall occur and an unspecified value is returned.23627 If *x* is +Inf, a domain error shall occur and an unspecified value is returned.23628 If *x* is -Inf, a domain error shall occur and an unspecified value is returned.

23629 If the correct value is positive and too large to represent as a **long**, a domain error shall occur  
 23630 and an unspecified value is returned.

23631 If the correct value is negative and too large to represent as a **long**, a domain error shall occur  
 23632 and an unspecified value is returned.

23633 **ERRORS**

23634 These functions shall fail if:

23635 **MX** Domain Error The *x* argument is NaN or ±Inf, or the correct value is not representable as an  
 23636 integer.

23637 If the integer expression (math\_errhandling & MATH\_ERRNO) is non-zero,  
 23638 then *errno* shall be set to [EDOM]. If the integer expression (math\_errhandling  
 23639 & MATH\_ERREXCEPT) is non-zero, then the invalid floating-point exception  
 23640 shall be raised.

23641 **EXAMPLES**

23642 None.

23643 **APPLICATION USAGE**

23644 On error, the expressions (math\_errhandling & MATH\_ERRNO) and (math\_errhandling &  
 23645 MATH\_ERREXCEPT) are independent of each other, but at least one of them must be non-zero.

23646 **RATIONALE**

23647 These functions provide floating-to-integer conversions. They round according to the current  
 23648 rounding direction. If the rounded value is outside the range of the return type, the numeric  
 23649 result is unspecified and the invalid floating-point exception is raised. When they raise no other  
 23650 floating-point exception and the result differs from the argument, they raise the inexact

23651 floating-point exception.

23652 **FUTURE DIRECTIONS**

23653 None.

23654 **SEE ALSO**

23655 *feclearexcept()*, *fetetestexcept()*, *llrint()*, the Base Definitions volume of IEEE Std 1003.1-2001,  
23656 Section 4.18, Treatment of Error Conditions for Mathematical Functions, <**math.h**>

23657 **CHANGE HISTORY**

23658 First released in Issue 6. Derived from the ISO/IEC 9899:1999 standard.

23659 **NAME**

23660 lround, lroundf, lroundl — round to nearest integer value

23661 **SYNOPSIS**

23662 #include &lt;math.h&gt;

23663 long lround(double x);

23664 long lroundf(float x);

23665 long lroundl(long double x);

23666 **DESCRIPTION**

23667 **CX** The functionality described on this reference page is aligned with the ISO C standard. Any  
 23668 conflict between the requirements described here and the ISO C standard is unintentional. This  
 23669 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

23670 These functions shall round their argument to the nearest integer value, rounding halfway cases  
 23671 away from zero, regardless of the current rounding direction.

23672 An application wishing to check for error situations should set *errno* to zero and call  
 23673 *feclearexcept*(FE\_ALL\_EXCEPT) before calling these functions. On return, if *errno* is non-zero or  
 23674 *fetestexcept*(FE\_INVALID | FE\_DIVBYZERO | FE\_OVERFLOW | FE\_UNDERFLOW) is non-  
 23675 zero, an error has occurred.

23676 **RETURN VALUE**

23677 Upon successful completion, these functions shall return the rounded integer value.

23678 **MX** If *x* is NaN, a domain error shall occur and an unspecified value is returned.23679 If *x* is +Inf, a domain error shall occur and an unspecified value is returned.23680 If *x* is -Inf, a domain error shall occur and an unspecified value is returned.

23681 If the correct value is positive and too large to represent as a **long**, a domain error shall occur  
 23682 and an unspecified value is returned.

23683 If the correct value is negative and too large to represent as a **long**, a domain error shall occur  
 23684 and an unspecified value is returned.

23685 **ERRORS**

23686 These functions shall fail if:

23687 **MX** Domain Error The *x* argument is NaN or ±Inf, or the correct value is not representable as an  
 23688 integer.

23689 If the integer expression (math\_errhandling & MATH\_ERRNO) is non-zero,  
 23690 then *errno* shall be set to [EDOM]. If the integer expression (math\_errhandling  
 23691 & MATH\_ERREXCEPT) is non-zero, then the invalid floating-point exception  
 23692 shall be raised.

23693 **EXAMPLES**

23694 None.

23695 **APPLICATION USAGE**

23696 On error, the expressions (math\_errhandling & MATH\_ERRNO) and (math\_errhandling &  
 23697 MATH\_ERREXCEPT) are independent of each other, but at least one of them must be non-zero.

23698 **RATIONALE**

23699 These functions differ from the *lrint*() functions in the default rounding direction, with the  
 23700 *lround*() functions rounding halfway cases away from zero and needing not to raise the inexact  
 23701 floating-point exception for non-integer arguments that round to within the range of the return  
 23702 type.

23703 **FUTURE DIRECTIONS**

23704           None.

23705 **SEE ALSO**

23706           *feclearexcept()*, *fetetestexcept()*, *llround()*, the Base Definitions volume of IEEE Std 1003.1-2001,  
23707           Section 4.18, Treatment of Error Conditions for Mathematical Functions, <math.h>

23708 **CHANGE HISTORY**

23709           First released in Issue 6. Derived from the ISO/IEC 9899:1999 standard.

23710 **NAME**

23711 lsearch, lfind — linear search and update

23712 **SYNOPSIS**

```
23713 xSI #include <search.h>
23714 void *lsearch(const void *key, void *base, size_t *nel, size_t width,
23715             int (*compar)(const void *, const void *));
23716 void *lfind(const void *key, const void *base, size_t *nel,
23717            size_t width, int (*compar)(const void *, const void *));
23718
```

23719 **DESCRIPTION**

23720 The *lsearch()* function shall linearly search the table and return a pointer into the table for the  
 23721 matching entry. If the entry does not occur, it shall be added at the end of the table. The *key*  
 23722 argument points to the entry to be sought in the table. The *base* argument points to the first  
 23723 element in the table. The *width* argument is the size of an element in bytes. The *nel* argument  
 23724 points to an integer containing the current number of elements in the table. The integer to which  
 23725 *nel* points shall be incremented if the entry is added to the table. The *compar* argument points to  
 23726 a comparison function which the application shall supply (for example, *strcmp()*). It is called  
 23727 with two arguments that point to the elements being compared. The application shall ensure  
 23728 that the function returns 0 if the elements are equal, and non-zero otherwise.

23729 The *lfind()* function shall be equivalent to *lsearch()*, except that if the entry is not found, it is not  
 23730 added to the table. Instead, a null pointer is returned.

23731 **RETURN VALUE**

23732 If the searched for entry is found, both *lsearch()* and *lfind()* shall return a pointer to it. Otherwise,  
 23733 *lfind()* shall return a null pointer and *lsearch()* shall return a pointer to the newly added element.

23734 Both functions shall return a null pointer in case of error.

23735 **ERRORS**

23736 No errors are defined.

23737 **EXAMPLES**23738 **Storing Strings in a Table**

23739 This fragment reads in less than or equal to TABSIZE strings of length less than or equal to  
 23740 ELSIZE and stores them in a table, eliminating duplicates.

```
23741 #include <stdio.h>
23742 #include <string.h>
23743 #include <search.h>
23744 #define TABSIZE 50
23745 #define ELSIZE 120
23746 ...
23747     char line[ELSIZE], tab[TABSIZE][ELSIZE];
23748     size_t nel = 0;
23749     ...
23750     while (fgets(line, ELSIZE, stdin) != NULL && nel < TABSIZE)
23751         (void) lsearch(line, tab, &nel,
23752                      ELSIZE, (int (*)(const void *, const void *)) strcmp);
23753     ...
```

**23754 Finding a Matching Entry**

23755 The following example finds any line that reads "This is a test.".

```
23756 #include <search.h>
23757 #include <string.h>
23758 ...
23759 char line[ELSIZE], tab[TABSIZE][ELSIZE];
23760 size_t nel = 0;
23761 char *findline;
23762 void *entry;

23763 findline = "This is a test.\n";

23764 entry = lfind(findline, tab, &nel, ELSIZE, (
23765     int (*)(const void *, const void *)) strcmp);
```

**23766 APPLICATION USAGE**

23767 The comparison function need not compare every byte, so arbitrary data may be contained in  
23768 the elements in addition to the values being compared.

23769 Undefined results can occur if there is not enough room in the table to add a new item.

**23770 RATIONALE**

23771 None.

**23772 FUTURE DIRECTIONS**

23773 None.

**23774 SEE ALSO**

23775 *hcreate()*, *tsearch()*, the Base Definitions volume of IEEE Std 1003.1-2001, <**search.h**>

**23776 CHANGE HISTORY**

23777 First released in Issue 1. Derived from Issue 1 of the SVID.

**23778 Issue 6**

23779 The DESCRIPTION is updated to avoid use of the term “must” for application requirements.

23780 **NAME**

23781 lseek — move the read/write file offset

23782 **SYNOPSIS**

23783 #include &lt;unistd.h&gt;

23784 off\_t lseek(int *fildes*, off\_t *offset*, int *whence*);23785 **DESCRIPTION**23786 The *lseek()* function shall set the file offset for the open file description associated with the file descriptor *fildes*, as follows:

- 23788 • If *whence* is SEEK\_SET, the file offset shall be set to *offset* bytes.
- 23789 • If *whence* is SEEK\_CUR, the file offset shall be set to its current location plus *offset*.
- 23790 • If *whence* is SEEK\_END, the file offset shall be set to the size of the file plus *offset*.

23791 The symbolic constants SEEK\_SET, SEEK\_CUR, and SEEK\_END are defined in &lt;unistd.h&gt;.

23792 The behavior of *lseek()* on devices which are incapable of seeking is implementation-defined.  
23793 The value of the file offset associated with such a device is undefined.23794 The *lseek()* function shall allow the file offset to be set beyond the end of the existing data in the file. If data is later written at this point, subsequent reads of data in the gap shall return bytes with the value 0 until data is actually written into the gap.23797 The *lseek()* function shall not, by itself, extend the size of a file.23798 SHM If *fildes* refers to a shared memory object, the result of the *lseek()* function is unspecified.23799 TYM If *fildes* refers to a typed memory object, the result of the *lseek()* function is unspecified.23800 **RETURN VALUE**23801 Upon successful completion, the resulting offset, as measured in bytes from the beginning of the file, shall be returned. Otherwise, (off\_t)-1 shall be returned, *errno* shall be set to indicate the error, and the file offset shall remain unchanged.23804 **ERRORS**23805 The *lseek()* function shall fail if:

- 23806 [EBADF] The *fildes* argument is not an open file descriptor.
- 23807 [EINVAL] The *whence* argument is not a proper value, or the resulting file offset would be negative for a regular file, block special file, or directory.
- 23808 [EOVERFLOW] The resulting file offset would be a value which cannot be represented correctly in an object of type **off\_t**.
- 23809 [ESPIPE] The *fildes* argument is associated with a pipe, FIFO, or socket.

23812 **EXAMPLES**

23813 None.

23814 **APPLICATION USAGE**

23815 None.

23816 **RATIONALE**23817 The ISO C standard includes the functions *fgetpos()* and *fsetpos()*, which work on very large files by use of a special positioning type.23819 Although *lseek()* may position the file offset beyond the end of the file, this function does not itself extend the size of the file. While the only function in IEEE Std 1003.1-2001 that may directly

- 23821 extend the size of the file is *write()*, *truncate()*, and *ftruncate()*, several functions originally  
23822 derived from the ISO C standard, such as *fwrite()*, *fprintf()*, and so on, may do so (by causing  
23823 calls on *write()*).
- 23824 An invalid file offset that would cause [EINVAL] to be returned may be both implementation-  
23825 defined and device-dependent (for example, memory may have few invalid values). A negative  
23826 file offset may be valid for some devices in some implementations.
- 23827 The POSIX.1-1990 standard did not specifically prohibit *lseek()* from returning a negative offset.  
23828 Therefore, an application was required to clear *errno* prior to the call and check *errno* upon return  
23829 to determine whether a return value of (*off\_t*)-1 is a negative offset or an indication of an error  
23830 condition. The standard developers did not wish to require this action on the part of a  
23831 conforming application, and chose to require that *errno* be set to [EINVAL] when the resulting  
23832 file offset would be negative for a regular file, block special file, or directory.
- 23833 **FUTURE DIRECTIONS**
- 23834 None.
- 23835 **SEE ALSO**
- 23836 *open()*, the Base Definitions volume of IEEE Std 1003.1-2001, <**sys/types.h**>, <**unistd.h**>
- 23837 **CHANGE HISTORY**
- 23838 First released in Issue 1. Derived from Issue 1 of the SVID.
- 23839 **Issue 5**
- 23840 The DESCRIPTION is updated for alignment with the POSIX Realtime Extension.
- 23841 Large File Summit extensions are added.
- 23842 **Issue 6**
- 23843 In the SYNOPSIS, the optional include of the <**sys/types.h**> header is removed.
- 23844 The following new requirements on POSIX implementations derive from alignment with the  
23845 Single UNIX Specification:
- 23846 • The requirement to include <**sys/types.h**> has been removed. Although <**sys/types.h**> was  
23847 required for conforming implementations of previous POSIX specifications, it was not  
23848 required for UNIX applications.
  - 23849 • The [EOVERFLOW] error condition is added. This change is to support large files.
- 23850 An additional [ESPIPE] error condition is added for sockets.
- 23851 The DESCRIPTION is updated for alignment with IEEE Std 1003.1j-2000 by specifying that  
23852 *lseek()* results are unspecified for typed memory objects.

23853 **NAME**

23854 lstat — get symbolic link status

23855 **SYNOPSIS**

23856 #include &lt;sys/stat.h&gt;

23857 int lstat(const char \*restrict *path*, struct stat \*restrict *buf*);23858 **DESCRIPTION**

23859 The *lstat()* function shall be equivalent to *stat()*, except when *path* refers to a symbolic link. In  
 23860 that case *lstat()* shall return information about the link, while *stat()* shall return information  
 23861 about the file the link references.

23862 For symbolic links, the *st\_mode* member shall contain meaningful information when used with  
 23863 the file type macros, and the *st\_size* member shall contain the length of the pathname contained  
 23864 in the symbolic link. File mode bits and the contents of the remaining members of the **stat**  
 23865 structure are unspecified. The value returned in the *st\_size* member is the length of the contents  
 23866 of the symbolic link, and does not count any trailing null.

23867 **RETURN VALUE**

23868 Upon successful completion, *lstat()* shall return 0. Otherwise, it shall return  $-1$  and set *errno* to  
 23869 indicate the error.

23870 **ERRORS**23871 The *lstat()* function shall fail if:

23872 [EACCES] A component of the path prefix denies search permission.

23873 [EIO] An error occurred while reading from the file system.

23874 [ELOOP] A loop exists in symbolic links encountered during resolution of the *path*  
 23875 argument.

23876 [ENAMETOOLONG]

23877 The length of a pathname exceeds {PATH\_MAX} or a pathname component is  
 23878 longer than {NAME\_MAX}.

23879 [ENOTDIR] A component of the path prefix is not a directory.

23880 [ENOENT] A component of *path* does not name an existing file or *path* is an empty string.

23881 [EOVERFLOW] The file size in bytes or the number of blocks allocated to the file or the file  
 23882 serial number cannot be represented correctly in the structure pointed to by  
 23883 *buf*.

23884 The *lstat()* function may fail if:

23885 [ELOOP] More than {SYMLOOP\_MAX} symbolic links were encountered during  
 23886 resolution of the *path* argument.

23887 [ENAMETOOLONG]

23888 As a result of encountering a symbolic link in resolution of the *path* argument,  
 23889 the length of the substituted pathname string exceeded {PATH\_MAX}.

23890 [EOVERFLOW] One of the members is too large to store into the structure pointed to by the  
 23891 *buf* argument.

23892 **EXAMPLES**23893 **Obtaining Symbolic Link Status Information**

23894 The following example shows how to obtain status information for a symbolic link named  
23895 **/modules/pass1**. The structure variable *buffer* is defined for the **stat** structure. If the *path*  
23896 argument specified the filename for the file pointed to by the symbolic link (**/home/cnd/mod1**),  
23897 the results of calling the function would be the same as those returned by a call to the *stat()*  
23898 function.

```
23899 #include <sys/stat.h>
23900 struct stat buffer;
23901 int status;
23902 ...
23903 status = lstat("/modules/pass1", &buffer);
```

23904 **APPLICATION USAGE**

23905 None.

23906 **RATIONALE**

23907 The *lstat()* function is not required to update the time-related fields if the named file is not a  
23908 symbolic link. While the *st\_uid*, *st\_gid*, *st\_atime*, *st\_mtime*, and *st\_ctime* members of the **stat**  
23909 structure may apply to a symbolic link, they are not required to do so. No functions in  
23910 IEEE Std 1003.1-2001 are required to maintain any of these time fields.

23911 **FUTURE DIRECTIONS**

23912 None.

23913 **SEE ALSO**

23914 *lstat()*, *readlink()*, *stat()*, *symlink()*, the Base Definitions volume of IEEE Std 1003.1-2001,  
23915 **<sys/stat.h>**

23916 **CHANGE HISTORY**

23917 First released in Issue 4, Version 2.

23918 **Issue 5**

23919 Moved from X/OPEN UNIX extension to BASE.

23920 Large File Summit extensions are added.

23921 **Issue 6**

23922 The following changes were made to align with the IEEE P1003.1a draft standard:

- 23923 • This function is now mandatory.
- 23924 • The [ELOOP] optional error condition is added.

23925 The **restrict** keyword is added to the *lstat()* prototype for alignment with the ISO/IEC 9899:1999  
23926 standard.

23927 **NAME**23928 `makecontext`, `swapcontext` — manipulate user contexts23929 **SYNOPSIS**

```
23930 xSI #include <ucontext.h>
23931
23932 void makecontext(ucontext_t *ucp, void (*func)(void),
23933                int argc, ...);
23934 int swapcontext(ucontext_t *restrict oucp,
23935                const ucontext_t *restrict ucp);
23935
```

23936 **DESCRIPTION**

23937 The `makecontext()` function shall modify the context specified by `ucp`, which has been initialized  
 23938 using `getcontext()`. When this context is resumed using `swapcontext()` or `setcontext()`, program  
 23939 execution shall continue by calling `func`, passing it the arguments that follow `argc` in the  
 23940 `makecontext()` call.

23941 Before a call is made to `makecontext()`, the application shall ensure that the context being  
 23942 modified has a stack allocated for it. The application shall ensure that the value of `argc` matches  
 23943 the number of integer arguments passed to `func`; otherwise, the behavior is undefined.

23944 The `uc_link` member is used to determine the context that shall be resumed when the context  
 23945 being modified by `makecontext()` returns. The application shall ensure that the `uc_link` member is  
 23946 initialized prior to the call to `makecontext()`.

23947 The `swapcontext()` function shall save the current context in the context structure pointed to by  
 23948 `oucp` and shall set the context to the context structure pointed to by `ucp`.

23949 **RETURN VALUE**

23950 Upon successful completion, `swapcontext()` shall return 0. Otherwise, `-1` shall be returned and  
 23951 `errno` set to indicate the error.

23952 **ERRORS**

23953 The `swapcontext()` function shall fail if:

23954 [ENOMEM] The `ucp` argument does not have enough stack left to complete the operation.

23955 **EXAMPLES**

23956 The following example illustrates the use of `makecontext()`:

```
23957 #include <stdio.h>
23958 #include <ucontext.h>
23959
23960 static ucontext_t ctx[3];
23961
23962 static void
23963 f1 (void)
23964 {
23965     puts("start f1");
23966     swapcontext(&ctx[1], &ctx[2]);
23967     puts("finish f1");
23968 }
23969
23970 static void
23971 f2 (void)
23972 {
23973     puts("start f2");
23974     swapcontext(&ctx[2], &ctx[1]);
23975 }
```

```

23972         puts("finish f2");
23973     }
23974     int
23975     main (void)
23976     {
23977         char st1[8192];
23978         char st2[8192];

23979         getcontext(&ctx[1]);
23980         ctx[1].uc_stack.ss_sp = st1;
23981         ctx[1].uc_stack.ss_size = sizeof st1;
23982         ctx[1].uc_link = &ctx[0];
23983         makecontext(&ctx[1], f1, 0);

23984         getcontext(&ctx[2]);
23985         ctx[2].uc_stack.ss_sp = st2;
23986         ctx[2].uc_stack.ss_size = sizeof st2;
23987         ctx[2].uc_link = &ctx[1];
23988         makecontext(&ctx[2], f2, 0);

23989         swapcontext(&ctx[0], &ctx[2]);
23990         return 0;
23991     }

```

#### 23992 APPLICATION USAGE

23993 None.

23995 None.

#### 23996 FUTURE DIRECTIONS

23997 None.

#### 23998 SEE ALSO

23999 *exit()*, *getcontext()*, *sigaction()*, *sigprocmask()*, the Base Definitions volume of  
24000 IEEE Std 1003.1-2001, <**ucontext.h**>

#### 24001 CHANGE HISTORY

24002 First released in Issue 4, Version 2.

#### 24003 Issue 5

24004 Moved from X/OPEN UNIX extension to BASE.

24005 In the ERRORS section, the description of [ENOMEM] is changed to apply to *swapcontext()* only.

#### 24006 Issue 6

24007 The DESCRIPTION is updated to avoid use of the term “must” for application requirements.

24008 The **restrict** keyword is added to the *swapcontext()* prototype for alignment with the  
24009 ISO/IEC 9899:1999 standard.

24010 **NAME**

24011 malloc — a memory allocator

24012 **SYNOPSIS**

24013 #include &lt;stdlib.h&gt;

24014 void \*malloc(size\_t size);

24015 **DESCRIPTION**

24016 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
 24017 conflict between the requirements described here and the ISO C standard is unintentional. This  
 24018 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

24019 The *malloc()* function shall allocate unused space for an object whose size in bytes is specified by  
 24020 *size* and whose value is unspecified.

24021 The order and contiguity of storage allocated by successive calls to *malloc()* is unspecified. The  
 24022 pointer returned if the allocation succeeds shall be suitably aligned so that it may be assigned to  
 24023 a pointer to any type of object and then used to access such an object in the space allocated (until  
 24024 the space is explicitly freed or reallocated). Each such allocation shall yield a pointer to an object  
 24025 disjoint from any other object. The pointer returned points to the start (lowest byte address) of  
 24026 the allocated space. If the space cannot be allocated, a null pointer shall be returned. If the size of  
 24027 the space requested is 0, the behavior is implementation-defined: the value returned shall be  
 24028 either a null pointer or a unique pointer.

24029 **RETURN VALUE**

24030 Upon successful completion with *size* not equal to 0, *malloc()* shall return a pointer to the  
 24031 allocated space. If *size* is 0, either a null pointer or a unique pointer that can be successfully  
 24032 CX passed to *free()* shall be returned. Otherwise, it shall return a null pointer and set *errno* to  
 24033 indicate the error.

24034 **ERRORS**24035 The *malloc()* function shall fail if:

24036 CX [ENOMEM] Insufficient storage space is available.

24037 **EXAMPLES**

24038 None.

24039 **APPLICATION USAGE**

24040 None.

24041 **RATIONALE**

24042 None.

24043 **FUTURE DIRECTIONS**

24044 None.

24045 **SEE ALSO**24046 *calloc()*, *free()*, *realloc()*, the Base Definitions volume of IEEE Std 1003.1-2001, <stdlib.h>24047 **CHANGE HISTORY**

24048 First released in Issue 1. Derived from Issue 1 of the SVID.

24049 **Issue 6**

24050 Extensions beyond the ISO C standard are marked.

24051 The following new requirements on POSIX implementations derive from alignment with the  
 24052 Single UNIX Specification:

24053

- In the RETURN VALUE section, the requirement to set *errno* to indicate an error is added.

24054

- The [ENOMEM] error condition is added.

24055 **NAME**

24056           mblen — get number of bytes in a character

24057 **SYNOPSIS**

24058           #include &lt;stdlib.h&gt;

24059           int mblen(const char \*s, size\_t n);

24060 **DESCRIPTION**

24061 cx       The functionality described on this reference page is aligned with the ISO C standard. Any  
 24062       conflict between the requirements described here and the ISO C standard is unintentional. This  
 24063       volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

24064       If *s* is not a null pointer, *mblen()* shall determine the number of bytes constituting the character  
 24065       pointed to by *s*. Except that the shift state of *mbtowc()* is not affected, it shall be equivalent to:

24066       mbtowc((wchar\_t \*)0, s, n);

24067       The implementation shall behave as if no function defined in this volume of  
 24068       IEEE Std 1003.1-2001 calls *mblen()*.

24069       The behavior of this function is affected by the *LC\_CTYPE* category of the current locale. For a  
 24070       state-dependent encoding, this function shall be placed into its initial state by a call for which its  
 24071       character pointer argument, *s*, is a null pointer. Subsequent calls with *s* as other than a null  
 24072       pointer shall cause the internal state of the function to be altered as necessary. A call with *s* as a  
 24073       null pointer shall cause this function to return a non-zero value if encodings have state  
 24074       dependency, and 0 otherwise. If the implementation employs special bytes to change the shift  
 24075       state, these bytes shall not produce separate wide-character codes, but shall be grouped with an  
 24076       adjacent character. Changing the *LC\_CTYPE* category causes the shift state of this function to be  
 24077       unspecified.

24078 **RETURN VALUE**

24079       If *s* is a null pointer, *mblen()* shall return a non-zero or 0 value, if character encodings,  
 24080       respectively, do or do not have state-dependent encodings. If *s* is not a null pointer, *mblen()* shall  
 24081       either return 0 (if *s* points to the null byte), or return the number of bytes that constitute the  
 24082       character (if the next *n* or fewer bytes form a valid character), or return -1 (if they do not form a  
 24083       valid character) and may set *errno* to indicate the error. In no case shall the value returned be  
 24084       greater than *n* or the value of the {MB\_CUR\_MAX} macro.

24085 **ERRORS**24086       The *mblen()* function may fail if:

24087 xSI       [EILSEQ]       Invalid character sequence is detected.

24088 **EXAMPLES**

24089       None.

24090 **APPLICATION USAGE**

24091       None.

24092 **RATIONALE**

24093       None.

24094 **FUTURE DIRECTIONS**

24095       None.

24096 **SEE ALSO**

24097 *mbtowc()*, *mbstowcs()*, *wctomb()*, *wcstombs()*, the Base Definitions volume of  
24098 IEEE Std 1003.1-2001, <stdlib.h>

24099 **CHANGE HISTORY**

24100 First released in Issue 4. Aligned with the ISO C standard.

24101 **NAME**

24102           mbrlen — get number of bytes in a character (restartable)

24103 **SYNOPSIS**

24104           #include &lt;wchar.h&gt;

24105           size\_t mbrlen(const char \*restrict *s*, size\_t *n*,  
24106                        mbstate\_t \*restrict *ps*);24107 **DESCRIPTION**24108 **CX**       The functionality described on this reference page is aligned with the ISO C standard. Any  
24109       conflict between the requirements described here and the ISO C standard is unintentional. This  
24110       volume of IEEE Std 1003.1-2001 defers to the ISO C standard.24111       If *s* is not a null pointer, *mbrlen()* shall determine the number of bytes constituting the character  
24112       pointed to by *s*. It shall be equivalent to:

24113       mbstate\_t internal;

24114       mbrtowc(NULL, *s*, *n*, *ps* != NULL ? *ps* : &internal);24115       If *ps* is a null pointer, the *mbrlen()* function shall use its own internal **mbstate\_t** object, which is  
24116       initialized at program start-up to the initial conversion state. Otherwise, the **mbstate\_t** object  
24117       pointed to by *ps* shall be used to completely describe the current conversion state of the  
24118       associated character sequence. The implementation shall behave as if no function defined in this  
24119       volume of IEEE Std 1003.1-2001 calls *mbrlen()*.24120       The behavior of this function is affected by the *LC\_CTYPE* category of the current locale.24121 **RETURN VALUE**24122       The *mbrlen()* function shall return the first of the following that applies:24123       **0**                If the next *n* or fewer bytes complete the character that corresponds to the null  
24124       wide character.24125       **positive**        If the next *n* or fewer bytes complete a valid character; the value returned shall  
24126       be the number of bytes that complete the character.24127       **(size\_t)-2**        If the next *n* bytes contribute to an incomplete but potentially valid character,  
24128       and all *n* bytes have been processed. When *n* has at least the value of the  
24129       {MB\_CUR\_MAX} macro, this case can only occur if *s* points at a sequence of  
24130       redundant shift sequences (for implementations with state-dependent  
24131       encodings).24132       **(size\_t)-1**        If an encoding error occurs, in which case the next *n* or fewer bytes do not  
24133       contribute to a complete and valid character. In this case, [EILSEQ] shall be  
24134       stored in *errno* and the conversion state is undefined.24135 **ERRORS**24136       The *mbrlen()* function may fail if:24137       [EINVAL]        *ps* points to an object that contains an invalid conversion state.

24138       [EILSEQ]        Invalid character sequence is detected.

24139 **EXAMPLES**

24140 None.

24141 **APPLICATION USAGE**

24142 None.

24143 **RATIONALE**

24144 None.

24145 **FUTURE DIRECTIONS**

24146 None.

24147 **SEE ALSO**

24148 *mbstowc()*, *mbstowc()*, the Base Definitions volume of IEEE Std 1003.1-2001, <**wchar.h**>

24149 **CHANGE HISTORY**

24150 First released in Issue 5. Included for alignment with ISO/IEC 9899:1990/Amendment 1:1995  
24151 (E).

24152 **Issue 6**

24153 The *mbrlen()* prototype is updated for alignment with the ISO/IEC 9899:1999 standard.

24154 **NAME**

24155 mbrtowc — convert a character to a wide-character code (restartable)

24156 **SYNOPSIS**

24157 #include &lt;wchar.h&gt;

24158 size\_t mbrtowc(wchar\_t \*restrict *pwc*, const char \*restrict *s*,  
24159 size\_t *n*, mbstate\_t \*restrict *ps*);24160 **DESCRIPTION**24161 **CX** The functionality described on this reference page is aligned with the ISO C standard. Any  
24162 conflict between the requirements described here and the ISO C standard is unintentional. This  
24163 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.24164 If *s* is a null pointer, the *mbrtowc()* function shall be equivalent to the call:24165 mbrtowc(NULL, "", 1, *ps*)24166 In this case, the values of the arguments *pwc* and *n* are ignored.24167 If *s* is not a null pointer, the *mbrtowc()* function shall inspect at most *n* bytes beginning at the  
24168 byte pointed to by *s* to determine the number of bytes needed to complete the next character  
24169 (including any shift sequences). If the function determines that the next character is completed, it  
24170 shall determine the value of the corresponding wide character and then, if *pwc* is not a null  
24171 pointer, shall store that value in the object pointed to by *pwc*. If the corresponding wide  
24172 character is the null wide character, the resulting state described shall be the initial conversion  
24173 state.24174 If *ps* is a null pointer, the *mbrtowc()* function shall use its own internal **mbstate\_t** object, which  
24175 shall be initialized at program start-up to the initial conversion state. Otherwise, the **mbstate\_t**  
24176 object pointed to by *ps* shall be used to completely describe the current conversion state of the  
24177 associated character sequence. The implementation shall behave as if no function defined in this  
24178 volume of IEEE Std 1003.1-2001 calls *mbrtowc()*.24179 The behavior of this function is affected by the *LC\_CTYPE* category of the current locale.24180 **RETURN VALUE**24181 The *mbrtowc()* function shall return the first of the following that applies:24182 **0** If the next *n* or fewer bytes complete the character that corresponds to the null  
24183 wide character (which is the value stored).24184 between 1 and *n* inclusive24185 If the next *n* or fewer bytes complete a valid character (which is the value  
24186 stored); the value returned shall be the number of bytes that complete the  
24187 character.24188 **(size\_t)–2** If the next *n* bytes contribute to an incomplete but potentially valid character,  
24189 and all *n* bytes have been processed (no value is stored). When *n* has at least  
24190 the value of the {*MB\_CUR\_MAX*} macro, this case can only occur if *s* points at  
24191 a sequence of redundant shift sequences (for implementations with state-  
24192 dependent encodings).24193 **(size\_t)–1** If an encoding error occurs, in which case the next *n* or fewer bytes do not  
24194 contribute to a complete and valid character (no value is stored). In this case,  
24195 [EILSEQ] shall be stored in *errno* and the conversion state is undefined.

24196 **ERRORS**

24197 The *mbrtowc()* function may fail if:

24198 CX [EINVAL] *ps* points to an object that contains an invalid conversion state.

24199 [EILSEQ] Invalid character sequence is detected.

24200 **EXAMPLES**

24201 None.

24202 **APPLICATION USAGE**

24203 None.

24204 **RATIONALE**

24205 None.

24206 **FUTURE DIRECTIONS**

24207 None.

24208 **SEE ALSO**

24209 *mbstinit()*, the Base Definitions volume of IEEE Std 1003.1-2001, <*wchar.h*>

24210 **CHANGE HISTORY**

24211 First released in Issue 5. Included for alignment with ISO/IEC 9899:1990/Amendment 1:1995 (E).

24213 **Issue 6**

24214 The *mbrtowc()* prototype is updated for alignment with the ISO/IEC 9899:1999 standard.

24215 The following new requirements on POSIX implementations derive from alignment with the  
24216 Single UNIX Specification:

- 24217 • The [EINVAL] error condition is added.

24218 ISO/IEC 9899:1999 standard, Technical Corrigendum No. 1 is incorporated.

24219 **NAME**

24220 `mbsinit` — determine conversion object status

24221 **SYNOPSIS**

24222 `#include <wchar.h>`

24223 `int mbsinit(const mbstate_t *ps);`

24224 **DESCRIPTION**

24225 **CX** The functionality described on this reference page is aligned with the ISO C standard. Any  
24226 conflict between the requirements described here and the ISO C standard is unintentional. This  
24227 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

24228 If *ps* is not a null pointer, the *mbsinit()* function shall determine whether the object pointed to by  
24229 *ps* describes an initial conversion state.

24230 **RETURN VALUE**

24231 The *mbsinit()* function shall return non-zero if *ps* is a null pointer, or if the pointed-to object  
24232 describes an initial conversion state; otherwise, it shall return zero.

24233 If an **mbstate\_t** object is altered by any of the functions described as “restartable”, and is then  
24234 used with a different character sequence, or in the other conversion direction, or with a different  
24235 *LC\_CTYPE* category setting than on earlier function calls, the behavior is undefined.

24236 **ERRORS**

24237 No errors are defined.

24238 **EXAMPLES**

24239 None.

24240 **APPLICATION USAGE**

24241 The **mbstate\_t** object is used to describe the current conversion state from a particular character  
24242 sequence to a wide-character sequence (or *vice versa*) under the rules of a particular setting of the  
24243 *LC\_CTYPE* category of the current locale.

24244 The initial conversion state corresponds, for a conversion in either direction, to the beginning of  
24245 a new character sequence in the initial shift state. A zero valued **mbstate\_t** object is at least one  
24246 way to describe an initial conversion state. A zero valued **mbstate\_t** object can be used to initiate  
24247 conversion involving any character sequence, in any *LC\_CTYPE* category setting.

24248 **RATIONALE**

24249 None.

24250 **FUTURE DIRECTIONS**

24251 None.

24252 **SEE ALSO**

24255 **CHANGE HISTORY**

24256 First released in Issue 5. Included for alignment with ISO/IEC 9899:1990/Amendment 1:1995  
24257 (E).

## 24258 NAME

24259 mbsrtowcs — convert a character string to a wide-character string (restartable)

## 24260 SYNOPSIS

24261 #include <wchar.h>

24262 size\_t mbsrtowcs(wchar\_t \*restrict dst, const char \*\*restrict src,  
24263 size\_t len, mbstate\_t \*restrict ps);

## 24264 DESCRIPTION

24265 cx The functionality described on this reference page is aligned with the ISO C standard. Any  
24266 conflict between the requirements described here and the ISO C standard is unintentional. This  
24267 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

24268 The *mbsrtowcs()* function shall convert a sequence of characters, beginning in the conversion  
24269 state described by the object pointed to by *ps*, from the array indirectly pointed to by *src* into a  
24270 sequence of corresponding wide characters. If *dst* is not a null pointer, the converted characters  
24271 shall be stored into the array pointed to by *dst*. Conversion continues up to and including a  
24272 terminating null character, which shall also be stored. Conversion shall stop early in either of the  
24273 following cases:

- 24274 • A sequence of bytes is encountered that does not form a valid character.
- 24275 • *len* codes have been stored into the array pointed to by *dst* (and *dst* is not a null pointer).

24276 Each conversion shall take place as if by a call to the *mbrtowc()* function.

24277 If *dst* is not a null pointer, the pointer object pointed to by *src* shall be assigned either a null  
24278 pointer (if conversion stopped due to reaching a terminating null character) or the address just  
24279 past the last character converted (if any). If conversion stopped due to reaching a terminating  
24280 null character, and if *dst* is not a null pointer, the resulting state described shall be the initial  
24281 conversion state.

24282 If *ps* is a null pointer, the *mbsrtowcs()* function shall use its own internal **mbstate\_t** object, which  
24283 is initialized at program start-up to the initial conversion state. Otherwise, the **mbstate\_t** object  
24284 pointed to by *ps* shall be used to completely describe the current conversion state of the  
24285 associated character sequence. The implementation behaves as if no function defined in this  
24286 volume of IEEE Std 1003.1-2001 calls *mbsrtowcs()*.

24287 The behavior of this function shall be affected by the *LC\_CTYPE* category of the current locale.

## 24288 RETURN VALUE

24289 If the input conversion encounters a sequence of bytes that do not form a valid character, an  
24290 encoding error occurs. In this case, the *mbsrtowcs()* function stores the value of the macro  
24291 [EILSEQ] in *errno* and shall return (**size\_t**)-1; the conversion state is undefined. Otherwise, it  
24292 shall return the number of characters successfully converted, not including the terminating null  
24293 (if any).

## 24294 ERRORS

24295 The *mbsrtowcs()* function may fail if:

- 24296 cx [EINVAL] *ps* points to an object that contains an invalid conversion state.
- 24297 [EILSEQ] Invalid character sequence is detected.

24298 **EXAMPLES**

24299 None.

24300 **APPLICATION USAGE**

24301 None.

24302 **RATIONALE**

24303 None.

24304 **FUTURE DIRECTIONS**

24305 None.

24306 **SEE ALSO**24307 *mbstowcs()*, *mbstowc()*, the Base Definitions volume of IEEE Std 1003.1-2001, <wchar.h>24308 **CHANGE HISTORY**24309 First released in Issue 5. Included for alignment with ISO/IEC 9899:1990/Amendment 1:1995  
24310 (E).24311 **Issue 6**24312 The *mbsrtowcs()* prototype is updated for alignment with the ISO/IEC 9899:1999 standard.

24313 The [EINVAL] error condition is marked CX.

24314 **NAME**

24315 mbstowcs — convert a character string to a wide-character string

24316 **SYNOPSIS**

24317 #include <stdlib.h>

24318 size\_t mbstowcs(wchar\_t \*restrict pwcs, const char \*restrict s,  
24319 size\_t n);

24320 **DESCRIPTION**

24321 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
24322 conflict between the requirements described here and the ISO C standard is unintentional. This  
24323 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

24324 The *mbstowcs()* function shall convert a sequence of characters that begins in the initial shift  
24325 state from the array pointed to by *s* into a sequence of corresponding wide-character codes and  
24326 shall store not more than *n* wide-character codes into the array pointed to by *pwcs*. No  
24327 characters that follow a null byte (which is converted into a wide-character code with value 0)  
24328 shall be examined or converted. Each character shall be converted as if by a call to *mbtowc()*,  
24329 except that the shift state of *mbtowc()* is not affected.

24330 No more than *n* elements shall be modified in the array pointed to by *pwcs*. If copying takes  
24331 place between objects that overlap, the behavior is undefined.

24332 XSI The behavior of this function shall be affected by the *LC\_CTYPE* category of the current locale. If  
24333 *pwcs* is a null pointer, *mbstowcs()* shall return the length required to convert the entire array  
24334 regardless of the value of *n*, but no values are stored.

24335 **RETURN VALUE**

24336 CX If an invalid character is encountered, *mbstowcs()* shall return **(size\_t)-1** and may set *errno* to  
24337 indicate the error.

24338 XSI Otherwise, *mbstowcs()* shall return the number of the array elements modified (or required if  
24339 *pwcs* is null), not including a terminating 0 code, if any. The array shall not be zero-terminated if  
24340 the value returned is *n*.

24341 **ERRORS**

24342 The *mbstowcs()* function may fail if:

24343 XSI [EILSEQ] Invalid byte sequence is detected.

24344 **EXAMPLES**

24345 None.

24346 **APPLICATION USAGE**

24347 None.

24348 **RATIONALE**

24349 None.

24350 **FUTURE DIRECTIONS**

24351 None.

24352 **SEE ALSO**

24353 *mblen()*, *mbtowc()*, *wctomb()*, *wcstombs()*, the Base Definitions volume of IEEE Std 1003.1-2001,  
24354 <stdlib.h>

24355 **CHANGE HISTORY**

24356 First released in Issue 4. Aligned with the ISO C standard.

24357 **Issue 6**

24358 The *mbstowcs()* prototype is updated for alignment with the ISO/IEC 9899:1999 standard.

24359 Extensions beyond the ISO C standard are marked.

24360 **NAME**

24361 mbtowc — convert a character to a wide-character code

24362 **SYNOPSIS**

24363 #include &lt;stdlib.h&gt;

24364 int mbtowc(wchar\_t \*restrict *pwc*, const char \*restrict *s*, size\_t *n*);24365 **DESCRIPTION**

24366 **CX** The functionality described on this reference page is aligned with the ISO C standard. Any  
 24367 conflict between the requirements described here and the ISO C standard is unintentional. This  
 24368 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

24369 If *s* is not a null pointer, *mbtowc()* shall determine the number of bytes that constitute the  
 24370 character pointed to by *s*. It shall then determine the wide-character code for the value of type  
 24371 **wchar\_t** that corresponds to that character. (The value of the wide-character code corresponding  
 24372 to the null byte is 0.) If the character is valid and *pwc* is not a null pointer, *mbtowc()* shall store  
 24373 the wide-character code in the object pointed to by *pwc*.

24374 The behavior of this function is affected by the *LC\_CTYPE* category of the current locale. For a  
 24375 state-dependent encoding, this function is placed into its initial state by a call for which its  
 24376 character pointer argument, *s*, is a null pointer. Subsequent calls with *s* as other than a null  
 24377 pointer shall cause the internal state of the function to be altered as necessary. A call with *s* as a  
 24378 null pointer shall cause this function to return a non-zero value if encodings have state  
 24379 dependency, and 0 otherwise. If the implementation employs special bytes to change the shift  
 24380 state, these bytes shall not produce separate wide-character codes, but shall be grouped with an  
 24381 adjacent character. Changing the *LC\_CTYPE* category causes the shift state of this function to be  
 24382 unspecified. At most *n* bytes of the array pointed to by *s* shall be examined.

24383 The implementation shall behave as if no function defined in this volume of  
 24384 IEEE Std 1003.1-2001 calls *mbtowc()*.

24385 **RETURN VALUE**

24386 If *s* is a null pointer, *mbtowc()* shall return a non-zero or 0 value, if character encodings,  
 24387 respectively, do or do not have state-dependent encodings. If *s* is not a null pointer, *mbtowc()*  
 24388 shall either return 0 (if *s* points to the null byte), or return the number of bytes that constitute the  
 24389 **CX** converted character (if the next *n* or fewer bytes form a valid character), or return -1 and may  
 24390 set *errno* to indicate the error (if they do not form a valid character).

24391 In no case shall the value returned be greater than *n* or the value of the {MB\_CUR\_MAX} macro.

24392 **ERRORS**

24393 The *mbtowc()* function may fail if:

24394 **XSI** [EILSEQ] Invalid character sequence is detected.

24395 **EXAMPLES**

24396 None.

24397 **APPLICATION USAGE**

24398 None.

24399 **RATIONALE**

24400 None.

24401 **FUTURE DIRECTIONS**

24402 None.

24403 **SEE ALSO**

24404            *mblen()*, *mbstowcs()*, *wctomb()*, *wcstombs()*, the Base Definitions volume of IEEE Std 1003.1-2001,  
24405            <stdlib.h>

24406 **CHANGE HISTORY**

24407            First released in Issue 4. Aligned with the ISO C standard.

24408 **Issue 6**

24409            The *mbtowc()* prototype is updated for alignment with the ISO/IEC 9899:1999 standard.

24410            Extensions beyond the ISO C standard are marked.

24411 **NAME**

24412 memccpy — copy bytes in memory

24413 **SYNOPSIS**

24414 XSI #include &lt;string.h&gt;

24415 void \*memccpy(void \*restrict s1, const void \*restrict s2,  
24416 int c, size\_t n);

24417

24418 **DESCRIPTION**

24419 The *memccpy()* function shall copy bytes from memory area *s2* into *s1*, stopping after the first  
24420 occurrence of byte *c* (converted to an **unsigned char**) is copied, or after *n* bytes are copied,  
24421 whichever comes first. If copying takes place between objects that overlap, the behavior is  
24422 undefined.

24423 **RETURN VALUE**

24424 The *memccpy()* function shall return a pointer to the byte after the copy of *c* in *s1*, or a null  
24425 pointer if *c* was not found in the first *n* bytes of *s2*.

24426 **ERRORS**

24427 No errors are defined.

24428 **EXAMPLES**

24429 None.

24430 **APPLICATION USAGE**24431 The *memccpy()* function does not check for the overflow of the receiving memory area.24432 **RATIONALE**

24433 None.

24434 **FUTURE DIRECTIONS**

24435 None.

24436 **SEE ALSO**24437 The Base Definitions volume of IEEE Std 1003.1-2001, <**string.h**>24438 **CHANGE HISTORY**

24439 First released in Issue 1. Derived from Issue 1 of the SVID.

24440 **Issue 6**

24441 The **restrict** keyword is added to the *memccpy()* prototype for alignment with the  
24442 ISO/IEC 9899:1999 standard.

24443 **NAME**

24444 memchr — find byte in memory

24445 **SYNOPSIS**

24446 #include &lt;string.h&gt;

24447 void \*memchr(const void \*s, int c, size\_t n);

24448 **DESCRIPTION**

24449 cx The functionality described on this reference page is aligned with the ISO C standard. Any  
24450 conflict between the requirements described here and the ISO C standard is unintentional. This  
24451 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

24452 The *memchr()* function shall locate the first occurrence of *c* (converted to an **unsigned char**) in  
24453 the initial *n* bytes (each interpreted as **unsigned char**) of the object pointed to by *s*.

24454 **RETURN VALUE**

24455 The *memchr()* function shall return a pointer to the located byte, or a null pointer if the byte does  
24456 not occur in the object.

24457 **ERRORS**

24458 No errors are defined.

24459 **EXAMPLES**

24460 None.

24461 **APPLICATION USAGE**

24462 None.

24463 **RATIONALE**

24464 None.

24465 **FUTURE DIRECTIONS**

24466 None.

24467 **SEE ALSO**24468 The Base Definitions volume of IEEE Std 1003.1-2001, <**string.h**>24469 **CHANGE HISTORY**

24470 First released in Issue 1. Derived from Issue 1 of the SVID.

24471 **NAME**

24472 memcmp — compare bytes in memory

24473 **SYNOPSIS**

24474 #include &lt;string.h&gt;

24475 int memcmp(const void \*s1, const void \*s2, size\_t n);

24476 **DESCRIPTION**

24477 *CX* The functionality described on this reference page is aligned with the ISO C standard. Any  
24478 conflict between the requirements described here and the ISO C standard is unintentional. This  
24479 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

24480 The *memcmp()* function shall compare the first *n* bytes (each interpreted as **unsigned char**) of the  
24481 object pointed to by *s1* to the first *n* bytes of the object pointed to by *s2*.

24482 The sign of a non-zero return value shall be determined by the sign of the difference between the  
24483 values of the first pair of bytes (both interpreted as type **unsigned char**) that differ in the objects  
24484 being compared.

24485 **RETURN VALUE**

24486 The *memcmp()* function shall return an integer greater than, equal to, or less than 0, if the object  
24487 pointed to by *s1* is greater than, equal to, or less than the object pointed to by *s2*, respectively.

24488 **ERRORS**

24489 No errors are defined.

24490 **EXAMPLES**

24491 None.

24492 **APPLICATION USAGE**

24493 None.

24494 **RATIONALE**

24495 None.

24496 **FUTURE DIRECTIONS**

24497 None.

24498 **SEE ALSO**24499 The Base Definitions volume of IEEE Std 1003.1-2001, <**string.h**>24500 **CHANGE HISTORY**

24501 First released in Issue 1. Derived from Issue 1 of the SVID.

24502 **NAME**

24503           memcpy — copy bytes in memory

24504 **SYNOPSIS**

24505           #include &lt;string.h&gt;

24506           void \*memcpy(void \*restrict *s1*, const void \*restrict *s2*, size\_t *n*);24507 **DESCRIPTION**

24508 **CX**       The functionality described on this reference page is aligned with the ISO C standard. Any  
24509           conflict between the requirements described here and the ISO C standard is unintentional. This  
24510           volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

24511           The *memcpy()* function shall copy *n* bytes from the object pointed to by *s2* into the object pointed  
24512           to by *s1*. If copying takes place between objects that overlap, the behavior is undefined.

24513 **RETURN VALUE**24514           The *memcpy()* function shall return *s1*; no return value is reserved to indicate an error.24515 **ERRORS**

24516           No errors are defined.

24517 **EXAMPLES**

24518           None.

24519 **APPLICATION USAGE**24520           The *memcpy()* function does not check for the overflow of the receiving memory area.24521 **RATIONALE**

24522           None.

24523 **FUTURE DIRECTIONS**

24524           None.

24525 **SEE ALSO**24526           The Base Definitions volume of IEEE Std 1003.1-2001, <**string.h**>24527 **CHANGE HISTORY**

24528           First released in Issue 1. Derived from Issue 1 of the SVID.

24529 **Issue 6**24530           The *memcpy()* prototype is updated for alignment with the ISO/IEC 9899:1999 standard.

24531 **NAME**

24532 memmove — copy bytes in memory with overlapping areas

24533 **SYNOPSIS**

24534 #include &lt;string.h&gt;

24535 void \*memmove(void \*s1, const void \*s2, size\_t n);

24536 **DESCRIPTION**

24537 cx The functionality described on this reference page is aligned with the ISO C standard. Any  
24538 conflict between the requirements described here and the ISO C standard is unintentional. This  
24539 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

24540 The *memmove()* function shall copy *n* bytes from the object pointed to by *s2* into the object  
24541 pointed to by *s1*. Copying takes place as if the *n* bytes from the object pointed to by *s2* are first  
24542 copied into a temporary array of *n* bytes that does not overlap the objects pointed to by *s1* and  
24543 *s2*, and then the *n* bytes from the temporary array are copied into the object pointed to by *s1*.

24544 **RETURN VALUE**24545 The *memmove()* function shall return *s1*; no return value is reserved to indicate an error.24546 **ERRORS**

24547 No errors are defined.

24548 **EXAMPLES**

24549 None.

24550 **APPLICATION USAGE**

24551 None.

24552 **RATIONALE**

24553 None.

24554 **FUTURE DIRECTIONS**

24555 None.

24556 **SEE ALSO**24557 The Base Definitions volume of IEEE Std 1003.1-2001, <**string.h**>24558 **CHANGE HISTORY**

24559 First released in Issue 4. Derived from the ANSI C standard.

24560 **NAME**

24561           memset — set bytes in memory

24562 **SYNOPSIS**

24563           #include <string.h>

24564           void \*memset(void \*s, int c, size\_t n);

24565 **DESCRIPTION**

24566 **CX**       The functionality described on this reference page is aligned with the ISO C standard. Any  
24567           conflict between the requirements described here and the ISO C standard is unintentional. This  
24568           volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

24569           The *memset()* function shall copy *c* (converted to an **unsigned char**) into each of the first *n* bytes  
24570           of the object pointed to by *s*.

24571 **RETURN VALUE**

24572           The *memset()* function shall return *s*; no return value is reserved to indicate an error.

24573 **ERRORS**

24574           No errors are defined.

24575 **EXAMPLES**

24576           None.

24577 **APPLICATION USAGE**

24578           None.

24579 **RATIONALE**

24580           None.

24581 **FUTURE DIRECTIONS**

24582           None.

24583 **SEE ALSO**

24584           The Base Definitions volume of IEEE Std 1003.1-2001, <**string.h**>

24585 **CHANGE HISTORY**

24586           First released in Issue 1. Derived from Issue 1 of the SVID.

24587 **NAME**

24588        mkdir — make a directory

24589 **SYNOPSIS**

24590        #include &lt;sys/stat.h&gt;

24591        int mkdir(const char \*path, mode\_t mode);

24592 **DESCRIPTION**

24593        The *mkdir()* function shall create a new directory with name *path*. The file permission bits of the  
 24594        new directory shall be initialized from *mode*. These file permission bits of the *mode* argument  
 24595        shall be modified by the process' file creation mask.

24596        When bits in *mode* other than the file permission bits are set, the meaning of these additional bits  
 24597        is implementation-defined.

24598        The directory's user ID shall be set to the process' effective user ID. The directory's group ID  
 24599        shall be set to the group ID of the parent directory or to the effective group ID of the process.  
 24600        Implementations shall provide a way to initialize the directory's group ID to the group ID of the  
 24601        parent directory. Implementations may, but need not, provide an implementation-defined way  
 24602        to initialize the directory's group ID to the effective group ID of the calling process.

24603        The newly created directory shall be an empty directory.

24604        If *path* names a symbolic link, *mkdir()* shall fail and set *errno* to [EEXIST].

24605        Upon successful completion, *mkdir()* shall mark for update the *st\_atime*, *st\_ctime*, and *st\_mtime*  
 24606        fields of the directory. Also, the *st\_ctime* and *st\_mtime* fields of the directory that contains the  
 24607        new entry shall be marked for update.

24608 **RETURN VALUE**

24609        Upon successful completion, *mkdir()* shall return 0. Otherwise, -1 shall be returned, no directory  
 24610        shall be created, and *errno* shall be set to indicate the error.

24611 **ERRORS**

24612        The *mkdir()* function shall fail if:

24613        [EACCES]        Search permission is denied on a component of the path prefix, or write  
 24614        permission is denied on the parent directory of the directory to be created.

24615        [EEXIST]        The named file exists.

24616        [ELOOP]        A loop exists in symbolic links encountered during resolution of the *path*  
 24617        argument.

24618        [EMLINK]        The link count of the parent directory would exceed {LINK\_MAX}.

24619        [ENAMETOOLONG]

24620        The length of the *path* argument exceeds {PATH\_MAX} or a pathname  
 24621        component is longer than {NAME\_MAX}.

24622        [ENOENT]        A component of the path prefix specified by *path* does not name an existing  
 24623        directory or *path* is an empty string.

24624        [ENOSPC]        The file system does not contain enough space to hold the contents of the new  
 24625        directory or to extend the parent directory of the new directory.

24626        [ENOTDIR]        A component of the path prefix is not a directory.

24627        [EROFS]        The parent directory resides on a read-only file system.

24628 The *mkdir()* function may fail if:

24629 [ELOOP] More than {SYMLOOP\_MAX} symbolic links were encountered during  
24630 resolution of the *path* argument.

24631 [ENAMETOOLONG]

24632 As a result of encountering a symbolic link in resolution of the *path* argument,  
24633 the length of the substituted pathname string exceeded {PATH\_MAX}.

#### 24634 EXAMPLES

##### 24635 Creating a Directory

24636 The following example shows how to create a directory named */home/cnd/mod1*, with  
24637 read/write/search permissions for owner and group, and with read/search permissions for  
24638 others.

```
24639 #include <sys/types.h>
```

```
24640 #include <sys/stat.h>
```

```
24641 int status;
```

```
24642 ...
```

```
24643 status = mkdir("/home/cnd/mod1", S_IRWXU | S_IRWXG | S_IROTH | S_IXOTH);
```

#### 24644 APPLICATION USAGE

24645 None.

#### 24646 RATIONALE

24647 The *mkdir()* function originated in 4.2 BSD and was added to System V in Release 3.0.

24648 4.3 BSD detects [ENAMETOOLONG].

24649 The POSIX.1-1990 standard required that the group ID of a newly created directory be set to the  
24650 group ID of its parent directory or to the effective group ID of the creating process. FIPS 151-2  
24651 required that implementations provide a way to have the group ID be set to the group ID of the  
24652 containing directory, but did not prohibit implementations also supporting a way to set the  
24653 group ID to the effective group ID of the creating process. Conforming applications should not  
24654 assume which group ID will be used. If it matters, an application can use *chown()* to set the  
24655 group ID after the directory is created, or determine under what conditions the implementation  
24656 will set the desired group ID.

#### 24657 FUTURE DIRECTIONS

24658 None.

#### 24659 SEE ALSO

24660 *umask()*, the Base Definitions volume of IEEE Std 1003.1-2001, *<sys/stat.h>*, *<sys/types.h>*

#### 24661 CHANGE HISTORY

24662 First released in Issue 3. Included for alignment with the POSIX.1-1988 standard.

#### 24663 Issue 6

24664 In the SYNOPSIS, the optional include of the *<sys/types.h>* header is removed.

24665 The following new requirements on POSIX implementations derive from alignment with the  
24666 Single UNIX Specification:

- 24667 • The requirement to include *<sys/types.h>* has been removed. Although *<sys/types.h>* was  
24668 required for conforming implementations of previous POSIX specifications, it was not  
24669 required for UNIX applications.

24670           • The [ELOOP] mandatory error condition is added.

24671           • A second [ENAMETOOLONG] is added as an optional error condition.

24672           The following changes were made to align with the IEEE P1003.1a draft standard:

24673           • The [ELOOP] optional error condition is added.

24674 **NAME**

24675 mkfifo — make a FIFO special file

24676 **SYNOPSIS**

24677 #include &lt;sys/stat.h&gt;

24678 int mkfifo(const char \*path, mode\_t mode);

24679 **DESCRIPTION**

24680 The *mkfifo()* function shall create a new FIFO special file named by the pathname pointed to by  
 24681 *path*. The file permission bits of the new FIFO shall be initialized from *mode*. The file permission  
 24682 bits of the *mode* argument shall be modified by the process' file creation mask.

24683 When bits in *mode* other than the file permission bits are set, the effect is implementation-  
 24684 defined.

24685 If *path* names a symbolic link, *mkfifo()* shall fail and set *errno* to [EEXIST].

24686 The FIFO's user ID shall be set to the process' effective user ID. The FIFO's group ID shall be set  
 24687 to the group ID of the parent directory or to the effective group ID of the process.  
 24688 Implementations shall provide a way to initialize the FIFO's group ID to the group ID of the  
 24689 parent directory. Implementations may, but need not, provide an implementation-defined way  
 24690 to initialize the FIFO's group ID to the effective group ID of the calling process.

24691 Upon successful completion, *mkfifo()* shall mark for update the *st\_atime*, *st\_ctime*, and *st\_mtime*  
 24692 fields of the file. Also, the *st\_ctime* and *st\_mtime* fields of the directory that contains the new  
 24693 entry shall be marked for update.

24694 **RETURN VALUE**

24695 Upon successful completion, 0 shall be returned. Otherwise, -1 shall be returned, no FIFO shall  
 24696 be created, and *errno* shall be set to indicate the error.

24697 **ERRORS**

24698 The *mkfifo()* function shall fail if:

24699 [EACCES] A component of the path prefix denies search permission, or write permission  
 24700 is denied on the parent directory of the FIFO to be created.

24701 [EEXIST] The named file already exists.

24702 [ELOOP] A loop exists in symbolic links encountered during resolution of the *path*  
 24703 argument.

24704 [ENAMETOOLONG]

24705 The length of the *path* argument exceeds {PATH\_MAX} or a pathname  
 24706 component is longer than {NAME\_MAX}.

24707 [ENOENT] A component of the path prefix specified by *path* does not name an existing  
 24708 directory or *path* is an empty string.

24709 [ENOSPC] The directory that would contain the new file cannot be extended or the file  
 24710 system is out of file-allocation resources.

24711 [ENOTDIR] A component of the path prefix is not a directory.

24712 [EROFS] The named file resides on a read-only file system.

24713 The *mkfifo()* function may fail if:

24714 [ELOOP] More than {SYMLOOP\_MAX} symbolic links were encountered during  
 24715 resolution of the *path* argument.

24716 [ENAMETOOLONG]  
 24717 As a result of encountering a symbolic link in resolution of the *path* argument,  
 24718 the length of the substituted pathname string exceeded {PATH\_MAX}.

#### 24719 EXAMPLES

##### 24720 Creating a FIFO File

24721 The following example shows how to create a FIFO file named `/home/cnd/mod_done`, with  
 24722 read/write permissions for owner, and with read permissions for group and others.

```
24723 #include <sys/types.h>
24724 #include <sys/stat.h>
24725
24726 int status;
24727 ...
24728 status = mkfifo("/home/cnd/mod_done", S_IWUSR | S_IRUSR |
24729               S_IRGRP | S_IROTH);
```

#### 24729 APPLICATION USAGE

24730 None.

#### 24731 RATIONALE

24732 The syntax of this function is intended to maintain compatibility with historical  
 24733 implementations of *mknod()*. The latter function was included in the 1984 `/usr/group` standard  
 24734 but only for use in creating FIFO special files. The *mknod()* function was originally excluded  
 24735 from the POSIX.1-1988 standard as implementation-defined and replaced by *mkdir()* and  
 24736 *mkfifo()*. The *mknod()* function is now included for alignment with the Single UNIX  
 24737 Specification.

24738 The POSIX.1-1990 standard required that the group ID of a newly created FIFO be set to the  
 24739 group ID of its parent directory or to the effective group ID of the creating process. FIPS 151-2  
 24740 required that implementations provide a way to have the group ID be set to the group ID of the  
 24741 containing directory, but did not prohibit implementations also supporting a way to set the  
 24742 group ID to the effective group ID of the creating process. Conforming applications should not  
 24743 assume which group ID will be used. If it matters, an application can use *chown()* to set the  
 24744 group ID after the FIFO is created, or determine under what conditions the implementation will  
 24745 set the desired group ID.

#### 24746 FUTURE DIRECTIONS

24747 None.

#### 24748 SEE ALSO

24749 *umask()*, the Base Definitions volume of IEEE Std 1003.1-2001, `<sys/stat.h>`, `<sys/types.h>`

#### 24750 CHANGE HISTORY

24751 First released in Issue 3. Included for alignment with the POSIX.1-1988 standard.

#### 24752 Issue 6

24753 In the SYNOPSIS, the optional include of the `<sys/types.h>` header is removed.

24754 The following new requirements on POSIX implementations derive from alignment with the  
 24755 Single UNIX Specification:

- 24756 • The requirement to include `<sys/types.h>` has been removed. Although `<sys/types.h>` was  
 24757 required for conforming implementations of previous POSIX specifications, it was not  
 24758 required for UNIX applications.

- 24759           • The [ELOOP] mandatory error condition is added.
- 24760           • A second [ENAMETOOLONG] is added as an optional error condition.
- 24761       The following changes were made to align with the IEEE P1003.1a draft standard:
- 24762           • The [ELOOP] optional error condition is added.

24763 **NAME**

24764 `mknod` — make a directory, a special file, or a regular file

24765 **SYNOPSIS**

24766 XSI `#include <sys/stat.h>`

24767 `int mknod(const char *path, mode_t mode, dev_t dev);`

24768

24769 **DESCRIPTION**

24770 The `mknod()` function shall create a new file named by the pathname to which the argument `path`  
 24771 points.

24772 The file type for `path` is OR'ed into the `mode` argument, and the application shall select one of the  
 24773 following symbolic constants:

24774

24775

24776

24777

24778

24779

24780

| Name    | Description                      |
|---------|----------------------------------|
| S_IFIFO | FIFO-special                     |
| S_IFCHR | Character-special (non-portable) |
| S_IFDIR | Directory (non-portable)         |
| S_IFBLK | Block-special (non-portable)     |
| S_IFREG | Regular (non-portable)           |

24781 The only portable use of `mknod()` is to create a FIFO-special file. If `mode` is not S\_IFIFO or `dev` is  
 24782 not 0, the behavior of `mknod()` is unspecified.

24783 The permissions for the new file are OR'ed into the `mode` argument, and may be selected from  
 24784 any combination of the following symbolic constants:

24785

24786

24787

24788

24789

24790

24791

24792

24793

24794

24795

24796

24797

24798

24799

24800

24801

| Name    | Description                                 |
|---------|---------------------------------------------|
| S_ISUID | Set user ID on execution.                   |
| S_ISGID | Set group ID on execution.                  |
| S_IRWXU | Read, write, or execute (search) by owner.  |
| S_IRUSR | Read by owner.                              |
| S_IWUSR | Write by owner.                             |
| S_IXUSR | Execute (search) by owner.                  |
| S_IRWXG | Read, write, or execute (search) by group.  |
| S_IRGRP | Read by group.                              |
| S_IWGRP | Write by group.                             |
| S_IXGRP | Execute (search) by group.                  |
| S_IRWXO | Read, write, or execute (search) by others. |
| S_IROTH | Read by others.                             |
| S_IWOTH | Write by others.                            |
| S_IXOTH | Execute (search) by others.                 |
| S_ISVTX | On directories, restricted deletion flag.   |

24802 The user ID of the file shall be initialized to the effective user ID of the process. The group ID of  
 24803 the file shall be initialized to either the effective group ID of the process or the group ID of the  
 24804 parent directory. Implementations shall provide a way to initialize the file's group ID to the  
 24805 group ID of the parent directory. Implementations may, but need not, provide an
